As for Frumentie called Alica, it is a meere Romane invention, and not long agoe firſt deviſed: for otherwiſe the Greekes if they had knowne of it, would never have written as they did in the commendation of husked Barley named Ptiſana, rather than of it. And I thinke verely, that the uſe thereof was not taken up in the daies of *Pompey* the great, and therefore the followers and diſciples of *Aſclepiades* have left little or nothing thereof in writing. That it is a ſoveraigne and
D moſt holeſome thing, no man verely maketh doubt or queſtion; whether it be waſhed and ſo given in honied water, or whether it bee ſodden and ſo uſed in a thin ſupping, or boiled higher to the conſiſtence of a thicke gruell or pottage. The ſame for to ſtay the bellie, and ſtop a laske, is torrefied: and then afterwards ſodden with virgine-wax, as before I have ſhewed. But a peculiar vertue it hath by it ſelfe to reſtore thoſe that are conſumed and fallen away through a long and languiſhing ſickneſſe: and then it muſt be ordered thus, Take three cyaths of the ſaid Frumentie, ſeeth it in a ſextar of faire water over a ſoft fire gently, untill by little and little all the water bee conſumed: now after this imbibition, when that the Frumentie hath thus drunke up all the water, there muſt be added thereto a ſextar of Ewes milke or Goats milke, and in the end a little ho-
E ney. This the patient is to take for certain daies together. And in truth, ſuch a broth or ſupping is this, as there is not in the world a more ſoveraigne reſtorative for all colliquations and con-
F ſumptions whatſoever, nor that will ſooner ſet upon their feet againe thoſe who bee farre gone and ſpent that way.

To come now to Millet, it is a graine, which being torrefied aforehand for the purpoſe, ſtoppeth the laske, and diſpatcheth all collicke paines and torments of the bellie. Being fried and laid too hot in a bag, there is not a better thing for the greefe of the ſinewes, or to allay any other paine: for, moſt ſoft it is and lighteſt of all other, and nothing in the world retaineth heat ſo well. No marvell then if Millet bee uſed ordinarily in thoſe caſes, where heat is to doe good. To conclude, the meale or pouder thereof incorporat with tarre, is a ſingular plaiſter to bee laid upon ſores, occaſioned by the ſting of ſerpents or the pricke of the vermine named Multipeda.

As for Panicke, *Diocles* the Phyſician called it Mel-frugum. The ſame operations and effects it hath that Millet. Being taken in wine, it is good for the dyſenterie or bloudie flix. To ſuch tumors as need to evaporat and be reſolved, it is ſingular good for to bee applied hot, by way of fomentation. Sodden in Goats milke, and given twice a day to drinke, it bindeth the belly, and ſtaieth flux: and in that manner it aſſuageth the torments and wrings in the collicke.

Seſama

Seſama ſtamped or beaten into pouder, and ſo taken in wine, reſtraineth immoderat vomits. Reduced into a liniment, and ſo applied, it doth mitigat the inflammation of the ears, and cureth any burne or ſcalt place of the bodie. The ſame effects it hath when it is green and groweth in the field. Over and beſides, a cataplaſme made thereof, being boiled in wine, is good for ſore eyes. To be eaten, it is no holeſome meat for the ſtomacke: and more than that, it cauſeth a ſtinking breath. Howbeit, they hold it excellent to withſtand the venomous ſting of the Stellions, and the daungers that it may inferre: as alſo to heale the old cancerous and maligne ulcers, named Cacoëthe, *i.* Morimals. There is an oile made thereof, which as I have before ſhewed, is good for the eares. G

Touching Seſamoeides, which taketh that name of the reſemblance that it hath to Seſama, but that the graine thereof is bitter, and the leafe leſſe, and it groweth in gravellie grounds: The ſame being taken to drinke in water, purgeth chollericke humors. A liniment made of the ſeed, doth aſſuage the heat of S. *Anthonies* fire, and doth diſcuſſe and reſolve biles. And yet there is another Seſamoeides growing in Anticyra, which thereupon ſome doe call Anticyricon: otherwiſe much like it is to the hearbe Groundſwell, whereof I will ſpeake in place convenient. The graine or ſeed of this Seſamoeides is given in ſweet wine, as a purgative of chollericke and flegmatick humors; to the quantitie of as much as may be contained with three fingers: but to quicken the ſame, the Phyſicians uſe to put one Obole and an halfe of the white Ellebore-root or Neeſewort: which purgation they uſe in caſe of madneſſe, the melancholike diſeaſe, the falling ſickneſſe, and the gout. By it ſelfe alone, the weight of one dram is a ſufficient laxative, and dooth evacuat the bellie. H

The beſt Barley is that which is whiteſt. The juice of Barley boiled in raine water, is made up into certaine troſches, which is ſingular good to be either conveighed into the guts by way of clyſter, for the exulceration thereof; or els injected into the Matrice by the metrenchyte, for the ulcers therein. The aſhes of Barley burnt, are good in a liniment for burnes, for places where the fleſh is gone from the bones, for wheales, and ſmall pocks, and for the biting of the Hardiſhrew mouſe. The ſame with a little ſprinckling of ſalt, and ſome honey among, is counted a good dentifrice, to make the teeth look white, and the breath to ſmell ſweet. There is an opinion commonly received, That whoſoever uſe to eat Barley bread, ſhall not bee troubled with the gout of the feet. And they ſay, that if a man take nine Barley cornes, and with every one of them draw three imaginarie circles about a fellon with his left hand: and when he hath ſo done, throw them all into the fire, preſently it ſhall bee cured. There is an hearbe which the Greekes call Phœnicea, and our countreymen in Latine Hordeum *Murinum. This hearbe or weed being beaten to pouder, and taken in wine, is ſingular to bring downe the courſe of womens fleurs. I K

Hippocrates the famous Phyſician, hath made one *entire booke in the praiſe of Ptiſana, which is a groat made of Barley: but all the vertues and properties thereof are now attributed unto our Frumentie Alica, and that goeth away with all the commendation. *And yet a man may ſee how much more harmeleſſe it is than Alica. *Hippocrates* commended it onely for a ſupping, as being ſlipperie and eaſie to be taken, good to put away thirſt, not ſwelling in the bellie, paſſing quickly and eaſily through the bodie, and ſuch a kind of meat as might alone of all others be given twice a day in a fever to thoſe who were uſed to it: ſo far was he in opinion from them who would famiſh all diſeaſes, and cure them by *faſting and utter hunger. Howbeit, hee forbad to give it whole in ſubſtance to be ſupped off, and allowed nothing but the very ſimple juice and broth of Ptiſane or husked Barley: neither allowed he it in the beginning of an ague fit, ſo long as the feet continued cold, for during that time he would not admit ſo much as a thin potion thereof. Now beſides the Alica or Frumentie made of Zea, there is another which commeth of the common Wheat, more glutinous and better indeed for the exulceration of the wind pipes. L

As touching Amylum or ſtarch pouder, it dimmeth the eyeſight, & is hurtfull to the throat, and is nothing good to be eaten, contrarie unto the common received opinion. It ſtaieth the inordinat flux of the bellie, repreſſeth the rheume into the eyes, it healeth ulcers, and cureth puſhes, wheales, and blaines, and reſtraineth fluxes of bloud. It mollifieth the hardneſſe growing in the eyelids. To ſuch as caſt up bloud, it is uſually given in an egg. In paine of the bladder, halfe an ounce of Amylum made hot over the fire untill it ſiver, with one egg and as much cuit as will go into three egg ſhels, taken immediatly after the bath or hot houſe, is a ſingular remedie. Moreover, oatmeale ſodden in vinegre, taketh away moles and freckles of the skin. M

*It groweth indeed commonly upon new wals, although the name ſeemeth to come from *Mures*, *i.* Mice and Rats: rather than *Muri*, i. Wals.

*This booke goeth now under this title, *De ratione victus in morbis acutis.*

**Contrà, quanto innocentior eſt alica.*

*He glanceth at *Diatritos*, *i.* faſting three daies together.

The

A The very ordinarie bread, which is our daily food, hath an infinite number of medicinable faculties. Bread crums being applied with water and common oile, or els with oile of Roſes, doth mollifie impoſtumes: and with honied water aſſuageth any hardnes, wonderfully. Given in wine, 2 it is good to diſcuſſe and reſolve. It is of force alſo to bind and knit where need is, and ſo much the rather, if it be given with vinegre. Alſo it is ſingular againſt the ſharpe and eager flux of fleam, 3 which the Greekes call Rheumes: likewiſe for bruiſed places upon ſtripes or blowes: yea, and for diſlocations. And in very deed, for all theſe purpoſes, leavened bread, called of the Greekes Autopyros, *i.* downeright made, is better than any other. Moreover, a liniment thereof applied with vinegre, is good for whitflawes and the calloſities of the feet. Moreover, ſtale bread and biſket, ſuch as ſea-faring men doe eat, being ſtamped and ſod againe, is good to bind the bellie. For B ſinging men and choriſters who are deſirous to have a cleare voice, for ſuch alſo as bee ſubject to rheumes falling from the head, it is the wholeſomeſt thing in the world, to eat drie bread in the 5 beginning of meales. The Sitanian bread, that is to ſay, which is made of three months corn, being incorporat with honey, is a faire medicine to cure either the blacke prints remaining after ſtrokes, or the skalling and pilling of the face. White bread crums ſoked either in hote or cold water, yeeld unto ſicke men a meat of light digeſtion. The ſame being applied with wine, cureth ſwelled eyes. And ſo it healeth the breaking out in the head, eſpecially if drie Myrtles be put thereto. It is an ordinarie thing to preſcribe unto them that are given to ſhaking, for to eat faſting bread ſoked in water, preſently after they come forth of the bath. The perfume of bread burnt, taketh away all other evill ſmels that may be in a bed-chamber: and being put into thoſe Hip- C pocras bags through which wines be ſtrained, it altereth the naughtie taſt which they have.

Furthermore, even Beanes have their properties which ſerve in Phyſicke: for beeing fried all whole as they bee, and ſo caſt piping hote into ſharpe vinegre, they helpe the collicke and pangs of the bellie. Bruiſed and ſo eaten, or ſodden with Garlick, they be excellent good againſt coughs 2 that were thought paſt cure and remedileſſe; yea, and impoſtumes in the breaſt growne to ſuppuration: but the patient ought to feed thereof continually every day. Alſo if one chew them faſting, and ſo applie them to a fellon, they are thought paſſing good either to ripen or to diſcuſſe the ſame. Boiled in wine, and ſo laid too, they aſſuage the ſwellings of the cods and privie parts ſerving to generation. Beane floure ſodden in vinegre, doth ripen and breake all tumours: in like manner it diſſolveth blacke bruiſed bloud lying under the skin, and healeth burnes. *M. Varro* is of D opinion, That it is good for the voice. Beane ſtalkes and Beane cods burnt to aſhes, and ſo incorporat with old Swines ſeame, is good for the Sciatica and all inveterat paines of the ſinews. The very huskes of Beans alone ſodden to the thirds, doe ſtop the laske and running out of the bellie.

The beſt Lentils be they that are moſt tender, and aske leaſt ſeething: alſo ſuch as drink much water. Lentils verely do dim the eyeſight, and breed ventoſities in the ſtomack: but taken in meat they ſtaie the flux of the guts, and the rather if they bee throughly ſodden in raine water: but in caſe they be not fully boiled, they doe open the bellie and make the bodie laxative. The eſcares or rouſes remaining upon cauterized or bliſtered ſores, they breake and make to fall off: & thoſe ulcers which are within the mouth, they mundifie and cleanſe. Applied outwardly, they appeaſe the paines of all impoſtumes, eſpecially if they be exulcerat and full of chaps: and reduced into E a cataplaſme with melilote or a quince, they are ſingular for to repreſſe the flux of humors to the eyes: but for to keepe impoſtumes and tumors from ſuppuration, they are laid too with Barley groats, or the groſſe meale thereof torrefied. The juice of Lentils after they bee ſodden, is good for the exulcerations of the mouth, and the genetoires: likewiſe with an addition of oile Roſat or Quince, for the inflammation of the ſeat or fundament. But if the parts affected and exulcerat do require ſtronger and ſharper remedies, the ſame would be applied with the rind of a pomgranat, and a little honey put thereto. And to the end that the ſaid cataplaſme ſhall not drie quickly, they uſe to put thereto Beet leaves. Lentils ſodden throughly in vinegre, ſerve for a cataplaſm to be laid upon the ſwelling kernils called the kings evill, and other fell biles, whether they be ripe or in the way onely of maturation. Applied with honied water, they bee very good for any clifts F and chaps: but with the pill or rind of a pomgranat, for Gangrenes. In like manner, with Barley groats they be appropriat for the gout, the kidneies, the naturall parts of women, for kibes, and ſuch ulcers as be hardly brought to cicatrize. Thirtie graines of Lentils ſwallowed downe by way of Bole, are ſingular for the feebleneſſe and diſſolution of the ſtomacke. In dyſenteries or bloudie flixes, in the violent rage of chollericke humors which cauſe evacuations both upward and downe-

downeward, Lentils doe effectuat their operation much more, if they be ſodden in three waters. G
For which purpoſe alſo better it is to torrefie them firſt, and then to pound or beat them ſmall, that they may be given to the patient as fine as may be, either by themſelves alone, or els with a Quince, with Pears, Myrtle berries, wild Cichorie, blacke Beets or Plantain. Howbeit, note thus much, That Lentils are naught for the lungs, for head-ach, for all nervous parts, and the gall; and this ill propertie they have beſides, to keepe the patient from ſleepe. Being ſodden in ſeawater, they are good for puſhes and angrie wheales, for S. *Anthonies* fire, and the accidents that befall womens breaſts: but if they be boiled in vinegre, they diſcuſſe all hard tumors, and the kings evill. They that have but weake and bad ſtomackes, uſe verely to put Lentils to thicken their pottage and gruels, in ſtead of Barley groats, and find thereby much eaſe. If they be halfe ſodden in water, afterwards braied or ſtamped, and then let paſſe through a tamiſe, that the brans might be H
ſeparate from the reſt, they are thought very good for burnes: but then, within a while as the cure goeth forward, they muſt be applied with honey alſo put thereto. Finally, if they be ſodden in Oxycrat or water and vinegre together, they helpe the ſwelling bunch of the throat called Bronchocele.

There is a kind of mariſh or moorie Lentils [called Duckes meat] growing of it ſelfe in ſtanding waters. This hearbe is by nature refrigerative: in which regard, it ſerveth to make a liniment uſed for inflammations and hot impoſtumes: but principally for all manner of gouts, either alone or mingled with Barley groats. The ſame hath vertue to knit and conſolidat ruptures, when the bowels are fallen downe.

Moreover, there be wild Lentils, called by the Greekes Eleliſphacos, by others, Phacos. Theſe I
be lighter than the tame Lentils which are ſowed, bearing a ſmaller leafe, drier alſo, & more odoriferous than the other. Of which wild Lentils, there is a ſecond ſort, carying a ſtrong ſmell: inſomuch as the former kind is counted the milder. Theſe Lentils have leaves formed to the faſhion of quince leaves, but that they be leſſe and white, and commonly they are ſodden branch and all together. Their medicinable vertues bee, to bring downe the monthly ſickneſſe of women, to provoke urines, and to heale the wounds occaſioned by the venomous prick of the ſea-puffin or forke-fiſh. Now the nature of this fiſh is to benum and mortifie the place which is ſtrucken. Of theſe Lentils and Wormewood, there is a drinke made, good for the dyſenterie, or bloudie flix. The ſame taken with wine, draweth downe womens fleurs that ſtay upon them: but if their bare decoction bee drunke, it will ſtay them when they flow immoderatly. The hearbe alone applied K
outwardly, repreſſeth the overmuch bleeding of freſh wounds: it cureth the ſores occaſioned by the ſtinging of ſerpents. The decoction thereof in wine, doth mitigat the itching of the cods, if they be bathed and fomented therewith.

Our moderne Herbariſts in theſe daies, doe call that in Latine Salvia, *i.* Sange, which the Greekes name Eleliſphacos. An hearbe it is much reſembling Mints, of a grey and hoarie colour, and withall odoriferous. Being applied to the naturall parts of women, it fetcheth away the dead infant within the wombe: it riddeth the eares alſo and feſtered ulcers of thoſe wormes and vermine which breed therein.

Moreover, there is a kind of wild Cich peaſe, bearing leaves like to the other of the garden, and which be ſowed, ſave that their ſmell is ſtrong and unpleaſant. If a man feed largely of them, L
they ſtirre the bellie and move to the ſeege, they breed ventoſities, cauſe the collicke and wringing of the guts. Howbeit, if they be parched or torrified they are reputed the wholeſomer.

The Cichling or petie cich peaſe, is thought to be better and more wholeſome to the bellie than the other. But the meale as well of the one as the other, doth heale the running ſores and ſkals of the head: howbeit, the wild better than the reſt. Moreover, theſe ciches are taken to bee good for the falling ſickneſſe, the ſwellings of the liver, and the ſting of ſerpents. They procure womens tearmes, and provoke urine, and eſpecially the graine it ſelfe rather than the leafe. The ſame are ſingular for tettars and ringwormes, for inflammations of the cods, for the jaundiſe and dropſie. But all the ſort of them be hurtfull to the bladder and kidneies, eſpecially if they bee exulcerat. For gangrenes and thoſe morimall ulcers called Cacoëthe, they bee better, in caſe M
they be tempered with honey. Some there be, who for to be rid of all kind of werts, take as many cich peaſe as there be werts, and with every one of them toucha wert, and that, upon the firſt day after the chaunge of the Moone: which done, they tie the foreſaid peaſe or ciches in a little linnen rag, and fling them away backward behind them: and they are perſuaded that the werts

will

A will be gone by this meanes. But our Latine Phyſicians are of opinion, That the blacke ciches, which be called Ram-ciches, ſhould be well & throughly ſodden in water and ſalt: of which decoction they preſcribe unto the patient for to drinke two cyaths, in difficultie of making water, for to expell the ſtone, and rid away the jaundiſe. Their leaves and ſtalkes or ſtraw beeing ſodden in water over a good fire, yeeld a decoction, which beeing uſed as hot as may bee ſuffered, dooth mollifie the calloſities and hardneſſe growing about the feet: ſo doth a liniment alſo made of the very ſubſtance it ſelfe, ſtamped and applied hot.

The Columbine ciches ſodden in water, are thought to leſſen and ſhorten the ſhaking fits in tertian and quartane agues. The blacke cich peaſe being beaten to powder with halfe the quantitie of gall-nuts, and incorporat with ſweet wine cuit, called Paſſum, and ſo applied, cureth the
B ulcers of the eyes.

As touching Ervile, ſomewhat I have ſaid alreadie touching the properties thereof, when I made mention of it among other kinds of pulſe. And indeed the old writers have attributed as great power & vertue unto it as to the Colewort. Beeing laid too with vinegre, it cureth the hurts that come by the ſting of ſerpents, or the teeth of man and crocodile. There bee writers of approved authoritie, who affirme for certaine, That if a man doe eat Ervile faſting every day, it will diminiſh and waſt the ſwelling of the ſpleene. The meale of Ervile (as *Varro* reporteth) taketh away the ſpots and moles of any part of the bodie. And in truth, this pulſe is ſingular to repreſſe corroſive and eating ulcers: but above all, it is moſt effectuall in the ſores of womens breaſts. Applied with wine, it breaketh carbuncles. Being torrefied and incorporat with honey, and reduced into an electuarie or bole, and ſo taken as much as an hazell nut, it amendeth the ſuppreſſi-
C on or difficultie of voiding urine, diſſolveth ventoſities, openeth obſtructions, and helpeth other accidents of the liver, the provocations and proffers to the ſtoole without doing any thing: reviveth thoſe parts that miſlike and feel no benefit or nutriment of meat, which they call in Greek Atropha. In like manner it cureth ſhingles, ringwormes, and tettars, if it be firſt ſodden in vinegre ſo applied, and not remooved untill the fourth day. If it bee laid too with honey, it keepeth biles from ſuppuration. A fomentation made with the decoction therof in water, helpeth kibed heels, and the itch. And it is generally thought, That if a man drinke it every day next his heart upon an emptie ſtomack, it will make the whole bodie looke with a better and more lively colour. Contrariwiſe, the common opinion is, That it is not good to be eaten ordinarily as meat; for it mo-
D veth to vomit, troubleth the bellie, lieth heavie upon the ſtomack, and fumeth up into the head: it breedeth ach and heavineſſe in the knees. But if it have lien many daies in ſteepe, after that imbibition of water, it becommeth more mild, and is a moſt wholeſome provender for horſe and oxen. The greene cods of Ervile before they wax hard, if they bee ſtamped with their ſtalkes and leaves together, do colour and die the haires of the head *blacke.

As touching wild Lupines, they be inferior to thoſe which come of ſeed, in all reſpects, but onely in bitterneſſe. And verely there is not a thing more commendable, holeſome, and light of digeſtion than wild Lupines, if they be eaten drie. They are brought to be ſweet and pleaſant by hot aſhes or ſcalding water. Being eaten at meales ordinarily, they make a freſh colour & chearfull countenance. Bitter Lupines are very good againſt the ſting of the Aſpides. Drie Lupines,
E huſked and cleanſed from their skins, if they bee applied to blacke and mortified ulcers, full of dead fleſh, with a linnen cloth betweene, reduce them to a lively colour, and to quick fleſh again. The ſame ſodden in vinegre, diſcuſſe the kings evill, and the ſwelling kernils and impoſtumations behind the eares. The broth or collature of them being ſodden with rue and pepper, may be given ſafely, although it were in an ague, to thoſe that be under thirtie yeares of age, for to expell the wormes in the bellie. As for young children who have the wormes, it is good to lay Lupines to their bellie whiles they be faſting. All others are to take them torrefied, either by way of drink in a kind of wine cuit, or els in electuarie after the manner of a lohoch. The ſame do give an edge to the ſtomacke, and quicken the appetite to meat. The meale or pouder of Lupines wrought with vinegre into a dough or paſte, and ſo reduced into a liniment, and uſed in a baine or ſtouve,
F repreſſeth and keepeth downe all wheales and itching pimples which are readie to breake forth: and of it ſelfe is ſufficient to drie up ulcers. It bringeth to the native and lively colour all places blacke and blew with ſtripes. Medled with Barley groats, it aſſuageth all inflammations. For the weakeneſſe of the huske bone, the haunch, and the loines, the wild Lupines are counted more effectuall than the other. A fomentation with the decoction of theſe wild Lupines, maketh the skin more

* For that colour in old time was beſt eſteemed: and therby chaſt Matrones were knowne from wanton harlots, who affected yellow haire. *Alex. ab. Alex. cap* 18. *li.* 5.

more ſmooth and beautifull, taking away all ſpots and freckles. But if the ſame or the garden Lupines bee boiled to the height and conſiſtence of honey, they doe cleanſe the skin from blacke morphew and the leproſie. Theſe alſo if they be applied as a cataplaſme, doe break carbuncles: bring downe, or els ripen the ſwelling kernils named the kings evill, and other biles and botches, which of their nature be long ere they gather to head. Boiled in vinegre, they reduce places cicatrized, to their naturall colour, and make them look faire and white again. But if they be throughly ſodden in raine water, of the collature that paſſeth from them, there is made an abſterſive and ſcouring lie in manner of ſope, moſt excellent for to foment, gangrenes, ſmall pocks, and running ulcers. A drinke made thereof, is ſingular for the ſpleene: and if honey be put thereto, it provoketh womens fleurs, which make no haſt downeward. Take raw Lupines, ſtampe them with drie figs and vinegre into a cataplaſme, and applie them to the ſpleene, it is an excellent remedie. The root alſo ſodden in water, provoketh urine forcibly. Lupines boiled in water with the herb Chamæleon, doe cure the diſeaſes incident to ſheep and other ſuch ſmall cattell, if they do but drink of this decoction. Let them bee ſodden in the mother or lees of wine, or mingle both their decoctions therewith: they do heale the farſins, ſcab, and mange of all ſourefooted beaſts whatſoever. The fume of them as they burne, killeth gnats.

Concerning Irio, I ſaid before in the treatiſe of corne and pulſe, that it was like Seſama, and named by the Greekes Eryſimon, whereas the Gaules doe call it Velarum. This plant brancheth very much, and beareth leaves like to Rocquet, but that they bee ſomewhat narrower, and bringeth foorth ſeed reſembling that of Creſſes. This Irio taken with honey in forme of a lohoch, is excellent good for the cough, and thoſe who reach out filthie matter from their cheſt. Given it is for the jaundiſe, the diſeaſes of the loines, for the pleuriſie, the torments and wrings of the collicke, and the fluxes occaſioned by the debilitie and weakeneſſe of the ſtomacke. Applied in forme of a liniment, it is ſingular good for the inflammations behind the eares, for the cancerous ulcers alſo, and the ſymptomes thereto belonging. Laid to the cods with water, and otherwhiles with honey, it altereth their diſtemperature of heat, and the inflammations whereto they are ſubject. And ſoveraigne it is for infants. Likewiſe a cataplaſme made of it, with figgs and honey, is ſingular for the accidents and greeſes of the fundament, as alſo for the gout and paines of the joints. Taken in drinke, it is an effectuall countrepoyſon. It cureth thoſe who are ſhort winded. Applied outwardly with old hogs greaſe, it helpeth fiſtulous ſores, ſo there be care had that none of it goe into the ulcers.

As for the graine Horminum, it hath a ſeed reſembling Cumin, as I have ſaid before: otherwiſe it is like to *Porret: and groweth to the height of a ſpan or nine inches. Two kinds there be of it: whereof the one hath a blacker ſeed than the other, and ſomewhat long. *This hath power to provoke luſt, and is much uſed for the pin and web, for the perle alſo in the eye. The other hath a whiter ſeed and rounder. Both the one and the other if they be ſtamped, draw forth pricks and thornes out of the bodie, if a liniment be made of them alone, and applied with water. But a cataplaſme of the leaves with vinegre, or alone by themſelves, or elſe with honey, diſcuſſe and reſolve biles without ſuppuration. In like manner they diſpatch fellons, if they bee taken before they grow to any head, and generally, all tumors proceeding from ſharpe and hot humors. And thus much of graine.

* πράσον for πράσιν, i. Horehound.

* He confoundeth (as it ſhould ſeeme) the vertues of Horminum, i. Clarie the hearbe, with the graine called alſo Horminum.

A ſtraunge thing that Nature hath ſo ordained, That the very peſtilent weeds which plague corne, ſhould have their uſe in Phyſicke. For firſt and formoſt there is Darnell, which albeit *Virgill* tearmeth Infœlix, *i.* unhappie, yet if it be ground and ſodden in vinegre, and ſo applied, it cureth tettars and drie ſcabs joined with a great itch: and the ſooner doth it the deed, the oftener it is removed and changed. Darnell flower laid too, with Oxymell, cureth the gout and other pains. And to ſay a truth, the manner of this cure differeth from the reſt. For the preparing of which medicine, the ſaid flower muſt be ordered in this manner, and after this proportion: For every ſextar of vinegre, it ſufficeth to diſſolve therein two ounces of honey; take then three ſextars of this mixtion, and put thereto two ſextars of Darnell meale, ſodden to a thicke conſiſtence: which done, temper all together, and applie this cataplaſme to the greeved and pained members. The ſame meale draweth forth ſpils of broken and ſhivered bones.

A weed there is, called Miliaria, for that it killeth the graine Millet. Beat this to pouder, and mingle it with wine, then poure this drench with an horne downe the throat of labouring jades: they ſay it will cure their gouts.

As

A As for Bromos, [i. wild Otes] which the Greeks take for the ſeed of a certain ſpiked or eared weed, counted it is for one of the imperfections growing among corne, and may bee raunged with the kinds of Otes: for blade and ſtalke, it commeth neare to wheat; it beareth in the haw or head certain grains hanging downe, which reſemble ſmall locuſts; the ſeed is good to be uſed in thoſe cataplaſms, into which barley and ſuch like doe enter; the juice or liquor made of it, is ſingular for the cough. A weed there is which we named Orobanche, for that it choketh Ervile and other pulſe: ſome call it Cynomorion, for the reſemblance that it hath to the cullions and pizle or genitall member of a dog. It riſeth up in a ſmall ſtem without any leaves or blade: fattie it is and red: ſometimes it is eaten alone; otherwhiles it is ſerved up tender ſodden, between two diſhes, with other viands. Moreover, there doe engender in pulſe, certain little venomous
B vermins, who will pricke and ſting their hands who are employed in the plucking, yea and put them in daunger of their life: a kind they are of theſe Solifugæ or Solpugæ. The remedies for all theſe, be the ſame which are ſet downe againſt Spiders, and Phalangia.

Thus much as touching all kinds of graine, as far foorth as they concerne Phyſicke. But this moreover is to be noted, that of corne there be certaine drinks made; as namely, Zythus, in Ægypt; Cœlia and Ceria, in Spaine; Ale and Beere and many more ſorts, in Gaule and other pro-
3 vinces. Now the froth or barme that riſeth from theſe Ales or Beers, have a propertie to keepe the skin faire and cleare in womens faces. But for the operation that Ale and Beere hath in them who drinke therof, I meane to paſſe them over here; for I thinke it better to proceed to the treatiſe of wine: but firſt I will diſcipher the medicinable vertues of trees, and begin with the vine.

C

THE XXIII. BOOKE OF
D # THE HISTORIE OF NATVRE,
WRITTEN BY C. PLINIVS SECVNDVS.

The Proëme.

E THus far forth have we gone over the upper face of the earth, and ſhewed what medicinable vertues there be in all kinds of graine, as well corne as pulſe: as alſo what Phyſicke may be found in woorts and pot-hearbs: yea and in thoſe garden plants, which by reaſon of their faire floures and ſweet odours, ſerve mans turne for guirlands and chaplets. It remaineth now to ſpeake of Ladie Pomona and her gifts, who certes, commeth not behind dame Ceres with all her riches. And verely this nymph and goddeſſe Pomona, not content thus to protect, maintaine, and nouriſh under the ſhade of her trees, thoſe fruits of the earth above-named; but diſpleaſed rather and taking ſcorne, that ſuch plants which grow farther from the cope of heaven, and began long after trees to come up and ſhew themſelves, ſhould ſeeme to have ſo many vertues: hath likewiſe furniſhed the fruits hanging upon her trees, with their properties, and thoſe of no ſmall operation and effect in Phyſicke. And in truth, if we conſider and weigh the cauſe aright, ſhee it was that affourded to mankind the firſt food from thoſe
F her trees; inducing us thereby to lift up our eies & looke to heaven-ward: yea and ſhe giveth the world to underſtand, that if Ceres and Flora both ſhould faile, ſhee with her goods onely were able even ſtill to ſuſtaine and feed us ſufficiently. And to begin with the Vine, which ought by right to be raunged in the higheſt ranke of all thoſe plants that beare the name of Trees: this bountifull Ladie not ſatisfied herein, that ſhee had done pleaſure unto man in furniſhing him with noble perfumes, odors, and delicat

ointments, by means of the grape verjuice, the vine floure Oenanthe, and namely the wild vine Massaris in Africke (according as I have discourſed more at large herctofore;) hath therefore beſtowed upon vines thoſe medicinable vertues in greateſt meaſure, and withall uſed theſe remonſtrances unto men in this manner: Call to mind (quoth ſhee) how many benefits and pleaſures thou receiveſt at my hands; Who is it but I, that have brought foorth wine, that ſweet juice of the grape? Who but I, have given thee Oile, that daintie liquor of the Olive? from me, come Dates and apples: from me thou haſt all fruits of ſuch varietie, that unpoſsible it is to number them. Neither doe I deale by thee as dame * Tellus doth, who beſtoweth nothing upon thee without labour and ſweat of thy browes; nothing (I ſay) but before it doth thee any good, requireth tillage by oxe and plough, thraſhing with ſtaile upon the floore, or trampling of beaſts feet upon the mow, and then the milſtones to grind it: ſuch adoe there is, and ſo long a time firſt, before thou canſt enjoy the benefit thereof for thy food. But contrariwiſe, whatſoever commeth from me, is readie at hand; there needs no intreating of the plough, nor any great labour and induſtrie to have and enjoy my fruits; for they offer themſelves of their owne accord: yea and if thou thinke much of thy pains to climbe, or to put up thy hand and gather them, loe they are readie to drop downe and fall into thy mouth, or els to lie under thy feet. See how good and gracious Nature hath been unto us herein, and how ſhe hath ſtroven with her ſelfe, Whether ſhe ſhould profit, or pleaſure, man more! and yet I take it, that ſhe affected Commoditie rather than Delight.

* The Earth.

For to come unto the vertues and properties of the vine, The very leaves and tender burgeons thereof, applied with barley groats, doe mitigat the paine of the head, and reduce all inflammations of the bodie to the due temperature. The leaves alone of the vine, laid unto the ſtomacke with cold water, allay the unkind heats thereof: and with barley meale, are ſingular for all gouts and diſeaſes of the joynts. The tendrils or young braunches of the vine being ſtamped and applied accordingly, drie up any tumors or ſwellings whatſoever. Their juice injected or poured into the guts by a clyſtre, cureth the bloudie flix. The liquor concreat (which is in manner of a gum iſſuing from the vine) healeth the leprie and all foule tettars, ſcabs, and manges, in caſe the parts affected were prepared and rubbed before with ſalnitre. The ſame liquor or gum is likewiſe depilatorie; for if the hairs be often annointed with it and oile togither, they will fall off: but the water eſpecially that ſweateth out of greene vine braunches as they burne, hath a mightie operation that way, inſomuch as it will fetch off werts alſo. The drinke wherein young vine tendrils have lien infuſed, is good for thoſe who reach up and ſpit bloud; as alſo for women who being newly conceived and breeding child, have many ſwawms come over their heart, and be eftſoons ſubject to faintings. The vine barke or rind, likewiſe the dried leaves, ſtaunch the bleeding in a wound, yea and doe conſolidat and heale up the wound it ſelfe. The juice drawne out of the white vine beeing ſtamped greene, and frankincenſe togither, take away ſhingles, ringworms, and ſuch like wildfires, if it be applied thereto. The aſhes of the vine-ſtocke, vine-cuttings, and of the kernels and skins of grapes after they be preſſed, applied with vinegre unto the ſeat or fundament, cure the piles, ſwellings, fiſſures, chaps, and other infirmities incident to that part: but incorporat with oile-roſat, Rue, and vinegre, they helpe diſlocations, burns, and the ſwelling of the ſplene. The ſame aſhes ſtrewed with ſome aſperſion or ſprinkling of wine, upon S. Anthonies fire, without any oile, doe cure the ſame: as alſo all frets and galls between the legs, and beſides eat away the haire of any place. The aſhes of vine-cuttings, beſprinkled with vinegre, are given to drinke for the diſeaſes of the ſplene; ſo as the Patient take two cyaths thereof in warme water, and when hee hath drunke it, lie upon the ſplene ſide. The verie ſmall tendrils of the vine whereby it climeth, catcheth, and claſpeth about any thing, being punned and taken in water, ſtaieth and repreſſeth vomiting in thoſe, whoſe ſtomacks uſe ordinarily to be keckliſh and ſoon to overturne. The aſhes of vines tempered with old hogs greaſe, is ſingular to abate ſwellings, to cleanſe fiſtulous ulcers firſt, and ſoone after to heale them up cleane: likewiſe for the paine of ſinews proceeding of cold, and for contraction and ſhrinking of the nerves: alſo for bruiſes, being applied with oile. Moreover, they eat away all excreſcenſe of proud fleſh about the bones, being tempered with vinegre & nitre: and laſt of all, mixed with oile, they heale the wounds made by ſcorpions or dogs. The aſhes of the vine-barke alone, cauſe the haire to come againe in a burnt place.

How grape verjuice ſhould be made, when the grapes are young and nothing ripe, I have ſhewed in the treatiſe of Perfumes and Ointments. It remaineth now to diſcourſe of the medicinall vertues thereof: and firſt to begin withall, It healeth all ulcers that happen in moiſt parts, and namely thoſe of the mouth, Tonſils or Almond-kernels on either ſide of the throat, and of the privie members: the ſame is ſoveraigne for to clarifie the eye-ſight: it cureth the aſperitie and roughneſſe of the eye-lids, the fiſtulous ulcers in the corners of the eyes, the clowds or filmes that ſhadow and cover the ſight, the running ſores

in

A *in any part of the bodie whatsoever: the corrupt and withered cicatrices or skars, and the bones charged with purulent and skinnie matter. Now if this verjuice be too tart and egre, it may bee delayed with honey or wine-cuit: and so it is good for bloudie fluxes, and the exulceration of the guts, for those who reject and reach up bloud, and for the squinance.*

Next after the wine verjuice Omphacium, I cannot chuse but write of Oenanthe, which is the floure that wild vines doe beare, whereof I have alreadie made mention in my discourse of Ointments. The best Oenanthe is that of Syria, especially along the coasts and mountains of Antiochia and Laodicea. That which groweth upon the white vine, is refrigerative and astringent: being powdred and strewed upon wounds, it doth verie much good: applyed as a liniment to the stomacke, it is exceeding comfortable. A proper medicine it is for the suppression of urine, the infirmities and diseases of the liver,

B *the head-ach, the bloudie flix, the imbecilitie of the stomacke, and the loosenesse proceeding from it: also for the violent motion of cholerique humours proceeding upward and downward. The weight of one obolus thereof taken with vinegre, helpeth the loathing that the stomacke hath to meat, and procureth appetite. It drieth up the running scalls breaking out in the head: and most effectuall it is to heale all ulcers in moist parts, and therefore cureth sores in the mouth, privie members, and the seat or fundament. Taken with honey and saffron, it knitteth the belly. The skurfe and roughnesse of the eye-lids it doth cleanse and make them smooth: it represseth rheume in waterie eyes. Given in wine to drinke, it comforteth and confirmeth feeble stomacks; but in cold water, it staieth the casting and reaching up of bloud. The ashes thereof is much commended in collyries and eye-salves: also for to mundifie filthie and ulcerous sores; to heale likewise whitflawes rising at the naile roots, and either*

C *the going away of the flesh from them, or the excrescence thereof remaining about them. For to bring it into ashes, it must bee torrified in an oven, and so continue untill the bread be baked and readie to bee drawne.*

As for Massaris, or the Oenanthe in Africke, it is employed onely about sweet odors and pomanders: and both it, as also other floures, men have brought into so great name, by making hast to gather them before they could knit to any fruit: so inventive is mans wit, and so greedie to hunt after novelties and straunge devises.

Chap. I.

D *The medecines which grapes fresh and new gathered doe yeeld. Of vine braunches and cuttings: of grape kernels, and the cake remaining after the presse. Of the grape Theriace. Of dried grapes or Raisins. Of Astaphis: of Staphis-acre, otherwise called Pituitaria. Of the wild vine Labrusca: of the wild vine both white and blacke. Of Musts or new wines. Of sundrie kinds of wine, and of Vinegre.*

E OF grapes that grow to their ripenesse and maturitie, the blacke are more vehement in their operation than the white: and therfore the wine made of them is nothing so pleasant: for in very truth, the white grapes bee sweeter far, by reason they are more transparent and cleare, and therefore receive the aire into them more easily. Grapes new gathered doe puffe up the stomacke and fill it with wind; they trouble also the belly, which is the cause that men are forbidden to eat them in fevers, especially in great quantitie; for they breed heavinesse in the head, and induce the Patient to sleepe overmuch, untill he grow into a lethargie. Lesse harme doe those grapes, which after they be gathered hang a long time: by which means they take the impression of wind and aire, and so become holesome to the stomacke and to any sicke person; for they doe gently coole and bring the Patient to a stomacke againe. Such grapes as have been condite and preserved in some sweet wine, are offensive to the head and fume up into the brains. Next in request

F to those abovesaid, which have hanged a long time, be such as have been kept in chaffe: for as many as have lien among wine-Marc, or the refuse of kernels & skins remaining after the presse, are hurtfull to the head, the bladder, and the stomack: howbeit they do stop a laske, and nothing is there better in the world for those that doe cast and reach up bloud: and yet those grapes that have ben kept in Must or new wine, are much worse than such as have lien in the Marc aforesaid.

Moreover, wine-cuit, if they have come into it, maketh them hurtfull and offenſive to the ſtomacke. But if they muſt needs be preſerved in ſome liquor, the Phyſicians hold them moſt holeſome which have been kept in raine water, although they be leaſt toothſome: for they do the ſtomacke a great pleaſure in the hot diſtemperature thereof; they be comfortable when the mouth is bitter, by occaſion of the regurgitation of choller from the liver and the burſe of the gall; they give great contentment alſo in bitter vomits; in the violent and inordinat motion of cholerique humors raging upward and downward; as alſo in caſe of dropſie, and to thoſe that lie ſick of burning fevers. As touching grapes preſerved in earthen pots, they refreſh and ſeaſon the mouth which was out of taſt: they open the ſtomacke, and ſtir up the appetite to meat. Howbeit this inconvenience they bring with them, That they are thought to lie more heavie in the ſtomacke, by reaſon of the breath and vapour which exhaleth from their kernels. If hens, capons, cocks, and ſuch like pullen, be ſerved amongſt their meat with the flours of grapes, ſo as they once taſt and eat therof, they will not afterwards pecke or touch any grapes hanging by cluſters upon the vine. G H

The naked braunches and bunches whereupon there were grapes, have an aſtrictive vertue; and indeed more effectuall that way be ſuch as come out of the pots aboveſaid. The kernels or ſtones within the grapes, have the ſame operation: and in very truth, theſe be they and nothing els, whereby wine cauſeth head-ach. Being torrified and beaten to powder, and ſo taken, they be good for the ſtomacke. Their powder is uſually put into the pot in manner of barley groats for to thicken broth and ſuppings, which are ordained for them who have the bloudie flix, who are troubled with a continuall looſeneſſe following them by occaſion of the imbecillitie of the ſtomacke; and for ſuch as are readie to keck and heave at every little thing. Their decoction ſerveth very well, to foment thoſe parts which are broken out and given to bleach and itch. The ſtones themſelves are leſſe hurtfull to the head or bladder, than the little kernels within. The ſame being driven into powder, and applied with ſalt, are good for the inflammation of womens breaſts. The decoction thereof, whether it be taken inwardly, or uſed by way of fomentation, helpeth as well thoſe who have gone a long time with a dyſenterie, or bloudie flix, as them who through imbecillitie of ſtomacke, doe ſcoure and purge downward continually. I

The grape Theriace, whereof we have written in due place, is good to be taken as a countrepoiſon againſt the ſting of ſerpents: And it is a common received opinion, that the burgeons and braunches of that vine, ſhould likewiſe be taken inwardly as meat, and applied outwardly for the ſame purpoſe: as alſo that both wine and vinegre which is made of them, is of ſingular operation to the ſame effect. K

The dried grape or raiſin, which they call Aſtaphis, would trouble the ſtomacke, belly, and entrails, but for the kernels that are within the ſtones, which ſerve as a remedie to prevent and cure thoſe inconveniences; which beeing taken forth, raiſins be thought good for the bladder: but particularly for the cough, thoſe of the white grapes be the better. Soveraigne are they alſo for the windpipe and the reins: like as the ſweet cuit which is made therof hath a ſpeciall power and vertue againſt the Hæmorrhois alone, of all other ſerpents. A cataplaſme made of them, togither with the powder of Cumin or Coriander ſeed, applied to the cods, cureth their inflammation. Likewiſe, if they be ſtamped without their ſtones or kernels, togither with Rue, they are ſingular good for carbuncles and gouts: but before this cataplaſme bee laid to any ulcers, they ought beforehand to be bathed and fomented with wine. Applied with their ſtones, they heale chilblanes and bloudyfalls, yea and eaſe the paines and wrings which accompanie the bloudie flix. Of them boiled in oile, there is a liniment made, which being applied with the outward rind of a radiſh root and honey, helpeth gangrenes: but if there be Panace or Loveach added therto, the liniment cureth the gout, and confirmeth nails which be looſe. Being chewed alone with ſome pepper, they purge the head and the mouth. L

Aſtaphis agria, or Staphis, which ſome (though untruly) call Vva Taminia (for this is a ſeverall kind by it ſelfe, growing up with ſtraight blacke ſtalks, and carying leaves like to the wild vine Labruſca) beareth bladders or little cods more like than grapes, of a greene colour, and reſembling cich peaſe, within which is to be ſeene a three-cornered kernell: it waxeth ripe and begin-neth to chaunge colour and looke blacke, at vintage time; whereas wee know that the grapes of the Taminian vine be red: alſo we are aſſured, that Staphis-acre loveth to grow in ſun-ſhine places, but the Taminian grape no where but in the ſhade. The ſaid kernels I would not adviſe to be uſed for a purgation, conſidering the doubtfull event and daunger that may enſue of choking M

and

A and ſtrangulation: neither for to draw downe fleame and wateriſh humours into the mouth, for ſurely they be enemies to the throat and weaſin-pipe. The ſame, if they be done into powder, rid lice out of the head and all parts of the bodie beſides: which they doe the better and with more eaſe, in caſe there be Sadaracha or Orpiment among. In like manner, they kill the itch and the ſcabs. For the tooth-ach, they uſe to be ſodden in vinegre; for the diſeaſes alſo of the eares, for rheums and eating cankers of the mouth. The floure beaten into powder and ſo taken in wine, is ſingular for the biting and ſting of ſerpents: For I would not give counſell to uſe the ſeed, ſo exceeding hot it is and of ſo fierie a nature. Some call this hearbe Pituitaria, and apply it as a liniment to the ſores occaſioned by the biting of ſerpents.

As for the wild vine Labruſca, it carieth alſo a floure named in Greeke Oenanthe, whereof I
B have written enough before. The wild vine which the Greeks name Ampelos Agria, hath thicke leaves, and thoſe enclining to a white colour: the ſtalks or branches be divided by joints & knots, and the barke or rind is all over full of chinks and creveiſes: it beareth certain red grapes much like unto the berries wherewith they colour ſcarlet; which being ſtamped with the leaves of the ſame plant, and applied with juice of the owne, are good to cleanſe and beautifie the skin in womens faces; and beſides, doe helpe the accidents and griefs that may befall to the haunch, huckleboue, and the loins. The root boiled in water, and ſo taken in two cyaths of the * wine of the Iland Coos, doth evacuat waterie humors gathered in the belly, and by conſequence is thought to be an excellent drinke for them who are in a dropſie. And this is the plant, which in my judgement ſhould be that vine which commonly is called in Latine Vva Taminia, rather than any
C other. Vſed much it is for a countrecharme againſt all witchcrafts: and given it is to gargariſe onely with ſalt, thyme, and honyed vinegre or oxymell, to them that ſpit and caſt up bloud, with this caveat, To let none of it go down the throat: and therefore men feare to purge therewith, ſo dangerous it is thought to be. Another plant there is much like to this, called in Latine Salicaſtrum, for that it groweth in willow rewes: and albeit theſe two carrie divers and diſtinct names, yet they be of the ſame nature and propertie, and be uſed to the like purpoſes. Howbeit this Salicaſtrum is taken to be more effectuall of the twain for to kill the ſcab, skurfe, and itch, as well in men as in fourefooted beaſts, if it be bruiſed and applied with honyed vinegre.

* Much like to our Malvaſey.

There is a certain wild white vine, which the Greeks call * Ampeloleuce, ſome Ophioſtaphylon, others Melothron or Pſilothrum; ſome Archezoſtis or Cedroſtis, others Madon. This plant
D putteth forth long and ſlender twigs, parted and divided by certein joints or knots, & theſe climb up and claſpe whatſoever they meet withall. The leaves grow thick and full of tendrils or young burgeons, as big as Ivie leaves, divided and jagged in manner of other vine leaves. The root is white and big, like at the firſt to a radiſh; from which there ſpring certain ſhoots or ſions reſembling the buds of Aſparagus: theſe yong ſprouts ſodden & eaten with meat, purge both by ſeege and urine: the leaves and braunches be exulcerative, and will raiſe blifters upon the bodie; and therfore applied with ſalt as a liniment, they be good for corroſive ulcers, gangrens, wolves, & the old morimall ſores in the legs. The ſeed or grain thereof is contained within certain beries hanging down thin here and there in ſmall cluſters, which yeeld a certaine red juice or liquor at the firſt, but afterwards it turneth to a yellow ſaffron colour: this know the curriours well who dreſſe
E skins, for they uſe it much. There is an ordinarie liniment made therwith, for skabs, mange, and leproſie. The ſeed being boiled with wheat, and ſo taken in drinke, cauſeth nources to have good ſtore of milke. The root of this wild vine is very ſoveraigne, and ſerveth in right good ſtead for a number of purpoſes: Firſt, if it be powdred to the weight of two drams and given in drinke, it is ſingular againſt the ſting of ſerpents: it is excellent to ſcoure the skin of the face, to take away all ſpots and ſpeckles, flecks and freckles, in any part of the body; the black & blew tokens of ſtripes, by reaſon of bruſed bloud lying under the skin; foule and unſeemly ſwert skars, it reduceth to the freſh and naturall colour: Theſe operations it hath, being boiled in oile. The decoction alſo is uſually given in drink to thoſe who be ſubject to the falling ſickneſſe: likewiſe to ſuch as be troubled in mind and beſide themſelves: to as many as are given to dizzineſſe and giddineſſe of the
F braine, and doe weene that every thing turns round; but they muſt take the poiſe of one dram every day throughout the yeare. The ſame root if it be taken in any great quantitie, * purgeth the ſences. But the principall and moſt excellent vertue that it hath, is this, That if it bee ſtamped with water, and ſo applied, it draweth forth ſpells of broken and ſhivered bones as well and effectually as the very true Bryonie, which is the cauſe that ſome doe call it white Bryonie:

* Some take it for Bryonie.

* *Purgat*, rather *turbat* out of *Dioſcor. i.* troubleth the braine.

for there is another which is blacke, and of greater efficacie to the ſame purpoſe, if it be applied with honey and frankincenſe. It is very good to reſolve impoſtumes and biles which are in growing, and not yet come to ſuppuration; but if they have continued and gather to an head, it bringeth them ſoone to maturation, and afterwards cloſeth them. It bringeth downe womens monthly ſickneſſe, and provoketh urine. An electuarie or lohoch made thereof, to licke, and ſuffered gently to melt under the tongue and goe downe leiſurely, is ſingular good for ſuch as bee ſhort winded and labour for breath: alſo for pleuriſies or pains of the ſide, for convulſions and inward ruptures. If one drinke the weight of three oboli thirtie dais togither, it will waſt and conſume the ſwelled ſplene. The ſame ſerveth in a liniment to be applied with figs unto the excreſcences or riſings of the fleſh over the naile, called Pterygia. Being laid too as a cataplaſme with wine, it fetcheth away the after-birth in women: and taken to the weight of a dram, in honeyed water, it purgeth phlegmaticke humors. The juice of the root muſt be drawne before the fruit or ſeed be ripe: this juice either alone, or incorporat with Ervile meale, if the bodie be annointed therewith, doth illuſtrat the colour, make the skin ſoft and tender; and in one word it is ſuch an embelifhment, that it maketh any perſon better for the ſale: [*where, by the way note, that it chaſeth ſerpents away.] Moreover, the very ſubſtance of the root, if it be ſtamped with fat figs, doth lay the rivels and wrinkles of the skin plaine and even, if it be rubbed or annointed therewith: but then the partie muſt walke immediatly upon it, a good quarter of a mile; for otherwiſe it will fret and burne the skin, unleſſe preſently it bee waſhed off with cold water. Howbeit the blacke wild vine doth this feat more gently and with greater eaſe, for ſurely the white ſetteth an itch upon the skin. There is therefore a blacke wild vine, which properly they call Bryonia, ſome Chironia, others Cynecanthe or Apronia, like in all reſpects to the former, but onely in the colour [of the root grape or berrie] for it is blacke, as I have before ſaid. The tender ſprouts and ſions that ſpring from the root, *Diocles* preferred to bee eaten in a ſalad or otherwiſe, before the verie crops and tender ſhoots of the true garden Sperage; and indeed they provoke urine and diminiſh the ſplene far better: it groweth commonly in hedges among buſhes and ſhrubs, and moſt of all in reed-plots. The root without-forth is blacke, but within of a pale yellow box colour; and this is of much more efficacie to draw out broken bones than the above-named white Brionie. Moreover, this peculiar propertie it hath beſides, To cure the farcines or ſores in horſe necks; and for this, it is thought to be the onely thing in the world. Said commonly it is, that if a man doe ſet an hedge or hay thereof round about a grange or ferme houſe in the countrey, there will no kites nor hawks, nor any ſuch ravening birds of prey, come neare; ſo as the pullen and other foule kept about the ſaid ferme, ſhall be ſecure from their claws or tallons. If it be tied about the ankles of a man, or the paſterns of labouring horſes, unto which there is a fall either of phlegmaticke humors or of a bloud, cauſing the gout in the one and the pains in the other, it cureth the ſame. Thus much concerning the ſundrie ſorts of vines, and their properties reſpective to Phyſicke.

G

H

I

K

L

M

*I ſee no reaſon of this clauſe here, but thinke it ſuperfluous according to ſome manuſcript copies.

As touching Muſts or new wines, the firſt and principall difference of them lyeth in this, That ſome by nature are white, others blacke, and others againe of a mixt colour between them both. Secondly, ſome muſts there bee, whereof wine is made; and others, which ſerve onely for cuit. But if we regard the artificiall deviſes and the carefull induſtrie of man about them, there be an infinit number of muſts all diſtinct and different one from the other. Thus much may ſuffice to deliver fully in generall tearms concerning muſts or new wines. As for their properties, There is no muſt or new wine, but it is hurtfull to the ſtomacke, though otherwiſe pleaſant to the veines and paſſages. Certes, if a man poure downe new wine haſtily, without breathing or taking the wind betweene, preſently as he commeth out of the baine or hot-houſe, he doth enough to kill himſelfe. Howbeit, of a contrarie nature it is to the Cantharides, & ſaveth thoſe that are in danger by drinking them. A ſingular countrepoiſon is new wine in the lees, againſt all ſerpents, but principally the Hæmorrhoids and the Salamanders. It cauſeth head-ach, and is an enemie to the throat and windpipes. Holeſome it is for the kidnies, the liver, and the inward parts of the bladder, for it eaſeth them all of paine. But a ſingular vertue it hath againſt the venomous worm or flie Bupreſtis, above the reſt: if one drinke it with oile, and caſt it up again by vomit, it is an excellent remedie for thoſe who have taken too much Opium: it helpeth thoſe who are in danger of crudled milke within the bodie: ſuch alſo as are poiſoned with hemlock, envenomed with the poiſon Toxica & Dorycnium. In ſum, white new wine is not ſo powerfull in operation as others.

Likewiſe

A Likewiſe, the Muſt, whereof cuit is made, is more pleaſant than the reſt, and cauſeth leſſe headach.

As touching the ſundrie kinds of wine, which are exceeding many, as alſo the vertues and properties of every ſeverall ſort in manner by it ſelfe, I have ſufficiently diſcourſed in a former Treatiſe. Neither is there any point more difficult to be handeled, or that affourdeth greater varietie of matter. And a man cannot readily ſay, Whether wine be more hurtfull or holeſome for our bodies? conſidering the doubtfull event and iſſue preſently upon the drinking therof, for that ſometime it is a remedie and helpe, otherwhiles it proveth to bee a miſcheeſe and a very poyſon. For mine owne part, according to my firſt deſſigne and purpoſe, I am to treat only of ſuch things as Nature hath brought forth for the health and preſervation of man. Well I wote, that *Aſclepiades* hath made one entire volume expreſſely, of the manner how to give wine in drinke. Vpon
B which Treatiſe or booke of his, an infinit number there were who have written their Commentaries. As for me, according to that gravitie which beſeemeth Romanes, and to ſhew affection and love to all liberall Sciences, I will not diſcourſe thereof as a Phyſician, but with great care and diligence write ſo deſtinctly, as a deputed judge or arbitrator delegat to determine of mans health, and the preſervation thereof. To diſpute and reaſon of every ſeverall kind, were an endles peece of worke, and ſo intricat, as I wot not how a man ſhould rid himſelfe out of it, if he were once entred; ſo repugnant and contrarie are the Phyſicians one to another in that argument.

To begin firſt with the wine of Surrentum, our ancients have held it ſimply for the beſt above all others. But our later and more moderne writers, have made greater account of the Albane and Falerne wines. In ſumme, every one hath judged of the goodneſſe of wine, according to his
C owne conceit and fantaſie: a moſt unequall courſe of proceeding, without all reaſon and congruitie, to pronounce definitively unto all others that for beſt, which pleaſed and contented his own taſt moſt. And yet ſet the caſe and ſay, they were all agreed and of one opinion as touching the moſt excellent wines; How is it poſſible, that the whole world ſhould enjoy the benefit thereof, ſince that great lords and princes themſelves have much adoe to meet with pure and perfect wines, without one ſophiſtication or other? In good faith, the world is growne to this abuſe, that wines be bought and ſold now at an higher or lower price, according to the name and bruit that goeth onely of the cellars from whence they come: whereas in truth, the wines were marred and corrupted at the firſt in the very preſſe and vatt, preſently after the vintage and grape-gathering. And therfore it is, that now adaies (a wonderfull thing to be ſpoken) the ſmalleſt and baſeſt wines
D are of all others leaſt ſophiſticat & moſt harmleſſe. Well, howſoever it be, and admit that the nobleſt kinds of wine are moſt ſubject to theſe bruings & ſophiſtications, which make indeed the ods that is; yet thoſe wines beforenamed, to wit, the Falerne, Albane, and Surrentine, do ſtill import, and carie away the victorie and priſe from all the reſt, by the generall voice & conſtant ſentence of all writers. As touching the Falerne wine, it is not holeſome for the bodie, either very new, or over old; a middle age is beſt, and that begins when it is fifteene yeares old, and not before. This wine is not hurtfull to a cold ſtomacke: but I cannot ſay ſo of a hot ſtomacke. If it be taken alone and pure of it ſelfe in a morning, and drunke faſting, it dooth much good unto them who have been troubled with a long cough, or vexed with a quartane ague. And verely, there is not a wine that ſtirreth the bloud and filleth the veines ſo much as this. It ſtaieth the laske, and nourifheth
E the bodie. Howbeit, generally received and beleeved it is, That this wine dimmeth the eyeſight, and doth no good to the bladder and nervous parts. And indeed, the Albane wines agree better with the ſinewes. And yet the ſweet wines that come out of the Vineyards of the ſame tract are not ſo holeſome to the ſtomacke: but the harſh and hard auſtere wines of this kind, bee in that regard better than the Falerne wines aboveſaid. And in one word, theſe Albane wines help digeſtion but little, and in ſome ſort ſtuffe and fill the ſtomacke. But the Surrentine wines charge not the ſtomacke any jot, nor yet ſume up into the head: nay, they doe reſtrain and repreſſe the rheumaticke fluxions both of ſtomacke and guts. As for the wines of Cæcubum, they bee now paſt date, and none of them are made any more. But thoſe of Setinum, which remaine ſtill and be in ſome requeſt, doe mightily aid concoction, and cauſe the meat for to digeſt. In a word, Surren-
F tine wines have moſt ſtrength, the Albane drinke harder, and the Falerne be more mild and nothing ſo peircing as the reſt.

The Statane wines come not farre behind theſe abovenamed. As for the Signine wine, out of all queſtion it is ſimply the beſt to bind the bodie, and ſtop a vehement flux. Thus much for wines and their properties in particular. It remaineth now to ſpeake of their vertues in generall.

Firſt

Firſt and formoſt, wine maintaineth and fortifieth the ſtrength of man, engendreth good bloud, and cauſeth a freſh and lively colour. And herein verely conſiſteth the principall difference betweene our temperat climat within the heart (as it were) and middle part of the world, from thoſe intemperat Zones on either hand. And looke how much the diſtemperature of the two Poles, worketh in the inhabitants of thoſe parts, and hardeneth them to endure and ſupport all kind of travell: ſo much dooth this ſweet and pleaſant liquor of the grape enable us to abide and ſuffer the like labour. And becauſe wee are entred into this theame, note thus much moreover, That the drinking of milke nouriſheth the bones: of beere and ale, and ſuch like, made with corne, feedeth the ſinewes and nervous parts: but of water, maintaineth the fleſh and brawnie muſcles onely. Which is the cauſe, that ſuch nations as drinke either milke, ale, beere, &c. or ſheere water, are nothing ſo ruddie of colour, nor ſo ſtrong and firme to undergoe painefull travell, as thoſe, whoſe ordinarie and familiar drink is wine. And in truth, as the moderat uſe of wine doth comfort the ſinewes and helpe the eyeſight; ſo the over-liberall taking thereof doth offend the one, and enfeeble the other. Wine doth recreate and refreſh the ſtomacke: wine ſtirreth up the appetite to meat: wine allaieth ſorrow, care, and heavineſſe: wine provoketh urine, and chaſeth away all chilling cold out of the bodie. Finally, wine induceth ſleep and quiet repoſe. Moreover, this good propertie hath wine, To ſtay the ſtomack and repreſſe vomits, taken into the bodie: and without-forth applied with wooll embrued and bathed therein, To diſſipat and reſolve all ſwelling apoſtemes. *Aſclepiades* was ſo addicted to the praiſe of wine, that hee baſhed not to make compariſons and pronounce, That the power and puiſſance of the gods was hardly able to match and countervaile the might and force of wine. Moreover, this is to be noted, that old wine will beare a greater proportion of water than new, and provoketh urine more: although it doe withſtand and allay thirſt leſſe. Sweet wines doe not ſo much inebriate and overturne the braine, as others; but they flote aloft in the ſtomacke: whereas auſtere and hard wines bee lighter of digeſtion and ſooner concocted. The lighteſt and ſmalleſt wine is that which ſooneſt commeth to his age, and ſheweth it moſt quickly. The wines which by age and long keeping, lay downe their verdure and become ſweet, are leſſe hurtfull to the ſinewes than others. The groſſe, fattie, & black wines, are not ſo good for the ſtomacke; howbeit, they be moſt nutritive: for the thin and bruske harſh wine doth nouriſh the bodie leſſe, but yet more agreeable and nutritive it is to the ſtomack. It paſſeth more ſpeedily away by urine, but fumeth up ſo much the rather into the head. And take this for a generall rule once for all, not onely in wines, but in any other liquors whatſoever, which be penetrative, ſubtile, & piercing, That they be alwaies offenſive to the head, howſoever otherwiſe they be piercing, and paſſe ſoone away. Furthermore, wines that are laid up in ſmokie places, thereby ſooner to ſeeme refined and old, are of all others moſt unholeſome. But this and ſuch caſts were deviſed by huckſters, vinteners, and taverners, after the wines were laid up in their cellars. And now adaies good houſekeepers alſo have invented meanes to renue their wines, and make them ſeeme freſh and new, after they have by long lying gotten a fuſtie rotten taſt, and gathered a mouldie mother of themſelves, which is called Caries in Latine. And verely, our auncitors by uſing this tearme, in wines overſtale and kept above their due age, have given us counſell and taught us ſufficiently, how to take away this unpleaſant taſt of wine, that is to ſay, by ſmoke: for like as ſmoke doth eat away and conſume the moiſture and mouldineſſe in timber, which cauſeth rottenneſſe, ſo it doth in wines. But wee forſooth contrariwiſe, are perſuaded, that the bitterneſſe of ſmoke, when it hath caught the wine, maketh it to appeare ſtale and old. Such wines as be very pale and whitiſh, proove the better and more holeſome by age and long lying. The more excellent that the wine is and of the kindlier grape, the thicker and groſſer it waxeth by age; and in this gathering turneth to a kind of bitterneſſe, which is hurtfull to mans bodie. Likewiſe, as unholeſome it is to mix, ſeaſon, and confect therewith ſome other wine, that is not ſo aged, and ſo to keepe or drinke them together. Each wine agreeth beſt with the ſtomacke, and doth leaſt harm, when it hath no other liquor nor taſt, but the own: and every wine is moſt pleaſant and delightſome when it is taken in due time, that is to ſay, neither old nor new, but of a middle age, which is the very flower. Such perſons as would feed, and deſire to be corpulent, or to keepe their bodies ſoluble, and have the riddance of their bellie at commaund, ſhall doe well to drinke often at their repaſt: Contrariwiſe, they who feed overmuch, and deſire to be gant and ſlender, and withall, to be coſtive, ought to forbear drinking at meales, ſo long as they eat, but after meat they may drink moderatly. To drinke wine upon an emptie ſtomacke faſting, is a new found deviſe lately come up,

A up, and it is moſt unholeſome for the bodie, and namely for thoſe who are to goe into the field for to fight a battell: for it hindereth the forecaſt of the mind, and dulleth the vigor and quickneſſe of the ſpirit: fitter indeed to bring and lull men aſleepe in the bed of ſecuritie. Certes, it was a practiſe long agoe among ſuch as deſired reſt and peace, and who loved to ſleepe in a whole skin, for to drinke wine faſting: for ſo we read in *Homer*, how *Helena* that faire ladie, preſented a cup of wine before meat. And hereupon came the proverbe, That wine doth overſhaddow and darken the light of wiſdome & underſtanding. Verely we that are men have this propertie above all other living creatures, and wee may thanke wine for it, That wee drinke many times when wee be not drie nor a thirſt. And therfore paſſing good it is to drink faire water otherwhiles between. In like manner ſuch as uſe ordinarily to be drunke, and are lightly never ſober, ſhall not do amiſſe
B to take a good draught of cold water preſently upon their liberall pouring in of wine: for it will forthwith diſpatch and diſcuſſe thoſe fumes which cauſe drunkenneſſe. *Heſiodus* giveth counſell to drinke wine ſomewhat delaied with water, for twentie daies before the riſing of the Dogge ſtar, and as many after. True it is indeed, that Mere * wine not delaied, is a remedie againſt Hemlocke, * *Merum.* Coriander, the poyſon Aconite or Libard-baine, the venomous gum of the plant Chamæleon, called Ixia, Opium, or the juice of Poppie, and Quickſilver: alſo, for ſuch as have ben ſtung with Bees, Waſpes, and Hornets, the venomous ſpiders Phalangia, Serpents, and Scorpions; and generally, againſt all thoſe poyſons, which by reaſon of a cold qualitie doe mortifie naturall heat. But partieularly it is a ſpeciall countrepoyſon againſt the venomous worms called Hæmorrhoids and Preſters, as alſo the deadly Muſhromes. Over and beſides, ſingular good is wine againſt ven-
C toſities, gripings, and gnawings about the midriffe and precordiall parts about the heart: alſo for thoſe, whoſe ſtomackes are readie every while to overturne and to caſt: and where the bellie or entrailes be troubled with rheumaticke fluxes. Semblably, wine a little delaied, is ſingular for the bloudie flix: for ſuch as bee given to faint ſweats, old coughs, and any violent fluxes either into the eyes or other inferiour parts. But a fomentation of meere wine may bee applied with a ſponge to the left pap in caſe of the Cardiacke paſſion, which is a feebleneſſe and trembling of the heart. And in theſe caſes white wine is better than any other, ſo it be of ſome reaſonable age. Alſo it is found by experience, That horſes and ſuch beaſts, either for the ſaddle and packe or draught, become very luſtie, if their ſtones or genetoires be bathed with wine hot: and when they be tired out, there is nothing (by report) better to refreſh their courage, than to poure wine into
D them with an horne. Apes and Marmoſets, and other foure-footed beaſts, whoſe feet are divided into clawes or toes, will not grow (men ſay) if they be uſed to drinke pure wine. But it is my purpoſe now to treat of the properties of wine, touching Phyſicke and the cure of maladies. For gentlemen, well borne and bred, who have wherewith, and may have what they will, the wines of Campaine I count moſt holeſome, ſo they make choiſe of the ſmalleſt and the thinneſt. But the common ſort may be Phyſicians to themſelves, and drinke euery man what wine he liketh moſt, and findeth beſt to agree with him. Howbeit to ſpeake generally, the holeſomeſt wines both of the one ſort and the other, and for all perſons, be ſuch as have run through a ſtrainer or Ipocras bag, and therby loſt ſome part of their ſtrength. But this we muſt remember every one of us, That the liquor of wine getteth all the force and ſtrength that it hath by working, ſpurging, and ſee-
E thing (as it were) in the lees whiles it is Muſt. To mingle ſundrie kinds of wine together, can bee good for none, neither rich nor poore. Contrariwiſe, that wine is held moſt healthfull, that is of it ſelfe, and had nothing put thereto in the firſt vatt or veſſell when it was new and meere Muſt of the grape: and the better will it bee, if there come no pitch into the barrels or veſſels wherein it is tunned or filled. For as touching thoſe wines, which are medicined with marble, plaſtre, & quicklime, what man is he (were he never ſo healthie and ſtrong) but he may be afraid well ynough to drinke therof? Well then, wines either tunned up or delaied with ſea water, be hurtfull to the ſtomacke, ſinewes, and bladder, as much as any other. As for the wines dreſſed and confected with Parrozine, they are thought to be holeſome for cold ſtomackes: but contrariwiſe, good they are not for ſuch as are prone to vomit, no more than Muſt it ſelfe, or cuit, whether it be Sapa or Paſ-
F ſum. Wine, wherein roſin hath been newly put, is not for any man to drinke; for it cauſeth headach, ſwimmings, and dizzineſſe in the braine: and no marvell if this mixture be called Crapula, for it doth intoxicat the braine. Howbeit, theſe wines thus brued and dreſſed with roſin, are good for the cough and all rheumes; likewiſe, for feeble ſtomackes and the flux thereof enſuing; as alſo in dyſenteries or exulcerations of the guts, and their bloudie flix; and laſt of all, for womens

termes.

termes. In these kind of wines thus mixed and sophisticated, the claret or deepe red are more astringent and hote than all others. Lesse harme yet commeth of those wines which bee prepared with pitch alone, and nothing else. Nevertheless, wee must not forget, that pitch is nothing else but the liquor that runneth from burnt Parrozin. And in truth, these wines that stand upon pitch, doe heat the stomacke, helpe concoction, and purge offensive humours: they bee good for breast and bellie: likewise, comfortable to the matrice, for they doe allay the paines thereof, if the woman have no feaverous disposition; and doe cure Rheumes and Catarrhes, which have continued their course a long time: they heale inward ulcers, ruptures, spasmes, and convulsions; impostumes bred within the interiour parts, feebleness of the sinewes, ventosities, coughs, pursiveness, wheezing, and shortnesse of breath; and finally, helpe dislocations, beeing applied with unwashed and greasie wooll, as it grew in the fleece. But note, that for all these infirmities abovenamed, the wine is more effectuall, which naturally hath a tast of pitch, and thereupon is called Picatum, than any other, that by artificiall meanes is dressed and prepared with pitch. And yet the wines made of the Helvenake grapes, if a man drinke over-liberally of them, are well knowne to trouble the head, notwithstanding they tast of pitch naturally. To come now unto the disease, which we call the Feaver or Ague, this is certaine, That wine ought not to bee given in that sickenesse, unlesse the patient bee well stept in yeares and aged, the disease chronicke and of long continuance, or that the sickenesse begin to decline and weare away: for in hote, quicke, and sharpe feavers, which commonly be very daungerous, the sicke persons, bee they young or old, ought to be restrained altogether from wine; except a man may evidently perceive some remission or alleviation of the disease: and the same rather in the night, than by day time; for certainely, the daunger is lesse by the one halfe, if they drinke wine toward night, and in hope to procure sleepe. Moreover, women newly delivered and brought to bed (whether they went their full time, or slipt an abortive fruit untimely) are not allowed in any case to drinke wine: neither those persons who have weakened their bodies with the immoderat use of women, and thereupon fallen sicke: ne yet such as be subject to the headach: no more than those, who during the fits of agues, feele their legges and other extreame parts to bee cold: or have a cough joined with their feaver. Moreover, wine is an enemie to all those who have a shaking and trembling of their joints, or be pained either in their sinewes or throat. Furthermore, in case the force of the disease be knowne to lie much about the * small guts and hypochondriall parts, the patient must altogether forbeare to drinke wine. They are to abstaine likewise when there is any hardnesse felt in the midriffe and precordiall parts: and when the pulses beat mightily, and goe faster than ordinarie. Semblably, in case the crampe doe draw the necke farre backe with a cricke, so as the head cannot stirre forward: or take the whole bodie so, as it is not able for to turne any way, but seeme as stiffe as if it were all of one peece; no wine must bee given unto such a patient. In like sort, those are forbidden to drinke wine, who are given to * yexing: and much more they, who in an ague labour for breath, and draw their wind hardly. But most of all must the sicke be kept from wine when their eyes bee set in their head, and their eye-lids stand stiffe and starke, with their eyes broad open: or bee shut, by reason that they are weake and heavie. Also, they must avoid wine (if they bee wise) who in their sickenesse, as they winke or twinckle with their eyes, doe imagine that they sparkle and glitter againe: like as those who cannot lay their eyes together and close their lids, but sleepe open eyed. And even so they ought to flie from drinking of wine whose eyes be red and bloud-shotten, or otherwise given to bee full of viscous and gummie matter. Neither are they permitted to drinke any wine, who eftsoones stut and cannot pronounce their words perfectly, whether it bee, that their tongue bee over-light and spongeous, or otherwise dull and heavie: no more than those, who hardly and with much difficultie, make water: who are affright suddainly at every little thing that they heare or see: who are given to crampes and crickes: such also as otherwhiles lie benummed, as if they were dead asleepe. And last of all, as many as shed their sperme voluntarily in their sleepe. True it is, and no man maketh any doubt, That the onely hope and right way to cure them, who in the Cardiake disease, for very faintnesse are troubled with the trembling and shaking of the heart and given unto diaphoreticall sweats, consisteth in the drinking of wine. And yet in the manner thereof, Physicians are not agreed: For some are of advise, not to give it but in the verie fit and extremitie of the disease: others againe prescribe it at no time else, but when the violence of the fit is past, and the patient at some ease.

* Circa ilia.

* Especially if it proceed frō some hote or sharpe humor.

They

A They who are of the former opinion, have a regard to their ſweat, for to repreſſe it: but theſe have an eye to the danger of the patient, being of this mind, that it is a more ſafer courſe to give wine when the violence of the ſickneſſe doth abate. And indeed of this judgement I ſee that moſt Phyſicians are. As touching the time to drinke wine, this is certaine, that good it is not but at meat: neither preſently after ſleepe, nor immediatly upon any other drinke, which is as much to ſay, as never but when a man is drie and thirſtie. Neither muſt a ſicke man bee allowed it, but in caſe of neceſſitie or deſperat extremitie. In ſumme, we graunt it to men rather than to women: to aged perſons ſooner than to young folke: and yet to a luſtie young man, before a child: in Winter oftener than in Summer: and to conclude, to ſuch as bee accuſtomed thereto more than to thoſe who have not drunke thereof beforetime. A meaſure alſo and meane would be kept, in the
B allowance of wine, according to the ſtrength thereof, and the proportion of water mixed therewith: and the common opinion importeth thus much, That to one cyath of wine it is ſufficient to put two cyaths of water ordinarily. But in caſe the ſtomacke be weake and feeble, ſo as the meat digeſt not nor paſſeth away downeward, meere wine is to be given to the patient, or at leaſtwiſe in greater proportion to the water.

But to returne again to thoſe artificiall and made wines, I have heretofore ſhewed many ſorts thereof: the making of them is at this day given over, as I ſuppoſe, and their uſe needleſſe and ſuperfluous, conſidering that now we give counſell and preſcribe, to uſe the very ſimples themſelves in their owne nature, which goe to their compoſition. Certes, beforetime the Phyſicians upon a vaine oſtentation, becauſe they would ſeem to have their Apothecarie ſhops furniſhed with ſuch
C varietie, exceeded all meaſure in this behalfe: inſomuch, as they were provided of a wine, made forſooth of Navewes; bearing the world in hand, that it was ſingular good for militarie men, if they found themſelves overwearied either with the practiſe or the bearing of armes, or in riding their horſes: yea, and to ſay nothing of all the reſt, they had the wine alſo of Iuniper. But is there any man ſo fooliſh, as to thinke and maintaine, That Wormewood wine ſhould be more profitable to our bodies, than Wormewood the hearbe it ſelfe? What ſhould I ſtand upon the wine of dates, among others of this range, conſidering that it cauſeth head-ach, and is good for nothing els but *to eaſe the coſtiveneſſe of the bodie, and for ſuch as reach up bloud? As for that which we called *Bion, I cannot ſee or ſay, that it is an artificiall wine: for ſurely, all the art and cunning that goeth to the making of it, lieth in this onely, That it is made and huddled up in haſt: and yet
D profitable it is for a weake ſtomacke readie to overturne, or that is not able to concoct and digeſt the meat within it: holeſome for *women with child: comfortable to thoſe who bee feeble and faint: good for the palſie, the ſhaking of the lims, the ſwimming and giddineſſe of the head, the wrings and torments of the bellie, and the gout, Sciatica. Moreover, it hath the name for to have a ſingular vertue to helpe in time of plague, and to ſtand them in great ſtead who are pilgrimes and travellers into far and ſtraunge countries. Thus much may ſuffice for Wines.

Moreover, ſay that wine be turned, corrupt, and changed from the owne nature, yet it leaveth not to retaine certaine vertues and properties requiſit in Phyſicke: for vinegre alſo is medicinable. Exceeding refrigerative it is, & cooleth mightily: howbeit, no leſſe vertue and force it hath to diſcuſſe and reſolve: an evident proofe whereof we may ſee in this, That if it be poured upon the
E ground, it will fome and caſt a froth. Concerning the manifold operations that it hath in compoſition with other things, I have written oftentimes alreadie, and will write ſtill as occaſion ſhall ſerve. But vinegre, even taken alone by it ſelfe, fetcheth the ſtomacke and appetite again to meat, and ſtaieth the yex or hocquet: and if it be ſmelled unto, it ſtinteth immoderat ſneeſing. Being held in the mouth, it preſerveth folke from fainting with extream heat, whiles they are in the bain or hot houſe. Of it and water together there is made Oxycrat, which is a drinke more mild than vinegre alone. And the ſame with water is comfortable to thoſe who upon the Sunnes heat have gotten the headach or a day-fever, and be newly recovered. Being uſed alſo in the ſame ſort with water, it is counted moſt holeſome for the inflammation or rheume of the eies. A fomentation with Oxycrat or water and vinegre, is ſingular good upon *burnes, ſcaldings, or riſing of the pim-
F ples. In like manner it cureth the leproſie, ſcurfe, and dandruffe, running ulcers and ſcals, bitings of dogs, ſtinging with ſcorpions, ſcolopendres, and hardiſhrewes; and generally, it is good againſt all pricks of venomous beaſts, or pointed darts, and any itch whatſoever. Likewiſe againſt the biting or prick of the *Cheeſlip or Mani-foot worme. Applied hot with a ſpunge to the ſeat, it is ſingular for the infirmities of the fundament. But for this purpoſe there muſt be a decoction or

*Contrarie to *Dioſcorides*, who giveth it *Cœliacis & dyſentericis.*

*or *Biæon.*

*Troubled with *κίτλα* and *μαλακία*, *i.* a corrupt and depraved appetite, longing after this and that, and not alwaies the beſt things.

**Poſt uredines.* Some read *hirudines*, *i.* after the ſucking of Horſe-leeches.

**Multipeda*, called otherwiſe *Seps.*

or fomentation made, with three ſextars of vinegre, whereunto there ſhould bee put of Sulphur or Brimſtone two ounces, or a bunch of Hyſſope, and then ſet over the fire for to boile together. G
In caſe of much effuſion and loſſe of bloud, which enſueth and followeth thoſe who are cut for the ſtone, or any thing els taken out of the body; there is nothing better than to foment the place without-forth, with the ſtrongeſt vinegre that may be had, in a ſpunge, and then to take inwardly in drinke two cyaths of the ſame: for ſurely it cutteth and diſſolveth the cluttered bloud lying within-forth. Vinegre taken inwardly and applied outwardly, cureth the filthie tetters called Lichenes. Being miniſtred by way of clyſter, it knitteth the bellie, and ſtaieth all rheumaticke fluxes which have taken a courſe by the guts and entrails. And the ſame helpeth as well the fall and ſlipping downe of the Longeon or fundament, as the laxitie and hanging forth of the Matrice. An *old cough it reſtraineth: the rheums alſo & catarrhes it repreſſeth, which light upon the throte and windpipe: it openeth the paſſages in them who labor for breath, and cannot take their wind but ſitting upright: it confirmeth alſo the teeth loſe in the head. Marie it hurteth the bladder, and doth harme in all infirmities of the ſinewes. The Phyſicians were ignorant heretofore of the ſoveraigne vertue that vinegre had againſt the ſting of the ſerpent called Aſpis, untill by a meere chaunce they came to the knowledge thereof. And thus ſtood the caſe: It fortuned that a certain fellow carying about him a bottle of vinegre, trode upon the ſaid adder or ſerpent, which turned upon him againe and ſtung him: howbeit he felt no harme at all ſo long as he caried the vinegre: but ſo often as hee ſet the bottle downe out of his hands, the ſting put him to ſenſible paine. By which experiment it was found and knowne, that vinegre was the onely remedie: and ſo with a draught thereof he had helpe out of hand, and was cured. But behold another proofe and triall thereof: They that uſe to ſucke out the poyſon of venomed wounds given by ſerpents and ſuch like, uſe no other collution to waſh their mouths withall, but onely vinegre. Certes, the force of vinegre is ſuch, that it conquereth not only the ſtrength of our viands and meats, but alſo many other things. For the very hard rockes, which otherwiſe it was unpoſſible to cleave before with the violence of fire, ſoon breake and give way, when vinegre is poured aloft. This ſingular gift moreover it hath, that no liquour in the world giveth a better taſt to our meats and ſauces, or quickeneth them more than vinegre doth: for which purpoſe, if it be overſharpe and ſtrong, there is a meanes to mitigat and dull the force thereof, either with a toſt of bread, or ſome wine: againe, if it be too weake and appalled, the way to revive it againe, is with Pepper or the ſpice Laſer: but nothing doth moderat it better than ſalt. And to knit up and cloſe this diſcourſe of vinegre, I cannot forget nor overpaſſe one rare and ſingular accident that befell of late: *M. Agrippa* in his latter daies was much troubled and afflicted with a greevous gout of his feet; and being not able to endure the intollerable paines thereof, tooke counſell of a certaine leaud leech, ſome bold and venterous Empiricke, who made great boaſt of his deepe skill and admirable knowledge (for the Emperour *Auguſtus Cæſar*, whoſe daughter hee had eſpouſed, hee made not acquainted with the matter;) who gave him counſell to bath his legs with hote vinegre, and to ſit therein above his knees, at what time as his diſeaſe tormented him moſt: True it is indeed, that hee was eaſed of his paine by this meanes, for hee loſt the very feeling of his feet. Howbeit, *Agrippa* choſe rather to be paralyticke in ſome ſort, and to want both uſe and ſence of his legs, than to abide the extremitie of his gout. H I K L

*For it ſtirreth the cough at the beginning. *Dioſcorides.*

Chap. II.

Of vinegre Scyllitick. Of Oxymel. Of the double cuit wine Sapa. The lees of wine: dregs of vinegre: and of the foreſaid cuit.

THe vinegre of Squilla or ſea-Onions, called Scillinum, the elder it is and longer kept, the more is it eſteemed. This vinegre, over and above the other vertues of common vinegre before rehearſed, hath this propertie, To helpe the ſtomack, in caſe the meats lie ſouring and corrupting therein: for no ſooner doth a man taſt thereof, but it diſpatcheth and riddeth away the foreſaid inconvenience. Moreover, it is good for them that are given to vomit, faſting, in a morning: for it hardeneth the throat and the mouth of the ſtomacke which is overſenſible, and knitteth the ſame. It cauſeth a ſweet breath, confirmeth the fleſh about the gums, faſteneth the teeth which are looſe, and maketh a bodie looke with a freſh and lively colour. Being gargarized, it draweth away and doth evacuat thoſe groſſe humours which cauſed hardneſſe of hearing, and openeth

A openeth the auditorie paſſages of the ears; and ſo by conſequence clarifieth the ſight of the eies. Soveraigne it is beſides for thoſe who have the falling ſickneſſe, and who are troubled in mind by occaſion of melancholy. It cureth the turning and dizzineſſe of the braine, the ſuffocation or riſing of the mother. It helpeth ſuch as be ſore and bruiſed with drie blowes; ſuch as are falne headlong from high places, and thereby have cluttered bloud gathered within their bodies: as many alſo as have the infirmitie or weakneſſe of ſinewes, or otherwiſe be diſeaſed in the kidnies: howbeit offenſive it is to thoſe that have any ulcer either within or without.

Touching the ſyrrup Oxymel, *Dieuches* ſaith, That the auncients in old time prepared and tempered it in this manner: They tooke of honey ten pounds, of old vinegre five hemines, of bay ſalt one pound, of Saverie three ounces, of ſea water five ſextars: Theſe togither in a kettle
B they did ſet to boile, and let them have ten walms over the fire: then they lifted the pan from the fire, powred this liquor out of one veſſell into another, and ſo kept it for their uſe. But *Aſclepiades* comes after, diſprooveth all the manner of this compoſition, and withall condemneth the uſe thereof; for the Phyſicians before his time, feared not to preſcribe it to be drunke even in fevers: and yet both he and all, do confeſſe and agree, That this was a good drink againſt the venomous ſerpent called Seps: alſo for them who were poiſoned with Opium, [*i.* the juice of Poppey] or with the gum Ixia, which commeth from the hearb Chamæleon. Moreover, they all commend it to be gargled hot for the ſquinancie, for the paine and deafeneſſe of ears, for the accidents and infirmities of the mouth and throat: like as at this day we uſe in all theſe caſes, the ſharpe brine or pickle called Oxalme; which, if it be made of ſalt and new vinegre that is freſh and quicke, it
C is better in operation.

As for the Cuit named in Latine Sapa, it commeth neare to the nature of wine, and in truth nothing els it is, but Muſt or new wine boiled untill one third part and no more do remaine: and this cuit, if it be made of white Muſt is counted the better. Vſe there is of it againſt the flies Cantharides and Bupreſtes; againſt the worms breeding in Pine trees, named thereupon Pityocampæ, againſt Salamanders, and generally all thoſe beaſts whoſe ſting or tooth is venomous. If a woman drinke thereof, togither with ſcallions or ſuch bulbs, it ſendeth downe the after-burden, and expelleth the dead infant out of the wombe. And yet *Fabianus* mine author ſaith, That it is no better than a very poiſon, if a man drinke it faſting preſently after he is come out of the baine.

A conſequent and appendant to theſe foreſaid things, is the lees of wine; which is to be con-
D ſidered according to the wine from whence it commeth: & verely the lees of wine are ſo ſtrong, that oftentimes it overcommeth and killeth thoſe, who go down into the vats and veſſels wherein the wine is made. But to know and prevent the daunger thereof, this experiment is found; namely, to let downe a candle into the ſaid vat: for ſo long as it will not abide light, but goe out ſtill, daungerous it is for a man to enter into thoſe veſſels. And yet wine lees without any waſhing at all, goe into the compoſition of many medecines. Take wine lees a certaine quantitie, and of the floure-de-lis or Ireos root a like weight, concorporat them togither into a liniment: ſingular it is to annoint the ſmall pocks and ſuch like cutanean eruptions. The ſame, either drie or wet, may be applied with very good ſucceſſe to the places ſtinged with the venomous ſpiders called Phalangia; to the inflammations likewiſe of the genetoirs or privie members; to the paps, or
E any other part of the bodie whatſoever. Now for the better preparing thereof, it ought to be ſodden in wine, togither with barley meale and the powder of frankincenſe; which done, to bee burned and ſo dried. And to know whether it bee ſufficiently ſodden or no, make this triall: If you touch it never ſo little at your tongues end and ſo taſt thereof, when it is throughly cold, it will ſeeme to bite and burne it, if it have had ſufficient boiling as it ought: but it ſoone looſeth the heart and force, if it be not kept in a place well encloſed: by the ſaid burning, it commeth to be much more ſtronger in operation. Sodden with figs, it yeeldeth an excellent decoction to repreſſe tettars, ſhingles, and ſuch like wildfires; to ſcoure away alſo ſcurfe and dandruffe: & in that ſort applied either as a cataplaſme or fomentation, it cureth the leprie, and running ſkalls of the head. Being taken in drinke, eſpecially raw, it is a ſoveraigne countrepoiſon for ſuch as have ea-
F ten venomous muſhroms. Boiled and waſhed, it it is mingled with colyries which ſerve for the eyes. A liniment thereof, cureth the accidents that befall to the cods and genetoirs. Taken in wine, it helpeth the ſtrangurie, and giveth them eaſe who otherwiſe could not piſſe but by dropmeale. Lees of wine, after it hath loſt the cauſticke operation and life that it had, will ſerve very well for a good lie or water to cleanſe the skin of our bodies, and to waſh or ſcoure cloaths: and

then verely, it hath the aſtrictive power of Acacia, and ſerveth for the ſame uſe. G

The dregs of vinegre, muſt of neceſſitie be much more ſharpe, biting, and ulcerative, than wine lees, in regard of the matter whereof it commeth: it driveth backe impoſtumes and biles, and keepeth them from ſuppuration. A liniment of it, helpeth the ſtomacke, belly, and entrails: it ſtaieth the flux of thoſe parts, and the overflow of womens moneths: it diſcuſſeth puſhes and ſmall biles, and ſquinances, if they be taken betimes before they feſter and impoſtumat: and a cerot made with it and wax togither, is good againſt S. *Anthonies* fire. The ſame drieth up the milke in womens breaſts, who would not be nources, or bee troubled with overmuch milke. It taketh away with eaſe the illfavoured rugged nails, and giveth roume for new to come up in their place. Applied with groſſe barly meale or groats, it is ſingnlar and moſt effectuall againſt the venome of the horned ſerpents, called in Greeke Ceraſtæ: and with Gith or Nigella Romana, it H is uſed for the biting both of crocodile and mad dog. The burning alſo of theſe dregs, doth quicken and fortifie the ſtrength thereof: and being thus burnt and incorporat with the oile of Lentiske, * it coloureth the haires of the head in one night red, if they bee annointed withall: The ſame lapped in a fine linnen cloth, and put up in forme of a peſſarie, cleanſeth and mundifieth the ſecret parts of women.

* *Serenus Samonicus* calleth this ointment *Vnguentum Cineris*, alledging *Plinie* for his author.

To conclude with the grounds or lees of the cuit Sapa; vinegre dregs are knowne to be verie good for to heale burnes; and the cure proceedeth better, in caſe they be mixed with the furrie cotton or downe of reeds: the ſame being ſodden, and the decoction thereof taken as drinke, cureth inveterat coughs. Laſt of all, they uſe to ſeeth or ſtew it betweene two platters with ſalt and greaſe, wherewith they make a liniment or ointment to take downe the ſwelling of the chaws I and the nape of the necke.

Chap. iii.

Of Olive trees: of the leaves of Olives, their floures and their aſhes. Of the white and blacke Olive berries: and of the mother or lees of Oile-olive.

NExt after the Vine, there is not a tree bearing fruit, of ſo great authoritie and account as the Olive. The Olive leaves, are exceeding reſtringent, good to cleanſe, good alſo to reſtraine or ſtop any flux: being chewed and applied to ulcers, they heale them: and reduced with oile into a liniment, they aſſuage the paine of the head. A decoction of their leaves, to- K gither with honey, is ſingular to bath and foment the parts cauterized by the Chirurgian, according to the direction of the learned Phyſician: the ſame uſed by way of a collution, cureth the inflammation of the gumbs, whitflaws, and excreſcences of ranke fleſh in filthie ulcers: with honey alſo it ſtauncheth the flux of bloud, proceeding from any nervous parts. The juice of Olive leaves is ſingular for the little ulcers in manner of carbuncles, with a cruſt or rouſe upon them, riſing about the eies; and all other ſmall wheals or bliſters: as alſo in caſe the ball or apple of the eye be readie to ſtart forth; and therefore it is uſed in collyries or eye-ſalves: for it healeth weeping eies that have run with water a long time, and the excoriations or frettings of the eye-lids. Now this juice is drawne out of the leaves, firſt ſtamped, and then well ſprinckled and wet with wine and rain water, & ſo preſſed forth; which being afterwards dried, is reduced into trochiſques. L The ſame rolled in wooll or bombaſt to the forme of a peſſarie, and ſo put up into the naturall parts of women, ſtaieth the immoderat flux of their fleurs. Good it is alſo for thoſe, who rid corrupt bloud by the inferiour parts. Moreover, it eaſeth the ſwelling piles or bigs ſticking out in the fundament; killeth the cholerique exulcerations called S. *Anthonies* fire; healeth corroſive and eating ſores, and allaieth the paine of night-foes or chilblanes, called by the Greeks Epinyctides. The ſame effects have their flours alſo. The tendrons or young twigs of Olives being in their floure, if they be burnt, yeeld a kind of aſhes which may ſerve as a ſuccedan in ſtead of Spodium: but the ſame muſt bee burnt a ſecond time, after they have been well drenched and ſoked with wine. Theſe aſhes applied as a liniment, or the very leaves onely ſtamped and tempered with honey, are good for impoſtumes growne to ſuppuration, and for the puſhes or biles named Pani: M but if they be mixed with groſſe barly meale or groats, they are in a liniment comfortable to the eyes. Take the green branches of an Olive and burne them, there will diſtill and drop from the wood a certaine juice or liquor, which healeth ringworms, tettars, and ſhingles, ſcoureth away the ſcales of the skin and dandruffe, and cureth the running skalls of the head.

Touching

A Touching the gum that iſſueth from the olive tree it ſelfe, and namely that wild olive which is called Æthiopica; I cannot wonder enough at ſome, who give counſell therewith to annoint the teeth which ake, conſidering that they themſelves give out, That it is a poiſon, and to be found as well in wild olives as others. The rind or barke pared from the root of a moſt tender and yong olive, reduced into an electuarie, and often licked and let downe by leiſure into the throat after the manner of a lohoch, cureth thoſe who reach up bloud, and cough out filthie and rotten matter. The aſhes of the very olive it ſelfe, mixed with ſwines greaſe, cure all tumors; draw forth corruption of fiſtulous ulcers; and when they are thus mundified, heale them up cleane. White olives agree very well with the ſtomacke, but they are not ſo good for the belly. A ſingular commoditie they yeeld before they be put up in their compoſt or pickle, for to be eaten greene by
B themſelves as meat: for they ſcoure away gravell with urine; and good they are for the teeth, whether they be worne, rotten, worme-eaten, or looſe in the head. Contrariwiſe, the blacke olive is not ſo friendly to the ſtomacke; better for the belly; but offenſive both to the head and the eies. Both the one and the other, as well the white as the blacke, being punned and applied to burned or skalded places, doe cure them: but the black have this propertie, That if they be chewed, and preſently as they be taken out of the mouth, laid to the burne or ſcald, they will keepe the place from bliſtering. Olives in pickle are good to cleanſe foule and filthie ulcers; but hurtfull to thoſe who piſſe with difficultie.

As touching the mother or lees of oile-olive, I might be thought to have written ſufficiently, following the ſteps of *Cato*, who delivered no more in writing: but I muſt ſet downe alſo the me-
C dicinable vertues obſerved therein: Firſt and foremoſt therefore, it helpeth the ſoreneſſe of the gumbs, cureth the cankers and ulcers of the mouth; & of all other medicines it is moſt effectuall to faſten the teeth in the head. If it be dropped or poured upon S. *Anthonies* fire, and ſuch other corroſive and fretting ulcers, it is of ſingular operation to heale them: but for kibed heeles, the grounds or dregs of the black oile-olive is the better; as alſo therewith to foment ſmall children. As for that of the white olives, women uſe to apply it with wooll unto their ſecret parts, for ſome accidents thereto belonging. Be it the one or the other, generally it is more effectuall ſodden than otherwiſe. Boiled it ought to be in a copper or braſſe veſſell, untill it come to the conſiſtence of honey. Vſed it is with vinegre, old wine, or with muſt, according as the cauſe requireth, in curing the infirmities of the mouth, teeth, and ears; in healing running skalls; and finally, in
D the cure of the genetoirs or privie members, and of the fiſſures or chaps in any part of the bodie. In wounds it is uſed with linnen cloth or lint; but in diſlocations, it is applied with wooll. And verely in theſe caſes and in this practiſe, it is much employed, eſpecially if the medicine be old and long kept: for being ſuch, it healeth fiſtulous ſores. And being injected by a ſyringe into the ulcers of the fundament and genetoirs, or otherwiſe by a metrenchyte into the ſecret ſores within the naturall parts of women, it cureth them all. Alſo a liniment thereof is ſingular for to be applyed to the gout of the feet: alſo in the reſt, whether they be in the hands, knees, hucklebone, or any other joynt; ſo they be not ſetled and inveterat, but taken at the firſt. But in caſe it bee ſodden againe in the oile of greene olives, untill it come to the conſiſtence of honey, and ſo applyed, it cauſeth thoſe teeth to fall out of the head without paine, which a man would willingly be rid of.
E It is wonderfull to ſee how it healeth the farcines and manges of horſes, being uſed with the decoction of Lupines and the hearbe Chamæleon. To conclude, there is no better thing than to foment the gout with theſe lees of oile, raw.

Chap. iiii.

*Of the wild Olive leaves. The oile of the floures of the wild vine Oenanthe. Of the oile Cicinum, i. of Palma Chriſti. The oile of Almonds: of Bayes, of Myrtles, of * Ruſcus or Chamæmyrſine, of Cypreſſe, of Citrons, and of Nuts.*

* i. Butchers broome.

F THe leaves of the wild olive have the ſame nature that the leaves of the tame. As for Antiſpodium, or the aſhes made of the tender braunches of the wild olive, it is of greater force and operation in ſtaying and repreſſing of rheume, catarrhes, and fluxes, than that above-named in the former chapter. Over and beſides, it aſſuageth the inflammations of the eyes, it mundifieth ulcers, it doth incarnat and fill up the void places where the fleſh is gone, it gently

eateth away and without mortdication, the excreſcence of ranke and prowd fleſh, drieth the G
ſores, healeth and skinneth them up. In other caſes, this olive is uſed as the other olives: and yet one peculiar propertie hath the wild olive, That a ſpoonefull of the decoction of their leaves with honey, is given with good ſucceſſe to them that ſpit and reach up bloud. Howbeit, the oile made hereof is more ægre and ſharpe, yea and mightier in operation, than that of the other olives: and a collution thereof to waſh the mouth withall, ſetleth the teeth that be looſe. The leaves of the wild olive reduced into a cataplaſme with wine, and ſo applied, doe cure whit-flaws about the root of the nails; carbuncles, and generally all ſuch apoſtemations: but with honey, the ſaid cataplaſme ſerveth well to cleanſe and mundifie where need is. The decoction of the leaves, yea and the juice of the wild olive, is put into many compoſitions and medicines appro-priat to the eies. To good purpoſe alſo the ſame is dropped into the ears with hony, yea although H
they ran filthie atter. A liniment made with the flours of the wild olive, is ſingular for the ſwel-ling piles and the chilblans that be angrie in the night: and the ſame applied with barley meale to the belly, or with oile to the head for the ach thereof, occaſioned by ſome rheume, is knowne to doe verie much good. The young tendrons or ſprings of the wild olive, being boiled and laid too with honey, do rejoyne and reunite the skin of the head which was departed from the bones of the skull. The ſame tendrils pulled ripe from the wild olive, and eaten with meat, doe knit the belly and ſtay laskes: but torrified, and ſo beaten to powder and incorporat with honey, they doe mundifie the corroſive and eating ulcers; they breake alſo carbuncles.

As touching oile of Olives, the nature and manner of making it, I have alreadie treated of at large. But foraſmuch as there be many kinds thereof, I purpoſe to ſet downe in this place ſuch as ſerve for Phyſicke onely: And firſt to begin with the oile made of unripe olives, called in Latine I
Omphacinum, and which commeth neare to a greene colour, it is thought of all others to be moſt medicinable: moreover, the ſame is beſt when it is freſh and new (unleſſe it be in ſome caſe when it were requiſit to have the oldeſt that may be found) thin and ſubtile, odoriferous, and no-thing at all biting; which bee qualities all of them contrarie to that oile which wee uſe with our meats. This greene or unripe oile (I ſay) is good for the ſores of the gumbs: and if it be held in the mouth, there is no one thing preſerveth the whiteneſſe of the teeth better: it repreſſeth alſo immoderat and diaphoreticall ſweats.

The oile Oenanthinum, made of the flours of the wild vine Oenanthe, hath the ſame opera-ons that oile roſat hath. (But note by the way, that any oile howſoever it doth mollifie the body, yet it bringeth vigor and addeth ſtrength thereto.) Contrarie it is to the ſtomacke: it encreaſeth K
the filthineſſe in ulcers, doth exaſperat the throat, and dull the ſtrength of all poiſons, eſpecially of ceruſe or white lead, and plaſtre; namely, if it bee drunke with honyed water, or the broth of dried figs: but it is taken againſt Meconium or Opium, with water: againſt the Cantharides, the Bupreſtis, Salamanders, and the worms Pityocampæ, if it be drunk alone without any thing els: but if it be vomited and caſt up again out of the gorge, it hath no fellow in all thoſe caſes above-named. Moreover, in laſſitudes and extreme colds, oile is a preſent refreſhing and remedie. Ta-ken hot to the quantitie of ſix cyaths, it mitigateth all wrings and torments of the belly; the ra-ther, if rue be ſodden with it: and in that manner it expelleth wormes out of the guts. Drinke it to the meaſure of one hemina, with wine and hot water, or els with the juice of husked barley, it L
looſeth the belly. It ſerveth in good ſtead for vulnerarie ſalves and plaſtres: it ſcoureth and clean-ſeth the skin of the face. Conveied up into the head of kine and oxen, untill they belch and deli-ver it againe, it doth allay and reſolve all their ventoſities: but old oile doth heat more, and is of greater force to reſolve a bodie into ſweats than the new: as alſo to diſſipat all hard tumors and ſwellings. More helpfull alſo it is to thoſe who lie of the lethargie, and eſpecially when the diſeaſe is in declining and wearing away. Somewhat it is thought to clarifie the eyes, namely if it be ap-plyed with an equall quantitie of honey that never came neare ſmoake. A proper remedie it is for the head-ach: likewiſe in ardent fevers, it is very good with water, to allay their heat: and if there cannot any old oile be gotten, it ought to be well ſodden, that therby it may ſeeme to have age ſufficient. M

The oile of Ricinus or Tick-ſeed, called Cicinum, taken as a drinke with the like quantitie of hot water, is ſingular to purge & evacuat the belly: and it is ſaid to have a ſpeciall vertue to clenſe the midriffe, and thoſe precordiall parts neare the heart. Soveraigne it is for all gouts, hard tu-mors, the infirmities of the matrice, of the ears, and for all burns or ſcaldings. And if it be med-

led

A led with the ashes of the shell-fishes called Burrets, it cureth the inflammation of the fundament; and any scab or mange whatsoever. It giveth a fresh colour to the skin of the visage, and causeth the haire to grow plentifully where it is applied. The seed whereof it is made, there is no living creature will touch. Of the grapes which this Palma Christi or Ricinus doth carie, there be made excellent weiks or matches for lamps and candles, which will cast a most cleare light: and yet the oile which is drawn out of the seed, giveth but a dim blaze or obscure flame, by reason of the exceeding grosseneſse and fatneſse thereof. Of the leaves tempered with vinegre, there is a liniment made, which is good for S. *Anthonies* fire: and of themselves alone being fresh and greene, they be applied with good succeſse to the paps, and any violent fluxion whatsoever. The same, boiled in wine, and laid too, with grosse barley meale or groats and saffron, are singular for all inflamma-

B tions: and if they be applied by themselves without any other thing, to the visage, they doe embelish and polish the skin passing well within three daies. Oile of Almonds is laxative: it serveth to soften the body & make it tender; the skin which was riveled, it causeth to looke neat, smooth,

5 and cleare: and being applied with honey, it taketh away freckles and spots out of the face. Boiled with oile rosat, honey, the * rind of pomegranats, it is comfortable to the eares, it killeth the * *Tegmine.*
worms therein, resolveth those grosse humors which were the cause of hard hearing, of the thumping, tinging, and other inordinat sounds within the ears; and withall, easeth the head-ach and cureth the dimneſse of the eies. Reduced into a cerot with wax, it healeth felons, and cleareth the skin of those who be tanned and sunburnt. Wash the head with it and wine togither, it killeth the running scall, and riddeth away the dandruffe: applied with Melilot, it discusseth the swelling

C piles and biggs in the fundament: if the head bee annointed with it alone, it procureth sleepe. Oile de-baies, the newer that it is and greener of colour, the better it is thought to be: hot it is of nature, and therefore good in a palsie, crampe, sciatica, and for bruised places looking blacke and blew upon stripes: and being heat in the rind or coat of a pomegranat, and so applied as a cataplasme, it helpeth the head-ach, old rheums, and infirmities of the ears. Oile of Mirtles is made after the same manner: astringent it is, and serveth to harden any part of the bodie: it knitteth the flaggie gumbs, helpeth the tooth-ach and bloudie flix: it cureth the exulceration of the mattice and bladder; healeth all old ulcers which run and yeeld filthie matter, if it bee brought into a cerot with the skales of brasse, and wax. Likewise it cureth the meazles and angrie wheals: and so it doth all burns and skalds. It healeth and skinneth any gall and raw place: it scoureth

D dandruffe, and represseth the breeding therof: it cureth clifts and chaps: piles and swelling bigs in the fundament, it bringeth downe and resolveth: it knitteth dislocations of joynts, and taketh away the strong and ranke savor of the bodie. A countrepoison it is against the Cantharides and the Bupreſtis: as also against all other venome which is corrosive and hurteth by exulceration. Touching the ground-Myrtle Chamæmyrsine, or Oxymyrsine, it hath the same nature that the other Myrtle hath; and the oiles be of semblable vertues. The oile of Cypresse also, and likewise of Citrons, be not unlike to the oile of Myrtles in operation. But the oile drawn from the Wall-nut kernels (which we called Caryinum) is singular to bring haire againe, where it is falne away by some infirmitie: and instilled into the eares, it helpeth the hardneſse of hearing: if the fore-head be annointed therewith, it cureth the head-ach. Otherwise, it is but dull in operation, and

E yet a stinking smell it hath with it. If but one nut kernell be corrupt and rotten, it marreth all the oile that is made of the rest, were there a pecke of them. The oile which is made of the graine or seed of the plant Thymelæa, is of the same vertue that the oile of Palma-Christi or Tickseed above-named. The oile of the Lentiske is passing good to make an ointment of, against lassitude and wearineſse: and verely it were æquivalent every way to oile-rosat, but that it is found to bee more astringent: it is used much in represſing of immoderat sweats, and those angrie pimples which rise after much sweating. Nothing is there so effectuall to heale the farcines or skab in horses, and such like beasts. The oile of Ben, doth mundifie freckles, cure felons and biles, take away spots and mols, and healeth the impostumations in the gumbs.

As for Cypiros, what a plant it is, and how there is an oile made thereof, I have shewed alrea-

F die. By nature it is hot, and softeneth sinews which be stiffe and starke. The leaves serve to make a good liniment for to annoint the pitch of the stomacke: and their juice applied in manner of a pessarie, setleth the mother when it rolleth every way and is out of her place. The greene leaves chewed and applyed, cure the running scalls in the head, the cankers and sores in the mouth, all risings and apostemations, and likewise the piles. A decoction of the said leaves, is singular for

burns and ſcalls; likewiſe for lims out of joynt, if they be bathed therein. The very leaves in ſubſtance ſtamped & incorporat with the juice of a peare-quince into an ointment, ſet a reddiſh yellow colour upon the haire of the head. The flours brought into a liniment with vinegre, aſſuage the paine of the head: the ſame calcined and burnt into aſhes within a pot of unbaked or rather earth, either alone or with hony, healeth corroſive ſores and putrified ulcers. Theſe flours have a certain ſavour with them, which procureth ſleepe. The oile called * Gleucinum is aſtringent; and yet it cooleth after the ſame ſort that the oile Oenanthinum. The Balſame oile, called Balme, is of all others moſt pretious (as heretofore I have ſaid in my treatiſe of odoriferous ointments) and of great efficacie againſt the venome of all ſerpents. It clarifieth the eye-ſight mightily, and diſpatcheth miſts and clowds which dimmed the ſame: it eaſeth all thoſe who draw their breath with difficultie: it aſſuageth impoſtumations and hard ſwellings: it keepeth bloud from clottering, and is excellent to mundifie foule ulcers: ſingular comfortable to the ears in caſe of paine, hardneſſe of hearing, and ſinging within: to the head alſo for to aſſuage the ach: for the nerves, againſt ſhaking, trembling, and convulſions; and withall, a proper remedie for ruptures. It danteth and mortifieth the poiſon of Aconitum, if it be taken with milke. If the Patient lying ſicke of an ague, be annointed all over therewith, it mitigateth the fits comming with ſhaking and ſhivering. Howbeit, folke muſt be warie and uſe it with moderation; for being hot in the higheſt degree, it is cauſticke, and ſo doth enflame and burne: and therefore if a meane be not kept, it bringeth a miſchiefe for a remedie, and doth more harme than good.

* Some read *Melinum.*

Concerning Malobathrum, the nature and ſundrie kinds thereof, I have diſcourſed heretofore. Now for the vertues which it hath in Phyſicke; firſt, it provoketh urine: being ſtamped, the juice drawne out of it with wine by way of expreſſion, is excellent to bee applied unto the eyes, for to ſtay their continuall watering: the ſame laid to the forehead as a frontall, procureth ſleepe unto them that would gladly take their repoſe. And more effectually it worketh, in caſe the noſethrils alſo be annointed therewith, or if it be drunke with water. The leafe of * Malobathrum, if it be but held under the tongue, cauſeth the mouth and the breath to ſmell ſweet: like as, if it lie among appparell, it giveth them a pleaſant ſavour. The oile of Henbane is emollitive, howbeit an enemie to the ſinews: certes, if it be taken in drinke, it troubleth the braine. The oile of Lupines, called Therminum, is likewiſe an emollitive, and commeth neareſt of any to the operation and effects of oile-roſat.

* *Folium Indicum.*

Touching the oile of Daffodils, I have ſpoken of it in the treatiſe of the flours thereof. Radiſh oile, cureth the lowſie diſeaſe; and namely, when lice are engendred upon ſome long and chronicke diſeaſe: it cleanſeth the skin of the face from all roughneſſe, and maketh it ſlicke and ſmooth. The oile of Seſama, cureth the paine of the ears; and healeth ulcers which eat as they ſpread, even ſuch as be morimals and checke the Chirurgians hand. Oile of Lillies, which wee have named Lirinon, Phaſelinum, and Syrium, is moſt agreeable and holeſome for the kidnies; alſo to procure and maintaine ſweat; to mollifie the matrice and naturall parts of women, and to promote digeſtion inwardly. The oile or ointment Selgiticum (as we have alreadie ſaid) is comfortable to the ſinews: like as the * graſſe-greene oile, which the Inguinians (dwelling upon the cauſey or ſtreet-way Flaminia) uſe to ſell. * Elæomeli, an oile which (as I have declared before) iſſueth forth from olive trees in Syria, carrieth a certain taſt of honey: howbeit their ſtomacks it maketh to riſe at it, who licke thereof; and it is of power to ſoften the bellie. It purgeth choller *Electivè*, if two cyaths thereof be given to drinke in one hemine of water: howbeit theſe ſymptomes or accidents do follow them who drinke thereof: They lie as it were in a dead ſleepe, and muſt eftſoons be awakened. Our luſtie drunkards who make profeſſion of carouſing, uſe to take one cyath thereof before they ſit downe to drinke one another under bourd. The oile of Pitch is uſed every where, for to heale the ſcurfe, mange, and farcins in beaſts.

* *Herbaceum.*
* Called likewiſe *Oleum Syriacum.*

Next to vines and olives, Date trees are to be raunged in the higheſt place, and doe carrie the greateſt name. Dates, if they be freſh and new, doe inebriat and overturne the brain: and if they be not very well dried, they do cauſe head-ach: neither are they (ſo far as I can ſee) any way good for the ſtomacke: againe, they do exaſperat the cough and make it worſe, yet they be great nouriſhers, and cauſe them to feed who eat of them. Our auncients in old time drew a certaine juice or liquor out of them when they were boiled, which they gave unto ſicke perſons in ſtead of an hydromell or honeyed water, to drinke; and that for to refreſh them, to reſtore their ſtrength, and to quench thirſt: and for this purpoſe, they preferred the Dates of Thebais in high Ægypt

before

A before all others. Being eaten as meat eſpecially at meales, they are good for them who reach up bloud. The Dates Caryotæ ſerve to make a liniment for the ſtomack, the bladder, belly and guts, with an addition of Quince among. Being incorporat with wax & ſaffron, they reduce the black and blew markes remaining after ſtripes in the skin, to their naturall colour. Date ſtones with their kernels are burnt in a new earthen veſſell which was never occupied before, and beeing thus calcined, and their aſhes waſhed, they ſerve in ſtead of Spodium, and doe enter with other ingredients into collyries or eye-ſalves: and with ſome Nard among, they make fukes to paint and embelliſh the eye-browes. *Calliblepharis.*

Chap. v.

B ❧ *Of the Myrabolane Date, and the Date Elate.*

THe beſt Palme or Date tree which beareth a fruit like to Myrabolanes, is that which groweth in Ægypt. Theſe Dates have no ſtones, like to others. Beeing taken in unripe and hard wine, they ſtop the flux of the bellie, and ſtay the extraordinarie courſe of womens fleurs, and doe conſolidat wounds.

As touching the Date tree, called Elate or Spathe, it affourdeth for uſe in Phyſicke, the young buds, the leaves, and the barke. The leaves ſerve to bee applied unto the midriffe and precordiall parts, the ſtomacke, liver, and ſuch corroſive ulcers, as hardly will bee brought to heale and skin up. The tender rind thereof incorporat with wax and roſin, healeth all manner of skals, within 20
C daies. The ſame boiled and applied accordingly, cureth the accidents befalling to the cods and genetoires. The very perfume thereof coloureth the haire of the head blacke: and the ſuffumigation fetcheth downe the dead infant out of the mothers bellie. It is given inwardly in drinke for the infirmities of the kidneies, bladder, and precordiall parts: howbeit, an enemie it is unto the head and ſinewes. A decoction or bath thereof, if a woman ſit in it, ſtaieth the immoderat flux both of Matrice and bellie. Likewiſe, the aſhes taken in white wine, are ſingular for the pains and torments of the collicke: as alſo a collution therewith, is as effectuall to cure the fall of the *Vvula and other defects incident to that part.

**Vvulariũ vitijs.* Some read *vũlvarum*, *i.* of the matrice and naturall parts of women.

Chap. vi.

D ❧ *The medicinable vertues conſidered in the flowers, leaves, fruit, boughs, branches, barke, wood, juice, root, and aſhes of many trees of ſeverall kinds.*

IT remaineth now to decipher the manifold medicines which apples & ſuch like fruits tender-skinned, doe affourd, according to the varietie of trees which bring them forth. Of which, thus much in generall is to be noted, That all fruits which ripen in the Spring, while they bee ſoure and harſh, be enemies to the ſtomacke; they trouble the belly, diſquiet the guts and bladder, and withall, be offenſive to the ſinews: but if they be full ripe or ſodden, they are the better. But to grow unto particulars: Quinces if they be boiled, baked, or roſted, are ſweeter and more pleaſant to the taſt, than raw. Yet being throughly ripe upon the tree, although they be eaten raw, they are good
E for thoſe that ſpit and reach bloud, and are diſeaſed with the bloudie flix: ſuch alſo as upon the violent motion of unbrideled chollericke humors void upward and downeward: as alſo for them who be ſubject to continuall looſeneſſe of the bellie, occaſioned by the feeblenes of the ſtomack. Being once boiled or baked, they are not of the ſame operation: for they looſe therby that aſtringent vertue which their juice had. In hote and ſharpe feavers they ſerve for to be applied unto the breaſt. And yet if they be ſodden in raine water, they will doe well in thoſe caſes above recited. But for the paine of the ſtomacke, it matters not whether they be raw, ſodden, or baked, ſo they be reduced into the forme of a cerot, and laid too. Their downe or moſſineſſe which they bear, if it be boiled in wine, and reduced into a liniment with wax, healeth carbuncles. And the ſame maketh
F the haire to grow againe in bald places occaſioned by ſome diſeaſe. Raw Quinces, condited and preſerved in honey, doe ſtirre the bellie, and moove to ſeege. They impart unto the honey a pleaſant taſt, whereby it is more familiar and agreeable to the ſtomacke. But ſuch as being parboiled before, are then kept and confited in honey, bethought good for the ſtomack, in the opinion of ſome, who ordaine and preſcribe to ſtampe them firſt, and then to take them in manner of a meat or conſerve, being incorporat with Roſe leaves boiled, for the infirmities of the ſtomacke.

The

The juice of raw Quinces is a ſoveraigne remedie for the ſwollen ſpleene, the dropſie, and difficul- G
tie of taking breath, when the patient cannot draw his wind but upright. The ſame is good for the accidents of the breaſts or paps, for the piles, and ſwelling veines. The flower or bloſſome of the Quince, as well green and freſh gathered, as drie, is held to be good for the inflammation of the eyes, the reaching and ſpitting of bloud, and the immoderat flux of womens monthly tearmes. There is a mild juice drawn alſo from theſe flowers, ſtamped with ſweet wine, which is ſingular for the flux proceeding from the ſtomacke, and for the infirmitiees of the liver. Moreover, the decoction of them is excellent for to foment either the matrice when it beareth downe out of the bodie, or the gut Longaon, in caſe it hang foorth. Of Quinces alſo there is made a ſoveraigne oyle, which is commonly called Melinum: but ſuch Quinces muſt not grow in any moiſt tract, but come from a ſound and drie ground: which is the reaſon, that the beſt Quinces for this purpoſe H
be thoſe that are brought out of Sicilie. The ſmaller Peare-Quinces called Struthia, are not ſo good, although they be of the race of Pome-Quinces. The root of the Quince tree tied faſt unto the Scrophules or Kings evill, cureth the ſaid diſeaſe: but this ceremonie muſt bee firſt obſerved, That in the taking up of the ſaid root, there be a circle made round about it upon the earth with the left hand, and the partie who gathereth it, is to ſay, What root hee is about to gather, and to name the patient for whom he gathereth it: and then, as I ſaid, it doth the deed ſurely.

The Pome-Paradiſe, or honey Apples called Melimela, and other fruits of like ſweetneſſe, do open the ſtomacke, and looſen the bellie, they ſet the bodie in a heat, and cauſe thirſtineſſe, but offenſive they be not to the ſinewes.

*Orbiculata. The *round Apples bind the bellie, ſtay vomits, and provoke urine. Wildings or Crabs are I
like in operation to the fruits that bee eaten foure in the Spring, and they procure coſtiveneſſe. And verely for this purpoſe ſerve all fruits that be unripe.

As touching Citrons, either their ſubſtance, or their graines and ſeed within, taken in wine, are a counterpoyſon. A collution made either with the water of their decoction, or their juice preſſed from them, is ſingular to waſh the mouth for a ſweet breath. Phyſicians give counſell to women with child for to eat the ſeed of Citrons, namely, when their ſtomackes ſtand to coles, chalke, and ſuch like ſtuffe: but for the infirmitie of the ſtomacke, they preſcribe to take Citrons in ſubſtance: howbeit, hardly are they to be chewed but with vinegre.

*Nonnih, and yet heretofore he named but five. As for Pomgranats, needleſſe altogether it were now to iterate and rehearſe the *nine kinds thereof. Sweet Pomgranats, all the ſort of them, which by another name we called Apyrena, are K
counted *hurtfull to the ſtomacke: they engender ventoſitives, and be offenſive to the teeth and gums. But ſuch as in pleaſant taſt are next unto them, which wee called Vinoſa, having ſmall kernels within, are taken and found by experience to be ſomewhat more holeſome. They do ſtay the bellie, comfort and fortifie the ſtomacke, ſo they be eaten moderatly, and never to ſatisfie the appetite to the full. And yet ſome there be who forbid ſick perſons once to taſt of theſe laſt named: yea, and in no hand will allow any Pomgranats at al to be eaten in a fever; for as much as neither their juice and liquor, nor the carnous pulpe of their graines is good for the patient. In like manner they give a charge and caveat not to uſe them in vomits, nor in the riſing of choller. Certes, Nature hath ſhewed her admirable worke in this fruit: for at the very firſt opening of the rind, ſhe
preſently maketh ſhew of a perfect wine, without apparence of any grape at all, nor ſo much as of L
Muſt, which ordinarily is the rudiment of wine. All Pomgranats, as well ſweet as tart, are clad with a very hard coat and rough rind. And verely, the coat which the ſour kind hath, is much uſed and in great requeſt: and namely the Curriers know full well how to dreſſe their skins therewith: and this is the cauſe, that the Phyſicians name it in Latine *Malicorium. And they would beare us in hand, That the ſame doth provoke urine: as alſo, that the decoction thereof in vinegre, with gall-nuts among, doth confirme and keepe the teeth faſt, which doe ſhake and are looſe in the head. Women with child, and given to longing after a ſtraunge and unreaſonable manner, find much good and contentment hereby: for no ſooner taſt they of it, but the child dooth ſtirre and ſprunt in their wombe. The Pomgranat devided into quarters or parcels, and laid to ſteep and infuſe in raine water, for three daies or thereabout, yeeldeth a good and holeſome drinke for them M
to take actually cold, who are troubled with looſeneſſe of the bodie, occaſioned by a flux from the ſtomacke; and with caſting and reaching up bloud. Of the tart and ſoure Pomgranat, there is a ſingular compoſition, which the Greekes call Stomatice: for that it is a moſt ſoveraigne medicine for the infirmities incident to the mouth: and yet it is as holeſome for the accidents of the

*Dioſcorides affirmeth the contrarie.

*For corium ſignifieth a skin or leather.

noſthrils

A noſthrils and eares, as alſo for the dimneſſe of the eyes, for the troubleſome overgrowing & turning up of the skin and fleſh about the roots of the nailes, for the genetoirs or privie members, for corroſive ulcers which they call Nomæ, and for the prowd fleſh and all excreſcences in ſores. Againſt the poyſon or venome of the ſea-Hare, there is an excellent compoſition made with Pomgranats in this manner: Take the graines or kernils of Pomgranats, after they be deſpoiled and turned out of their outward rind or skin, ſtampe them well, and preſſe out the juice or liquor from them: ſeeth the ſame untill a third part be conſumed, together with Saffron, Roch allome, Myrrhe, and the beſt Atticke honey, of each halfe a pound. Others doe compound and prepare a medicine after another ſort in this wiſe: They take and pun many foure Pomgranats, and draw out of them a juice, which they ſeeth in a new cauldron or pot of braſſe, never uſed before, to the
B thickneſſe of honey: this they uſe in all infirmities of the fundament & privie parts; for all greefs and maladies which be cured with the medicinable juice Lycium: with this they cleanſe eares that run with filthie matter; reſtraine all violent fluxes of humors newly begun, and eſpecially taking a courſe to the eyes; and rid away the red pimples and ſpots that ariſe in any part of the bodie. Whoſoever carieth in his hand a branch of the Pomgranat tree, ſhall ſoone chaſe away any ſerpents. The pill or rind of a foure Pomgranat boiled in wine, and ſo applied, cureth kibes. A Pomgranat ſtamped and then ſodden in three hemines of wine untill one remaine, is a ſingular remedie for the torments of the collicke, and driveth wormes out of the bellie. A Pomgranat torrified in an oven within a new earthen veſſell never occupied before, well ſtopped and covered with a lid; and ſo beeing calcined, and drunke in wine, ſtaieth the flux of the bellie, and aſſuageth the
C wrings in the guts. The firſt knitting of this fruit, when the tree *beginneth to flower, is called by the Greekes Cytinus. Of which there be obſerved ſtrange properties, approoved by the experience of many men: For if any perſon, man or woman; unbraced, unlaced, unpointed and unbuttoned, with girdle looſe, hoſe ungartered, and ſhoes unbuckled, and having not ſo much as a ring about any finger, come and gather one of theſe tender buds or knots, with two fingers onely, to wit, the thumbe and the fourth ring-finger of the left hand; and after this ceremonie performed proceed forward to another, namely, to touch lightly with the ſame bud the compaſſe of the eyes round about, as if the prieſt ſhould ſacre or hallow them; and withall, when this is done, conveigh the ſame into the mouth, and ſwallow it downe whole, ſo as a tooth touch it not: there goeth an opinion, That he or ſhe for certaine ſhall feele no impediment or infirmitie of the eyes that year
D throughout. The ſame knots or young Pomgranats, if they bee dried and beaten to pouder, are very good to keepe downe all excreſcences of ranke fleſh, and bee holeſome for the gums and teeth. Moreover, the very juice drawne out of them after they be ſodden, do faſten the teeth in the head, although they were looſe and readie to fall out before. The very *yong Pomgranats themſelves alone newly knit, and making ſhew upon the tree, if they be ſtamped to the forme of a liniment, are ſingular for any corroſive ulcers, and ſuch as tend to putrifaction. Likewiſe, they bee excellent good in that ſort prepared and applied, for the inflammation of the eyes, and of the entrailes, and in manner for all thoſe occaſions wherein the outward rinds and pils doe ſerve. And here before that I proceed any farther, I cannot ſufficiently admire and wonder at the carefull induſtrie and diligence of our auncients beforetime, which they emploied in the conſideration of
E Natures workes, ſearching as they did into every ſecret, and left nothing behind them unaſſaied and untried: inſomuch, as they tooke regard of thoſe little pretie flowers appearing upon theſe knots or buds beforeſaid, ſuch I meane as breake forth and ſpring, before the Pomgranat it ſelfe is formed, and maketh any apparence; which ſmall bloſſomes as I ſaid before, *are called Balauſtium. For even theſe, as little as they bee, our auncitours have found by their experiments to bee adverſe unto ſcorpions. And true it is, that being taken in drinke, they do reſtraine the extraordinarie flux of womens fleurs: they heale the cankers and ſores in the mouth, the diſeaſes of the Tonſils or Amygdales, and of the Vvula: they doe helpe the ſpitting and reaching up of bloud: they cure the feebleneſſe both of bellie and ſtomacke, with the fluxes thereupon enſuing: they are ſingular beſides for the greevances of the privie members, and for all running ulcers, ſpreading
F in any part of the bodie whatſoever. Moreover, they made proofe of the ſaid flowers dried, and this high magiſterie they found, That beeing beaten to pouder, they cured thoſe of the bloudie flix, who lay at the very point of death upon that diſeaſe; as alſo that there was not a better thing in the world to ſtay any laske or flux of the bellie. Nay, they ſtaied not here (ſo inventive were our forefathers) nor thought much to make triall of the very kernils or ſtones, within their graines, to

ſee

* *Florere incipientis*: rather *defluentis*, according to *Galen*. For then the fruit is ſaid to knit, when a tree ſheddeth the bloſſome.

* *Ipſa corpuſcula*. Some read *Vaſcula*, meaning the veſſels containing the grames.

* Here is *Plinie* out of the way

ſee if they could meet with any goodneſſe therein, for to deliver unto poſteritie and the age fol- G
lowing. And in good faith, they found, That even thoſe as contemptible as they ſeeme, beeing torrified and ſo pulverized, doe helpe and comfort the ſtomacke, if either the meat be ſtrewed or ſprinckled, or the cup ſpiced with the ſaid pouder. And in truth, if they be drunke with rain water, they bind the bodie. The root of the Pomgranat tree, if it bee boiled, yeeldeth a liquour or juice, which being taken in drinke to the weight of a Roman victoriat, [*i.* halfe a denier, or halfe a dram] killeth the wormes in the bellie. The ſame throughly ſodden in water, is of the ſame operation that Lycium is for any purpoſe that it ſhall be put unto.

Finally, there is a wild Pomgranat, ſo called for the reſemblance that it hath to the planted Pomgranat: The roots are red without-foorth, *which being taken to the poiſe of one denier or dram in wine, doe procure ſleepe. The graines or ſeeds in drinke, drie up the waterie humours H
which are gotten betweene the skin and the fleſh, in that dropſie which is called Intercus. To conclude, a perfume made with the rind or pill of a Pomgranat, chaſeth Gnats out of the place, where it burneth.

*I doubt that *Plinie* miſtakes here: and is caried away with the ſimilitude of two Greeke names, to wit, φοινὶξ, *i.* the red wandering Poppie; and φοινὰ the Pomgranat. For ſurely the properties by him aſsigned unto his wild Pomgranat, in ſome ſort accord with thoſe of *Papaver erraticum*, or *Corne Roſe*.

Chap. VII.

Of Peares, and the properties obſerved in them. Of tame Figge trees, and their Figges. Of the wild Figge tree. Of Erineus, and other plants, with the medicines which they affourd.

ALL Peares whatſoever, are but a heavie meat, even to them that are in good health. And I
ſicke folke are debarred for eating them, as well as for drinking wine. And yet if the ſame bee well boiled or baked, they are marvellous holeſome and pleaſant to the taſt, eſpecially thoſe of Cruſtuminum. There is no kind of Peare at all, but if it be ſodden or baked with honey, agreeth with the ſtomacke. Of Peares there be uſually made certaine cataplaſmes, which are ſingular good to diſcuſſe all puſhes, riſings, and pimples upon the bodie: and their decoction ſerveth well to reſolve all hard tumours. Peares in ſubſtance bee a good countrepoyſon againſt venomous Tadſtooles and Muſhromes; for either they drive them down by their very weight and ponderoſitie, or elſe chaſe them out of the ſtomacke, through a certaine ſecret antipathie in Nature, that their juice hath. The wild choke Peares be very late ere they ripen. The manner is to cut them into certaine ſlices or roundles, and ſo to hang them up a drying, for to ſtay the laske and K
knit the bellie; which their decoction alſo will doe ſufficiently, if the patient doe drinke it. The leaves likewiſe, together with the Peare, are uſed to bee ſodden for the ſame purpoſes. The aſhes alſo of the Peare tree *wood, in caſe of peſtilent Muſhromes is of more efficacie than the Peare it ſelfe. Poore jades that carie Apples and Peares upon their backes in paniers, are ſhrewdly loaden: and wonderfull it is to ſee, how heavie they doe weigh, and how a few of them will make the poore beaſts to ſhrinke under their burden: but what is the remedie? Let them eat ſome of thoſe Peares before, or do but ſhew them unto them, they will undergoe (as folke ſay) their load more willingly, and goe away with it more roundly.

*Pyrorum ligni. *Quere*, if he meane not the ſtonie kernils of ſome Pears, which he uſeth otherwhiles to call *lignum*.

The milke or white juice that the Figge tree yeeldeth, is of the ſame nature that vinegre: and therefore it will cruddle milke as well as rennet or rindles. The right ſeaſon of gathering this mil- L
kie ſubſtance, is before that the figs be ripe upon the tree, and then it muſt bee dried in the ſhadow. Thus prepared, it is good to breake impoſtumes, and keepe ulcers open: alſo to bring down the monthly tearmes of women, either applied with the yolk of an egge, or taken in drinke with *Amyl or *Starch pouder. If the ſame be tempered with the flower of Fenigreeke ſeed and vinegre, and ſo applied in maner of a liniment, it helpeth the gout. Alſo it is depilatorie, and fetcheth off haires: it taketh away the skurfe of the eye-lids. In like manner it killeth tettars, ringworms, and any wild ſcabs. It openeth the bodie, and maketh it ſoluble. This Figge-tree milke is naturally adverſe unto the venomous ſtings of Hornets, Weſpes, and ſuch like, but particularly to the pricke of Scorpions. The ſame if it be incorporat with hogs greaſe, taketh away werts. Figge tree leaves and greene figs unripe, reduced into a liniment, doe diſcuſſe and reſolve the Scrophules, called M
commonly the kings evil, yea, and all ſuch nodoſities as are to be mollified. The leaves alſo alone will doe as much. There is another uſe of them beſides, namely, to rub therewith tettars & bald places, which through ſome infirmitie have loſt haire: and generally all thoſe parts that had need to be bliſtered. The tender tops and twigs of Figge-tree braunches are ſingular to cure the biting

of

*Amylo. Dioſc. hath *Amygdala*, *i.* Almonds.

A of mad dogs,if they be applied to the skin where it is broken. The ſame brought to a liniment with honey,healeth the wens or impoſtumations which be called Ceria, yeelding foorth an humor like to honey out of the combe. And if they be tempered with the leaves of the wild Poppie, they draw forth broken ſpils of ſhivered bones. Figg tree leaves ſtamped with vinegre,do reſtrain the venome,occaſioned by the biting of mad dogs. The white tendrils or ſprigs of the black Figtree made into a cerot with wax,and ſo applied,doe cure fellons and the biting of hardiſhrewes. The aſhes made of blacke Fig tree leaves,heale gangrenes, and conſume all excreſcence of dead or proud fleſh. Ripe Figgs provoke urine,make the bellie ſoluble, move ſweat,and bring foorth ſmall pockes and meaſels:In regard of which operation thus to open the pores,they bee unholeſome to be eaten in Autumne or at the fall of the leafe: for when by their meanes our bodies be
B ſet into a ſweat,they are more ſubject to take a through cold. Neither bee they holeſome for the ſtomacke: but the beſt is,their offence continueth but a while. Mary,they are well knowne to be enemies to the voice. The Figgs which be of a later breed(as it were) and come laſt,are wholeſomer than thoſe which ripen betimes.[Whereas verely,if they be brought unto their maturitie by medicining,that is to ſay,by caprification,then they are never good.] And theſe Figges encreaſe the ſtrength of young folke: preſerve elder perſons in better health, and make them looke more young and with fewer wrinckles. They doe quench and allay thirſt, and coole unkind heat. And therefore ſuch muſt not bee denied to the patient,in fevers proceeding from the conſtriction of the pores,which agues the Greekes call Stegnas. Drie Figges offend the ſtomacke: but for the throat and weaſant they are exceeding good. Theſe dried Figs are by nature hote in operation,
C and therefore engender thirſt. They ſet the bellie into a looſeneſſe: in which regard they are not good to bee eaten in any flux or catarrhes, taking a courſe either to it or the ſtomacke. Holſome they be at all times for the bladder, for ſuch alſo as bee ſhort winded and purſie. Semblably,they open the obſtructions of liver,kidneies,and ſpleene,and cure their infirmities. Nutritive they be, and therefore much eating of them cauſeth a man to grow corpulent,& natheleſſe to be ſtrong and luſtie withall: Which is the cauſe,that profeſſed wreſtlers and champions were in times paſt fed with Figs. For *Pythagoras*,a great maiſter and warden of theſe exerciſes,was the firſt man who brought them to eat fleſh meat. Moreover,Figs be reſtorative, and the beſt thing that they can eat who are brought low by ſome long and languiſhing ſickneſſe, and now upon the mending hand and in recoverie. In like manner they are ſingular for the falling evill and the dropſie. Figgs
D applied as a cataplaſm, are excellent either to diſcuſſe or els bring to maturitie any impoſtumes or ſwellings: but they do the feat more effectually,if either quick-lime or ſal-nitre be mixed therwith. Boiled with Hyſſope they cleanſe the breaſt, breake and diſſolve the phlegmatick humors, either fallen to the lungs,or there engendred; & ſo by conſequence rid away an old cough. Soddẽ in wine, and ſo applied as a liniment, they cure the infirmities incident to the ſeat or fundament,they mollifie and reſolve the ſwelling tumours of the paps, they diſcuſſe and heale fellons, puſhes,biles,and riſings behind the ears. A fomentation made with their decoction,is good for women. And the ſame being ſodden with Fœni-greeke, are excellent for the pleuriſie and Peripneumonie,that is to ſay,the inflammation of the lungs. Boiled with Rue, they aſſuage the ventoſities or collicke in the guts. The ſame being incorporat with Verdegreece or the ruſt of braſſe,
E cureth the morimals of the legs: and with Pomgranats,they heale the riſing and exulceration of the fleſh and skin about the naile roots. But made into a cerot with wax,they heale burnes, ſcaldings,and kibed heeles. Seeth Figges in wine with Wormewood and Barly meale,and put nitre to them,they are paſſing holeſome for thoſe who are in adropſie. Chew them,they *bind the bellie. Make a cataplaſme of Figges and ſalt together: the ſame is ſingular for the ſting of ſcorpions. Boile them in wine,and ſo applie them, you have an excellent remedie to draw forth carbuncles to the outward parts,and bring them to an head. Take the fatteſt and fulleſt Figs you can get,lay them upon the ugly and ill favored tumor called Carcinoma, *i.* the Canker,ſo it be not yet exul-
F cerat,I aſſure you it is a ſoveraigne remedie, and hardly can be matched againe: and ſo it is alſo for the feſtering and eating ulcer Phagedæna. There is not another tree againe growing upon the face of the earth that yeeldeth better or ſharper aſhes than the wood of the Figge tree doth, either to cleanſe *ulcers,or to incarnat,conſolidat,and reſtraine flux of humors. It is taken in drink for to diſſolve cluttered bloud within the bodie. Semblably,if it be given to drink with water and oile,of each one cyath,it ſerveth well for thoſe who are drie beaten & bruſed,who are fallen from ſome high place: ſuch alſo as have ſpaſmes and inward ruptures. And thus they uſe to give it in all crampes,

* *Siſtit*, rather *cient*, or *mileſſunt*. διχόθιλα &c. Ex Dioſcor.

* *Vlcera*, out of *Dioſcorides*, though ſome read *aciem*, *i.* the ſight of the eye: which hath no warrant from the author, whom he followeth and would ſeeme to tranſlate.

crampes,and namely,in that univerſall convulſion,which holdeth the bodie ſo ſtiffe, that it can ſtirre no way nor other,as if it were made of one entire peece without any joint.Likewiſe,both taken in drink,and alſo infuſed or injected by clyſtre,it helpeth the flux, occaſioned either by a feeble and rheumaticke ſtomacke,or els by the ulcer of the guts.If a man rub the bodie all over with it & oile together, it ſetleth it into an heat,were it before benummed. A liniment made of it,and wrought with wax and oile roſat together, skinneth a burnt or ſcalded place, moſt finely,leaving no skar at all to bee ſeene. Temper it with oile, and therewith annoint their eies who are pore-blind, ſandblind, or otherwiſe ſhort-ſighted, it amendeth their eye-ſight: and to conclude, rub the teeth often therewith,it preſerveth them white,neat,and from rotting. Thus much of Figge-tree aſhes. G

Moreover,it is commonly ſaid, That if one come to a Fig tree,bend a bough or branch thereof downeward to the ground,and bearing up his head without ſtooping,reach and catch hold of a knot or joint with his teeth,and ſo bite it off,that no man ſee him when he is doing of it; & then lap the ſame within a peece of fine leather,tied faſt by a thred,and hang it about his necke,it will diſpatch the kings evill and ſwelling kernils or inflammations behind the eares. H

The barke of the Figge tree reduced into pouder,mixed with oile,and ſo applied,healeth the ulcers of the bellie. Greene Figges taken raw,ſtamped and incorporat with nitre and meale,take away all werts,whether they bee ſmooth or rough. The aſhes made of thoſe ſhoots that ſpring from the root,is a kind of Antiſpodium,and may goe for Spodium indeed.If the ſame bee twice calcined and burnt,and then mixed with ceruſſe or white lead,and ſo reduced in trochiskes,they make a good collyrie or eye-ſalve,to cure the roughneſſe and exulceration of the eyes.

As many vertues as the mild Figge tree hath, yet the wild is much more effectuall in operation: howſoever ſhe yeeldeth leſſe milke or white juice than the other doth. For a braunch onely of it,is as good as rennet or rindles to make milke turne and run to a cheeſe-curd. Howbeit,that milkie liquor which it hath,if it be gathered and kept untill it be drie and wax hard,ſerveth to ſeaſon our fleſh meats,and give them a good taſt. For which purpoſe it is wont to be mixed and diſſolved in vinegre,and then the fleſh muſt be well rubbed and poudered therwith.The ſame is uſually mingled with cauſticke and corroſive medicines, when there is an intention to raiſe bliſters, and make an iſſue.It cauſeth the bellie to be laxative,and openeth the matrice, if it be uſed with Amyl pouder.Being taken in drinke with the yolke of an egge,it provoketh womens fleurs.Applied in a liniment with the flower of Feni-greeke, it eaſeth the paines of the gout: it cleanſeth the leproſie,and foule wild ſcab: it killeth ring-wormes and fell tettars: it ſcoureth away freckles and ſuch fleckes as diſfavor the face: likewiſe it cureth the parts ſtung with venomous ſerpents, or bitten with mad dogs.Moreover,this juice of the wild Figge tree,applied unto the teeth with a locke of wooll,allaieth their ach: ſo it doth alſo if it be put into them that bee worme-eaten and hollow. The tender young branches,together with the leaves,if they be mingled with Ervile,are good againſt the poyſon of venomous ſea-fiſhes. But then, according to ſome Phyſicians,there muſt be wine added to this receit. The ſaid tender braunches being put into the pot with Eœufe, and ſo boiled together, ſave much fewell, for leſſe fire by farre will ſerve to ſeeth the meat. The greene Figges of this wild Figge tree brought into a liniment,do mollifie and diſcuſſe the kings evill, and all other tumors and apoſtemes. And in ſome meaſure the leaves alſo have the ſame operation:Chuſe the ſofteſt and tendereſt of them,let them be ſtamped and mixed with vinegre, they will cure running ſcals and ſores,eaſe bloudie fals and chilblanes, yea, and ſcoure away filthie ſcurfe or dandruffe. The ſaid greene Figges,together with the leaves,incorporat with hony, doe cure the wens or exulcerat bunches,which yeeld matter out of them reſembling hony: likewiſe they heale the biting of mad dogs.The greene and freſh Figges newly gathered,if they bee laid too with wine, doe heale filthie eating ulcers: and mixed with Poppie leaves, they draw and fetch away broken bones out of the bodie. The greene Figs of the wild Fig tree,doe ſcatter and diſcuſſe inflammations, onely by their perfume,if they be burnt. They are a countrepoyſon, in caſe one have drunke Buls bloud,or ceruſſe: the ſame alſo put away the danger of milke crudled within the ſtomacke,if they be taken in drinke. Likewiſe,ſodden in water,and reduced into a liniment,they cure the riſings and tumors behind the eares.The tender branches and the leaſt green Figges of this wild Figg tree,being taken in wine,are very good for the ſting of ſcorpions: with this charge,that the milkie juice thereof bee inſtilled into the wound,and the leaves laied aloft. The ſame alſo ſerveth for the hardi-ſhrew. The aſhes of the ſmall tendrons being burnt,duly I K L M

applied,

A applied, bring the Vvula againe into the right place, and aſſuage the paine thereof. The aſhes of the very tree it ſelfe, being incorporat with honey, doe cure the rhagadies, fiſſures, and chaps in the feet, or elſewhere. The root boiled in wine, eaſeth the tooth-ach. The winter wild fig-tree; (which beareth fruit late in the yeare) if it be ſodden in vinegre, and ſo ſtamped and brought into a liniment, is ſingular to kill tettars and wild ſcalls. But to prepare this medicine, the wood and boughs of the tree muſt be deſpoiled of the barke, and then ſhaven or ſcraped ſo fine as any pouder or ſaw-duſt, that they may be reduced into an ointment. Yet there is one medicine more belonging to the wild figg-tree, which is admirable and may make a man to wonder at it: If a yong boy not yet undergrowne nor fourteene yeers of age, breake a braunch or bough of the wild fig-tree, and with his teeth doe pill the ſaid braunch, and fetch off the rind before it have gathered
B any downe or moſſe about it; then the marow or pith within the ſaid braunch, if it be taken forth and tied faſt about one that hath the kings evill (ſo that all this be done in a morning before the ſun-riſing) doth repercuſſe and ſmite backe the ſaid diſeaſe, ſo that it ſhall not ariſe and grow. Moreover, this wild figtree hath one ſingular propertie beſides, That if a collar made of the branches thereof be but about a bulls neck, it will make him perforce to ſtand ſtill and not to ſtir, how fell and fierce ſoever he be otherwiſe; ſuch a wonderfull vertue it hath to bridle and keepe under his courage.

Moreover, ſince that the Greeks do tearme this wild fig-tree in their language Erineos, which putteth me in mind of a certaine hearbe called Erineos alſo in their tongue, I cannot will nor chuſe but for affinitie and neighbourhood ſake, deſcribe the ſame in this place; and ſet downe
C the properties and vertues thereof. An hearbe it is, one good handfull high, riſing up commonly with five or ſix little ſtalks or braunches, much like unto Baſill; bearing a white floure, a black ſeed, and the ſame ſmall: which ſeed beaten to powder and medled with the beſt Atticke honey, cureth the rheume which falleth into the eyes and cauſeth them to weep and water continually. As touching the hearbe it ſelfe, if it be applied or uſed accordingly, with a little ſal-nitre put thereto, it is a paſſing good remedie for the paine of the ears. The leaves are a countrepoiſon.

To come now to the Plum-tree: the leaves thereof boiled in wine, are good for the infirmities incident to the amigdals, the gums, and the Vvula, in caſe the mouth be oftentimes waſhed with a collution made of their decoction. Plums themſelves make the bodie ſoluble, and very commodious they are to the ſtomacke; but this benefit continueth but a ſmall while.

D Peaches are much better than plums; and ſo is their juice, principally if it be drawne in wine or vinegre: and verely for a fruit, there is not in the world any more harmeleſſe than it. You ſhall not ſee a fruit againe, to have leſſe ſmell, & more juice within, than the Peach; and yet as liquid as it is, it cauſeth them to be drie and thirſtie who eat thereof. The leaves of the Peach tree, punned and applied, doe ſtaunch bleeding. The kernels of Peaches, incorporat in vinegre and oile to a liniment, and laid too as a frontall, allay the head-ach.

Bulleis, Skegs, and Slone (which are the berries, as it were, or fruit of the wild plum-tree) or the very barke and rind growing to the root, boiled in one hemine or ſmall pint of ſome hard and crabbed wine, untill a third part only remaine, doe yeeld a decoction effectuall to allay the pains of the chollique, and to ſtop the flux of the belly: Of this liquor, a cyath is a ſufficient draught to
E be taken at a time. As well in this wild kind as in planted plumtrees of the hortyard, there is to be found a certain skinnie gum, in Greek called Lichen, which hath a wonderfull operation to cure the Rhagadies or chaps, yea and the ſwelling piles or knobs that appeare in the fundament.

In Ægypt and Cypres both, there groweth the Sycomore, which is a kind by it ſelfe between a fig-tree and a mulberrie tree, as I have before ſaid; the fruit or berries whereof be full of liquor, which ſo ſoone as the uppermoſt rind or pill onely is pared away, appeareth in great abundance: Cut and gaſh them deeper in, they ſeeme drie, after a wonderfull and incredible manner. This juice iſſuing out of them, is a ſingular defenſative againſt the poiſon of ſerpents; a holeſome medicine for the bloudie flix; and * a notable carminative to diſcuſſe and reſolve puſhes, biles, and all impoſtumations. It ſoudereth and healeth up wounds, it allaieth head-ach, and aſſuageth
F the wens or pains of the ears. Such as alſo as be ſplenitick or diſeaſed in the ſplene, find much eaſe and comfort by drinking thereof. Moreover, a liniment made therewith, is good to chauſe and heat thoſe, who chill and quake for extremitie of cold: howbeit, laſt it will not, but breed worms very quickly. Certes, the juice of our mulberries which wee have, is of no leſſe operation and effect; for if it be taken in wine, it is a ſingular countrepoiſon for them who have drunke ei-

* The like is *Emplaſtrum διὰ συκαμίνου*: commended by *Galen*, and deſcribed by *Ægineta*.

ther the juice of Aconit, [*i.* Libard-bane] or ſwallowed a venomous ſpider. The ſame doth looſen the belly, evacuat ſlimie and roping fleame, and expelleth the broad worms and other ſuch vermin engendred in the belly. Of the like efficacie is the barke, if it be pulveriſed and ſo taken in drinke. The leaves boiled in raine water, togither with the bark of the black fig-tree and the vine, doe make a lavature or water to * colour the haire [blacke.] The juice of mulberries doth worke ſpeedily, and provoke to the ſeege: and the very fruit or mulberrie it ſelfe, for the preſent is comfortable to the ſtomacke; it cooleth for the time, but bringeth thirſt with it. If a man eat them alone, or laſt, and lay no other meat upon them, they ſwell in the ſtomacke and be very flatuous. The juice drawne out of unripe mulberries, are of vertue to bind the belly. In ſumme, there be ſtraunge and woonderfull properties worthy to be obſerved in this tree, which ſeemeth to have ſome ſenſe and underſtanding, as if it were a living and ſenſible creature, whereof I have alreadie * written more at large in the deſcription of it, and the nature thereof. There is a notable * compoſition made of mulberries, reſpective to the mouth and throat, called thereupon Panchreſtos Stomatice, and by another name, Arteriace: the receit and making whereof, is in this manner; *Recipe*, of the juice drawne out of mulberries, three ſextars, ſeeth it over a gentle and ſoft fire [or rather let it ſtew in balneo Mariæ] untill it be reduced to the conſiſtence of hony: afterwards put thereto of verjuice made of dried grapes, the weight of two * deniers or drams; of myrrhe, the poiſe of one denier; of ſaffron likewiſe, one dram or denier. Let theſe ingredients (I ſay) be firſt beaten to powder (ſuch I meane as need pulveriſing) and ſo mingle them togither with the foreſaid decoction, and put it up for your uſe. A better and more pleaſant medicine there is not, for the mouth, the windpipe, the uvula, and the ſtomacke. There is another way of making it in this ſort, Take of the juice aforeſaid, the quantitie of * two meaſures called ſextars, of Attick honey one ſextar, ſeeth them togither as before. Many marvails beſides are reported of this tree, of which I will give you a little taſt: Spie where the little mulberries that ſhall be are newly knit, to wit, when the tree firſt buddeth and before the leaves be fully out; gather their young knots of the fruit toward, which the Greeks call Ricinos, but in any caſe with the left hand; take heed alſo that they touch not the ground, howſoever you doe: and if when you have obſerved theſe circumſtances, you weare them about your wreſts, hang them about your necke, or otherwiſe tie them about you, be ſure they will ſtaunch bloud, whether it guſh down from your noſthrils, flow out of a wound, run out of the mouth, or iſſue by the hæmorrhoid veins. And in truth, folke uſe to keepe theſe little buds or knots very carefully for this purpoſe. The ſame vertue and operation the braunches have (as they ſay) but then they muſt bee broken from the tree at the full of the moon, when they begin to knit & give ſome hope of fruit: and if the ſame touch not the ground, then they have a ſpeciall propertie reſpective unto women, for to reſtrain the immoderat flux of their monthly terms, being tied or faſtened to their arms. And it is thought, that they worke this effect, if the woman her ſelfe do gather them at any time whenſoever; provided alwaies, that the braunch in any wiſe touch not the ground, and that ſhe weare it faſt about her in manner aforeſaid. The leaves of the mulberrie tree ſtamped greene, or beeing drie and boiled, ſerve in a cataplaſme to be applied unto thoſe places which are ſtung by ſerpents. The ſame good they do alſo, if they be taken in drinke. The juice of the barke which grew to the root, if it be drunke either in wine or oxycrat, [*i.* vinegre and water togither] is ſingular againſt the pricke of ſcorpions. But here I muſt ſet down the compoſitions that our auncients deviſed and made of mulberries: Firſt and foremoſt, They took a quantitie of the juice preſſed out of mulberries, as well ripe as unripe, which they ſod in a braſſe pan, unto the conſiſtence or thickneſſe of honey. Some uſed to put thereunto, myrrhe and cypreſſe, ſetting all to frie and take their fermentation in the ſun, untill it grew to hardneſſe in the foreſaid veſſell, ſtirring it thrice a day with a ſpatule: This was the ſtomaticall medicine of the auncients, which they uſed alſo in healing and skinning up wounds. And yet there was another kind made after this ſort: They preſſed forth the juice of the unripe mulberries, but firſt they let the ſaid fruit to be very well dried, and this ſerved them in lieu of ſauce, which gave an excellent taſt to their other meats. In Phyſick alſo, they employed it much, namely, about corroſive and eating ulcers, and for to evacuat tough fleame out of the breaſt: they uſed it alſo as need required, as an aſtrictive, to corroborat the noble and principall parts within the bodie. It ſtood them alſo in good ſtead for collutions, to waſh the teeth withall. Moreover, a third kind of juice they had, which they drew from the leaves and roots after they were well boiled: and with this juice and oile togither, they were woont to annoint any burnt or ſcalded place

of

Tingunt capillum: for the black colour was in moſt requeſt in thoſe daies.

* *Lib. 16. ca. 25.*

* *Diamorum*, or the compoũd ſyrrup of mulberries.

* *Pondus X duorum.*

* Somewhat under two wine quarts with us.

G H I K L M

A of the bodie: for which purpoſe, the leaves alſo they applyed alone without more adoe. As touching the root of the mulberrie tree, it yeeldeth in harveſt time (by way of inciſion) an excellent juice for the tooth-ach, for biles, and impoſtumes, eſpecially ſuch as are growne to ſuppuration, and be at hand to breake: the ſame purgeth the belly. The leaves of the mulberrie tree infuſed and ſoked in urine, fetch off the haire from thoſe skins which are to be courried & dreſſed.

Cheries looſen the belly, and be hurtfull to the ſtomacke: yet, if they be hanged up and dried, they doe bind the bellie, and provoke urine. I find a notable experiment in ſome authours, That if a man eat cheries ſtones and all in a morning, new gathered from the tree with the dew upon them, they will purge ſo effectually, that he ſhall find himſelfe cleane rid from the gout of the feet, if he were diſeaſed that way.

B Medlars, all of them, except thoſe great ones called Setania (which in deed are more like to apples) doe cloſe up the ſtomacke, and bind the belly. In like manner Sorveiſes, if they be dried; for being freſh and new gathered, they bee good to ſcoure and ſend excrements ſpeedily out of the ſtomacke and belly both.

Chap. XVIII.

Of Pine-nuts, or Pine-apples: of Almonds, Filberds, and Hazell-nuts: of Walnuts, Fiſticks, Cheſtnuts, Carobs, and Cornoils. Of the fruit of the Arbut or Strawberrie tree, and the Bay.

C THe Pine apples or nuts, which have roſin in them, if they be lightly bruiſed, and then ſodden to the halfe in water, with this proportion, to wit, one ſextar of water to every ſuch apple, do yeeld a decoction ſingular good for ſuch as reach and ſpit up bloud; ſo that the Patient drinke two cyaths thereof at one time. The decoction likewiſe of the Pine tree barke boiled in wine, is given to drink for the pains and torments in the belly. The kernels of the Pine-nuts quench thirſt; they pacifie and ſtill the frettings and gnawings of the ſtomack: they rectifie the corrupt and putrified humors there ſetled and bedded: they ſtrengthen weake bodies in maner of a reſtorative, and are right good and agreeable to the reins and bladder: howbeit they ſeeme to exaſperat the throat, and to encreaſe a cough. Being taken inwardly, either in water, wine, ſweet cuit, or the decoction of *Dates or Tamarinds, they purge cholerique humours. When
D the gnawing gripes within the ſtomacke bee exceeding violent and painefull, it is good to mix therewith Cucumber ſeed and the juice of Pourcellane: likewiſe in caſe either bladder or kidnies be exulcerat: for diureticall they be alſo, and provoke urine.

Balanorum decoctio.

Touching the bitter Almond tree, the decoction of the roots thereof, doth ſupple the skin and lay it even and ſmooth without wrinkles; it embeliſheth the viſage with a freſh, lively, and cheerefull colour. The bitter Almonds themſelves bring folke to ſleepe, and get them appetit to their meat: they moove urine, and ſtir the ordinarie courſe of womens monthly fleurs: they ſerve in a liniment for the head-ach, eſpecially in fevers; but if the ſaid head-ach come by occaſion of drunkenneſſe or a ſurfet of wine, they would be applied with vinegre, oile roſat, and a ſextar of water. They have a propertie to ſtanch bleeding, mixed with amylfloure and mints. They
E are good in a lethargie, and the falling ſickneſſe, if the head bee therewith annointed all over. They cure the angrie night-foes, called chilblans and bloudyfalls: applied with cold wine, they cure ulcers which grow to putrifaction; and with honey, the bitings of mad dogs: they take away the ſcales and dandruffe about the face, if ſo be there have been uſed before ſome convenient fomentation to prepare the skin for this medicine. An almond milke drawne with water, and taken as a drinke, eaſeth the pains of the liver and kidnies. Bitter Almonds reduced into a loch with Terpentine, worke the ſame effect, ſo that the Patient bee often licking thereof. For thoſe who be troubled with the ſtone and gravell, with difficultie alſo of piſſing, they be very effectuall if they be taken with ſweet wine cuit: alſo beaten with honyed water, they are ſingular to cleanſe the skin, and make it looke neat and faire. Reduced into the forme of a loch with honey, they be
F holeſome for the liver, good to ripen and diſpatch a cough, & excellent for to mitigat the pains of the cholique: and this electuarie muſt be taken, to the quantitie of an hazell nut at a time, with a little ſauge put thereto. It is ſaid, that our luſtie toſſe-pots and ſwill-bolls, if they eat foure or five bitter almonds before they ſit them downe to drinke, ſhall beare their liquor well, and never be drunke, quaffe they and poure they downe as much as they will: alſo, that if foxes chance

to eat of them, and cannot come by water neare at hand to lap, they will die thereof. Sweet al- G
monds are not so medicinable as the bitter, and yet they be purgative, absterſive, and diureticall. If they be new and freſh, they charge and ſtuffe the ſtomacke.

Hazle nuts and Filberds, otherwiſe called the Greekiſh nuts, beeing taken in vinegre with wormwood ſeed, cure the yellow jauniſe, as it is commonly ſaid: and a liniment made with them, doth helpe the diſeaſes incident to the ſeat, and particularly the piles and ſwelling bigs there appearing. The ſame medicine is good for the cough, and ſuch as ſpit and caſt up bloud.

As for Walnuts, the Greeks have given them a * name importing as much as the heavineſſe of head; and not without good cauſe, for the very ſhade of the tree and the ſent of the leaves, do pierce & enter into the head: ſo do the kernels alſo in leſſe while, if they be eaten: now the newer they be, the more pleaſant taſt they have: the drie are more oily and unctious, hurtfull to the H
ſtomacke, hard of digeſtion, cauſing headach, naught for them who have a cough, and for ſuch as would vomit in a morning faſting: good only in that trobleſome running to the ſtoole and ſtraining for nought, by reaſon of their propertie to evacuat fleame. The ſame beeing eaten before meat, doe dull the force of any poiſons: they helpe the ſquinancie alſo, applied with rue & oile. Adverſe and contrarie they are to the nature of onions, and doe keepe downe and repreſſe their ſtrong ſmell which riſeth from them, after a man hath eaten them. Applied with a little honey, they are thought to be very good for the inflammation of the ears; and with rue, for the breaſts and paps; as alſo for diſlocations and parts out of joynt. But if they be uſed with onions, ſalt, and honey, they are ſingular for the biting both of dog and man. The ſhell of a wallnut, is thought to be of a cauſtick qualitie, and good to burne or ſeere an hollow tooth: the ſame being burnt, pul- I
verized, and incorporat with oile or wine, ſerveth to annoint the heads of yong babes for to make the haire grow thicke: and in that maner it is uſed to bring the haire againe of elder folke, when through ſome infirmitie it is ſhed. The more Walnuts that one eateth, with more eaſe ſhall hee drive worms out of the belly. Walnuts that have been very long kept, doe cure carbuncles, gangrens tending to mortification, and reduce the blacke and blew ſpots (remaining after ſtripes) to their owne colour. The barke of the walnut tree, is a ſoveraigne remedie for the bloudie flix, and the foule tettars or ringworms. The leaves bruiſed and ſtamped with vinegre, and ſo applied, put away the paine of the eares. After that *Mithridates* (that moſt mightie and puiſſant king) was vanquiſhed, *Cneus Pompeius* found in his ſecret cloſet or cabinet, among other pretious jewels, the receit of a certain antidot or preſervative againſt poiſon, ſet downe under the hand of the ſaid K
prince, in a privat note-booke of remembrances, in this manner following: Take two drie walnut kernels, as many figs, of rue, twentie leaves: ſtampe all theſe togither into one maſſe, with a grain or corne of ſalt among. Vnder which receit, was thus much ſubſcribed, Whoſoever uſe to eat of this confection in a morning next his heart, there ſhall no poiſon hurt him that day. It is ſaid moreover, that the kernels of walnuts chewed by a man or woman faſting, doe cure the biting of a mad dog, ſo that the place be annointed and dreſſed therewith.

But to returne againe to Hazle nuts and Filberds, they doe cauſe head-ach, they breed wind in the ſtomacke: and a man would not thinke nor beleeve how ſoone they will make one fat, but that experience approoveth it. If they bee roſted or torrified, they cure a rheume: and if they be beaten to powder, and given to drinke in honeyed water, they rid away an old cough that hath L
ſtucke to one a long time: ſome put thereto certaine pepper cornes, and others drinke them in wine cuit that is ſweet. Fiſticks are uſed in the ſame ſort, and have the ſame operation and effects as the Pine-nut kernels have: Over and above, they are ſoveraigne for the ſting of ſerpents, whether they be eaten or taken in drinke.

Cheſtnuts be exceeding aſtringent, and mightily ſtay all fluxes both of the ſtomacke and the belly: for ſuch as ſcoure overmuch and have * a great laske upon them: alſo for them who reach up bloud, they be paſſing holeſome; and withall, nutritive and breeding good faſt fleſh.

Carobs, which be freſh and greene, are hurtfull to the ſtomacke, and do looſe the belly; yet the ſame, if they be dried, do bind, and are more holeſome for the ſtomacke: diuretical they be alſo, and provoke urine. As for thoſe Carobs or Cods of Syria, ſome uſe to ſeeth three of them M
in a ſextar of water untill halfe be conſumed, and drinke that juice or liquor thereof for the paine of the ſtomacke. If a man take the greene twigs of a Corneil tree, there will (by the meanes of a red hot plate or ſlice of yron ſet unto them) ſweat or frie out a certain liquid humor, which muſt be received ſo, as no wood touch it: the ruſt of yron beſmeared with this liquor, cureth foule tettars

* κάρυον, of κάρη. i. the head: like as in Latine, *Nux*, à *nocendo*.

* *Alvo cite*, and not *alvũ cient.*

A tars and ringworms called Lichenes, if they be taken at the firſt before they have run far. The Arbut or Strawberrie tree, otherwiſe named Vnedo, beareth a fruit hard of digeſtion, and offenſive
2 to the ſtomacke. The Lawrell, both leafe, barke, and berrie, is by nature hot; and therefore it is agreed among all writers, That their decoction, eſpecially of the leaves, is comfortable to the bladder and naturall parts of women: the ſame being applied as a liniment, be ſingular good for the pricke or ſting of waſps, hornets, and bees; and likewiſe againſt the poiſons of ſerpents, eſpecially of the viper, & Seps otherwiſe called Dipſas. Boiled with oile, they are good to bring down womens fleures. The tender leaves of the Bay ſtamped, and mixed with groſſe barley meale or groats, cure the inflammations of the eies: with rue, they helpe the hot tumors and ſwellings of the cods: but incorporat with oile roſat, or with oile of Ireos or floure-de-lis, they aſſuage the
B head-ach. Whoſoever doth chew and ſwallow downe three Bay leaves, for three daies togither, ſhall be delivered by that means from the cough. The ſame, if they be beaten to powder and reduced into an electuarie or loch with honey, are good for ſuch as be purſie and labour for wind. The barke or rind growing to the root, is daungerous for women great with child, and ſuch muſt
2 take heed how they meddle with it. The very root it ſelfe, breaketh or diſſolveth the ſtone, and is holeſome for the liver, if it be taken to the weight of three oboli in odoriferous wine. Bay leaves given doe drinke, doe provoke vomit. Bay berries bruiſed and ſo applied, or otherwiſe pulveriſed and taken in drinke, draw downe the iſſue of womens terms. Take two Bay berries, rid or cleanſe
2 them from their huske and drink them in wine, it is a ſingular medicine for inveterat coughs, and the difficultie or ſtraightneſſe of breath, when a man is forced to ſit upright for to fetch and de-
C liver his wind: howbeit, if the Patient be in a fever, it is better to take theſe berries in water; or els by way of a loch or electuarie, after they have been ſodden in honeyed water or ſweet cuit. And in this manner they be good in aphthiſicke or conſumption of the lungs, and all catarrhs which fall to the pectorall parts; for they ripen fleame, and ſend it out of the cheſt. Foure Bay berries drunk with wine, are a good remedie for the ſting of ſcorpions. The ſame being brought to powder and reduced into a liniment with oile, and ſo applyed, doe heale the bloudy-falls called Epinyctides; rid away freckles and pimples; cure running ſcalls and ulcers, cankers and ſores in the mouth; and cleanſe the bodie of ſcurfe, ſcalls, and dandruffe. The juice drawne out of Bay ber-
2 ries, killeth an itch that fretteth the skin, and beſides, the lice that crawle and ſwarme all over the bodie. The ſame, mingled with old wine and oile roſat, and ſo dropped into the ears, cureth their
D paine and deafeneſſe: and whoſoever be annointed all over therewith, need feare no venomous things, for they will flie from them. The ſame juice, eſpecially if it be drawne from the berries of that Lawrell which hath the ſmaller and thinner leaves, may be taken in drinke, and ſo it is effectuall againſt all ſtings. The berries drunke in wine, withſtand the venome of ſerpents, ſcorpions, and ſpiders. Brought into a liniment with oile and vinegre, and ſo applied, they helpe the ſplene and liver; but with hony, they heale gangrens. Such as be wearied with travaile, or otherwiſe ſtiffe and benummed with cold, find much good by being annointed with the ſaid liniment or juice, if ſome ſal-nitre be put thereto. Some are of opinion, That if a woman in labour drinke the quantitie of one acetable of the Lawrell root in water, ſhee ſhall have the more ſpeedie deliverance: and for this purpoſe (they ſay) that a freſh and greene root is better than a drie. Others preſcribe,
E to give in drinke ten Bay berries againſt the pricke of ſcorpions. Alſo when the Vvula is falne, ſome give counſell to take three ounces of the leaves and berries, and ſeeth them in three ſextars of water to the thirds, & to gargarize with this decoction hot: alſo for the head-ach, to take ſome odd number of Bay berries, and ſtampe them with oile into a liniment, and therwith to annoint the forhead and temples, as hot as the patient can well abide it. The leaves of the Delphick Lawrell beaten to powder, and held to the noſe and ſmelled unto ever and and anon, ſerve for a good preſervative in time of the contagious peſtilence; and the rather, if they bee burnt, their perfume doth rectifie the infection of the aire. The oile of the ſaid Bayes of the Iſle Delphos, is good for to make thoſe cerots which put away laſſitude & wearineſſe, to diſcuſſe and reſolve the cold humors which cauſe quivering and quaking, to mollifie and ſtretch the ſinewes, to allay the
F pain of the ſides in a pleuriſie, and laſt of all to drive away the cold fits of agues. Semblably, if the ſame be warmed in the rind of a Pomegranat, and inſtilled into the ears, it eaſeth their pain. The leaves boiled in water to the conſumption of a third part, keep up the Vvula, uſed by way of a gargariſme: but the ſaid decoction taken inwardly, allayeth the pains of belly and guts. The tendreſt leaves that may be had, ſtamped with wine into a liniment, doe repreſſe and keepe down wheals

and itching, if the bodie be annointed therewith every night. Next unto this, the other kinds are G
to be raunged according to the validitie of their operation. As for the Lawrell Alexandrica or Idæa, if a woman in travaile of child-birth take three deniers weight of the root, and drinke the same in three cyaths of sweet wine, she shall be quickly delivered and brought to bed. The same drinke sendeth forth the after-birth, and provoketh womens monthly terms.

Daphnoides, or the wild Lawrell (or call it by any other of those names before rehearsed) hath many good vertues: It purgeth the belly, if you take the leafe either greene or drie, to the weight of three drams with salt, in hydromel or honyed water: being chewed, it draweth downe phlegmaticke and waterie humors. The leafe also mooveth to vomit, and is offensive to the stomack. The berries likewise be purgative, if a man take five or ten of them at once.

H

Chap. ix.

Of the tame or gentle Myrtle tree planted. Of Myrtidanum, and the wild Myrtle.

OF garden Myrtles, the white is not so medicinable as the blacke: the fruit or berries of the Myrtle, helpe those that reach up bloud: taken with wine, they put by the danger of venomous mushroms: chew them in your mouth, your breath will bee the sweeter for it two daies after. It appeareth by the Poët *Menander*, that the good-fellows Synaristeusæ were woont to eat Myrtle berries. The weight of one denier in wine, is good for the bloudie flix. If they have a little sivering or waulme over the fire in wine, they make a good water or liquor to cure untoward ulcers to heale, especially such as be in the extreame parts of the bodie. Of them and barley I
groats, there is made a cataplasme for bleered eies: for the fainting also and trembling of the heart, being applied to the left pap or breast. In like manner, the same beeing used with pure undelaied wine, is singular for the pricke of scorpions: for the infirmities of the bladder, the headach, and the apostemations betweene the angle of the eies and the nose, if they be taken before they yeeld filthie matter: and so they cure other tumors or swellings: and if their pepins or kernels be taken foorth, and then incorporat with old wine, they be singular for the small pocks and meazles. The juice of Myrtle berries bindeth the belly, but provoketh urine. A liniment also is made thereof with wax, for the said pocks and meazles: also against the sting of the venomous spiders Phalangia. The said juice doth colour the haire black. Of the same Myrtle there is an oile made, more lenitive and mild than the juice or liquor above-named: and yet there is a wine of K
Myrtles more kind and gentle than it, which will never overturne the brain or make one drunke. The same, if it have lien and bee stale, bindeth the belly and staieth a laske: it strengtheneth the stomacke also, and represseth vomits: it assuageth the griping paines in the guts, and restoreth appetit to meat. The powder of drie Myrtle leaves, restraineth sweats, if the bodie bee strewed therwith, though it were in a fever. The same powder is good for the feeblenesse of the stomack, and the flux from thence proceeding: it reduceth the matrice into the right place, when it beareth downe out of the bodie: it cureth the infirmities of the seat; healeth running scalls and ulcers; warisheth S. *Anthonies* fire, and the shingles, being used thereto in some fomentation; retaineth and staieth the haires readie to shed; scoureth away dandruffe; drieth up wheals, pocks, and meazles; and last of all, skinneth burns and skaldings. The powder entreth into those unguinous or oleous plasters which the Greeks call Liparas. And such a kind of plastre in like maner as the oile of these Myrtle beries, is most effectuall in those sores which light upon moist parts, as for example, the mouth, and the matrice. The leaves in substance, beaten to powder and tempered with wine, are a countrepoison against venomous mushroms; but incorporat with wax into a liniment, they do ease the gout of any joints, and drive backe risings and impostumations. The same leaves boiled in wine, are given to drinke for the bloudie flix, and the dropsie. When they be dried and brought into powder, they serve to cast and strew upon ulcers; also to restraine any bleeding. They scoure away freckles, and such like spots of the skin: they heale the rising, overgrowing, and parting of the skin about the naile roots; also whitflaws, chilblanes, piles, and swelling biggs in the fundament; the accidents befalling to the cods; filthie maligne and morimall M
ulcers; and last of all, burns (applied in manner of a cerot.) For the ears running with filthie matter, there is good use of the leaves burnt; also of their juice and decoction. The same are likewise burned, to serve for certaine antidots or countrepoisons. In like manner, to the said purpose the tender sprigs of the Myrtle with the floure upon them, are gathered and calcined within an

oven,

A oven, in a new earthen pot, well covered and cloſe luted: after which they bee reduced into pouder, and mixed with wine. The aſhes of the leaves burnt, healeth burnes. To keepe the ſhare or groine from ſwelling, although there bee an ulcer there, it is ſufficient, if the partie have about him a ſhoot or braunch onely of the Myrtle; provided alwaies, that it touched neither yron nor the earth.

As touching Myrtidanum, how it is made I have ſhewed alreadie. Applied unto the matrice or naturall parts of a woman either by way of fomentation or liniment, it doth much good. And much better, if it be made with the barke, leafe, and berrie of the Myrtle. Moreover, of the ſofteſt leaves braied and ſtamped in a morter, there is a juice preſſed foorth, by pouring greene wine by little and little among, and otherwhiles raine water: which is uſed much for the ulcers and ſores
B of mouth, ſeat, matrice, and bellie: to die the haire blacke: to waſh and *bath the arme-holes with: to ſcoure away ſpots and freckles: and in one word, when and whereſoever there is need of aſtriction.

*Alarum perfuſiones.

The wild Myrtle or Oxymyrſine, called alſo Chamæmyrſine, differeth from the civile and gentle Myrtle, in the redneſſe of the berries, and the ſmall grouth. The root is highly eſteemed: for boiled in wine, and ſo taken it drinke, it cureth the paine in the raines, the difficultie of urine, eſpecially when it is thicke, and of a ſtrong ſavour. The jaundiſe alſo it helpeth, and cleanſeth the matrice, if it be brought into pouder, and mixed with wine. The young and tender buds eaten after the manner of Sperage crops with meat, firſt roſted in the embers; the ſeed likewiſe taken in wine, oile, or vinegre, breake the ſtone. The ſame ſeed ſtamped and drawne with vinegre and oile
C roſat, allaieth the head-ach; but in drinke it cureth the jaundiſe. *Caſtor* called Oxymyrſine (with the ſharpe prickie leaves like the Myrtle, and wherewith beeſomes be made) by the name of Ruſcus, and ſaith it hath the ſame properties. Thus much for planted trees, and their medicinable vertues, proceed we now forward to the wild.

¶ The Proëme.

CHAP. I.

& Medicinable vertues obſerved in wild Trees.

F NAture, that ſacred and bleſſed mother of all things, willing and deſirous that man, whom ſhe loveth ſo well, ſhould find every place ſtored with proper & convenient remedies for all maladies incident unto him; hath ſo diſpoſed of her works, and taken that order, that the rough woods and forreſts, even the moſt hideous parts of the earth, and fearefull to ſee unto, be not without their plants medicinable. Nay the very wilds and deſerts are enriched and furniſhed therewith: inſomuch, as in every coaſt and corner of the world there may be obſerved both ſympathies and antipathies (I meane thoſe naturall combinations and contrarieties in thoſe her creatures.) From whence proceed the greateſt miracles which are to be ſeene in this round fabrick and admirable frame.

frame. For first and formost, the Oke and the Olive tree beare such mutuall rancour and mallice (as it were) and are so stiffely bent to warre one with another, that if a man replant one of these trees in the trench or hole from whence the other was taken up, it will surely die. Also, if an Oke be set neare unto a Walnut tree, it will not live. The Colewort and the Vine hate one another to the very death; in such sort, that if a Vine stand neare unto it, a man shall sensibly perceive the same to shrinke away and recule backward from it: and yet this wort, which maketh the vine thus to retire and flie, if it chaunce to grow overagainst Origan or Cyclamine, will soone wither and die. Moreover, it is commonly said, That trees in the forrest fully growne, which have stood many a yeare, and namely such as are readie to be fallen and laid along for timber, prove harder to be hewed and sooner wax drie, if a man touch them with his hand before hee set the edge of the ax to their butt. And some say, that pack-horses, asses, and other labouring beasts which have Apples and such like fruit aload, will quickly shrinke and complaine under their burden, yea, and presently run all to sweat (carrie they but a very few to speake of) unlesse the said fruit, wherewith they are to be charged, be first shewed unto them. Asses find great contentment and good by feeding upon Fennell-geant or Ferula plants: and yet, to horses, garrons, and other beasts of cariage and draught, they are present poyson, if they eat them: which is the cause, that the Asse is a beast consecrated unto the god *Bacchus*, as well as the foresaid plant Ferula. Over and besides (see the admirable operation in Nature) the very insensible and liveleſse creatures, yea, the least that be, meet every one of them with some contrarie thing or other, which is their bane and poyson: For, as our cookes know well ynough, the inner barke of the Linden tree slived thin into broad flakes and fine boulted flower together, doe drinke and suck up the salt of viands, overmuch poudered, and make it fresh againe. Likewise, salt giveth a good rellish to any meat that is over sweet, and tempereth those that have a lushious and wallowish tast. If water be nitrous, brackish, & bitter, put some fried Barley meale into it, within two hours and lesse it will be so well amended and sweet, that a man may drinke thereof: and this is the reason that the said Barley meale is put ordinarily in those strainers and bags through which wines doe passe, that thereby they may be refined and drawne the sooner. Of the same operation also and effect there is a kind of chalke in the Island of Rhodes: and our cley here in Italie will doe as much. Thus you see what enmitie & discord there is in some things. Contrariwise, wee may observe in others, how wonderfully they accord and agree together: For pitch will dissolve, spread, and be drawne out with oile, being both as they are of a fattie nature; oile alone will incorporat and mingle well with lime: and they hate water, the one as well as the other. Gums are sooner dissolved and more easily tempered with vinegre than with any thing els; & inke with water: besides an infinit number of other such, which I shall have occasion to write of continually in their due places. And indeed, this is the very ground and foundation of all our Physicke. For (to say a truth) Nature ordained at the first such things and none but such, for to be the remedies of our diseases, which wee feed and live daily upon; even those which are soone found and as soone prepared, which bee readie at hand, common every where, and cost us little or nothing at all. But afterwards the world grew to bee so full of deceit and cousenage, that some fine wits and nimble heads devised to set up Apothecarie shops, promising and bearing us in hand, that every man might buy his life and health there for money. Then anone a sort of compositions, mixtures, & confections were set on foot, then there was no talke but of strange and intricat receits, and these were bruited abroad for the only medicines, of wonderfull and unspeakeable operations. So that now adaies we use no other drugs but those that come from Arabia and India. And if a man aile never so little, or have the least push or wheale about him, hee must have some costly Physicke forsooth for it: and a plastre that came from as farre as the red sea: whereas in truth, the right remedies appropriat for every maladie, be no other than such as the poorest man that is feedeth upon every night ordinarily at his supper. But if we went no farther than to the garden for medicines, and sought after hearbes, shrubs, and plants onely, for to cure our sickneſse or maintaine our health, certes there were not a baser occupation in the world than the profession of Physick, and Physicians would be nought set by. But will you have the truth? To this passe are we come, the old world we have bidden farwell unto: the auncient manners and rites of Rome citie are dead and gone; our state is grown so much in greatneſse, as there is no goodnes left. Our victories and conquests bee these, and nothing els, which have vanquished and subdued us: for subject we must acknowledge our selves to strangers and forraine nations, so long as Physicke (one of their arts) is able to command our commanders,

A ders,and overrule our Emperours.But the discourse of this matter in more ample manner,I will reserve to some other time and place.

Chap. II.

Of Lotos.

AS touching the hearbe*Lotos,the Ægyptian plant likewise of that name: as also, of another tree about the Syrtes so called, I have written sufficiently in their due places. As for this Lotos,which our countreymen call in Latine the Greekish Beane,hath a property for to bind and knit the flux of the bellie,with the fruit or berries which it beareth. The shavings or
B scrapings of the wood therof,boiled in wine,and so taken inwardly,cure the bloudie flix and exulceration of the guts; represse the immoderat flowing of womens months; helpe the dizzinesse and swimming of the braine; and those who be subject to the falling sickenesse. The same decoction also*keepeth the haires from shedding,if the place be bathed therewith. But wonderfull it is, that these small shavings should be so bitter,as nothing more, when the fruit it selfe is as sweet as any other.Moreover,of the fine dust sawed or filed from this wood,sodden in Myrtle water, then kneaded and wrought into paste, and so reduced into severall trochiskes,there is a soveraine medicine made for the bloudie flix: if the patient drinke the weight of one Victoriat or halfe dram of these troches in three cyaths of water.

* Called otherwise *Cola casia* and the Ægyptian Beane.

* *Cohibent capillum. Dioscor.* hath ξηρᾶίζει, *i. Rufans, i.* colloureth them yellow.

C

Chap. III.

Of Mast.

ACorns or Mast of the Oke, beaten to pouder, and incorporat with Hogs lard salted,heale all those hard and swelling cankerous ulcers, which they call in Greeke Cacoëthe. In all these trees bearing Mast, the very substance of the wood is more forcible than the fruit;
3 the outward barke more than the wood; and the inner rind or tunicle under it, more than the barke or all the rest.This membrane or pellicle if it bee boiled,is singular for the flux of the stomacke,proceeding of weakenesse. The very Mast or Acorne it selfe reduced into a liniment and applied,staieth the bloudie flix. And the same resisteth the venom of serpents stings,restraineth
D rheumes and catarrhes, and namely that flux of humors which causeth apostemations. As well the leaves,the mast or berries of this tree,as the barke or juice drawn from it,after boiling,are excellent against the poysons called in Greeke Toxica. The barke sodden and brought into a liniment with Cow milke,is very good to bee applied unto the place where serpents have bitten or stung: it is given also in wine for the bloudie flix.Of the same vertue & efficacie is the Holm-oke.

Chap. IIII.

Of the [Scarlet] graine of Holme-oke: of Gals and Misselto: of certaine little bals growing upon the Oke: of Mast: of the root of *Cerrus: and of Corke.

* The great Holme Oke.

E THe *Skarlet grain growing upon the Oke-holme,is very good to be laid unto fresh wounds with vinegre.It is applied with water for the flux of waterie humors unto the eyes: and dropped likewise into them when they be bloudshotten.Now there is a kind of it growing commonly in the region of Attica and throughout Natolia,which very quickly turneth to be a grub or maggot (whereupon it is called Scolecion) and is rejected,as being of no worth. Many more sorts there be of it,whereof the cheefe and principall I have shewed alreadie.

* *Coccum Ilicis*, our Kermes, or Kutchenel,as some thinke.

As touching the Gall-nuts,I have likewise made of it as many kinds: for some bee solide and massie,others full of holes,as if they were bored through. You shall have of them white,& black: some great,and others small: But how different soever they bee in substance,colour,or quantitie, they bee all of like nature.The best are those of Comagene.Gals are good to eat away the superF fluous excrescences in the bodie. They serve very well for the infirmities of the gums and Vvula; for the cankers and exulcerations breeding in the mouth.Beeing first burnt,and then quenched in wine,they are singular for the fluxes occasioned by a feeble stomacke.Applied in manner of a liniment,they helpe the bloudie flix.Incorporat in honey,they cure whitflawes,risings, and partings of the flesh and skin about the naile roots; the roughnesse of the nailes; the running skals and

and ulcers in the head: the knobs or ſwelling piles in the fundament, and in one word, all thoſe corroſive and eating ulcers, which conſume the fleſh to the very bone. Boiled in wine, and ſo inſtilled into the eares, they cure the infirmities of that part: So doe they likewiſe helpe the eyes, if they be annointed therwith. Applied with vinegre, they diſcuſſe phlegmaticke wheales and ſuch like breakings out, as alſo the flat biles & impoſtumes called Pani. The round kernill within them if it bee chewed, allaieth the toothach. The ſame is good to skin raw and galled places, and any burne or ſcalded place. Take unripe Gall-nuts, and drinke them with vinegre, they will conſume and weare away the ſwelled ſpleene. Burne the ſame, and quench them with ſalted vinegre; a fomentation thereof, ſtaieth the immoderat flux of womens fleurs, and reduceth the matrice (fallen downe) into the right place. All the ſort of theſe Gals do colour the haires of the head blacke. G

Concerning Miſſelto: That the principall and beſt is found upon the Oke, how it is cut, and in what manner birdlime is made therof, I have alreadie ſhewed. Some for to make the ſaid glew or birdlime, ſtampe Miſſelto firſt, and then ſeeth it in water, *untill it ſwim aloft. Others uſe to chew the graines or kernils onely which they beare, and ſpit out their outward pils or skins. But the very beſt is that, which hath no husk or skin at all: which alſo is the *ſmootheſt: without forth of a light tawnie or yellowiſh red: within, as greene as a leeke: for indeed, there is not a thing more glutinous or glewie than it. This Miſſelto is a great emollitive; for it ſofteneth, diſcuſſeth, and reſolveth alſo hard tumors: it is exiccative beſides, and drieth up the Scrophules or ſwelling kernils, knowne by the name of the Kings evill. If it be incorporat with roſin and wax, it mittigateth all ſorts of impoſtumes or flat biles whatſoever. Some put thereto Galbanum alſo, in equall quantitie or weight: and ſo uſe it in the ſame manner for to heale wounds. It polliſheth and maketh ſmooth the rough and uneven nailes, if it be laid too for ſeven daies, and the medicine not removed before: but the nailes ought to be well waſhed with Sal-nitre. Some obſerve certain ſuperſtitious ceremonies herein, and are of opinion, That it will worke the better and with more efficacie, in caſe it be gathered from the Oke, the firſt day of the new Moone; alſo if it be not cut downe with any bill, hooke, knife, or edged yron toole. Moreover, they doe hold, That if it touch not the ground, it cureth thoſe who are troubled with the falling ſickneſſe. Semblably, if women doe but carie it about them, it helpeth them to conceive. Finally, if it bee chewed and ſo applied unto ulcers, it is moſt effectuall to heale them perfectly. H I

Donec innatet. Some read *Donec nihil innatet:* that is, ſo long untill it ſettle all to the bottom, which may ſtand well with the firſt reading in this ſence, ſo long as it ſwimmeth aloft.
**Sæpiſſimum.*

As for the little round bals or apples found upon the Oke Robur, if they bee incorporat with Beares greaſe, they cauſe the haire to come thick againe, where it is ſhed, in caſe the bare or bald place be annointed therewith. K

Of the great Oke Holme Cerrus, thus much I have to ſay, That the leaves, the bark, and maſt thereof doe diſcuſſe and drie up all gathering of impoſtumations, even ſuch as grow to ſuppuration or mattering; and ſtay the flux of humors which feed them. A decoction thereof doth corroborat any member or part of the bodie which groweth to bee ſenceleſſe or benummed, if the ſame be fomented therewith. Alſo for to drie, bind, & confirme any part which is feeble & weake, it is ſingular good to ſit in a bath of this decoction. The root of this Cerrus is powerfull againſt the pricke of ſcorpions.

The barke of the Corke tree beaten into pouder and taken in hot water, is excellent for to repreſſe any flux of bloud, whether it bee upward or downeward. The aſhes of the ſaid barke given in wine hote, is greatly commended for the reaching and ſpitting of bloud. L

Chap. V.

Of the Beech and Cypreſſe trees. Of the great Cedars and their fruit called Cedrides: of Galbanum.

THe leaves of the Beech tree being chewed, doe much good to the gums and lips, in any accidents that befall unto them. The aſhes of Beech maſt is ſingular for the *ſtone, if it be applied as a liniment. The ſame alſo bringeth haire againe, when by occaſion of ſickneſſe it is ſhed and fallen away, if the place be annointed with it and honey together. M

Calculis. Some read *oculis*, *i.* eyes: others, *Callis*, *i.* hard knots or calloſities: and both to better ſence in mine opinion.

Cypreſſe tree leaves ſtamped and ſo applied, are a convenient remedie from the ſting of ſerpents. Alſo laid unto the head with dried groats of Barley, they eaſe the paine thereof, occaſioned by the heat of the Sunne. In like ſort, the ſame cataplaſme cureth ruptures. For which cauſe a drinke made of them is very good. A liniment alſo of Cypreſſe leaves and wax mingled together,

A ther, aſſuageth the ſwelling of the cods. Tempered with vinegre, they will make the haire cole blacke. Moreover, if they be ſtamped with two parts either of ſoft dough or the tender crums of bread, and ſo incorporat together with Amminean wine, they doe allay the paine of the feet or the ſinewes. The little bals or apples hanging upon Cypreſſe trees, are ſoveraigne for to be taken in drinke againſt the ſting of ſerpents, and for the caſting up of bloud out of the bodie. Brought into an ointment, they ſerve for the ſwellings or impoſtumes gathered to a place. Take them whiles they be young and tender, ſtamp them with Swines greaſe and Bean floure, they do much good to thoſe that are burſten: and for that purpoſe a drinke made of them, is paſſing effectuall. With ordinarie meale they ſerve in a cataplaſme to be applied upon the ſwelling kernils behind the eares, as alſo the Kings evill. There is a juice drawne out of theſe apples after they have beene
B ſtamped together with their graines or ſeed within: which if it bee mingled with oile, helpeth them to their cleare ſight againe, whoſe eyes are overcaſt with a web and dimmed. The ſame effect it hath if it be taken in wine to the weight of one Victoriat or halfe dram. But Cypreſſe Apples rid and cleanſed from their graines within, and reduced into a liniment with fat dried Figges, and ſo applied unto the cods, cure their infirmities, and namely, reſolve the tumors incident to thoſe parts: but incorporat with levaine, they diſpatch the Scrophules or Kings evill. The root and leaves punned together, and then taken in drinke, do comfort the bladder, and helpe ſuch as are diſeaſed with the ſtrangurie: they ſerve alſo againſt the pricke of the venomous ſpiders Phalangia. Their ſmall ſhavings or ſcrapings if a woman take in her drinke, procure her monethly termes, and are ſingular for the ſting of ſcorpions.

C The great Cedar, called by the Greekes Cedrelate, as one would ſay, the Fir-Cedre, yeeldeth a certaine pitch or parroſin named Cedria, a ſingular medicine for the toothach; for it breaketh them, fetcheth them out of the head and eaſeth all their paine. As touching the liquor that runneth from the Cedar, and the manner how it is made, I have written alreadie. This *kind of pitch were excellent for the eyes but for one diſcommoditie, in that it cauſeth headach. It preſerveth dead bodies from corruption, a world of yeares: contrariwiſe, living bodies it doth putrifie and corrupt: A ſtrange and wonderfull propertie, thus to mortifie the quicke, and quicken (as it were)
2 the dead. It marreth and rotteth apparell, as well linnen as woollen: and it killeth all living creatures. And therefore I would not adviſe as ſome have done, to taſt this medicine and take it inwardly for the Squinancie or crudities of the ſtomacke: neither would I be bold, but fear rather,
D to preſcribe it in a collution with vinegre to waſh the mouth withall for the toothach, or to drop it into their eares who be hard of hearing or otherwiſe have vermine within them. But a monſtrous and beaſtly thing it is which ſome report of it, That if a man doe annoint therewith the inſtrument or part ſerving for generation, at what time as he is minded to know a woman carnally, it will bring her to an *abortive ſlip, if ſhe were conceived before; or hinder conception, if ſhe were cleare. Howbeit, I would not make doubt to annoint therewith the head and other parts, for to kill lice, or to rid away the skurfe and skalie dandruffe among the haire, either in head or face. Some give counſell for to drinke it in ſweet wine cuit, unto them who are poyſoned with the ſea-Hare. For mine owne part, I hold it a ſafer way and an eaſier to annoint therwith the leproſie. But
E ſome of the foreſaid authours have applied it to filthie, putrified, and ſtinking ulcers, and the excreſcences therein: as alſo to rub or annoint therewith the eyes againſt the pin and web, & ſuch accidents as dim and darken the ſight. Moreover, they have preſcribed to drinke a cyath of it for to cure the ulcer of the lungs, and to expell wormes and vermine out of the bellie. Of this pitch or roſin there is an oile made, which they call Piſſelæon, and the ſame is farre more ſtrong in operation for all the infirmities abovenamed, than the ſimple roſin it ſelfe. Certaine it is, that the fine duſt ſcraped or filed from the Cedar wood, chaſeth away ſerpents: ſo doe the Berries alſo of the Cedar beaten to pouder and reduced with oile into a liniment, in caſe a man annoint his bodie all over with the ſame.

As touching Cedrides, that is to ſay, the fruit of the Cedar, it is ſoveraign for the cough and
F provoketh urine, bindeth the bellie, & healeth ruptures. It cureth ſpaſms, convulſions or cramps: yea, and helpeth the infirmities of the matrice, if it *be applied accordingly. Alſo it is a countrepoyſon againſt the venomous ſea-Hare: and a medicine for other maladies abovenamed, and namely for apoſtemes and inflammations.

Of Galbanum I have written heretofore. Good Galbanum ſhould be neither moiſt nor drie but ſuch in all reſpects as I have deſcribed alreadie. Beeing taken of it ſelfe alone in drinke, it cureth

*Cedrium.

* *Abortum fieri. Græcorum φθόριον ἢ ἀπόκιον.*

* *Admoti.* Some read *poti*, i. take in drinke.

reth an inveterat cough, ſhortneſſe, and difficultie of wind, ruptures, crampes and convulſions. G
Outwardly applied, it is ſingular for the Sciatica, pleuriſie, or paines of the ſide, angrie biles and
fellons. It is good alſo to bee uſed, in caſe the fleſh (corrupted by meanes of corroſive ulcers, as
wolves and ſuch other) is departed and eaten from the bone: moreover, for the wens called Scro-
phules or the Kings evill: the knots and nodoſities growing upon the joints: and the tooth-ach:
it ſerveth alſo in a liniment with honey for to annoint skald heads. With oile of Roſes or with
Nard, it is good to be infuſed or dropped into ears that run with matter. The very perfume alone
or ſmell thereof is good to raiſe them who are taken with the epilepſie or falling ſickneſſe: alſo
to recover women, lying (as it were) in a trance or dead, upon a fit of the mother: & to bring them
again who are gone in a ſwoune. If a woman fall to travaile before her time, it is good to fetch out
that untimely fruit of hers (if it be loth to come away) either by way of cataplaſme or ſuffumigati- H
on. The ſame effect it hath, if the braunches or ſmall roots of Ellebore bee well annointed there-
with, and ſo put up as a peſſarie. The ſmoke of it frying in the fire (as I ſaid before) driveth ſerpents
away: and more than ſo, ſerpents will not come neare unto them that are beſmeared with Galba-
num. And ſay that one be ſtrucken with a ſcorpion, a plaſtre of Galbanum will heale the wound.
If a woman have been long in labour of childbirth, and cannot be delivered, let her drink in one
cyath of wine, as much Galbanum as the quantitie of a Beane, ſhe ſhall fall to her buſineſſe and
be delivered anone. The ſame is a good medicine to reduce the mother into the right place, if it
be unſetled or turned. If Galbanum be taken in wine with Myrrhe, it ſendeth out the dead infant
in the mothers wombe. Alſo with Myrrhe and *wine, it is good againſt all poyſons, and eſpecial- I
ly thoſe which be called Toxica. Incorporat Galbanum with oile and *Spondylium together, it
will kill any ſerpents, if they be but touched therewith. Howbeit, there is an opinion of Galba-
num, that *in difficultie of urine it is not good to be uſed.

* *Vino.* Rather *aceto, i.* vineger, after *Dioſcor.*
* Cow-Parſnep or Madnepe.
* *Dioſcorides* reporteth the contrarie.

Chap. vi.

Of Gum Ammoniacke: of Storax: Spondylium: Spagnos: Terebinth: Chamapitys: of Pityuſa: of Roſius: of the Pitch tree: and the Lentiske.

Since we are fallen into the mention of Gums, it will not be amiſſe to treat of Ammoniacke; being as it is ſo like in nature (as I have ſaid) to Galbanum: for it hath vertue to mollifie, to heat, diſcuſſe, and diſſolve. Vſed in collyries, it is a proper medicine to clarifie the eyeſight: K
and ſerveth well to take away the itch, the ſpots or cicatrices, the pin and web alſo of the eyes. It allaieth the toothach, but more effectually, if it be ſet a burning, and the fume received into the mouth. Taken in drinke, it helpeth thoſe who hardly fetch and deliver their wind. It cureth the pleuriſie, Peripneumon or inflammation of the lungs, the infirmities of the bladder, piſſing of bloud, the ſwelled ſpleene, and the Sciatica. And in that manner it eaſeth the bellie, and maketh it ſoluble. Boiled with the like weight of pitch or wax and oile roſat together, and ſo reduced into an ointment, it is good for all gouts, and eſpecially that which lieth in the feet. It ripeneth the biles called Pani, if it be applied to them with honey: and fetcheth away any cornes by the roots. In which ſort it doth ſoften any hardneſſe. Incorporat with vinegre and Cyprian wax, or els with oile roſat, it maketh an excellent plaſtre for to mollifie the hard ſpleene. Moreover, if it be redu- L
ced into an ointment with vinegre, oile, and a little ſal-nitre, it is ſingular to annoint thoſe that have a laſſitude or wearineſſe upon them.

Touching Storax and the nature thereof, I have ſaid ynough in my Treatiſe of ſtraunge and forraine trees. But over and above the qualities or properties before required, I take that for the beſt Storax, which is fatteſt, pure, and cleane, and whereof the peeces or fragments doe breake white. This drug cureth the cough, the ſoreneſſe of the throat, and the accidents of the breaſt: it openeth the obſtructions of the matrice, and mollifieth the hardneſſe thereof. Whether it be taken inwardly in drinke, or outwardly applied, it provoketh womens fleurs, & moveth to the ſeege. I read in ſome authors, that if one doe drinke Storax Calamita, in ſmall quantitie, it will procure gladneſſe and mirth of heart: but if it be taken in greater quantitie, it breedeth heavineſſe of the M
mind. Inſtilled or poured into the eares, it riddeth away all the ſinging therein: and in a liniment it reſolveth the wens called the Kings evill, and the nodoſities of the ſinews. Soveraign it is againſt thoſe poyſons which hurt by meanes of their coldneſſe, and therefore it is good for them that have drunke the juice of Hemlocke.

Likewiſe

A Likewiſe of Spondylium, a kind of wild Parſnep or Madnep, I have ſpoken thereof heretofore, togither with Storax. An embrachotion made of it, to be infuſed upon the head, is excellent for ſuch as be in a frenſie or lethargie: alſo to cure the inveterat pains of the head. Taken in drinke with old oile, it helpeth the infirmities of the liver, the jaundiſe, the falling ſickneſſe, the ſtreightneſſe of breath (whereby one cannot take his wind but ſitting upright) and the riſing or ſuffocation of the mother; in which caſes, a ſuffumigation thereof is good. This Spondylium is effectuall to mollifie the belly, and make the bodie ſoluble. Reduced into a liniment with rue, it ſerveth fitly to be applied unto ulcers that ſpread and eat as they goe. The juice of the flours is of great effect, if it be poured into the ears that run with filthie matter: but when this juice is a preſſing or drawing forth, it had need to be kept well covered, for feare of flies and ſuch like, which
B are very greedie thereof, and love a-life to ſettle upon it. The root of Spondylium, or a peece thereof ſcraped, if it be put in manner of a tent into a fiſtula, eateth away all the hardneſſe and calloſitie thereof. Being dropped into the eares, togither with the juice, it is exceeding good for them. The root given alone in ſubſtance, cureth the jaundiſe, the infirmities of the liver and matrice. If the head be all over annointed therewith, the haire will curle and frizle.

Concerning the ſweet Moſſe, called of the Greeks * Sphagnos, Sphacos, or Bryon, growing (as I have ſhewed before) in Fraunce, it is good for the naturall parts of women to ſit over the decoction of it, in manner of a bath: likewiſe if it be mingled with creſſes, and ſo ſtamped togither in ſalt water, it ſerveth well to be applied as a cataplaſme to the knees and thighs for any tumors or ſwellings in thoſe parts. Taken in wine with drie per-roſin, it cauſeth one moſt ſpeedily
C to make water. Stamped with juniper, and drunke with wine, it doth evacuat the aquoſities in the dropſie. * *Vſnea.*

The leaves and the root of the Terebinth tree, applied in forme of a cataplaſme, are good for the collection of humors to an impoſtumation. A decoction made with them, doth comfort and fortifie the ſtomacke. In caſe of head-ach, of ſtopping and difficultie of urine, it is paſſing good to drinke the ſeed or grains of the Terebinth tree in wine. The ſame gently eaſeth and ſofteneth the belly; it provoketh alſo carnall luſt. The leaves of the * Pitch tree and * Larch tree bruiſed and ſodden in vinegre, doe eaſe the tooth-ach, if the mouth be waſhed with the decoction. The aſhes made of their barks, skin the places that be chafed, fretted, and galled between the thighs; and heale any burne or ſcald. Taken in drinke, they bind the belly, but open the paſſages of the
D urine. A perfume or ſuffumigation therof, doth ſettle the matrice, when it is looſe and out of the right place. But to write more diſtinctly of theſe two trees; The leaves of the Pitch tree have a particular propertie reſpective to the liver, and the infirmities thereof, if one take a dram weight of them and drinke it in mead or honyed water. It is well known and reſolved upon, That to take the aire of thoſe woods and foreſts only where theſe trees be cut, launced, and ſcraped, for to draw pitch and roſin out of them, is without all compariſon the beſt courſe which they can take who either be in a conſumption of the lungs, or after ſome long and languiſhing ſickneſſe, have much adoe to recover their ſtrength. Certes, ſuch an aire is far better, than either to make a long voiage by ſea into *Ægypt, or to go among the cottages in ſummer time for to drinke new milke comming of the freſh and greene graſſe of the mountains. * *Picea.* * *Laricij.* It ſeemeth that *Plinie* tooke πίτυν, which is the Pine, for *Picea*; and πίτυς, which is the Pitch tree, for *Larix*. * *i.* Into a more groſſe aire.

E As for Chamæpitys, it is named in Latine by ſome Abiga, for that it cauſeth women to ſlip their conception before time: of others, *Thus terræ*, [*i.* ground Frankincenſe:] This hearbe putteth forth braunches a cubit long; and both in floure and ſavour reſembleth the *Pine tree. A ſecond kind there is of Chamæpitys, lower than the other, ſeeming as though it bended and ſtooped downward to the ground. There is alſo a third ſort, of the ſame odour that the reſt, and therefore ſo named. This laſt Chamæpitys, riſeth up with a little ſtalke or ſtem of a finger thickneſſe; it beareth rough, ſmall, ſlender, & white leaves; and it groweth commonly among rocks. All theſe three be hearbs in deed and no other, and ſhould not be raunged among trees: yet for names ſake, becauſe they carrie the denomination of Pitys, [*i.* the Pitch tree] I was induced the rather to treat of them in this preſent place, & to ſtay no longer. Soveraigne they be all againſt
F the pricks or ſtings of ſcorpions: applied in manner of a liniment, with dates or quinces, they be holeſome for the liver: their decoction, togither with barley meale, is good for the infirmities of reins and bladder. Alſo the decoction of theſe hearbs boiled in water, helpeth the jaundiſe and the difficultie of urine, if the Patient drinke thereof. The third kind laſt named, taken with hony, is ſingular againſt the poiſon of ſerpents: and in that maner only applied as a cataplaſme, * Or rather, the Pitch tree.

it cleanſeth the matrice & naturall parts of women. If one drinke the ſame hearbe, it will diſſolve and remoove the cluttered thick bloud within the bodie: it provoketh ſweat, if the bodie be therwith annointed; and it is eſpecially good for the reins. Being reduced into pils, togither with figs, it is paſſing holeſome for thoſe that be in a dropſie; for it purgeth the belly of wateriſh humors. If this hearbe be taken in wine to the weight of a victoriat peece of ſilver, *i.* halfe a Romane denier, it wariſheth for ever the paine of the loins, and ſtoppeth the courſe of a new cough. Finally, if it be boiled in vinegre, and ſo taken in drinke, it is ſaid that it will preſently expell the dead infant out of the mothers wombe. G

For the like cauſe and reaſon, I will do the hearbe Pityuſa this honour as to write of it among trees, ſince that it ſeemeth by the name to come from the Pitch tree: this plant ſome doe reckon among the * Tithymals: a kind of ſhrub it is, like unto the Pitch tree, with a ſmall floure, and the ſame of purple colour. If one drinke the decoction of the root, to the quantitie of one hemina, it purgeth downward both fleame and choller: ſo doth a ſpoonfull of the ſeed therof, put up into the bodie * by ſuppoſitories. The decoction of the leaves in vinegre, doth cleanſe the skin of dandruffe and ſcalls: and if the decoction of rue be mingled therwith, it is ſingular for ſore breſts, to appeaſe the wrings and torments of the cholique, againſt the ſting of ſerpents, and generally for to diſcuſſe and reſolve all apoſtemations and botches a breeding. H

* *i.* Spurges.

* *In balanis*: unleſſe wee reàd, *cum Phœnicobalanis*, *i.* a kind of Date, as ſome thinke, Tamarinds.

But to returne againe to our former trees; how roſin is engendred in them, of their ſeverall kinds, and the countries where they grow, I have ſhewed before, firſt in the treatiſe of Wines, and afterwards in the diſcourſe and hiſtories of Trees. And to ſpeake ſummarily of roſins, they may be divided into two principall kinds, to wit, the drie and the liquid roſin. The drie is made of the Pine and the Pitch trees; the liquid commeth from the Terebinth, Larch, Lentiske, & Cypreſſe trees; for theſe beare roſin in Aſia and Syria: and wheras ſome there be of opinion, That the roſins of the Pitch and Larch trees be all one, they be much deceived; for the Pitch tree yeeldeth a fattie roſin, and in manner of frankincenſe, unctuous: but from the Larch tree there iſſueth * a ſubtile and thin liquor, running like to life honey, of a ſtrong and ranke unpleaſant ſmell. Phyſicians ſeldome uſe any of theſe liquid roſins, and never preſcribe them but to be taken or ſupped off with an egg. As for that of the Larch tree, they give it for the cough and exulceration of ſome noble parts within: neither is that per-roſin of the Pine tree much uſed: as for the reſt, they be not of any uſe unleſſe they be boiled. Touching the divers manners of boiling them, I have ſhewed them ſufficiently. I

* Which is thought to be our Terpentine.

But if I ſhould put a difference betweene theſe roſins according to the trees from whence they come; the right Terpentine in deed which the Terebinth yeeldeth, liketh and pleaſeth me beſt, being of all others lighteſt and moſt odoriferous. If I ſhould make choice of them in regard of the countries where they are found; certes they of Cypreſſe and Syria be beſt, and namely thoſe that in colour reſemble Atticke honey: and for the Cyprian roſin, that which is of a more fleſhie ſubſtance and drier conſiſtence. Of the drie per-roſins, thoſe are in moſt requeſt, which be white, pure, tranſparent or cleere, quite through. In generall, thoſe that come from trees growing upon mountains, be preferred before them of the plains: alſo regarding the Northeaſt, rather than any other wind. For ſalves to heale wounds, as alſo for emollitive plaſters, roſins ought to be diſſolved in oile: for drinks or potions, with bitter almonds. As touching their medicinable vertues, they be good to cleanſe and cloſe up wounds: to diſcuſſe and reſolve any apoſtemes which be in gathering. Moreover, they be uſed in the diſeaſes of the breaſt (and namely true Terpentine) by way of liniment; for then it is ſingular good, eſpecially if it be applied hot: alſo for the pains of the lims, and for thoſe that be plucked with the crampe, in caſe the grieved parts be well rubbed therewith in the ſun; which they know well enough who buy ſlaves and ſell them for gaine, after they have trimmed and ſet them out for ſale: for they eſpecially are very curious to annoint their bodies all over with this Terpentine, for to looſen the skin when they bee hidebound, lanke, and carrion leane, to give more libertie and ſpace for every part to receive nutriment, and ſo to make their bodies ſeeme fat and faire liking. Next unto the right Terpentine, is the roſin of the Lentiske tree: this hath an aſtringent or binding qualitie; but of all others it provoketh urine moſt: all the reſt doe mollifie the belly and make it ſoluble, concoct and digeſt all crudities, ſtent the inveterat cough, and draw downe all the ſuperfluous burdens of the matrice: for which purpoſe laſt named, their fume received by a ſuffumigation, is very effectuall. They are more particularly as good as a countrepoiſon againſt the venomous gum Ixia, growing upon K L M

A the plant Chamæleon. Incorporat with bulls tallow and honey, they cure the biles called Pani, and ſuch riſings in the fleſh. The Lentiske roſin, is ſingular good for to lay even and ſtreight the haires of the eyelids when they grow into the eyes. In fractures and broken bones, it is moſt neceſſary; as alſo for the ears running with filthie matter: likewiſe to kill the itch in the privie members. Finally, the per-roſin of the Pine tree, is a moſt ſoveraigne medicine to cure all the wounds of the head.

Chap. VII.

Of Stone-pitch: of Tarre: of Pitch twice boiled: of Piſſaſphalt or Mummie: of Zopiſſa: of Torch-wood, and the Lentiske.

B FRom what tree Pitch commeth, and the ſundrie wayes of making it, I have declared heretofore: alſo that there be two principall kinds thereof, to wit, the thicke or faſt Pitch, and the thin or liquid: of the former ſort, the beſt for uſe in Phyſicke is the Brutian Pitch; for that (being of all others fattieſt and fulleſt of gum) it yeeldeth a twofold commoditie both for medicines, and alſo to trim and roſin wine-veſſels: for which purpoſes, that which enclineth to a reddiſh yellow is counted the chiefe. But wheras ſome do ſay moreover, that the better Pitch commeth from the male tree, I cannot conceive what they ſhould meane therby, neither do I thinke it poſſible to diſcerne any ſuch difference. True it is, that Pitch by nature is hot, and a good incarnative: a ſpeciall and particular propertie it hath againſt the venom inflicted by the ſting or
C tooth of the horned ſerpent Ceraſtes, if it bee made into a cataplaſme with fried barley groats; and being applied with honey, it healeth the ſquinancie, cureth catarrhs, and reſtreineth ſneezing: with oile of roſes, it ſerveth well to be poured into running ears, out of which there doth ooſe filthie matter: or being applied in manner of a liniment with wax, it is paſſing good: it healeth the illfavoured tettars called Lichenes, and it looſeneth the belly: licked or let downe leiſurely in maner of a loch, it is a good means to void and reach up from the breaſt, tough fleame: and to annoint the tonſils or almonds in the mouth with it and honey togither, is a proper medicine: being in that manner prepared and uſed, it cleanſeth ulcers: and if it be incorporat with raiſins and ſwines greaſe, it doth incarnat and fill them up againe with new fleſh: carbuncles alſo it doth mundifie; ſo doth it ſores that begin to putrifie and gather corruption: but if they be ſuch
D as ſpread & be corroſive withall, then there would be an addition of the Pine tree barke, or brimſtone. Some have preſcribed, for the conſumption of the lungs, and a cough of long continuance, to drinke the quantitie of one cyath in Pitch. The fiſſures & chaps as well about the ſeat as in the feet, it cureth: for the flat biles named Pani, it is very good: as alſo to take away the rough nails that be ſo troubleſome. The very odour or perfume thereof, helpeth the hardneſſe of the matrice; and ſetleth it againe, being either falne downe, or turned out of the due place: likewiſe it helpeth ſuch as be ſurprized with the lethargie. Moreover, if it be boiled in the urine of a yong boy under fourteen years of age with barly meale, it is a good maturative, and bringeth the wens called the Kings evill to ſuppuration. As for drie Pitch or ſtone Pitch, it helpeth much to make the haire grow againe, where it is ſhed by ſome diſeaſe. The Pitch called Brutia, or of Calabria,
E boiled in wine to a waulme or two, with the fine floure of the bearded wheat Far, and ſo applied in a cataplaſme as hot as may bee ſuffered, is ſingular good for womens paps. Concerning liquid Pitch or Tar, as alſo the oile which they call Piſſelæon, and how it is made, I have alreadie written at large. Some boile it a ſecond time, and then they name it Palimpiſſa. With this liquid Pitch it is good to anoint the ſquinzie that groweth inwardly; as alſo the uvula within the mouth. The ſame is ſingular for the paine in the ears, to clarifie the ſight, to cleanſe the mouth furred as it were, ſo as it hath no taſt of meat: likewiſe for thoſe who are ſhort winded: for women who are diſeaſed in their matrice: to ripen & rid away old coughs; and to eaſe them that can do nothing but ſpit and reach out of the cheſt: for ſpaſmes, cramps, ſhaking, and trembling: moreover, it
F helpeth them whoſe heads or bodies are drawne backward: it cureth palſies, and any paines or griefs of the ſinews. There is not a better thing to kill either the mange in dogs, or the ſcab and tarcines in horſes, aſſes, and ſuch like travailing beaſts.

Moreover, as touching Piſſaſphalt, which is of a mixt nature, as if Pitch and Bitumen were mingled togither, it groweth naturally ſo, in the territorie of the Apolloniats: yet ſome there be who make an artificiall Piſſaſphalt, and meddle the one with the other, and hold it for a remedie

to cure the fatcins and ſcabs of cattaile; as alſo when the young ſucklings doe hurt the teats of their dams. Of this kind, that is beſt which is of it ſelfe, and come to maturitie and perfection: the ſame in boiling ſwimmeth aloft. * Zopiſſa; is that Pitch, which (as I ſaid heretofore) is ſcraped from ſhips, and is confected of wax well ſoked in the ſalt water of the ſea: the beſt is that which commeth from ſhips that have been at ſea and made ſome voiages: it goeth into emollitive plaſtres, for to reſolve the gathering of impoſtumes. As for Tæda or Torch-wood, if it be ſodden in vinegre, it maketh a ſingular collution for to waſh the teeth withall when they ake.

*Pix navalis.

Let us come now to the Lentiske tree: The wood, the ſeed or fruit, the barke and gum therof, doe provoke urine, and bind the belly: a fomentation made with their decoction, is excellent good for eating and corroſive ulcers: it ſerveth in a liniment for all ſores in moiſt and phlegmatick parts: likewiſe to cure S. *Anthonies* fire, and to waſh the gumbs withall: chew the leaves therof and cruſh them well between the teeth, the ſame will eaſe their ach: waſh them with their decoction, and they will ſet them faſt in the head. The ſame are good to colour the haire blacke. The gum which this tree doth yeeld, is ſovetaigne for the infirmities of the ſeat, eſpecially ſuch as require either drying or heating. The very decoction of Maſticke is comfortable to the ſtomacke, it cauſeth it to rift, and is beſides diuretical. Applied unto the head as a liniment, incorporat with the fried groats of barley, it cureth the ach or paine thereof. The tender leaves be applied to right good purpoſe, for the inflammation of the eyes. Moreover, this Maſtich, which is the gum of the Lentiske tree, is uſed ordinarily to lay the hairs of the eyelids even, and to extend or make plaine and ſmooth the riveled skin of the face: therefore it is uſed in ſope, and waſh-bals. Moreover, there is good uſe thereof, for ſpitting and reaching up of bloud, & for an old cough. In one word, it ſerveth all thoſe turns whereto the gum Ammoniacke is uſed. It healeth all places galled and chaufed, where the skin is rubbed or fretted off; and if the cods and members of generation be fomented either with the oile made of the ſeed of the maſtich tree mixed with wax, or with a decoction of the leaves boiled in oile or els in water, it will skin any raw part therof. To knit up this diſcourſe, I am not ignorant that *Democritus* the Phyſician, who had in cure *Conſidia* the daughter of *M. Servilius* late Conſull of Rome, for an *infirmitie or maladie of hers, (for that this damoſell could not abide to heare of any unpleaſant Phyſicke) cauſed her to be fed a long time with the milke of goats which were kept with the Lentiske tree leaves, and did eat nothing elſe, and ſo he cured her of her maladie.

* It ſhould ſeeme the ulcer of the lũgs or kidnies, or els ſome outragious flux of bloud.

Chap. viii.

Of the Plane tree, the Aſh, and Maple: of the white Poplar and Elme, the Tillet or Linden tree, the Elder, and the Iuniper.

THe Plane tree is an enemie to Bats or Reremice: their little balls which they beare, if they be taken to the weight of foure Romane deniers in wine, doe cure all poiſons of ſerpents and ſcorpions: likewiſe they heale any burn. Being braied or ſtamped with ſtrong & ſharp vinegre (which if it be Squilliticum is the better) they ſtaunch any bleeding whatſoever. Incorporat in honey, they mundifie and cleanſe all cancerous ulcers, the red pimples and ſpecks, with all blacke ſpots and marks in the skin which have remained a long time. The leaves and barke reduced into a liniment, their decoction alſo, helpe to rid away any gathering of humors to an head, and namely if they matter and run. The decoction of the barke ſodden in vinegre, is a ſingular remedie for the tooth-ach; like as the tendreſt leaves boiled in white wine, for the infirmities of the eyen. The aſhes which come of the foreſaid little balls, doe heale up any burne, occaſioned either by fire or extreame cold. The barke taken in wine, repreſſeth the venome of the ſcorpions ſting, ſo that it ſhall goe no farther.

As touching the Aſh tree, of what effectuall operation it is againſt ſerpents, I have declared heretofore: it beareth a * ſeed encloſed within certaine * cods, which being taken in wine, is an ordinarie remedie for the obſtructions and infirmities of the liver; as alſo for the pain in the ſides. The ſame alſo doe evacuat the aquoſities or wateriſh humours ſpread between the skin and the fleſh in the dropſie Leucophlegmatia. The leaves do take down by little and little and make lean a bodie over-groſſe, and doe eaſe it of the troubleſome carriage that it hath of ſo much fat, if the ſame be ſtamped and given in wine: but herein good regard ought to be had of the ſtrength of the partie, after this proportion: If it be a child, five leaves of the Aſh are ſufficient to be infuſed

* Called *Lingua avis.*
* Which are named Keyes.

in

A in three cyaths of wine; but elder folke and of a ſtronger complexion, may abide ſeven well
7 enough in five cyaths, and drinke the infuſion. But before I doe leave this tree, it would not be forgotten that the ſmall chips and ſhavings, yea and the ſaw-duſt or filed powder of this wood, are thought to be hurtfull unto ſome, and they are forbidden to meddle withall. The root of the Maple tree, ſtamped into a cataplaſme, is ſingular to bee applied for the griefs of the liver, and worketh mightily.

As touching the white Poplar or the trembling Aſpe, I have ſhewed heretofore how the perfumers uſe the berries or * grapes thereof in their ſweet ointments. The barke infuſed and taken in drinke, is good for the ſciatica and the ſtrangurie. The juice drawne out of the leaves, dropped hot into the ears, eaſeth their paine. Whoſoever carrieth a twig of Poplar in their hands,
B ſhall not need to feare any ſurbating of the feet, or galling between the legs. The beſt black Poplar and of greateſt operation in Phyſicke, is that reputed which groweth in the Iſland Creta; the fruit or graine thereof if it be drunke in wine, is ſingular for thoſe who be taken with the falling ſickneſſe. This Poplar yeeldeth a certaine ſmall gum or roſin, which is much uſed by Phyſicians in emollitive plaſters: the leaves ſodden in vinegre, make a proper cataplaſme to be ap-
3 plied unto the gout: the liquor or humor that iſſueth out of the pores or concavities of the black Poplar, taketh away werts and wheals; it skinneth alſo galled and raw places in any part of the bodie. Theſe Poplars as well white as blacke, beare upon their leaves certain werts like to drops of water ſtanding upon them, out of which the Bees doe gather that cereous ſubſtance named Propolis. The drops alſo of water, which the ſaid Propolis doth yeeld, if they be mingled with water,
C is a very effectuall remedie for many things.

Now for the Elme: the leaves, the barke, and the woodie ſubſtance of the braunches, have a glutinous nature to conſolidat, unite, and heale wounds: the thinner rind or tunicle verely which lieth between the outward barke and the tree, doth aſſuage the leproſie, called of ſome S. *Magnus* evill: ſo doe the leaves alſo, applied with vinegre. The barke of the Elme pulverized and taken to the weight of a Roman denier in one hemine of cold water, is a very purgative, and doth evacuat
2 flegmaticke and wateriſh humors particularly. The liquor that iſſueth from the tree as a jelly, is ſingular good for apoſtemations, wounds, and burns; but if the places were fomented before with the decoction, it would be the better. The Elme beareth certain ſmall bladders or husks, wherin there is engendred and contained a wateriſh humor, which is very proper to embeliſh the skin,
D and beautifie the face. The firſt tender ſprouts of the leaves boiled in wine, do aſſuage all tumors, and * draw filthie matter and corruption foorth of fiſtulous ſores: the ſame doe the inward thin rinds within the barke. Many are of opinion, That the very barke chewed onely, and applied to
2 greene wounds, is ſingular good to heale them. They affirme moreover, That the leaves bruiſed and applied to the feet, allay their ſwelling, ſo there be water ſprinckled among. Furthermore, the watet or liquor which runneth from the heart or pith of the wood when the tree is lopped or disbraunched (as I have ſaid before) if the head bee annointed or bathed withall, cauſeth the haire to grow againe if it be loſt, and keepeth it on if it be readie to ſhed and fall.

As touching the Tillet or Linden tree, the very wood thereof is uſed for all things in a manner that the wild olive is emploied unto, if the ſame be lightly bruiſed or ſtamped: howbeit, the
E leaves only are occupied; which, if they be chewed and ſo applied, doe cure the cankers breeding in the mouth of ſmall infants. Beeing boiled and their decoction inwardly taken, they provoke urine: outwardly applied, they doe ſtay the inordinat and exceſſive flux of womens fleures; but given in drinke, they evacuat the ſame ſuperfluous bloud.

There is a ſecond kind of Elder more wild of nature, which ſome of the Greeke writers call * Chamæacte, others Helion, and it groweth much lower than the other. The decoction of the leaves as well of Walwoort as Elder, boiled in old wine, is contrarie and noiſome to the ſtomacke, and purgeth downward waterie humors: even ſo doth the decoction either of the ſeed or the root, if it be taken inwardly to the quantitie of two cyaths: the ſame is excellent to coole any inflammation, and namely, to take out the fire of any new burne or ſcald. The young and
F tender leaves, as well of Elder as Wallwort, reduced into a cataplaſme and laid too with barley groats, doe cure the biting of a dogge. The juice both of the one and the other, infuſed and conveyed accordingly into the head, is a ſoveraigne lenitive for all impoſtumes of the braine, and eſpecially thoſe which are growing in the fine membrane or pellicle called Pia Mater, which immediatly lappeth and enfoldeth the braine. The fruit or berries either of the Elder or

* And yet heretofore he ſaith, that it hath neither the one nor the other.

* *Extrahúntque pus fiſtulis.*

* *i.* Ground-Elder, Wall-wort, or Dane-wort.

of Walwoort, are weaker in operation than the other parts of the tree or plant: howbeit, they G
ſerve well to colour the haire of the head blacke. The ſame alſo taken in drinke, to the meaſure of one acetable, be diureticall and provoke urine. The ſofteſt and tendereſt leaves are eaten ordinarily in a ſalad with oile and ſalt, for to purge fleame and choller. In ſum, the leſſer plant, which is the Wallwort, is in all things more effectuall than the elder it ſelfe; for if the root thereof be ſodden, and a draught of two cyaths be given to them who are in a dropſie, it will purge mightily and evacuat waterie humors. A decoction of the roots and leaves of Danewort, is ſingular to mollifie the matrice and naturall parts of a woman, if ſhe ſit over the ſame and take the vapor thereof into her bodie. The tender ſprigs of the milder Elder, boiled between two platters, doe make the bodie ſoluble, and move to the ſeege. The leaves drunke in wine, reſiſt and kill the poiſoned ſting of ſerpents. The tendrons of the Elder, incorporat with goats tallow, and reduced H
into a liniment, are ſingular good for the gout, if they be applied to the grieved place. The water of their infuſion, if it be caſt or ſprinkled in any roume of the houſe, killeth fleas: and if the place be likewiſe ſprinkled with the decoction of the leaves, it will not leave a flie alive. There is a kind of diſeaſe [much like to purples or meazles] when the bodie is bepainted all over with red bliſters: a braunch of the Elder tree is excellent good to laſh the ſaid wheals or riſings, for to make them fall againe and go downe. Take the inner barke or rind of the Elder, beat it into powder, and ſo drinke it in white wine, it is a ſufficient purgation.

The Iuniper of all other trees, paſſeth, either for to heat any part, or to extenuat and make ſubtile any humors: in operation much like to the Cedar. Of it there be two kinds; the greater, and the leſſe: a perfume made with the one as well as the other, driveth away ſerpents. The ſeed I
or berries of Iuniper, aſſuage the pains of ſtomacke, breaſt, and ſides: the ſame ſerve well to breake wind and reſolve all ventoſities, yea and to evaporat all cold and chilneſſe: they ripen any cough, and mollifie all hardneſſe: a liniment made therof applied outwardly, cauſeth any tumor to goe down, and repreſſeth the riſing thereof: likewiſe if the berries be drunke in ſome groſſe or thicke red wine, it will ſtay a laske: like as they will abate the ſwelling of the belly, if they be laid too by way of a cataplaſme or liniment. The Iuniper berrie is reckoned among the ingredients
* Oxyporis, which goe into antidots, or preſervatives againſt poiſon; ſuch I meane, as be * penetrative and of quicke operation. It is diureticall and mooveth urine. In caſe the eyes doe water much by reaſon of a continuall rhewme taking to them, it is good to apply a liniment unto them made therewith. Foure Iuniper berries are given in white wine, or twentie of them boiled in wine, for K
convulſions, cramps, ruptures, wrings, and torments in the bellie, for the grieſes of the matrice and the Sciatica. To conclude, ſome there be, who fearing to be ſtung with ſerpents, uſe ordinarily to rub or annoint their bodies with a liniment made of Iuniper ſeed or berries.

Chap. ix.

Of the Sallow, Willow, or Withie: of the twig Withie or Oiſier Amerina. Of twigs or binding rods. Of Heath or Lings.

THe fruit which the Willow or Sallow yeeldeth, if it be ſuffered to hang, before it doth ripen is converted into a certaine ſubſtance reſembling a cobweb; but beeing gathered ere it be L
thus transformed, it is ſingular good for ſuch as reach or caſt up bloud. The aſhes of the rind pilled from the firſt braunches that the willow putteth foorth, and tempered with water, taketh away corns and calloſities of the feet: they ſerve alſo to rid the ſpots and ſpecks which diſfigure the viſage, the rather if they be incorporat with the juice of the willow. Now there be found in the ſaid willow, three ſorts of juice: The firſt ſweateth out of the tree it ſelfe in manner of a gum: the ſecond iſſueth forth by way of inciſion, when the tree is in the bloum; provided alwais that the cut or gaſh in the barke, bee made three fingers broad: this liquor is ſingular good to cleanſe the eies, and to rid away ſuch impediments as hinder the ſight; likewiſe to incraſſat or thicken where need requireth; to provoke urine, and draw forth all inward impoſtumes outwardly: the third juice is that which diſtilleth from the braunches preſently after the bill or cutting- M
hooke, when the tree is lopped, or the boughs cut from the bodie. Take any one of theſe juices, and heat the ſame well with oile of roſes in the rind of a pomegranat, excellent it is for to bee dropped into the ears: likewiſe the decoction of Sallows, or the leaves ſtamped and incorporat with wax, and ſo applied, do the like: as alſo laid too in maner of a cataplaſme, they eaſe the pain

of

A of the gout. The decoction of the leaves & barke boiled in wine, is paſſing holeſome to foment the nerves withall. The bloumes or chattons of the Willow, ſtamped together with the leaves, cleanſe the brannie skales that appeare in the face. The leaves of the Willow punned and taken in drinke, doe coole them that are given too much unto laſcivious luſt, and over-hote in the acti-
2 on of *Venus*: and if they uſe to take the ſame often, they will diſable them altogether for the act of generation. The ſeed of the blacke Oiſier or Willow called Amerina, mixed in like weight with white litharge of ſilver, and brought into a liniment, is a depilatorie, and fetcheth off the haire, if the place be annointed therewith preſently after the baine.

There is a kind of tree named Vitex, not much different from the Willow, in regard of the uſe that the twigs bee put unto, as alſo of the leaves which reſemble thoſe of the Willow in out-
B ward ſhew, but that their ſmell is more pleaſant and odoriferous: the Greeks, ſome call it Lygos others Agnos, *i.* chaſt; for that the dames of Athens, during the feaſts of the goddeſſe *Ceres*, which were named Theſmophoria, made their pallets and beds with the leaves thereof, to coole the heat of luſt, and to keep themſelves chaſt for the time. And two ſorts there be of it. The greater riſeth up to a tree in manner of a Willow: the other, which is leſſe and lower, brancheth thicke, bearing white leaves, and thoſe full of downe and cotten. The former of theſe two, which is called the white Agnus Caſtus, putteth forth white flowers & purple one with another: wher-
C as contrariwiſe, all the flowers of the leſſe, which is called the blacke, be purple onely. Both the one and the other love to grow in plaines and moores. The ſeed of Agnus Caſtus, if it be taken in drinke, hath a certaine relliſh or taſt of wine, and it is commonly thought that it cureth feavers: and whoſoever is annointed therewith, beeing incorporat into a liniment with oile, ſhall ſoone ſweat: and by that meanes it is good to rid away wearineſſe. Agnus Caſtus, as well the one as the other, provoketh urine and the monthly termes of women. Both of them fume up into the head as wine doth: and no marvell, for they have the very ſmell of wine. They bee ſingular to ſend all ventoſities downeward. They ſtop the flux of the bellie, and be excellent good for thoſe who are in a dropſie, or troubled with the ſpleen. They have this ſpeciall propertie beſides, to breed good ſtore of milke in milch nources. Adverſe they be to all poyſons of ſerpents, ſuch eſpecially as do miſcheefe by their cold qualitie. The leſſe is more effectuall againſt ſerpents. And for this pur-
D poſe they uſe to give either one dram of the ſeed to drinke in wine or Oxycrat, which is vinegre and water; or els two drams of the moſt tender leaves. There is neither of them both, but as well the ſeed as the leaves, reduced into a liniment, bee ſingular good for the pricke of ſpiders. And there is not any venomous creature that will come neare thoſe who are but annointed therwith: nay they will flie from the very perfume thereof, or the couch which is made of the leaves. They abate the heat of wanton luſt: and in that regard eſpecially they bee contrarie to the venomous ſpiders Phalangia, which by their ſting doe pricke a man forward that way, and cauſe his fleſh to riſe. The flowers and yong tendrils of Agnus Caſtus, incorporat in oile roſat, do allay the head-ach, occaſioned by drinking overliberally. But if the ſaid headach be exceeding great, it is good to foment the head with a decoction of the ſeed of the ſaid Agnus: for it will reſolve and diſpatch the extremitie thereof. The ſame likewiſe by way either of ſuffumigation or cataplaſme, mundifi-
E eth and cleanſeth the matrice. And being taken as a drinke with peniroyall and honey, it is a pur-gative, and ſcoureth the bellie. Mixed with Barley meale, and applied pultiſſe-wiſe, it mollifieth thoſe botches and biles which hardly grow to ripeneſſe. The ſeed tempered with ſalt-petre and vinegre, healeth tettars, ringwormes, and red pimples: and with hony cureth the cankers or ſores in the mouth, yea, and any wheales and breaking forth whatſoever. The ſame reduced into a lini-ment with butter and vine leaves, wariſheth the infirmities incident to the cods: and if the ſeat be annointed with it and water medled together, it taketh away the chaps and fiſſures in that part. Brought into a cerot with ſalt, nitre, and wax, it is ſingular good for all diſlocations. Both the ſeed and leaves of Agnus, enter into many cataplaſmes or mollitive plaſtres, deviſed for the ſinews and the guts. The ſeed boiled in wine, maketh a good decoction, which if it be dropped upon the head by way of embracation, is right ſoveraigne for lethargie and phrenſie both. It is ſaid, that who-
F ſoever beareth in his hand a twig of Agnus, or gird himſelfe about the middle therewith, ſhall not be galled or fretted betweene the legs.

As touching Heath or Lings, which the Greekes call Erice, it is a ſhrub not much different from Tamariske, in colour and forme of leafe, ſuch as it is, reſembling Roſemarie. The leafe of this plant (they ſay) is an enemie to ſerpents.

As

As for Broome, it ſerveth alſo very well to make halters and cords of. The flowers pleaſe Bees passing well. I am in doubt and not able to ſay, Whether this Geniſta or Broome, be that which the auncient Greek writers called Sparton; for, I have ſhewed, that they uſed therof to make their fiſhing nets: and I wot not well whither *Homer* meant it, when he ſaid, That the ſhip-ſparts were untwiſted and looſe. For this is certaine, that neither the ſpart of Affrick, ne yet the Spaniſh ſpart was as yet in any uſe: and at what time as barges and veſſels were ſowed together with ſeames, it is well known, that the ſtitches were made with linnen thred, & not with ſpart. The ſeed that it beareth, which the *Greeks give one and the ſame name unto, growing within ſmall cods in manner of Phaſeols, is as ſtrong a purgative [of Melancholie] as Ellebore; if it bee taken when one is faſting, to the weight of a dram and halfe, in foure cyaths of honied water. The branches and leaves (ſuch as they be) of Geniſta or Broome, being ſtamped after they have lien many daies infuſed in vinegre, yeeld a certaine juice ſingular good for the Sciatica, if it bee drunke to the quantitie of one cyath. Some chuſe rather to ſteepe it in ſeawater, and to draw forth the juice, and ſo miniſter it with a clyſtre for the ſaid purpoſe. The ſaid juice incorporat with oile, ſerveth for an ointment alſo to be applied outwardly for the Sciatica. Some uſe the ſeed for the ſtrangurie. The ſubſtance of Broome ſtamped with Swines greaſe, helpeth the ach or paine in the knees.

* For they call it *Sparton*, as well as the plant.

To come now to Tamariske, which the Greekes call Myrice, *Lenæus* affirmeth, That it is uſed in manner of the Amerian Willow for beeſomes: and more than ſo, that if it be ſodden in wine, ſtamped and reduced into a liniment with honey, it healeth cankerous ulcers. And in very truth, ſome hold, That the Myrice and Tamariske bee both one. But doubtleſſe, ſingular it is for the ſpleene, in caſe the patient drinke the juice preſſed out of it, in wine. And by report, there is that wonderfull antipathie and contrarietie in Nature betweene Tamariske and this one part alone of all the other bowels, that if the troughs out of which Swine drinke their ſwill, bee made of this wood, they will be found when they are opened, altogether without a ſpleen. And therfore ſome Phyſicians doe preſcribe unto a man or woman alſo diſeaſed in the ſpleene, and ſubject to the opilations therof, both do drink out of cups and cans of Tamariske, and alſo to eat their meat out of ſuch treen diſhes as be made of that wood. One renowmed writer above the reſt, and for knowledge in great credit and authoritie among Phyſicians, hath affirmed and avouched conſtantly, That a twig of Tamariske ſlipped or broken from the plant, ſo as it touched neither the ground, nor any yron toole, aſſuageth all bellie-ach, in caſe the patient weare it about him ſo, as that his girdle and coat hold it faſt and cloſe to the bodie. The common people call it The unluckie tree, as I have heretofore ſaid, becauſe it beareth no fruit, & is never with us ſet or planted. In Corinth and all the territorie or region round about, they name it Brya, and make two kinds thereof; to wit, the wild, which is altogether barren, and that which is of a more tame and gentle nature. This Tamariske in Ægypt and Syria beareth in great plentie a certain fruit, in ſubſtance hard & woodie, in quantitie bigger than the Gall-nut, of an unpleaſant and harſh taſt; which the Phyſicians doe uſe in ſtead of the Gall-nut, and put into thoſe compoſitions which they name Antheras. Howbeit, the very wood of this plant, the flower, leaves, and barke alſo, bee uſed to the ſame purpoſe, although they bee not ſo ſtrong in operation as the ſaid fruit. The rind or barke beaten to pouder, is given with good ſucceſſe to them that caſt up bloud: alſo, to women who have a great ſhift of their fleurs: likewiſe to ſuch as bee troubled with a continuall flux, occaſioned by the imbecilitie of the ſtomacke. The ſame bruiſed and applied as a cataplaſme, repreſſeth and ſmiteth backe all impoſtumations a breeding. The juice preſſed out of the leaves, is good for the ſame infirmities: moreover, they uſe to boile the leaves in wine, for the ſame intent. But of themſelves alone being brought into a liniment with ſome honey among, they are good to be applied unto gangrenes. The foreſaid decoction of the leaves beeing drunke in wine, or the leaves applied with oile of Roſes and wax, mitigat the ſaid gangrenes, namely, when the fleſh tendeth to mortification. And in this manner they cure the night-foes or chilblanes. Their decoction is holeſome for the paine of teeth or eares: for which purpoſe ſerveth the root likewiſe & the leaves. Over and beſides, the leaves have this propertie, That if they be brought into the forme of a cataplaſme with Barley groats and ſo applied, they keepe downe and reſtraine corroſive ulcers. The ſeed, if it be taken to the weight of a dram in drinke, is a preſervative and counterpoyſon againſt ſpiders, and namely thoſe which be called Phalangia. And if the ſame be incorporat with the tallow or greaſe of any fatlings or beaſts, kept up in ſtall, ſtie, or mow, into a liniment, it is ſingular good for any uncom or fellon. Of great efficacie it is alſo againſt the ſting of all ſerpents, except

the

A the Aspis. The decoction likewise of the seed clysterized, is singular for the laundise, it killeth lice and nits, and staieth the immoderat flux of womens months. The ashes of the very wood of the tree, is good in all those cases beforesaid: which if they be mingled in the stale of an Oxe, and so taken of man or woman, either in meat or drinke, it will disable them for having any mind to the sports of *Venus* ever after. And a burning coale of this wood, when it is quenched in that stale or beasts pisse, they use to save and lay up in the shade for that purpose: but if one list to kindle lust, *then they set it on fire againe. To conclude, the Magicians say, That it would doe as much, if the urine onely of a guelded man were taken for the said purpose. *Rursum uritur.

Chap. X.

B *Of the bloud-rod. Of Siler. Of Privet. The Alder tree, and Ivie. Of Cisthus and Cissos. Of Erithranos. Of Chamæcissos or Ground-Ivie. Of Smilax or Bindweed. Of Clematis.*

THe plant called the Sanguin-Rod, is as unhappie as the foresaid Tamariske. The inner bark thereof is singular good to open again those ulcers, which are healed aloft onely and skinned before their time.

The leaves of *Siler, brought into a liniment and applied as a frontall to the forehead, allay the paine of the head. The seed thereof driven into pouder and incorporat with oile, is good for the lousie disease, and keepeth the bodie from lice. The very serpents cannot abide this plant or C shrub, but flie from it: which is the cause, that the peasants of the countrey make their walking staves thereof. *Some thinke it is the broad-leafed Oisier.

Our Ligustrum or Privet, is the very same tree that Cypros is in the East parts. To good use it serveth amongst us here in Europe: for the juice of it is holesome for the sinewes, the joints, and any extreame cold. The leaves applied with some cornes of salt, heale all inveterat ulcers in any part whatsoever, and particularly the Cankers in the mouth. The graines or berries that it beareth, are good to kill lice: also for any gall, where the skin is fretted off betweene the legs: and so be the leaves likewise. The foresaid berries doe cure the pip in Hens and Pullain.

As for the Alder tree: the leaves if they be applied hote as they be taken out of scalding water, doe cure without faile any tumor or swelling.

D As touching the Yvie tree, twentie kinds thereof and no fewer I have alreadie shewed: and of all these there is not one, but the use of it in Physicke is doubtfull and daungerous. For first and formost, Yvie, if it be drunk in any quantitie, howsoever it may purge the head, surely it troubleth the braine. Taken inwardly, it hurteth the sinewes: applied outwardly, it doth them much good. Of the very same nature it is, that vinegre. All the sort of Yvies be refrigerative. In drink they provoke urine. But the soft and tender leaves, sodden in vinegre and oile rosat, and then stamped, F and so tempered with more oile of roses put too afterwards, untill they be reduced into an ointment, are a singular remedie for the paines of the head; and especially for the brain and the thin pellicle Pia mater, which enwrappeth the braines: To which effect the forehead ought to bee annointed with the foresaid liniment, the mouth to be fomented and washed with the decoction, E and the whole head afterwards well rubbed also with the abovesaid unguent. They are good for 2 the spleene, both taken inwardly in drink, and outwardly applied as a liniment. The decoction of the same leaves may be drunke very well against the fit of an ague, to drive away the shaking cold: also for the small pockes and measels: for which turne likewise they serve, if they bee pulverized and taken in wine. The berries of the yvie cure the oppilation and hardnesse of the liver, either given in drinke, or applied outwardly. So doe they open also the obstructions of the liver, if a liniment be used onely. The same applied accordingly to the naturall parts of women, draw down their monthly sicknesse. The juice of Ivie (and specially of the white, which is planted in gardens) cleanseth the nosthrils of the foule ulcers and vermine therein breeding, it rectifieth also the filthie smell proceeding from thence. If the same bee conveighed up into the nose, it purgeth the F head: but more effectually, if sal-nitre be put therto. Moreover, it is to right great purpose dropped into the eares with oile, in case they either run matter, or be pained. It reduceth cicatrices or wounds and ulcers newly skinned, to the naturall colour of the other skin. The juice of the white Ivie is of more force and better operation for the oppilations of the spleene, & the swelling hardnesse thereof, if it bee made hot with a red hot yron, than otherwise: whereof six berries in two

cyaths

cyaths of wine, is a ſufficient doſe. Moreover, three berries of the ſame white Ivie drunk at a time G
in Oxymell, doe expell the wormes in the bellie: during which cure, it were not amiſſe to applie
* Golden berrie Ivie. them outwardly alſo. As for the Ivie, which I called *Chryſocarpos, if one take twelve of the golden yellow berries thereof beaten to pouder, and put them to a ſextar of wine, three cyaths thereof given to drinke, according to *Eraſiſtratus*, purge by urine the waterie humors betweene the skin and the fleſh, which engender the dropſie. The ſame *Eraſiſtratus* was wont to take five ſuch berries ſtamped into pouder and mixed with oile roſat, which after they were made hote in the rind of a Pomgranat, he uſed to drop into the eare of the contrarie ſide, for the tooth-ach. The berries of Ivie, which yeeld a juice as yellow as Saffron, if a man take before he ſit down to drink, may be aſſured, that he ſhall not be drunke at that ſitting. Likewiſe, they eaſe them much who are given to caſt and reach up bloud, or be ſubject to the collicke and wrings of the bellie. The white H
berries of the blacke Ivie if a man take in drinke, dull the vigour of his genetall ſeed, and diſable him for getting children. Any wine whatſoever, being boiled in wine, & ſo brought to a liniment and applied, doth cure all ulcers, even morimals, and ſuch as be untoward for to bee healed. The liquor iſſuing out of Ivie, is depilatorie, but as it taketh away haire, ſo it riddeth lice and vermine. The flowers of any kind of Ivie, taken (as much as a man may comprehend with three fingers) twice a day in ſome green and hard wine, helpe the dyſenterie or bloudie flix, yea, and any other laske. The ſame reduced into a liniment with wax, are very good to skin and heale burns or ſcaldings. The berries of Ivie, colour the haire of the head blacke. The juice of the Ivie root drawne with vinegre and taken in drinke, is ſingular againſt the poyſon of the venomous ſpiders Phalangia. Moreover, I find in ſome writers, That the drinking out of a cup or diſh of Ivie wood alſo, as I
well as of Tamariske, cureth thoſe who have hard ſpleenes. The ſame authors preſcribe to bruiſe the berries, afterwards to burne them, and with the aſhes to dreſſe and beſtrew the place that is burnt or ſcalded, ſo that it be firſt waſhed and bathed in hot water. There are Phyſicians who give order to cut and launce the Ivie tree, for to draw a juice or liquour from the place of the inciſion, which is to bee uſed for rotten and worme-eaten teeth: and by their ſaying, the faultie teeth will breake and crumble into peeces if they be annointed therewith; provided alwaies, that the ſound and good teeth ſtanding next, bee well defended with wax for catching harme by this medicine. Moreover, they ſeeke and lay for the gum of Ivie, which they would perſuade us aſſuredly upon their word to be ſingular for the teeth, being applied thereto with vinegre.

For the vicinitie and likeneſſe of the name of Ivie in Greeke, which is Ciſſos, I may take occa- K
ſion to ſpeak in this place of another ſhrub or plant called Ciſthos, bigger than Thyme, & leaved like Baſill. Of it be two kinds, namely, the male, with a red Roſe coloured flower; the female with a white: Both ſorts are good for dyſenteries or bloudie flixes, and all looſeneſſe of the belly, if there be drunke twice aday in ſome greene and hard wine, as much of their flowers as may bee held at three fingers ends: which if they be made into a cerot with wax, heale old ulcers, burns, and ſcaldings: and alone of themſelves cure the cankers or ſores in the mouth.

Vnder this plant eſpecially groweth Hypociſthis, wherof I have written in my treatiſe of Ivies.

Likewiſe, there is another plant like unto the Ivie, and the Greekes call it Ciſſos Erythranos: which being taken in drinke, helpeth the Sciatica, and is good for the loines: but they ſay it is ſo vehement and forcible in operation, that together with urine it will evacuate bloud. L

Moreover, there is an Ivie which creepeth and traileth alwaies cloſe by the ground, and the ſame the Greekes call Chamæciſſos. This hearbe being ſtamped and taken in wine to the quantitie of one Acetable, cureth the infirmitie of the ſpleene. The leaves incorporate with Swines greaſe, ſerve to cure burnes.

Furthermore, the Bindweed Smilax, knowne alſo by the name of Nicephoros, reſembleth Ivie, but that it hath ſmaller leaves. They ſay, that a chaplet or guirland made of this Smilax, is ſingular for the headach; provided alwaies, That the leaves which goe to the making of it, bee in number odde. Some have ſaid that Smilax is of two ſorts: the one, which continueth a world of yeares, groweth in ſhaddowie vallies, climbing trees, & tufted in the head with cluſters (as it were) of berries in manner of grapes; a ſoveraigne plant againſt all poyſons, inſomuch, as if the juice M
or liquor of the berries be oftentimes dropped into the eares of young babes or little infants, no poyſons (by report) will ever hurt them afterwards. As for the other Smilax or Bindweed, it loveth places well toiled and husbanded, wherein it uſually groweth: but of no vertue it is and operation. The former Bindweed is that, the wood whereof we ſaid would give a ſound, if it were held

cloſe

A cloſe to the eare. Another hearbe there is like to this, which ſome have called Clematis. This plant creepeth & climbeth upon trees, having many joints alſo or knots. The leaves are good to mundifie the foule leproſie. The ſeed drunke to the meaſure of one acetable, in a hemin of water or mead, maketh the bellie looſe. The decoction thereof is given likewiſe to the ſame effect.

Chap. xi.

The vertues and properties of Canes or Reeds, of the Papyr reed, of Ebene, Oleander, Sumach otherwiſe called Rhus Erythros, Madder, Allyſſon, Sopewort or Fullers-weed, Apocynon, Roſemarie, Cachrys, Savine, Selago, and Samulus. Alſo of Gums.

B HEretofore have we ſhewed nine and twentie ſundrie kinds of Reeds, all endued with their medicinable vertues: and in no plants more appeareth the admirable power of dame Nature, the onely ſubject matter handeled in all theſe bookes of ours. For in the firſt place, there preſenteth it ſelfe unto us the root of Reeds or Canes, which being bruiſed and applied accordingly, draweth forth of the bodie any ſpils of Fearne ſticking within the fleſh: So dooth the Fearne root by the Reed. And for as much as we have ſet down many ſorts of Canes, that among the reſt, which commeth out of India and Syria, and wherof perfumers have ſo great uſe in their ſweet ointments and odoriferous compoſitions, hath this propertie beſides, That if it be boyled with the graſſe called Dent de Chien [*i.* Quoich graſſe, or Perſely ſeed] it is diuretical and provo-
C keth urine. Applied outwardly, it draweth downe the deſired ſickneſſe of women. Taken in drinke to the weight of two oboli, it cureth thoſe who are ſubject to convulſions or crampes: it helpeth the liver and the reines: it is a remedy alſo for the dropſie. As for the cough, a very perfume therof will ſtay it, and the rather, if it be mixed with Roſin. The root ſodden in wine with Myrrhe, cleanſeth ſcurfe and dandruffe, it healeth alſo the ſpreading ulcers and running ſcals of the head. There is a juice beſides drawn from it, which becommeth like to Elaterium, or the juice of the wild Cucumber. Moreover, in any Reed, the beſt and moſt effectuall part thereof is that holden to bee, which is next to the root. The joints alſo and knots be of great efficacie. The Cyprian Cane is named Donax, the rind whereof, if it bee burnt and brought into aſhes, is ſingular for to bring hair again in places where it is ſhed: it healeth likewiſe ulcers growing to putrefaction. The leaves
D thereof are uſed, to draw forth any prickes or thornes. The ſame be of great vertue againſt S. *Anthonies* fire, the ſhingles, and ſuch like, yea and againſt all impoſtumations. The common and ordinary Reeds have an extractive or drawing facultie, if they be ſtamped green: which is not ment of the root onely, but alſo of the very ſubſtance of the Reed it ſelfe, which they ſay is of great operation. The root being reduced into a liniment, and applied with vinegre, cureth all diſlocations and eaſeth the pains of the chine bone. The ſame punned greene and new, ſtirreth to luſt, if it be drunke in wine. The downe or cotton growing upon the cane, if it bee put into the eares, cauſeth hardneſſe of hearing.

There groweth in Ægypt a certain plant named Papyrus, which reſembleth much the Cane or Reed: a thing of great uſe and commoditie, eſpecially when it is drie; for it ſerveth as a ſpunge
E both to ſucke up the moiſture in Fiſtulaes, and alſo to enlarge them. For ſwelling as it doth, it keepeth the ulcer open, and maketh way for the medicines to enter accordingly by that means. The paper made thereof when it is burnt, is counted to be cauſticke. The aſhes of it beeing drunke in wine, cauſe ſleepe: and applied outwardly, taketh away hard calloſities.

Touching Ebene, it groweth not (as I have alreadie ſaid) ſo neare unto us, as in Ægypt. And albeit my meaning & purpoſe is not to deale with any medicinable plants growing in the ſtrange and unknown countries of another world: yet in regard of the wonderfull properties that Ebene hath, I will not paſſe by it in ſilence. For, firſt and formoſt, the fine duſt or pouder filed from it, hath the name to be a ſingular medicine for the eyes: as alſo, that the wood therof being ground upon an hard ſtone, together with wine cuit, diſpatcheth away the cloudy miſt which overcaſteth
F the eyes. As for the root, if it bee uſed likewiſe and applied with water, it conſumeth the pin and web, and other ſpots in the eyes. The ſame being taken with equall quantitie of the hearb Dragon in honey, cureth the cough. In ſumme, Phyſicians repute and raunge Ebene among the medicines which be corroſive.

Oleander, called in Greeke Rhododendros, which ſome name Rhododaphne, and others Nerion,

rion,hath not been ſo happie yet,as to find ſo much as a name among the Latines. A ſtraunge G
and marvellous qualitie of this plant:The leaves are a very poyſon to all fourefooted beaſts; and yet they ſerve man as a preſervative and countrepoyſon againſt ſerpents,if they be taken in wine with Rue among.Alſo ſheepe and goats if they chance to drinke of the water wherin thoſe leaves lay ſoaked,will(by report)thereupon die.

Neither hath Rhus a Latine name,notwithſtanding it be much uſed in Phyſicke,& otherwiſe. For it is a wild plant growing of it ſelfe,bearing leaves like unto the Myrtle, upon ſhort ſtalks and branches;ſingular for to expell any poyſon and wormes out of the bodie: and beſides, called it is the Curriers ſhrub,for that they uſe to dreſſe their skins with the drie leaves therof,inſtead of pomgranat rinds.Of a reddiſh colour it is,a cubit in height,and a finger thick.Moreover,Phyſicians employ the medicines whereinto this Rhus is put, for bruiſes: likewiſe, for the flux proceeding H
from a feeble ſtomacke,as alſo for the ulcers in the ſeat.But the leaves ſtamped and incorporat with honey,and ſo brought into a liniment or ſalve with vinegre,doe heale cankerous ſores,ſuch as with inflammation doe eat away the fleſh to the very bone. Their decoction is ſingular to bee inſtilled into eares that run with filthie matter. Moreover,there is made a ſtomaticall compoſition of the branches of this Rhus,boiled,which ſerveth in the ſame caſes as the abovenamed Diamoron,*i.*of Mulberries: but if it have allum joined withall, it is of greater efficacie. The ſame
*This kitchin Rhus or meat-Sumach, is all one with the other: but that the cooks uſed the ſeed, and the curriers occupied the leaves and the branches.

being brought into a liniment,is paſſing good for the ſwellings in a dropſie. As for the *Rhus, which is called Erythros, *i.*the red, it is a ſhrub,and the ſeed thereof is both aſtringent and refrigerative.Much uſed is the graine or ſeed of this Rhus in ſtead of ſalt to pouder and ſeaſon meats. Laxative it is, and giveth a pleaſant taſt to any fleſh meats, eſpecially if Silphium bee mingled I
withall.Tempered with honey,it cureth and healeth all running ulcers: and in that manner prepared,it is excellent for the roughneſſe of a furred tongue,for places bruiſed,looking blacke and blew,or otherwiſe raw where the skin is raſed and pilled off.Nothing ſo ſoon healeth any wounds in the head, and bringeth them ſo quickly to cicatrice. And taken inwardly with other meats, it ſtoppeth the immoderat flux of womens fleurs.

As touching Madder,which ſome Greekes call Erythrodanus, others Ereuthodanus,and we in Latine Rubia,it is an hearbe different from Rhus Erythros abovenamed.Diers uſe it much to colour their wooll and woollen cloth,ſo doe curriers about their skins and leather. In Phyſicke it ſerveth to provoke urine: it cureth the jaundiſe,if it bee taken in mead or honied water: and reduced into a liniment with vinegre,it healeth the illfavoured tettars call Lichenes.Over and beK
ſides,it is good for the Sciatica and the palſie: in caſe the patient who drinke therof, do likewiſe bath every day. The root and ſeed both of Madder,draw downe womens months, ſtop the laske, and diſcuſſe or reſolve any apoſtumations breeding. The braunches and leaves thereof reduced into a cataplaſme and laid too,are good for the ſting of ſerpents. The leaves alſo have a ſpeciall propertie to colour the haire of the head.I read in ſome writers,That if this hearbe be tied about the necke or ſome other part of the bodie, and the patient doe no more but looke thereupon, it is ſufficient to cure the jaundiſe.

*Some take it to be *Aſperula*, *i.*Woodroſe.

The hearbe *Alyſſon differeth from this Madder,in regard of the leaves and branches only, which be leſſe.It tooke that name Alyſſon,becauſe thoſe that bee bitten with a mad dog,if they drinke it with vinegre,or weare it tied faſt about them, ſhall not likewiſe run mad. But it is very L
ſtrange which is ſaid moreover of this hearbe, namely,That the very ſight thereof is ynough to drie up and conſume that venomous matter or humour infuſed by the tooth of the ſaid dog, and which is the cauſe of madneſſe.

As for the Fullers weed,which the Latines call Radicula,and the Greekes Struthion,as I have beforeſaid,it ſerveth to ſcoure and prepare wooll and woollen cloth for the diers hand. In Phyſicke the broth or decoction thereof drunke,cureth the jaundiſe,and the infirmities or diſeaſes of the breaſt. It provoketh urine, looſeth the bellie, and cleanſeth the matrice, which is the cauſe, that Phyſicians call it Aureum poculum, *i.*the golden cup, or golden drinke. The ſame taken with honey in manner of an electuarie,to the quantitie of one ſpoonefull at a time,is of ſingular operation for the cough and ſhortneſſe of breath, when the patient cannot draw and deliver his M
wind but ſitting upright.Reduced into a liniment with parched Barley groats and vinegre, it cureth and cleanſeth the foule leproſie. Drunke with Panaces and Caper-roots, it breaketh the ſtone,and expelleth it out of the bodie. Sodden with Barley meale in wine, and brought to a pulteſſe,it diſpatcheth riſings in the fleſh,or broad flat biles called Pani.It is uſuallyput into emollitive

A litive cataplaſmes, yea, and into collyries ordained for to cleare the eyeſight. I know few things ſo good to provoke ſneeſing as this Radicula: neither is there a better hearbe for the ſpleene and the liver. The ſame alſo if it be drunke to the weight of a Romane denier or dram, in mead or honied water, helpeth thoſe that be ſhortwinded. So doth the ſeed thereof taken with water, cure the pleuriſie and any ſtitches or paine in the ſides.

To come now to Apocynon: a ſhrub it is bearing leaves like unto Ivie, but that they be ſofter and the ſhoots or tendrils thereof not ſo long: the ſeed is ſharp pointed, clift, or divided, full of a ſoft downe, and of a ſtrong or unpleaſant ſavor. Being given either to dogs or any other fourfooted beaſts in meat, it is their bane and killeth them. Moreover, there is the Roſemarie, whereof be two kinds: the one is barren & beareth no ſeed: the other, which riſeth alſo up in a ſtem or main
B ſtalke, carieth ſeed or a roſinous gummie fruit, called Cachrys. The leaves in ſmell reſemble frankincenſe. The root freſh and new gathered, reduced into a ſalve, healeth greene wounds. Applied unto the ſeat, it reduceth the fundament when it is fallen, into the right place, reſolve the ſwelling piles, and cureth the running hæmorrhoids. The juice both of the braunches and hearbe it ſelfe as alſo of the root, is ſingular for to ſcour the jaundiſe, and all things els which have need of clenſing and mundification: it cleareth and quickeneth the eyeſight. The ſeed is given to drinke with great ſucceſſe for all old accidents of the breaſt: but with wine and pepper it is good for the matrice, and helpeth to ſend downe womens monthly termes. Made into a cataplaſme with *cocle flower, it is applied with good effect unto the gout. It cleanſeth and ſcoureth away morphew: it
C ſerveth well to bring any part to heat that hath need of chauſing, yea, and to procure ſweat, if the caſe require, ſo the place be annointed therwith: alſo it helpeth any convulſion or cramp. Drunk in wine, it encreaſeth milke, ſo doth the root likewiſe. The very ſubſtance of the hearbe reduced into a liniment, cureth the wens called the Kings evill, if it bee applied unto them with vinegre: and taken with honey, it is good for the cough. As for Cachrys, there be many kinds of it, as I have ſhewed before. But this Cachrys of the Roſemarie aboveſaid, if it be rubbed, yeeldeth a ſubſtance or liquor of roſin. Contrarie it is to poyſons and ſtings of all venomous beaſts, but only of Snakes. It moveth ſweat, diſpatcheth the wringing torments of the bellie, and cauſeth nurces to have plentie of milke. Savine the hearbe, called by the Greekes Brathy, is of two ſorts: the one in leafe reſembleth the Tamariske, the other the Cypreſſe tree: Wherupon ſome have given it the name of Candie-Cypreſſe. Many uſe it in ſuffumigations and perfumes, for Frankincenſe. But in
D medicines we Phyſicians take the double weight of it in ſtead of Cinnamon, and it is thought to have the ſame operations and effects. It driveth back and keepeth down all ſwelling impoſtumes: it repreſſeth alſo thoſe ulcers which be corroſive and cankerous. Brought into a ſalve, it mundifieth filthie ſores. Applied outwardly, it draweth dead infants out of the bodie: and no leſſe it worketh, being but received by way of perfume. Made into a liniment, it healeth S. *Anthonies* fire, and carbuncles. Drunke with honey and wine, it cureth the jaundiſe. It is ſaid, that the very fume or ſmoke of this hearbe will rid hens and ſuch like pullein of the pip.

Much like unto this hearbe Savine, is that which they call Selago. Many ceremonies are to
E be obſerved in the gathering of this hearb: Firſt and formoſt, the partie who is to gather it, muſt be apparelled all in white, as it were in a ſurplice; goe barefoot he muſt, and have his feet waſhed in faire water: before he commeth to gather it, he ought to do ſacrifice unto the gods with bread and wine: moreover, no knife or yron toole is to bee uſed hereabout: neither will any hand ſerve but the right, and that alſo muſt doe the deed not bare and naked, but by ſome skirt or lappet of his coat betweene, which was done off with the left hand; and ſo cloſely beſides, as if he came to ſteale it away ſecretly: laſt of all, when it is gathered, wrapped it muſt be, and carried in a new linnen napkin or towell. The Druidæ of France have a great opinion of this hearbe thus gathered, and have preſcribed it to be kept as the onely preſervative againſt all hurtfull accidents & misfortunes whatſoever, ſaying, that the fume thereof is ſingular good for all the infirmities and diſeaſes of the eyes. The Druida or Prelats of Fraunce abovenamed, make great account of another hearbe growing in moiſt grounds, which they name Samolus: and (forſooth) if you did well
F you ſhould gather it faſting, with the left hand in any wiſe: and in the gathering, not looke backe howſoever you doe. Moreover, when it is thus gathered, it ought not to be laid downe out of the hand in any place, but in the troughs, ciſternes, or channels, where ſwine, kine, or oxen uſe ordinarily to drinke, where it muſt be likewiſe ſtamped: and then without faile, the foreſaid cattaile ſhall be wariſhed and ſecured from all diſeaſes.

*Ærina. Some read *Ervina*, i. of Ervile.

As concerning gums, I have heretofore declared how many kinds thereof are to be found. G
To ſpeake of them in generall, The better that any gum is, the more effectuall bee the operations thereof: hurtfull they are to the teeth: they have a propertie to thicken or coagulat bloud, and therfore be good for thoſe who caſt and reach up bloud: likewiſe they be ſingular for burns, as alſo for the windpipe and inſtruments of reſpiration. The ſuperfluous and corrupt urine within the body, they provoke and give paſſage unto. They dull and diminiſh the bitterneſſe of other medicines wherin they be mingled, howſoever otherwiſe they be aſtringent and do fortifie other qualities. That which commeth from the bitter almonds, and is of a ſtronger operation to thicken and incraſſat, hath vertue alſo to heat the bodie. The beſt gums be thoſe of plumtrees, cherie trees, and vines: they have all of them a drying and aſtringent qualitie, if any part be annointed with them: and diſſolved in vinegre, they kill the tettars or ringworms in children, and heale H
them up. Being drunke to the weight of foure oboli, in * new wine, they be good for any inveterat cough. Moreover, they be thought to make the colour more freſh, lively, and pleaſant; to procure and ſtirre up the appetite to meat; alſo to helpe thoſe who be pained with the ſtone, in caſe they be drunke in ſweet wine cuit. And to conclude with ſome particularitie, The * gum of the Ægyptian thorne is ſoveraigne for wounds, and all accidents of the eyes.

* *Muſto*, or *Miſto, id eſt*, in ſome made or compound wine.

* Thought to be *Acacia*.

Chap. xii.

*Of the Arabian thorne: of the * white thiſtle Bedegnar: of Acanthium and Acacia.*

* Our la lies thiſtle.

I
TOuching the Arabian Thorne or Buſh, and the commendable qualities thereof, I have ſufficiently ſpoken in the treatiſe of perfumes and odoriferous confections: yet thus much moreover I have to ſay of the medicinable vertues, That it doth thicken and incraſſat thin and rheumaticke humors, it reſtraineth all catarrhs and diſtillations, it repreſſeth the reaching up bloud, and ſtaieth the immoderat flux of womens monethly tearms: for which purpoſes the root is more effectuall than any other part of the plant.

The ſeed of the white Thiſtle is ſingular for the ſting of ſcorpions: a garland made of it and ſet upon the head, aſſuageth the paine thereof. Much like unto this, is that Thiſtle which the Greeks call Acanthion, but that the leaves be much ſmaller, and thoſe are ſharpe pointed and prickly all about the edges, and covered with a downe reſembling a cobweb; which the people K
of the Eaſt countries doe gather, and therof make certaine cloth for garments, reſembling ſilke. The leaves or roots drunke in ſubſtance, are ſuppoſed to bee a ſingular remedie for the crampe or convulſion which draweth the necke and bodie backeward.

Moreover, there is a kind of Thorne, whereof commeth Acacia, and it is the juice thereof. It is found in Ægypt to iſſue from certaine trees, which be white, blacke, and greene: howbeit, the beſt Acacia by farre, is that which the former (that is to ſay, the white and the blacke) doe yeeld. There is made likewiſe a kind of Acacia in Galatia, which is moſt ſoft and tender; and the tree that affourdeth it, is more prickie and thornie than the reſt. The ſeed or fruit of all theſe trees, is like unto Lentils, but onely that the graine is leſſe, and the cod or huske wherein it lieth, ſmaller. The right ſeaſon to gather this fruit, is in autumne; for if it be taken before, it is too too ſtrong. L
For to draw this juice which we call Acacia, the cods wherin the grains lie, ought to be throughly ſteeped firſt in raine water: ſoone after, when they be punned or ſtamped in a mortar, the ſaid juice is preſſed foorth with certaine inſtruments ſerving for the purpoſe: which done, they let it remaine within mortars in the ſun, and there take the thickening; and ſo at length reduce it into certain trochiſchs, and reſerve them for uſe. There is a juice likewiſe drawne out of the leaves, but the ſame is not ſo effectuall as the other. The curriours uſe to dreſſe their skins with the ſeed or grains thereof, in lieu of Galls. The juice which the leaves of the Galatian thorne aboveſaid doth yeeld, (and namely, the blackeſt) is rejected for naught; like as that alſo which is of a deepe red colour. Contrariwiſe, that which is either purple or aſh-coloured and ruſſet to ſee too, as alſo that which will ſoone be diſſolved, is of exceeding efficacie to thicken and coole withall; and is M
preferred before all other in colyries or eyeſalves. Now for theſe uſes, ſome are wont to waſh the troſches aforeſaid, others torrifie and burne them. They are good to colour the haire of the head blacke: they heale S. *Anthonies* fire, and corroſive ſores; yea and all grievances of the bodie that conſiſt in moiſture: they cure any impoſtumes, joynts that are bruiſed, kibed heels, and the turning

A ning up of the skin and fleſh from the naile roots. They repreſſe the exceeding flux of womens monthly fleurs: the matrice and tiwill if they be ſlipt and falne out of the bodie, they reduce into their place againe. In ſumme, for the eyes, for the ſores and infirmities of the mouth, and naturall parts ſerving for generation, they be ſoveraigne.

Chap. XIII.

*Of the common Thorne: of the wild or wood Thorne: of Eryſiſceptrum: of Spina Appendix: of * Pyxacanthus, and * Paliurus: of Hulver or Hollie: of Yeugh: and Brambles: with the medicinable vertues of them all.*

* Box-thorne. * Some call it Chriſts thorn.

B THe common Thorne alſo, wherewith the Fullers uſe to fill their vats and caudrons, hath the ſame operation that * Struthium, and is put to the ſame uſe. Many there bee verely in all parts of Spaine, who uſe it both in ſweet pomanders, and alſo in ointments, calling it Aſpalathus: and without all doubt, there is a kind of wild white thorne of this race growing in the eaſterly countries (as I have ſaid) among the woods, and riſeth to the full heigth of a good tree. Yea and a ſhrubbie plant there is, lower than the other, but as full of pricks, growing in Niſyrus and the Iſlands of the Rhodians, which ſome call Eryſiſceptron, others Adipſatheon, or Dipſacon, or Dracheton: the beſt is that which groweth nothing like to the Ferula, and beeing deſpoiled of the rind, is of a reddiſh colour enclining to purple. It is found in many places, but not every where odoriferous. Of what force it is, when the rainbow ſeemeth to reſt upon it, I have

C ſhewed alreadie. It healeth the filthie cankers or ſores of the mouth, and the ſtinking ulcers or alepocks in the noſthrils: likewiſe the ſores, botches, and carbuncles in the privie parts; the crevaiſes alſo and clifts in the fundament, or elſewhere, applied unto the place affected: but if it bee drunke, it abateth all ſwelling of ventoſities. The barke or rind thereof, diſpatcheth thoſe obſtructions and impediments which cauſe the ſtrangurie or piſſing by drop-meale. The decoction is a ſingular remedie for them that either piſſe or vomit bloud. The foreſaid rind ſtoppeth the flux of the belly. The like effects is that thought to worke which groweth in the woods [and is called Aſpalathus of the Levant.]

* *Radicis*, for it is called *Radicula*.

There is a kind of thornie buſh called * Appendix, for that there bee red berries hanging thereto, which be likewiſe named Appendites. Theſe berries, either raw by themſelves, or elſe

D dried and boiled in wine, doe ſtay the flux of the belly, and beſides aſſuage the torments and wrings therof. As for the berries of Pyxacanthus, they be drunke to right good purpoſe againſt the ſting of ſerpents. Paliurus alſo is a kind of thornie buſh: The people of Africk call the ſeed of it Zura, which is found to be moſt effectuall againſt ſcorpions; and for thoſe who are troubled with the ſtone, and the cough. The leaves have an aſtringent or binding qualitie. The root reſolveth and diſpatcheth biles, impoſtumations, and botches: and if the ſame be taken in drink, it procureth urine: if it be ſodden in wine, and the decoction drunke, it ſtoppeth a laske, and is a defenſative againſt the poiſon of ſerpents: the root eſpecially is given in wine. Some there be who ſtampe the leaves, putting ſalt thereto, and beeing reduced into the forme of a cataplaſme, apply the ſame to the gout. The leaves bee good to ſtay the immoderat flux of womens terms,

E the looſeneſſe of the belly occaſioned by a feeble ſtomacke, the bloudie flix, and the inordinat motions of chollerique humors both upward and downward. The root boiled and brought to a liniment, draweth forth whatſoever ſticketh within the bodie. Soveraigne it is and of exceeding great operation, in caſe of diſlocations and ſwellings.

* Some take it for the Berberie buſh.

As touching the Holly or Hulver-tree, if it be planted about an houſe, whether it be within a citie, or ſtanding in the countrey, it ſerveth for a countrecharme and keepeth away all ill ſpels or inchantments. *Pythagoras* affirmeth, that the floure of this tree will cauſe water to ſtand all upon an yce: alſo that a ſtaffe made thereof, if a man doe fling it at any beaſt whatſoever, although it chaunce to light ſhort for default of ſtrength in his arms who flung it, will notwithſtanding etch forward and roll from the place where it fell upon the earth, and approch neare to the beaſt afore-

F ſaid; of ſo admirable a nature is this Holly tree.

The fume or ſmoke of any Yeugh tree, killeth mice and rats. Neither hath Nature produced brambles for nothing els but to pricke and do hurt; for ſuch is her bountie, that the beries which they beare are mans meat, beſides many other medicinable properties: for they have a deſiccative and aſtringent vertue, and ſerve as a moſt appropriat remedie for the gumbs, the inflamma-

tion of the Tonſils, and the privie members. The flours alſo as well as the berries of the brambles, G
be ſingular againſt the Hæmorrhoid and the Preſter, which are the two wickeddeſt and moſt miſ-
chievous ſerpents that be. The wounds inflicted by ſcorpions, they cloſe and heale up againe
without any danger of rankling or apoſtemation: and withall, they have a propertie to provoke
urine. The juice drawne and preſſed out of the tendrons or young ſprouts of brambles ſtamped,
and afterwards reduced unto the conſiſtence of honey by ſtanding in the Sun, is a ſingular me-
dicine either taken inwardly or applyed outwardly, for all the diſeaſes of the mouth and eyes; for
them that reach up bloud; for the ſquinancie; the accidents of the matrice and fundament; fi-
nally, for the immoderat flux of the belly occaſioned by the weakneſſe of ſtomacke. As for the
ſores and infirmities of the mouth, the very leaves alone of the bramble if they be but chewed,
are paſſing good: but if they be reduced into a liniment and ſo applied, they heale running ſores H
or any ſcalls whatſoever in the head: & even ſo being laid alone upon the left pap, they be hole-
ſome for ſuch as are given to the fainting and trembling of the heart, and ſubject to fall into cold
ſweats: likewiſe being applied accordingly, they eaſe the paine of the ſtomack, and ſuch as have
their eies readie to ſtart out of their head: and to helpe the infirmities of the ears, their juice is
excellent to be dropped into them. The ſame juice incorporat with the cerot of roſes, healeth
the clifts and ſwelling knubs in the fundament: and for the ſaid infirmitie, the decoction of yong
tendrils in wine, is a preſent remedie, in caſe the place be bathed and fomented therein. The
ſame yong ſprings eaten alone by themſelves in a ſalad, in manner of the tender crops and ſpurts
of the Colewort, or boiled in ſome harſh, groſſe, and greene wine, do faſten the teeth which be
looſe and ſhake in the head: they ſtop a laske, and reſtraine an unnaturall iſſue or flux of bloud;
and beſides, are good in the bloudie flix. Beeing dried in the ſhade, and afterwards burnt, their I
aſhes are ſingular to ſtay the uvula for falling. The leaves alſo being dried and beaten to powder,
are excellent good for the farcines and ſores in horſes, and ſuch like beaſts. As for the black ber-
ries which theſe brambles doe beare, there is a kind of Diamoron made of them, which is far bet-
ter for the infirmities of the mouth and more effectuall, than the other of the garden mulberries.
The ſame being ſo prepared in that ſtomaticall compoſition aforeſaid, or drunke only with Hy-
poquiſtis and hony, be ſingular to repreſſe the furie of choller provoking both waies: they be cor-
diall likewiſe, in caſe of faintings and cold ſweats: and laſtly, a preſervative againſt the poiſon of
the venomous ſpiders. Among thoſe medicines which they call Stypticke or Aſtringent, there is
not a better thing than to boile the root of this blackberrie bramble in wine to the thirds; and
namely to make a collution therewith to waſh the cankers or ſores breeding in the mouth, or to K
foment the ulcers growing in the fundament. And verely of ſuch a binding and aſtringent force
is this bramble, that the very ſpongeous balls that it beareth, will grow to be as hard as ſtones.

Another kind of brier or bramble there is, upon which groweth a roſe: ſome call it Cynosba-
tos, others Cynoſpaſtos: it beareth a leafe like to the print or ſole of a mans foot. A little ball or
pill it breedeth, furred or briſtled much after the manner of the cheſtnut, which ſerveth as a ſpe-
ciall remedie for thoſe that be ſubject to the ſtone. As for Cynorthodos, it is another plant diffe-
rent from this, whereof I will ſpeake in the next booke.

Chap. xiiii. L

Of *Cynosbatos, and the Raſpiſe: of the Rhamnos, and of Lycium and Sarcocolla. Of a certaine compoſition in Phyſicke called Oporice.

i. the Cane-brier or Can-cre brier.

AS for the bramble named Chamæbatos, it beareth certain black berries like grapes, with-
in the kernell whereof it hath a certain ſtring like a ſinew, whereupon it came to be called
Newroſpaſtos: it is a different plant from the Caper, which the Phyſicians have named alſo
Cynosbatos. Now the tender ſtems of the foreſaid * Cynosbatos or Chamæbatos condite in
vinegre, are good for them to eat who are troubled with the opilation of the ſplene, and with ven-
toſities; for it is a ſingular remedie for thoſe infirmities. The ſting or ſinew thereof chewed with
maſtick of Chios, purgeth the mouth. The wild roſes that grow upon this brier, being incorporat
with ſwines greaſe, are excellent for to make the haire grow againe, when it is ſhed by ſome infir- M
mitie. * The berries of theſe brambles if they be tempered with oile olive made of greene and
unripe olives, colour the haire blacke. The proper ſeaſon to gather the floures of theſe brambles
that carie berries like to mulberies, is in harveſt time. The white kind of them drunk with wine, is a
ſoveraigne remedie for the pleuriſie, and the flux of the ſtomacke. The root ſodden to the thirds,

* *Rubus canis.*

* Obſerve how eõfuſedly *Plinie* ſetteth down the ſtorie of *Cynosbatos* and *Chamæbatos*, *i.* the Cane-brier, and the Blackberrie brãble,

ſtoppeth

A ſtoppeth a laske, and ſtaieth the flux of bloud: likewiſe a collution made therwith, faſteneth looſe teeth, if they be waſhed withall. The ſame decoction or liquor is good to foment the ulcers of the ſeat privie parts. The aſhes of the root burnt, keepe up the uvula from falling.

The Raſpis is called in Latin Rubus Idæus, becauſe it groweth upon the mountain Ida, and not elſewhere *[ſo plenteouſly.] Now is this bramble more tender, & leſſe in growth: it putteth forth alſo fewer ſtalks upright, and thoſe more harmleſſe and nothing ſo prickie as the other brambles before-named: beſides, it loveth well to grow under the ſhade of trees. The flours of this bramble reduced into a liniment with hony, reſtraine the flux of rheumatick humors into the eies, and keepeth down the ſpreading of S. *Anthonies* fire: and given in water to drinke, it cureth the infirmities of the mouth. In all other caſes, it hath like operations to the former brambles. * *Ex Dioſcor.*

B Among the divers kinds of Brambles, is reckoned the Rhamne, which the Greeks call Rhamnos, notwithſtanding that it is whiter and more branching than the reſt. This Rham beareth many flours, ſpreading forth his branches armed with pricks not crooked or hooked as the reſt, but ſtreight and direct, clad alſo with larger leaves. A ſecond kind there is of them growing wild in the woods, blacker than the other, & yet inclining in ſome ſort to a red colour: this carieth as it were certain little cods. Of the root of this Rhamne boiled in water, is made that medicine which is called Lycium. The ſeed of this plant draweth down the after-birth. The former of theſe twain (which alſo is the whiter) hath a vertue more aſtringent and cooling than the other, and therfore better for impoſtumations and wounds: howbeit the leaves of both, either greene or boiled, are uſed in liniments with oile for the ſaid purpoſe. But as touching Lycium, the beſt of all other is (by re-

C port) made of a certain Thorne tree or buſh, which they call Pyxacanthos Chironia, the forme wherof I have deſcribed among the Indian trees: and indeed the moſt excellent Lycium by many degrees, is that Indian Lycium thought to be. The manner of making this Lycium, is in this wiſe: They take the branches of this plant, togither with the roots which be exceeding bitter, and after they be well punned and ſtamped, ſeeth them in water within a braſen pan, for three daies togither or thereabout: which done, they take forth the wood, & ſet the liquor over the fire again, where it taketh a ſecond boiling, ſo long untill it be come to the conſiſtence or thickneſſe of honey: howbeit ſophiſticated it is many times with ſome bitter juices, yea and with the lees of oile and beaſts gall. The very froth and ſcum, in manner of a florie that it caſteth up, ſome uſe to put into colyries and medicines for the eies. The ſubſtance of the juice beſides is abſterſive, it mundi-

D fieth the face, healeth ſcabs, cureth the exulcerations or frettings in the corners of the eies: it repreſſeth old rheums and diſtillations, clenſeth ears running with filthie matter, repreſſeth the inflammations of the almonds in the mouth called Tonſillæ, and of the gums; ſtaieth the cough, reſtraineth the reaching & caſting of bloud, if it be taken to the quantitie of a beane: being ſpred in maner of a plaſtre or liniment and ſo applied, it drieth up running and waterie ſores; it healeth the chaps and clifts in any part of the bodie, the ulcers of the ſecret parts ſerving for generation, any place fretted or galled, new and green ulcers, yea and ſuch as be corroſive and withall growing to putrefaction: it is ſingular for the calloſities, werts, or hard corns growing in the noſthrils, and all impoſtumations: moreover, women find great helpe by drinking it in milke, for any violent ſhift or immoderat flux of their monthly ſicknes. The beſt Indian Lycium is known by this,

E That the maſſe or lump thereof is black without-forth, red within when it is broken, but ſoone it commeth to a black colour. An aſtrictive medicine this is, and bitter withall; and hath the ſame effects which the other Lycium is reported to have, but ſpecially if it be applied to the privie members of generation. As touching Sarcocolla, ſome bee of opinion that it is the gum or liquor iſſuing from a certain thornie plant or buſh: and they hold, that it reſembleth the crums of frankincenſe, called Pollen or Manna Thuris, and in taſt ſeemeth to be ſweetiſh, & yet quick and ſharpe withall. This Sarcocoll ſtamped with wine, and ſo applied, repreſſeth all fluxes: and in a liniment, good it is for yong infants. This gum alſo by age and long keeping, waxeth blacke; but the whiter is the better, and thereby is the goodneſſe knowne.

But Before I depart from this treatiſe of Trees, and their medicinable vertues, I muſt needs ſay,

F we are beholden to them yet for one excellent medicine more, which is called Oporice by the Greeks, as one would ſay, made of fruits. This compoſition is ſingular for the bloudie flix or exulceration of the guts; alſo for the infirmities of the ſtomacke. The manner of making it, is in this wiſe: Take five quinces, with their kernels, ſeeds and all, as many pomegranats likewiſe, let them boile gently over a ſoft fire in one gallon of new white wine, put therto the weight or meaſure of

one ſextar of Serviſes, and as much in quantitie of the Sumach which is called Rhus Syriacum, togither with halfe an ounce of ſaffron; ſeeth all theſe togither to the heigth or conſiſtence of honey. Thus much concerning the properties of Trees ſerving in Phyſicke. It remaineth now to annex hereunto a diſcourſe of thoſe plants which the Greeke writers (by giving them names in ſome analogie reſpective unto trees) have left in ambiguitie and made us doubt of them whether they be trees or hearbs. G

Chap. xv.

*Of * Chamædrys, i. Germander: * Chamædaphne, i. Lawreoll: * Chamelæa: * Chamæſyce: * Chamæciſſos, i. Ale-hoove: * Chamæleuce, i. Fole-foot: * Chamæpeuce: * Chamæcypariſſus, i. Lavander-cotton: * Ampelo-praſos: Stachys: Clinopodium, Centunculus, and Clematis Ægyptia, with the medicines that they afford.* H

q. ground-oke, or petie oke.
q. ground-bay, or pety-Lawrell.
q. ground-Olive, &c.
q. ground-figtree, &c.
q ground-Ivie.
q. ground-Poplar.
q ground-Pine, or Pitch tree.
q. ground-Cypreſſe.
q. Porret-vine, or Leek-vine.

GErmander is an hearb, called in Greeke Chamædrys, and in Latine Triſſago: ſome have named it Chamædrope, others Teucrion: it beareth leaves for bignes reſembling mints, in colour like unto the oke leaves, cut and indented alſo after the ſame manner. Of ſome it is called Serrata, and they affirme that the firſt patterne of a ſaw was taken from the leaſe of this hearb, whereupon it ſhould be ſo called. The floure beareth much upon the purple colour: it loveth to grow in ſtonie places, and would be gathered whiles it is full of juice: and thus gathered in due ſeaſon, whether it bee taken in drinke, or applied outwardly in a liniment, moſt effectuall it is againſt the poiſon of ſerpents: likewiſe it is holeſome for the ſtomacke, good againſt an inveterat cough; ſingular to cut, diſſolve, and raiſe the tough fleame ſticking in the throat: a ſpeciall remedie for ruptures, convulſions, and pleuriſies: it waneth away the overgrowne ſplene: it provoketh urine, and womens fleurs: in which regard, a bundle or handfull of Germander boiled in three hemines of water, untill a third part be conſumed, maketh a ſoveraigne decoction or drinke for thoſe who are newly falne into a dropſie. Some there be, who ſtampe this hearbe and ſprinkle water among, and ſo reduce it into troſchs. Over and beſides the vertues before rehearſed, it is good to heale botches newly broken and full of matter; yea old ulcers, though they bee filthie and putrified, if it be applied thereto: for the ſplene, it is uſually taken with vinegre: and this juice doth chaufe and heat thoſe parts which be annointed therewith. I K

As touching Lawreoll, called by the Greeks Chamædaphne, it ariſeth up with one only ſtem of a cubit high or thereabout: the leaves are but ſmall, howbeit like to thoſe of the Lawrell: it bringeth forth a reddiſh ſeed appearing among the leaves, which being uſed in a liniment freſh and green, eaſeth the head-ach. The ſame cooleth all exceſſive heats: and if it be drunke in wine, appeaſeth the wrings and torments of the belly. The juice thereof taken in drinke, draweth down womens fleurs, and provoketh urine: the ſame applied in wooll to the naturall parts of a woman, cauſeth her to be ſoone delivered when ſhe is in hard travaile of childbirth.

* otherwiſe called *Mezereon*, Widow-waile.

As for * Chamelæa, it hath leaves like unto thoſe of the olive: the ſame be bitter in taſt, and in ſmell odoriferous. This plant groweth in ſtonie grounds, and exceedeth not in heigth a hand-breadth or ſpan at moſt: a purgative hearb it is; for thereof is made an excellent ſyrrup to evacuat fleame and choller; namely, if there be taken one part of the leaves of this hearbe, with two parts of wormewood, and ſo boiled; for certainly this decoction drunke with hony, is ſingular for to purge the foreſaid humors. A cataplaſme made with the leaves, cleanſeth ulcers. It is commonly ſaid, that if this hearbe be gathered before the ſun riſing, and the partie do ſay expreſſely in the gathering, That it is for the pin and web in the eyes; it will diſpatch and rid away the ſaid infirmitie, if one doe but weare it tied about him. And howſoever it be gathered, whether it be with any ſuch circumſtance and ceremonie, or without, yet is it ſingular for the haw gnawing in the eyes of horſes and ſheepe. L

Chamæſyce beareth leaves reſembling thoſe of the Lentill, but they alwaies creepe along the ground and riſe not up. This hearbe groweth in drie and ſtonie grounds: the ſame boiled in wine and uſed as a liniment unto the eyes, cleareth their ſight; for it is ſingular to diſpatch and remoove cataracts, ſuffuſions, and cicatrices, growing therein: as alſo to rid away the miſtie clowds and films that overcaſt the ſight. Being put up into the matrice within a linnen cloath in manner of a peſſarie, it allaieth the pains thereof. Warts of all ſorts it taketh away, if they be annointed M

A nointed therewith. It is a ſoveraigne remedie alſo for thoſe who cannot take their wind but ſitting upright.

*Chamæciſſos groweth up ſpiked with an ear like unto Wheat, and ordinarily putteth forth five braunches, and thoſe full of leaves. When it ſheweth in the flower, a man would take it to be the *white Violet or Gilloſie. The root is but ſmall. They that are troubled with the Sciatica, uſe to drinke the leaves thereof to the weight of three oboli in two cyaths of wine, for ſeven daies together: but it is an exceeding bitter potion.

* It is not our ground Ivie or Alehove. *Viola alba.

As for Fole-foot, it is called in Greeke Chamæleuce: but we in Latine name it Farranum or Farfugium. It loveth to grow by river ſides. The leaves ſomewhat reſemble thoſe of the Poplar, but that they be larger. If the root of Fole-foot be burnt upon the coales made with Cypreſſe
B wood, the ſmoke or perfume therof received or drunk through a pipe or tunnell into the mouth, is ſingular for an old cough.

Touching *Chamæpeuce, in leafe it is like unto the Larch-tree: a plant very appropriat to the paine of the backe and the loines. The hearbe Chamæcypariſſos, if it bee drunke in wine, is ſingular good againſt all the venomous ſtings of ſerpents and ſcorpions.

*Some take it for Chamæpitys.

The hearbe Ampelopraſos groweth in vineyards, bearing leaves reſembling Porret: but it cauſeth them to belch foure that eat thereof. Howbeit, of great power it is againſt the ſting of ſerpents. It provoketh urine and womens monthly termes. And yet whether it be drunke or applied outwardly, it is paſſing good for them that piſſe bloud, and repreſſeth the iſſue & eruption thereof. Our midwives uſe to give it unto women newly delivered and brought to bed: Likewiſe it is
C found to availe much unto them that be bitten with mad dogs.

Moreover, the hearbe called Stachys hath a reſemblance alſo to *Porret, but that the leaves be longer and more in number: it yeeldeth a pleaſant ſmell, and the leaves be of a pale colour, enclining ſomewhat to yellow. The nature of this plant is to move the monthly purgation of women. As for Clinopodium (called otherwiſe Cleonicion, Zopyron, and Ocymoeides) like it is to running wild Thyme, and full of braunches, growing up a ſpan or handfull high at the leaſt. It groweth in ſtonie places, with a ſpoakie tuft of flowers ſhewing in a round compaſſe, and for all the world reſembleth the feet or pillers that *beare up a table or bed. This hearbe taken in drinke is good for convulſions, ruptures, ſtranguries, and ſerpents ſtings. So is the ſyrrup or juleb that is made thereof, by way of decoction. Thus much of thoſe hearbs, which in name carie a ſhew and reſemblance of Trees.

* πράσιον, i. Porri: but it ſeems that *Plinie* ſhould have read πράσιον, i. *Marrubij* or Horehound, out of *Dioſcorides*, as *Rondeletius* hath obſerved. Whereupon it took the name Clinopodium.

D

It remaineth now to write of ſome other hearbs, which I muſt needs ſay are of no great name and reckoning, howbeit ſuch as be endued with wonderfull vertues. As for the famous and notable hearbes indeed, I will reſerve the Treatiſe of them for the bookes following. And firſt I meet with that which we in Italie call Centunculus, but the Greeks Clematis, with leaves pointed like the beake of a bird, or reſembling the cape of a cloake, growing cloſe to the ground in toiled corne fields. This hearbe is moſt effectuall and ſingular above all other, for to ſtay a laske, if it be drunke in ſome red or greene hard wine. The ſame beaten into pouder, and taken to the weight of one denier Roman, in five cyaths of Oxymell or hot water, ſtancheth bleeding: and yet in that ſort it is of great effect to fetch away the after-birth of women lately delivered.

E

But there be other hearbes among the Greek writers, going under the name of Clematides: and namely one, which ſome call Echites, others Lagines, and there are beſides who name it Petie-Scammonie; and in very truth, braunches it hath a foot long, full of leaves, and not unlike to thoſe of Scammonie, but that the leaves be more blacke or duskiſh, and ſmaller. This hearbe is found as well in vineyards as corne lands. People uſe to eat this hearb with oile and ſalt, as they doe Beets, Coles, and other ſuch pothearbes: and ſo eaten, it maketh the bodie ſoluble. And yet nevertheleſſe, thoſe who bee troubled with the bloudie flix, are wont to take it in ſome aſtringent wine with Lineſeed, and find it to work with good ſucceſſe. The leaves applied unto the eyes with parched Barley groats, doe reſtraine the wateriſh humors which fall thither, ſo there bee a fine linnen cloth wet *between. The ſame applied in a pulteſſe to the wens called the Kings evill, bring
F them firſt to ſuppuration, and afterwards having Hogs greaſe put thereto, heale them throughly. Incorporat with greene oile Olive, they eaſe the hemorrhoids: and with honey helpe thoſe that be in a Phthiſicke or Conſumption. If nources eat them with their meat, they ſhall have good ſtore of milke in their breaſts. And if they annoint therewith the heads of their young infants, the haire will come the thicker. A collution made with them and vinegre, aſſuageth the tooth-

*Suppoſito: ſome read contrariwiſe, *ſuperpoſito.*

ach,

ach, if the mouth be waſhed therewith. To conclude it ſtirreth ap to fleſhly luſt. G

There is beſides another kind of Clematis, knowne by the name of the Ægyptian Clematis: howſoever ſome call it Daphnoeides, others, Polygonoeides. Leaved it is like the Lawrell, ſave that the leaves bee long and thin. But againſt all ſerpents, and eſpecially the Aſpides, it is a ſoveraigne countrepoyſon if it bee drunke in vinegre. Ægypt bringeth foorth this hearbe in great abundance.

Chap. xvi.

Of Aron, Dracunculus, or Dracontium. Of Aris. Of Milleſoile. Of another hearbe of that name. Of Pſeudobunium. Of Myrrhis and Onobrichis: with their medicinable vertues. H

Wake-robin. Dragon.

THere is a great difference betweene *Aron (of which hearbe I have written among thoſe with bulbous roots) and *Dracontium: although writers bee at ſome variance about this point, for ſome have affirmed that they be both one. Howbeit *Glaucias* hath diſtinguiſhed them, in that the one groweth wild, and the other is planted: and he pronounceth and calleth Dragon, the ſavage Aron. Others are of opinion, That there is no other difference between them, but that the onion root is called Aron, and the ſtem of the ſame hearbe Dracontium: whereas indeed there is no likeneſſe at all betweene the one and the other, if ſo be that Dracontium of the Greekes be the ſame that we call Dracunculus in Latine. For Aros hath a blacke root growing broad, flat, and round, yea, and farre greater, inſomuch as it is a good handfull: but the root of Dracunculus is ſomewhat red, and the ſame wrythed and folded round in manner of a Dragon, whereupon it tooke that name. Nay, the very Greekes themſelves have made an exceeding great difference, betweene Dragon and Wake-Robin: for they affirme, That the ſeed of Dragon is hot and biting, and beſides, of ſuch a virulent and ſtinking ſmell, that the very ſent thereof is ynough to drive a woman great with child to travaile before her time, and to ſlip an untimely birth. Contrariwiſe, they have wonderfully commended Aron: For firſt and formoſt, they prefer the female of this kind as a principall meat, before the male, which is harder to be chewed, and longer ere it be concocted and digeſted: moreover, they affirm, That as well the one as the other, doth expectorat the fleame gathered in the cheſt: and whether it be dried and brought into pouder and ſo the drinke ſpiced withall, or otherwiſe taken in forme of a lohoch or electuarie, it provoketh both urine and alſo womens monthly termes. Drunke with Oxymell, it mundifieth and comforteth the ſtomacke: and Phyſicians have given it in Ewes milke for the exulceration of the guts: & roſted under the embers, they have preſcribed it to be taken with oile for the cough: Some have ſodden it in milke, and given the decoction thereof to be drunke in that caſe. They have appointed it alſo to bee boiled, and then applied accordingly, to waterie eyes for to repreſſe the violence of the rheume: likewiſe, unto places blacke and blew with ſtripes: as alſo for the inflammation of the amygdales: alſo, they have given direction to inject the ſame with oile by way of clyſtre, as an excellent remedie for the Hæmorrhoids: and to applie it in a liniment with honey, for to take away the pimples and freckles of the skin. *Cleophantus* hath given it the praiſe of an excellent antidote or countrepoyſon: preſcribing alſo the uſe thereof for the pleuriſie and inflammation of the lungs, in the ſame manner, as in caſe of the cough: he appointed likewiſe to beat the ſeed into pouder, and being mixed either with common oile or oile roſat, to drop it into the eares for to aſſuage the paine. *Dieuches* ordained, to take and temper it with meale, and ſo to worke it into a paſte, and to give the bread ſo made, unto them that cough: to thoſe who be ſhort winded: ſuch alſo as cannot breath unleſſe they ſit upright: and laſtly, to as many as reach up filthie matter out of their breaſt. *Diodotus* the Phyſician made therof an electuarie or lohoch with honey, for them to licke who are in a Phthiſicke, or otherwiſe diſeaſed in the lights: and hee appointed it to bee laid as a pulteſſe for fractures of bones. There is not a beaſt or living creature whatſoever, but if the ſhap or naturall parts be annointed therewith, it will fetch away the fruit of their wombe. The juice drawne out of the root, if it be incorporat with Atticke honey, ſcattereth the miſtie clouds and filmes in the eyes that trouble the ſight: the ſame alſo cureth the defects and infirmities of the ſtomacke. And a ſyrrup made with the decoction therof and honey, is good to ſtint a cough. All ulcers whatſoever, bee they woolves, cankerous ſores, or otherwiſe corroſive and eating forward ſtill: yea, the very illfavoured Polype and Noli-me-tangere in the noſthrils, the

These deſcriptions agree not with our Wake robin and Dragon.

I K L M

A the juice of this root dooth cure and heale wonderfully. The leaves ſodden in wine and oile, are good to be applied unto any burne or place ſcalded. Being eaten in a ſallad with ſalt and vinegre, they purge the bellie: ſodden with honey, and applied as a cataplaſme, they are good for diſlocations and bones out of joint. Semblably, the ſaid leaves, whether they bee greene or dried, are excellent for the gout in any joint, if they bee laid too with ſalt. *Hippocrates* deviſed a plaſtre of them and honey together, which was ſingular for all impoſtumations whatſoever. For to bring downe the deſired ſickneſſe of women, two drams of the root or ſeeds (it skils not whether) taken in two cyaths of wine, is a ſufficient doſe. The ſame potion fetcheth away the after-birth, in caſe it make no haſt to come away after a woman is delivered of child. And for this purpoſe *Hippocrates* appointed the very bulbous root of Aron in ſubſtance to be applied unto the nature of a woman
B in the like caſe. It is ſaid, that in time of peſtilence it is a ſingular preſervative, if it bee eaten with meats. Certes, it is excellent to keepe them for being drunke, who have taken their liquor liberally; or at leaſtwiſe to make them ſober againe. And yet the perfume or ſmoke thereof, when it burneth, chaſeth ſerpents away, and eſpecially the Aſpides; or els dooth intoxicat their heads, and make them ſo drunke that a man ſhall find them lying benummed and aſtonied, as if they were dead. The ſame ſerpents moreover will not come neare unto thoſe that bee annointed all over with this hearbe Aros and oile of baies: hereupon it is thought, that it is a good preſervative againſt their ſtings, if it be drunke in groſſe red wine. They ſay moreover, that cheeſes will keepe paſſing well, if they be wrapped within the leaves of Aron.

To come now to Dragons, called in Latine Dracunculus, whereof I have ſpoken before: The
C onely time to dig it out of the ground, is when Barley beginneth to ripen, and within the two firſt quarters of the Moone, all the while that ſhe doth encreaſe in light. Let one but have the root of this hearbe about him in any part of the bodie (it makes no matter how or where hee carie it) hee ſhall be ſure that ſerpents will flie from him. And therfore it is ſaid, that the greater kind of them is ſingular to be given in drinke unto thoſe who are ſtung alreadie by them; as alſo that it ſtoppeth the immoderat courſe of womens fleurs, in caſe it touched no yron inſtrument when it was gathered. The juice thereof is paſſing good for paine in the eares.

As for that Dragon which the Greekes name Dracontium, it hath ben ſhewed and deſcribed unto me in three formes: The one leaved like unto the Beets, growing with an upright main ſtem with a flower of a purple colour: this Dragon is like unto Aron. Others brought unto mee a ſe-
D cond kind with a long root (as it were) marked foorth and devided into certaine joints; it putteth out three ſmall ſtems and no more: and they declared moreover and gave direction to ſeeth the leaves therof in vinegre againſt the ſting of ſerpents. There was a third ſort ſhewed unto me, bearing a leafe bigger than that of the Corneil tree, with a root reſembling thoſe of the canes or reeds: and (as they avouched) parted into as many joints and knots juſt, as it was yeares old, and ſo many leaves likewiſe it had, neither more nor leſſe. Thoſe that preſented it unto me, uſed to give the ſame in wine or water againſt ſerpents.

There is an hearbe alſo named Aris, growing in the ſame Ægypt: like unto Aron aboveſaid, ſave that it is leſſe, hath ſmaller leaves, and not ſo big a root, and yet the ſame is full as great as a good round and large olive. Of theſe, there bee two kinds: the one which is white, riſeth up with
E two ſtalks: the other putteth forth but one ſingle ſtem. Both of them have vertue to cure running ſkals and ulcers; to heale burnes alſo and fiſtulous ſores, if a collyrie or tent be made thereof and put into the ſore: the leaves boiled in water, and afterwards ſtamped and incorporat with oile roſat doe ſtay the ſpreading of corroſive and eating ulcers. But mark one wonderfull property that this plant hath: touch the nature or ſhap of any female beaſt therewith, ſhe will never lin gadding untill ſhe die with one miſcheefe or other.

Touching Millefoile or Yarrow, which the Greekes call Myriophyllon, and we in Latine Millefolium: it is an hearbe growing up with a tender and feeble ſtalke, like in ſome ſort unto Fenell, and charged with many leaves, whereupon it tooke the name: it groweth in moores and fennie grounds: uſed to very good purpoſe and with ſingular ſucceſſe, in curing of wounds. Over & be-
F ſides, it is given to drinke with vinegre for the difficultie of urine and the ſtoppage of the bladder, for thoſe that take wind thicke and ſhort, and ſuch as are inwardly bruiſed by falling headlong from on high; the ſame is moſt effectuall to take away the toothach.

In Tuſcane they have another hearb ſo called, growing in medows, which putteth forth on either ſide of the ſtalke or ſtem, a number of pretie leaves as ſmall in manner as hairs. The ſame alſo

is

is a moſt excellent wound-hearbe. And it is avouched by the people of that country, That if an Ox chaunce to have his ſtrings or ſinewes cut quite atwo with the plough ſhare, this hearbe will conglutinat and ſouder them againe, if it be made into a ſalve with ſwines greaſe. G

Concerning baſtard Navew, called in Greeke Pſeudo Bunion, it hath the leaves of Navew gentle, and braunch eth to the height of a hand breadth or ſpan. The beſt of this kind groweth in the Iſle Candie, where they uſe to drinke five or ſixe branches therof for the wringing torments of the bellie, for the ſtrangurie, the paine of the ſides, midriffe, and precordiall parts.

Myrrhis, which ſome call Smyrrhiza, others Myrrha, is paſſing like unto Hemlocke, in ſtalke leaves, and flower; onely it is ſmaller and ſlenderer, and hath no ill grace and unpleaſant taſt to be eaten with meats. Taken in wine, it haſteneth the monthly courſe of womens fleurs if they bee too ſlow, and helpeth them in labour to ſpeedie deliverance. It is ſaid moreover, That in time of a plague it is holeſome to drinke it for feare of infection. A ſupping or broth made of it, helpeth thoſe who are in a Phthyſicke or conſumption. This good propertie it hath beſides, to ſtirre up a quicke appetite to meat. It doth extinguiſh and kill the venome inflicted by the ſting or pricke of the venomous ſpiders Phalangia. The juice drawne out of this hearbe after it hath lien infuſed or ſoaked three daies together in water, healeth any ſore breaking out either in face or head. H

Finally, Onobrychis carieth leaves reſembling Lentils, but that they are ſomewhat longer: it beareth alſo a red flower: but reſteth upon a ſmall and ſlender root. It groweth about ſprings and fountaines. Being dried and reduced into a flower or pouder, it maketh an end of the ſtrangurie, ſo it be drunke in a cup of white wine well ſtrewed and ſpiced therwith. It ſtoppeth a lask. To conclude, the juice thereof cauſeth them to ſweat freely who are annointed all over with it.

I

Chap. XVII.

The medicinable vertues of Coriaceſia, Callicia, and Menais, with three and twentie other hearbes, which ſome hold to be Magicall. Moreover, of Conſidia, and Aproxis, beſides ſome other which are revived and in requeſt againe, having been long time out of uſe.

TO diſcharge and acquit my ſelfe of the promiſe which I made of ſtraunge and wonderfull hearbes, I cannot chuſe but in this place write a little of thoſe which the Magicians make ſuch reckoning of. For can there bee any more admirable than they? And in verie truth, *Democritus* and *Pythagoras*, following the tracts of the ſaid wiſe men and Magicians, were the K firſt Philoſophers, who in this part of the world ſet thoſe hearbes on foot, and brought them into a name.

And to begin with Coriaceſia and Callicia. *Pythagoras* affirmeth, That theſe two hearbes will cauſe water to gather into anyce. I find no mention at all in any other authors of theſe hearbs, neither doth he report more properties of them.

The ſame author writeth of an hearbe called Menais, knowne alſo by the name of Corinthas, the juice whereof (by his ſaying) if it be ſodden in water, preſently cureth the ſting of ſerpents, if the place be fomented with the ſaid decoction. Hee affirmeth moreover, that if the ſaid juice or liquor be poured upon the graſſe, whoſoever fortuneth to goe thereupon, and touch it with the L ſole of the foot, or otherwiſe chaunce to be but daſhed or ſprinckled therewith, ſhall die thereupon remedileſſe, and no way there is to eſcape the miſcheefe. A monſtrous thing to report that this juice ſhould be ſo ranke a venome as it is, unleſſe it be uſed againſt poyſon.

The ſelfeſame *Pythagoras* ſpeaketh yet of another hearbe which he calleth Aproxis: the root whereof is of this nature, to catch fire a farre off; like for all the world to Naphtha, concerning which, I have written ſomwhat alreadie in my diſcourſe as touching the wonders of Nature. And he reporteth moreover, That if a man or woman happen to be ſick of any diſeaſe, at what time as this Aproxis is in the flower, although he or ſhee bee throughly cured of it, yet ſhall they have a grudging or minding thereof as often as it falleth to flower againe yeare by yeare. And of this opinion he is beſides, That Frumentie corne, Hemlocke, and Violets, are of the ſame nature and M propertie. I am not ignorant, That this booke of his wherein theſe ſtrange reports are recorded, ſome have aſcribed unto *Cleomporus*, a renowmed Phyſician: but the currant fame or ſpeech holdeth ſtill ſo conſtantly, time out of mind, that we muſt needs beleeve *Pythagras* to be the author of the ſaid booke. True it is indeed, that the name of *Pythagoras* might give authoritie and credit

A dit to other mens bookes attributed unto him, if haply any other had laboured and travelled in compiling some worke, which himselfe judged worthie of such a man as he was: but that *Cleomporus* should so doe, who had set forth other bookes in his owne name, who would ever beleeve? No man doubteth verely, but that the booke entituled *Chirocineta, was of *Democritus* his making: and yet therein be found more monstrous things by a hundred fold, than those which *Pythagoras* hath delivered in that worke of his. And to say a truth, setting *Pythagoras* aside, there was not a Philosopher so much addicted to the schoole and profession of these Magicians, than was *Democritus*.

*As one would say, such a book as should be continually occupied, and never laid out of hand.

In the first place he telleth us of an hearbe called Aglaophotis, Worthie to bee admired and wondered of men, by reason of that most beautifull colour which it had: and for that it grew
B among the quarries of marble in Arabia, confining upon the coasts of the realm of Persia, therfore it was also named Marmaritis. And he affirmeth, that the Sages or Wise men of Persia called Magi, used this hearbe when they were minded to conjure and raise up spirits.

He writeth moreover, That in a countrey of India inhabited by the Tardistiles, there is another hearbe named Achæmenis, growing without leafe, and in colour resembling Amber: of the root of which hearbe there be certaine Trochiskes made: whereof they cause malefactors and suspected persons to drinke some quantitie with wine, in the day time, to the end they should confesse the truth: for in the night following they shal be so haunted with spirits and tormented with sundrie fansies and horrible visions, that they shall be driven perforce to tell all, and acknowledge the fact for which they are troubled and brought in question. The same writer calleth this plant
C *Hippophobas, because Mares of all other creatures are most fearefull and warie of it.

* or Hippophobas.

Furthermore, he reporteth, That thirtie Schœnes from the river Choaspes in Persia, there groweth an hearbe named Theombrotion: which for the manifold and sundrie colours that it hath, resembleth the painted taile of a Peacocke, and it casteth withall a most sweet and odoriferous sent. This hearbe (saith he) the Kings of Persia use in their meats and drinkes: and this opinion they have of it, That it preserveth their bodies from all infirmities and diseases, yea and keepeth their head so staied and setled, that they shall never bee troubled in mind and out of their right wits: In such sort, that for the powerfull majestie of this plant, it is also called Semnion.

He proceedeth moreover to another, knowne by the name Adamantis, growing only in Armenia and Cappadocia: which if it bee brought neare unto Lions, they will lie all along upon
D their backs, and yawne with their mouths as wide as ever they can. The reason of the name is this, because it cannot possibly be beaten into pouder.

He goeth on still and beareth us in hand, that in the realme Ariana, there is found the hearbe Arianis, of the colour of fire. The inhabitants of that countrey use to gather it when the Sunne is in the signe Leo: and they affirme, that if it doe but touch any wood besmeared and rubbed over with oile, it will set the same a burning on a light fire.

What should I write of the plant Therionarca, which whensoever it beginneth to come up and rise out of the ground, all the wild beasts will lie benummed and (as it were) dead: neither can they be raised or recovered againe, untill they be sprinckled with the urine of Hyæna.

The hearb Æthiopis, by his report groweth in Meroë, for which cause it is called also Meroïs:
E In leafe it resembleth Lectuce: and being drunke in mead or honied water, there is not such a remedie againe for the dropsie.

Over and besides, he speaketh of the plant Ophiusa, found in a countrey of the same Æthyopia, named Elephantine: Of a leaden hue it is, and hideous to see to: whosoever drinke thereof, shall be so frighted with the terrors and menaces of serpents represented unto their eyes, that for very feare they shall lay violent hands on themselves: and therefore church robbers are enforced to drinke it. Howbeit, if a man take after it a draught of Date wine, he shall not be troubled with any such fearefull visions and illusions.

Moreover, there is found (saith *Democritus*) the hearbe Thalassegle about the river Indus, and thereupon is knowne by another name Potamantis: which if men or women take in drink, tran-
F sporteth their sences so far out of the way, that they shall imagin they see strange sights.

As for Theangelis, which by his saying groweth upon mount Libanon in Syria, and upon Dicte, a mountaine in Candie; also about Babylon and Susis in Persia; if the wise Philosophers (whome they tearme Magi) drinke of that hearbe, they shall incontinently have the spirit of prophesie, and foretell things to come.

There

There is beſides in the region called Bactriana and about the river Boryſthenes, another G
ſtrange plant named Gelotophyllis, which (by his report) if one doe drinke with Myrrhe and wine, it will cauſe many fantaſticall apparitions: and the partie ſhall thereupon fall into a fit of laughter without ceaſing and intermiſſion, and never give over, unleſſe it bee with a draught of Date wine, wherein were tempered the kernils of Pine nuts together with pepper and honey.

Touching the hearbe of good fellowſhip Syſſitieteris, found in Perſis, it tooke that name becauſe it maketh them exceeding merie who are met together at a feaſt. They call the ſame hearb likewiſe Protomedia, for that it is ſo highly eſteemed among kings and princes. And another name it hath beſides, towit, *Acaſignete, becauſe it commeth up alone and no other hearbs near unto it: yea, and one more yet, namely, Dionyſonymphas, becauſe wine and it ſort ſo well together, and make as it were a good mariage. H

*As one would ſay, without brother or ſiſter.

The ſame *Democritus* talketh alſo of Helianthe: an hearbe leaved like to the Myrtle, growing in the countrey Themiſcyra, and the mountaines of Cilicia, coaſting along the ſea. And he giveth out, that if it be boiled with Lions greaſe, and then together with Saffron and Date wine reduced into an ointment, the foreſaid Magi and the Perſian kings therewith annoint themſelves, to ſeeme thereby more pleaſant and amiable to the people: which is the reaſon, that the ſame hearbe is called Heliocallis.

Over and beſides, he maketh mention of Hermeſias, (for ſo he tearmeth not an hearbe but a certaine compoſition) ſingular for the getting of children, which ſhall proove faire and of good nature beſides. Made it is of Pine-nut kernils, ſtamped and incorporat with Honey, Myrrhe, Saffron, and Date wine, with an addition afterwards of the hearbe Theombrotium and milke: and I
this confection he preſcribeth to be drunk by the man a little before the very act of generation: but by women upon their conception, yea, and after their deliverie all the while they be nourees and give ſucke: and in ſo doing they may be aſſured, that thoſe children of theirs, thus gotten, bred, and reared, ſhall be paſſing faire and well favoured, of an excellent ſpirit and courage: and in one word, every way good. Of all theſe hearbes before ſpecified, he ſetteth downe alſo the very names which the ſaid Magi call them by. Thus much for the Magicke hearbes found in *Democritus* his booke.

Apollodorus, one of his diſciples and followers, comes in with his two hearbes to the other beforenamed. The one he calleth Æſchynomæne, becauſe it draweth in the leaves, if one come neare unto it with the hand: the other Crocis, which if the venomous ſpiders Phalangia doe K
but touch, they will die upon it.

Cratevas writeth of an hearbe called Oenotheris, which being put in wine, if any ſavage beaſts be ſprinckled therewith, they will become tame, gentle and tractable.

*Appion, called alſo *Pleiſtonices*

A famous* Grammarian of late daies made mention of another hearb Anacampſeros, of this vertue, That if a man touched a woman therewith, were ſhee departed from him in all the hatred that might bee, ſhee would come again and love him entirely. The ſame benefit alſo ſhould the woman find thereby, in winning the love of a man. This may ſuffice for the preſent to have written of theſe wonderfull Magicke hearbs, conſidering that I meane to diſcourſe more at large of them and their ſuperſtition in a more convenient place. L

Chap. xviii.

Of Eriphia, Lanaria, and Stratiotis, with the medicines which they yeeld.

MAny writers have made mention of Eriphia. This hearb hath within the ſtraw of the ſtem a certain flie like a beetle, running up and downe, and by that means making a noiſe like unto a young kid, whereupon it tooke the foreſaid name. There is not a better thing in the world for the voice, than this hearb, as folke ſay.

The hearbe Lanaria, given to ewes in a morning when they are faſting, cauſeth their udders to ſtrout with milke. Lactoris likewiſe is a common hearb and as well knowne, by reaſon that it is ſo full of milke, which cauſeth vomit, if one taſt thereof never ſo little. Some there be who ſay, M
That the hearb which they call * Militaris, is all one with this Lactoris: others would have it to be verie like unto it; and that it ſhould have that name, becauſe there is not a wound made with ſword or edged weapon, but it healeth it within five daies, in caſe it be applied thereto with oile.

*The ſoldiors hearbe.

Semblably, the Greeke writers make great reckoning of their* Stratiotes: but this hearbe

*All one with *Millitaris.*

groweth

A groweth onely in Ægypt, and namely in floten grounds where the river Nilus hath overflowed: and like it is unto Sengreene or Houſleeke, but that it hath bigger leaves. It is exceeding refrigerative; and a great healer of greene wounds, beeing made into a liniment with vinegre: moreover it cureth S. *Anthonies* fire, and all apoſtumes which are broken and run matter: if it be taken in drinke with the male-frankincenſe, it is wonderfull to ſee how effectuall it is to repreſſe the flux of bloud from the reins.

Chap. xix.

Of the hearbs that grow upon the head and chapter of Images and Statues. Of hearbs found in rivers. Of the hearb called Lingua. Of hearbs growing through a ſieve, and upon dunghills. B *Of Rhodora and Impia, two hearbs. Of Pectен Veneris. Of Nodia. Of Clavers, or Gooſe-graſſe, called otherwiſe Philanthropos. Of the little Bur named Canaria: of Tordile. Of the ordinarie Coich-graſſe, Stitchwort, or Dent-de-chien. Of the hearbe Dactylus, and Fenigrecke: with their medicinable vertues.*

IT is commonly ſaid, That the hearbs or weeds growing upon the head of any ſtatue or image, preſently allay the head-ach (if they bee gathered in the lappet or any part of ſome garment) ſo as the Patient weare them tied about the necke, by red linnen thread, or enfolded within ſome red linnen clout. Any hearbe whatſoever gathered out of ſome riveret, brooke, or great river, before the ſun-riſing, ſo as no man ſee the partie during the time of the gathering, provided C alwaies that it be tied to the left arme of the ſicke Patient, and he or ſhee not know what it is, driveth away any tertian ague, if it be true which is commonly ſaid. There is an herb growing about fountains called Lingua, *i.* a Tongue: the root thereof being burnt into aſhes, and incorporat with the greaſe of a ſwine (but you muſt looke, ſay they, that the ſwine be blacke and barraine) cauſeth haire to come againe, in caſe the place which is bare and bald, be annointed therewith in the ſun. Caſt a ſieve or riddle foorth into any beaten path or high-way, the graſſe or weeds comming up underneath, and growing through the ſame, if they be gathered and bound about the necke or any other part of women with child, doe haſten their travaile and deliverie. Thoſe hearbs which be found growing upon muckhills about countrey ferms, are paſſing good and effectuall for the ſquinancie, if they be drunke with water. The graſſe or hearbe neare unto which D a dog lifts up his leg and piſſeth, if it bee plucked out of the ground without touching knife or yron inſtrument, cureth any diſlocation or bone out of joynt, moſt ſpeedily.

Touching the tree (in manner of an Opiet or Poplar) called Rumbotinus, I have deſcribed it in my treatiſe of Hortyards and Tree-plots. Neare to one of theſe (and namely, when there is no vine coupled or married to it) there groweth a certain herb, which in Fraunce they call Rhodora: it riſeth up with a ſtem pointed and knotted in manner of a figtree rod or wand; beareth leaves reſembling nettles, ſomwhat whitiſh in the mids, but the ſame in proceſſe of time become red all over; and a floure of ſilver colour: This hearbe ſtamped and mixed with old hogs greaſe, maketh a ſoveraigne liniment for all ſwellings, inflammations, and impoſtumes gathering to an head; provided alwaies that no edge toole come near to touch it, and that the partie who is dreſ- E ſed or annointed therewith turne the head to the right hand, and ſpit thrice upon the ground on that ſide. And the operation of this medicine will be the more effectuall, if three ſundrie men of three divers nations, ſtand on the right hand when they annoint the Patient.

Concerning the hearb Impia, which is of a hoarie colour and white withall, it reſembleth in ſhew the Roſemarie, riſing up with a maine ſtem, leafed and headed in manner of a Cole-ſtocke: from which principall bodie, there grow foorth other ſmall braunches, every one bearing little tufts or heads riſing and mounting above the mother ſtocke (whereupon they called it in Latine Impia, for that the children over-topped their parents;) yet there be others who have thought it rather ſo called, becauſe there is no beaſt will touch or taſt it. This hearb, if it be ground between two ſtones, waxeth as hot as fire, and yeeldeth a juice which is excellent for the ſquinancie, if the F ſame be tempered with milke and wine. But this is ſtraunge that is reported moreover, namely, That whoſoever hath once taſted of this hearbe, ſhall never be troubled with that diſeaſe; and therefore they uſe to give it in waſh and ſwill, to ſwine: but looke which of them refuſe to drinke of this medicine, ſhall die of the ſaid ſquinancie. Some are of opinion, That in birds neſts there is ſome of this hearbe commonly ſet and twiſted among other ſticks, whereby it commeth to

passe that the yong birds never be choked, gobble they their meat as greedily as they will. G

As touching the hearbe called Veneris Pecten, which tooke that name of the resemblance that the long cods thereof hath to combe or rake teeth: the root, if it be stamped with mallows, and so reduced into a cataplasme, draweth forth all spills, thorns, or whatsoever sticketh within the flesh. The hearb * Exedum, is singular to cure the lethargie, and all drowsinesse.

* It seemeth by name and effect, to be of some sharpe and fretting qualitie.

As for Nodia, it is an hearbe well knowne in curriours shops. They call it also Mularis, and other names besides they have for it: but tearme it how you will, it healeth corrosive ulcers: and I find, that it is of singulular operation against the poison of scorpions, if it be drunke in wine or oxymell, *i.* vinegre and water mingled togither. There is a certaine rough and prickie hearbe, which the Greeks call by a pretie name * Philanthropos, for that it sticketh to folks cloaths as they passe by. A chaplet or guirland made of this hearb, and set upon the head, easeth the paine thereof. As for the little Bur called Lappa Canaria, if it be stamped with Plantaine and Millefoile, and togither with them concorporat in wine, it healeth all cancerous sores, so it be applied unto the place and remooved once in three daies. The same hearbe digged forth of the ground without any spade or yron instrument, cureth swine, if it bee put into the trough where they be served with draffe & swill, or given them in milk and wine. Some add moreover, that this charme must be said in the digging, *Hæc est herba Argemon, quam Minerva reperit suibus remedium, qui de illa gustaverint: id est*, This is the hearb Argemon, which *Minerva* invented as a remedie for diseased swine, as many as tasted thereof. H

*Goose-grasse or Clivers.

As for Tordile, some have said that it is the seed of Seseli, or Siler of Candie: others take it to be an hearbe by it selfe, which also they called Syreon: for mine owne part, I find by my reading, nothing of it, but that it delighteth to grow upon mountains; and that being burnt, it is good to be drunke for to provoke womens monethly terms, and to expectorat the superfluous fleame out of the brest: for which purposes (they say) that the root is more effectuall in operation: also that the juice thereof taken in drinke to the weight of three oboli, is singular for the reines: finally, that the root is one of the ingredients which go to the making of emollitive plasters or cataplasms. I

The Quich-grasse, otherwise named Dent-de-chien, or Dogs-grasse, is the commonest hearb that groweth: it runneth and creepeth within the earth by many knots or joints in the root, from which, as also from the braunches and top-sprigs trailing above-ground, it putteth foorth new roots and spreadeth into many braunches. In all other parts of the world, the leaves of this grasse grow slender and sharpe pointed toward the end: onely upon the mount Pernassus (whereupon it is called Gramen Pernassi) it brauncheth thicker than in other places, and resembleth in some sort Ivie, bearing a white floure, and the same odoriferous. There is not a grasse in the field wherein horses take more delight to feed, than this, whether it be greene as it groweth, or drie and made into hay, especially if it be given them somewhat sprinkled with water. Moreover, it is said, That the inhabitants about the foresaid mount Pernassus, do draw a juice out of this grasse, used much to encrease plentie of milke; for sweet and pleasant it is: but in other parts of the world, in stead thereof, they use the decoction of the common grasse, for to conglutinat wounds: [and yet the very hearbe it selfe in substance will doe as much, if it bee but stamped and so applied: and besides, a good defensative it is to keepe any place that is cut or hurt, from inflammation.] To the said decoction, some put wine and honey: others adde a third part in proportion of Frankincense, Pepper, and Myrrhe: and then set all over the fire againe, and boile it a second time in a pan of brasse: which composition they use as a medicine for the tooth-ach and watering eyes, occasioned by the flux of humors thither. The root sodden in wine, appeaseth the wrings & torments of the guts; openeth the conduits of the urine, and giveth it passage; besides, it healeth the ulcers of the bladder: yea, it breaketh the stone. But the seed is more diureticall, and with greater force driveth downe urine than the root. And yet it stoppeth a laske, and staieth vomite. A peculiar vertue it hath against the sting of dragons or serpents. Moreover, some there be, who give direction in the cure of the Kings evill, and other flat impostumes called Pani, to take nine knots or joints of a root of this grasse: and if they cannot find one root with so many joints, to take two or three roots, untill they have the foresaid number: which done, to enwrap or fold the same in unwashed or greasie wooll which is blacke, [with this charge by the way, that the partie who gathered the said roots bee fasting] and then to goe unto the house of the patient that is to be cured, waiting a time when he is from home: and be readie at his returne to receive him with K L M

these

A theſe words three times pronounced, *Iejunus jejuno medicamentum do*, [*i.* I being yet faſting, give thee a medicine alſo whiles thou art faſting:] and with that, to bind the foreſaid knots and roots unto the parts affected, and ſo continue this courſe for three daies togither. Furthermore, that kind of graſſe which hath ſeven joynts in the root, neither more nor leſſe, is ſingular for the head-ach, and worketh great effects if the Patient carrieth it tied faſt about him. Some Phyſicians doe preſcribe for the intollerable paine of the bladder, to take the decoction of this graſſe boiled in wine unto the conſumption of one halfe, and give it to drinke unto the Patient, preſently upon the comming out of the baine or hot-houſe.

Touching the graſſe, which by reaſon of the pricks that it beareth is named Aculeatum, there be three ſorts of it: The firſt is that which ordinarily hath five ſuch pricks in the head or top
B thereof, and thereupon they call it Penta-Dactylon, *i.* the five-finger graſſe: theſe pricks when they be wound togither, they uſe to put up into the noſthrils and draw them downe againe, for to make the noſe bleed. The ſecond is like to * Sengreen or Houſleeke: ſingular good it is for the whitflaws, and excreſcences or riſings up of the fleſh about the naile roots, if it bee incorporat into a liniment with hogs greaſe: and this graſſe they call Dactylos, becauſe it is a medicine for the fingers. * The third kind named likewiſe Dactylos, but ſmaller than the other, groweth upon old decaied walls or tyle-houſes: this is of a cauſticke and burning nature, good to repreſſe the canker in running and corroſive ulcers. Generally, a chaplet made of the hearbe Gramen or Dogs-graſſe, and worne upon the head, ſtancheth bleeding at the noſe. The Gramen that groweth along the high waies in the countrey about Babylon, is ſaid to kill camels that graſe upon it.

C Fenigreeke commeth not behind the other hearbs before ſpecified, in credit and account for the vertues which it hath: the Greeks call it Telus and Carphos: ſome name it Buceras and Ægoceras, for that the * ſeed reſembleth little horns: wee in Latine tearme it Silicia or Siliqua. The manner of ſowing it, I have declared in due place ſufficiently. The vertues thereof, is to drie, mollifie, and reſolve: the juice drawne out of it after the decoction, is right ſoveraigne for many infirmities and diſeaſes incident to women, and namely in the naturall parts, whether the matrice have a ſchirre in it and be hard or ſwolne, or whether the necke thereof be drawne too ſtreight and narrow: for which purpoſes, it is to bee uſed by way of fomentation, inſeſſion, or bath; alſo by infuſion or injection with the metrenchyte. Very proper it is to extenuat the ſcurfe or ſcalls like dandruffe, appearing in the viſage: being ſodden and applied togither with ſal-nitre,
D it helpeth the diſeaſe of the ſplene. The like effect it hath with vinegre: and being boiled therin, it is good for the liver. For ſuch women as have painefull travaile in child-birth, and bee hardly delivered, *Diocles* appointed Fenigreeke ſeed to the quantitie of one acetable, to bee given in nine cyaths of wine cuit for three draughts: with this direction, that the woman firſt ſhould take one third part of this drinke, and then goe to a hot bath, and whiles ſhe were ſweating therein, to drinke one halfe of that which was left: and preſently after ſhe is out of the baine, ſup off the reſt. And he ſaith there is not the like medicine to be found in this caſe, when all others will take no effect. The flower or meale of Fenigreeke ſeed boiled in mead or honied water, together with Barly or Lineſeed is ſingular for the paine of the matrice, either applied to the ſhare in maner of a cataplaſme, or put up into the naturall parts as a peſſarie, according as the abovenamed *Diocles* ſaith:
E who was wont likewiſe to cure the leprie or S. *Magnus* evill; to cleanſe and mundifie the skin, of freckles & pimples, with a liniment made with the foreſaid flower incorporat with the like quantitie of brimſtone: with this charge, to prepare the skin by rubbing it with ſalnitre, before the ſaid ointment were uſed, and then to annoint it oftentimes in a day. *Theodorus* uſed to mix with Fenigreeke a fourth part of the ſeed of garden Creſſes well cleanſed, and to temper them in the ſtrongeſt vinegre that he could come by, which he tooke to be an excellent medicine for the leproſie. *Damion* ordained to make a drink with halfe an acetable of Fenigreek ſeed put into nine cyaths of cuit or ſheere water, and ſo to give it for provoking of womens fleurs. And no man doubteth but the decoction of Fenigreeke is moſt holſome for the matrice & the exulceration of the guts: like as the ſeed it ſelfe is excellent for the joints and precordiall parts about the heart. But in caſe it be
F boiled with Mallows, it is good for the matrice & the guts, ſo there be put unto the ſaid decoction ſome honied wine, and then given in drinke: for even the very vapor or fume of the ſaid decoction doth much good to thoſe parts. Alſo the decoction of Fenigreeke ſeed rectifieth the ſtinking ranke ſmell of the arme-pits, if they be waſhed therewith. The flower made of Fenigreeke ſeed, incorporat with nitre and wine, quickly cleanſeth the head of ſcurfe, ſcalls, and dandruffe. But

* Some take this to be *Paronychia*, *Dioſc.* or rather a kind of Atizoon, Mouſe-taile, or Prick-madam.

* This is thought to be great Stone-crop, wild Purcellane, or Wall-pepper.

Or rather the cods wherein the ſeed is encloſed.

boiled in hydromell (that is to say, honyed water) and brought into a liniment with hogs greaſe, G
it cureth the ſwelling and inflammation of the members ſerving to generation: likewiſe it is ſingular for the broad and flat apoſtems called Pani, the ſwelling kernels and inflammations behind the eares, the gout as well of the feet as of the hands and other joynts; alſo the putrefaction of the fleſh readie to depart from the bone: and being incorporat in vinegre, it helpeth diſlocations: being boiled in vinegre and honey onely, it ſerveth as a good liniment for the ſplene: and tempered with wine, it cleanſeth or mundifieth cancerous ſores; but put thereto hony, it healeth them throughly in a ſhort time. The ſaid floure of Senigreeke ſeed taken in a broth or ſupping, is an approoved remedie for an ulcer within the breaſt, and any inveterat cough; but it asketh long ſeething, even untill it have loſt the bitterneſſe: and afterwards hony is put therto, and then it is a ſingular grewell for the infirmities beforeſaid. Thus you ſee what may bee ſaid of thoſe H
Hearbs which are in compariſon but of meane account: it remaineth now to diſcourſe of thoſe which are of more account and eſtimation than the reſt.

THE XXV. BOOKE OF I
THE HISTORIE OF NATVRE,
WRITTEN BY C. PLINIVS SECVNDVS.

CHAP. I. K

The nature and properties of Hearbs growing wild and of their owne accord.

WHen I conſider the excellencie of ſuch hearbs, whereof now I am to treat, and which the earth ſeemeth to have brought forth onely for the uſe of Phyſicke, I cannot chuſe but grow withall into a woonderfull admiration of the great induſtrie and carefull diligence of our auncients before-time, who have made experiments of all things, and left nothing untried: neither reſerved they afterwards this hidden knowledge to themſelves nor concealed ought, but were willing to communicat the ſame unto poſteritie for their good and benefit: but wee contrariwiſe in theſe daies, are deſirous to keepe ſecret and to ſuppreſſe the labours of other men; yea and to defraud the world of thoſe L
commodities which have been purchaſed by the ſweat of other mens browes: for verely we ſee, it is an ordinarie courſe, that ſuch as have attained to ſome knowledge, envie that little skill unto their neighbours: and to keepe all forſooth to themſelves and teach none their cunning, they thinke the onely way to win a great name and opinion of ſome deepe and profound learning. And ſo far be wee off from deviſing new inventions, and imparting the ſame to the generall profit of mankind, that for this long time men of great wit and high conceit have ſtudied and practiſed to compaſſe this one point, That the good deeds of their aunceſtors might with themſelves die and be buried for ever. But certes, we ſee and know, that the ſeverall inventions of ſome one thing or other, have cauſed divers men in old time to be canonized as gods: in ſuch ſort, as their memoriall hath been eternized by the names even of hearbs which they found out: ſo M
thankefull was the age enſuing, as to recognize and acknowledge a benefit from them received, and by this means (in ſome meaſure) to make recompenſe. This care and induſtrie of theirs, if it had been emploied in domeſticall plants neare home, which either for pleaſure and delight, or elſe for the kitchin and table, are ſet and ſowed, could not have been ſo rare and wonderfull: but they

A they spared not to climbe up the top of high mountains, and to rocks unaccessible; to travaile through blind and unpeopled deserts, to search every veine and corner of the earth, and all to find and know the vertues of hearbs: of what operation the root was, for what diseases the leaves were to be used; yea and to make holesome medicines for mans health of those simples, which the very fourefooted beasts of the field never fed upon, nor once touched.

Chap. II.

The Latin authors who have written of Hearbs, and their natures. At what time the knowledge of Simples began to be practised and professed in Rome. The first Greeke writers who travailed in this Argument. The invention of Hearbs. The auncient Physicke, and the manner of curing diseases in old time. What is the cause that Simples are not now so much used for remedies of diseases as they have been. Finally, of the sweet Brier or Eglantine, and the hearbe Dragons, with their medicinable vertues.

B

WEe Romans have been more slacke and negligent in this behalfe than was beseeming us, considering how otherwise, there was not a nation in the world more apprehensive of all vertues and things profitable unto this life, than ours. For to say a truth, *M. Cato* (that famous clerke and great professor, so well seene in all good Arts and Sciences) was the first (and for a long time the onely author) who wrate of Simples: and howsoever hee handled that argument but briefly and summarily, yet he omitted not the leech-craft belonging also to kine
C and oxen. Long after him, *C. Valgius* (a noble gentleman of Rome, and a man of approoved literature) compiled a treatise of Simples, which he left unperfit; howbeit he dedicated the book to *Augustus Cæsar* the Emperor; as may appeare by a preface by him begun, wherein (after a religious and ceremonious maner of supplication) he seemeth to beseech the said Prince, That it might please his majestie especially, to cure all the maladies of mankind. And before his time, the onely man among our Latines (as far as ever I could find) who wrote of Simples, was *Pompeius Lenæus*, the vassall or freed man of *Pompey* the Great. And this was the first time that the knowledge of this kind of learning was set on foot and professed at Rome. For *Mithridates* (the
D most mightie and puissant king in that age, whose fortune notwithstanding was to be vanquished and subdued by *Pompey*) was well knowne unto the world not only by the fame that went of him, but also by good proofe and evident arguments, to have been of all other before his time, a prince most addicted to the publicke benefit of all mankind: for the only man he was who devised to drinke poison every day (having taken his preservatives before;) to the end that by the ordinarie use and continuall custome thereof, it might be familiar unto his nature, and harmlesse. The first he was also who devised sundrie kinds of antidots or counterpoisons, whereof * one re- *i. Mithridatium.
teineth his name to this day: he it was also and none but he (as men thinke) who first mingled in the said antidots and preservatives, the bloud of Ducks bred in his own realm of Pontus, for that they fed and lived there, of poisons and venomous hearbs. Vnto him, that famous and renowmed professor in Physicke *Asclepiades*, dedicated his books now extant: for this Physician being sollicited to repaire unto him from Rome, sent the rules of Physicke digested into order and set
E downe in writing, in stead of comming himselfe. And *Mithridates* it was (as it is for certaine knowne) who alone of all men that ever were, could speake two and twentie languages perfitly; so as for the space of six and fiftie yeers (for so long he reigned) of all those nations which were under his dominion, there never came one man to his court, but he communed and parled with him in his owne tongue without any truchman or interpretor for the matter. This noble prince, (among many other singular gifts that hee had, testifying his magnanimitie and incomparable wit) addicted himselfe particularly to the earnest studie of Physicke: and because he would be exquisit and singular therin, he had intelligencers from all parts of his dominions (and those tooke
F up no small part of the whole world) who upon their knowledge, exhibited unto him the particular natures and properties of every simple: By which means, hee had a cabinet full of an infinit number of receits and secrets set down togither with their operations and effects, which he kept in his said closet, & left behind him with other rich treasure of his. But *Pompey* the Great, having under his hands the whole spoile of this mightie prince, and meeting in that faccage with those notes above said, gave commandement unto his vassall or enfranchised servant the abovenamed *Lenæus* (an excellent linguist and most learned Grammarian) to translate the same into the

Latine tongue: for which act of *Pompey*, the whole world was no leſſe beholden unto him, than G
the common-wealth of Rome for the foreſaid victorie. Over and beſides theſe, what Greeke au-
thors have travailed in Phyſicke, I have declared heretofore in convenient place. And among
the reſt, *Evax* a King of the Arabians, wrate a booke as touching the vertues and operations of
Simples, which he ſent unto the Emperour *Nero*. *Cratevas* likewiſe, *Dionyſius* alſo, and *Me-*
trodorus, wrote of the ſame Argument after a moſt pleaſant and plauſible manner (I muſt needs
ſay;) yet ſo, as a man could picke nothing almoſt out of all their writings, but an infinit difficul-
tie of the thing: for they painted every hearbe in their colours, and under the pourtraicts they
couched and ſubſcribed their ſeverall natures and effects. But what certeintie could there be ther-
in? pictures (you know) are deceitfull; alſo, in repreſenting ſuch a number of colours, and eſpe-
cially expreſſing the lively hew of Hearbs according to their nature as they grow, no marveile if H
they that limned and drew them out, did faile and degenerat from the firſt pattern and originall.
Beſides, they came far ſhort of the marke, ſetting out hearbs as they did at one onely ſeaſon (to
wit, either in their floure, or in ſeed time) for they chaunge and alter their forme and ſhape eve-
rie quarter of the yeere. Hereof it came, that all the reſt laboured to deſcribe their forms and co-
lours, by words onely. Some without any deſcription at all of their figure or colour, contented
themſelves (for the moſt part) with ſetting downe their bare names, and thought it ſufficient to
demonſtrat and ſhew their power and vertue afterwards, to whoſoever were deſirous to ſeeke af-
ter the ſame: and verely, the knowledge therof is no hard matter to attaine unto. For mine owne
part, it hath been my good hap to ſee growing in the plant, all theſe medicinable hearbs (except-
ing very few) by the means of *Antonius Caſtor* (a right learned and moſt renowmed Phyſician I
in our daies) who had a pretie garden of his owne well ſtored with ſimples of ſundrie ſorts, which
he maintained and cheriſhed for his owne pleaſure and his friends, who uſed to come and ſee
his plot, as indeed it was worthie the ſight. This Phyſician was then above an hundred yeeres old,
and in all his life never found what ſickneſſe meant; neither for all this age of his, was his wit de-
caied or memorie any whit empaired, but continued as freſh ſtill as if he had been a yong man.
But to proceed forward with our diſcourſe: Certes we ſhall not find a thing againe which our an-
ceſtors ſo much admired and were more raviſhed withall, than the knowledge of Simples. True it
is (I confeſſe) that the invention of the Ephemerides (to fore-know thereby not onely the day
and night, with the eclypſes of Sun and Moone, but alſo the verie hours) is auncient: howbeit,
the moſt part of the common people have been and are of this opinion (received by tradition K
from their forefathers) That all the ſame is done by enchantments, & that by the means of ſome
ſorceries and hearbs togither, both ſun and moon may be charmed, and enforced both to looſe
and recover their light: To do which feat, women are thought to be more skilfull and meet than
men. And to ſay a truth, what a number of fabulous miracles are reported to have been wrought
by *Medea* queene of Colchis, and other women; and eſpecially by *Circe* our famous witch here in
Italy, who for her ſingular skill that way, was canonized a goddeſſe. And from hence it came (I
ſuppoſe) that *Æſchylus* a moſt auncient Poët, made report of * Italy to be furniſhed with hearbs
of mightie operation: and many others have ſpoken much of the mountaine Circeios bearing
her name, wherein the ſaid ladie ſometime dwelt & kept her reſidence. And for a notable proofe
of her ſingular skill in that kind, the ſame knowledge in ſome meaſure continueth unto this day L
in the Marſians (a nation deſcended from a ſonne of hers) who are well knowne to have a natu-
rall power by themſelves to tame and conquer all ſerpents, and not to be ſubject to any daunger
from them. As for *Homer* verely (the father and prince of all learning and learned men, and the
beſt author that we have of antiquities) howſoever otherwiſe he was addicted to extoll and mag-
nifie dame *Circe*, yet he attributeth unto Ægypt the glorie & name for good hearbs; yea though
in his time there was not that Baſe Ægypt watered as now it is, with Nilus: for afterwards it grew,
by the mud left there by the inundation of the ſaid river. Truly this Poët maketh mention of ma-
ny ſingular hearbs in Ægypt, which the * Kings wife of that countrey gave unto that ladie of his,
Helena, of whom he writeth ſo much; and namely, the noble Nepenthes, which had this ſingular
vertue and operation, To worke oblivion of melancholy and heavineſſe, yea and to procure eaſe- M
ment and remiſſion of all ſorrows: which (I ſay) the queene beſtowed upon *Helena* to this end,
That ſhee ſhould communicat and impart it to the whole world for to be drunke in thoſe ca-
ſes aboveſaid. But the firſt man knowne by all records to have written any thing exactly and cu-
rioufly of ſimples, was *Orpheus*. As for *Muſæus*, and *Heſiodus* after him, in what admiration they
held

* Τυρσηνων γης φαρμακοτοιον ἐθνος.

* *Polydamna*, Θωνος παρακοιτις, *i.* the wife of king *Thon*. *Homer. Odyſſ. δ.* & *Diodorus Siculus Antiquit. lib. 2.*

held and how highly they eſteemed the hearbe Polion above the reſt, I have ſhewed alreadie. Certes, *Orpheus* and *Heſiodus* both have highly commended unto us perfumes and ſuffumigations. And *Homer* likewiſe writeth expreſſely of certaine hearbs by name, of ſingular vertue, which I will put downe in their due places. After him came *Pythagoras*, a famous Philoſopher, who was the firſt that compoſed a booke, and made a Treatiſe purpoſely of ſundrie hearbes, with their divers effects; aſcribing wholly the invention and originall of them to the immortall gods, and namely, to *Apollo* & *Æſculapius*. *Democritus* compiled a volume of the ſame argument. But both he and *Pythagoras* had travelled before all over Perſis, Arabia, Æthyopia, and Ægypt, and there conferred with the Sages and learned Philoſophers of that countrey, called Magi. In ſumme, ſo farre were men in old time raviſhed with the admiration of hearbes and their vertues, that they baſhed not to avouch even incredible things of them. *Xanthus* an auncient Chronicler, writeth in the firſt booke of his Hiſtories, of a Dragon, which finding one of her little ſerpents killed, raiſed it to life againe by a certaine hearbe, which hee nameth Balis: and with the ſaid hearbe, a man alſo named *Thylo*, whom the dragon had ſlaine, was revived and reſtored to health againe. Alſo King *Iuba* doth report, That there was a man in Arabia, who being once dead, became alive againe by the vertue of a certaine hearbe. *Democritus* ſaid, and *Theophraſtus* gave credit to his words, That there is an hearbe, with which a kind of foule (wherof I have made mention before) is able to make the wedge or ſtopple to flie out of the hole of her neaſt, into which the ſheepeheards had driven it faſt, in caſe ſhe bring the ſame hearb and but once touch the foreſaid wedge therewith. Theſe be ſtrange reports and incredible, howbeit they draw men into a wonderfull opinion of the thing, and fill their heads with a deepe conceit, forcing them to confeſſe, That there is ſome great matter in hearbs, and much true indeed which is reported ſo wonderfully of them. And from hence it is, that moſt are of this opinion and hold certainly, That there is nothing impoſſible, but may be performed by the power of hearbs, if a man could reach unto their vertues: Mary few there bee who have attained to that felicitie: and the operation of moſt ſimples is unknowne. In the number of theſe, *Herophilus* the renowmed Phyſician may be reckoned: who was of this mind, and gave it out in his ordinarie ſpeech, That ſome hearbs there were, which were effectuall and did much good, if a man or woman chaunced but to tread upon them under their feet. And verely, this hath beene knowne and found true by experience, that ſome diſeaſes would be more exaſperat and angrie, yea, and wounds grow to fretting and inflammation, if folke went but over certaine hearbes in the way as they paſſed on foot. Loe what the Phyſick in old time was! and how the ſame lay wholly couched in the Greeke language, and not elſewhere to bee found. But what might be the reaſon, that there were no more ſimples knowne? Surely it proceeds from this, That for the moſt part they bee ruſticall peaſants, and altogether unlettered, who have the experience and triall of hearbs, as thoſe who alone live and converſe among them where they grow. Another thing there is, Men are careleſſe and negligent, and love not to take any paines in ſeeking for them. Againe, every place ſwarmeth ſo with Leeches and Phyſicians, and men are ſo readie to run unto them for to receive ſome compound medicine at their hands, that little or no regard there is made of Hearbs and good Simples. Furthermore, many of them which have been found out and knowne, have no name at all: as for example, that hearbe which I ſpake of in my Treatile concerning the cure and remedies of corne growing upon the lands: and which wee all know, if it bee enterred or buried in the foure corners of the field, will skare away all the foules of the aire, that they ſhall not ſettle upon the corne, nor once come into the ground. But the moſt diſhoneſt and ſhamefull cauſe why ſo few ſimples in compariſon be knowne, is the naughtie nature & peeviſh diſpoſition of thoſe perſons who will not teach others their skill, as if themſelves ſhould looſe for ever that which they imparted unto their neighbour. Over and beſides, there is no certaine way or meanes to direct us to the invention and knowledge of hearbes and their vertues: for if we looke unto theſe hearbes which are found alreadie, we are for ſome of them beholden to meere chaunce and fortune: and for others (to ſay a truth) to the imediat revelation from God. For proofe hereof, mark but this one inſtance which I will relate unto you. For many a yeare untill now of late daies, the biting of a mad dog was counted incurable: and looke who were ſo bitten, they fell into a certaine *dread and feare of water: neither could they abide to drinke, or to heare talke thereof, and then were they thought to be in a deſperat caſe: It fortuned of late, that a ſouldiour, one of the guard about the *Pretorium was bitten with a mad dog, and his mother ſaw a viſion in her ſleepe, giving (as it were) direction unto her for to ſend the root unto her ſonne for

*Ὑδροφοβία.

*or the prince;

to

to drinke, of an Eglantine or wild Rose (called Cymorrhodon) which the day before she had espied growing in an Hortyard, where she tooke pleasure to behold it. This occurrent fell out in *Lacetania, the neareſt part unto us of Spaine. Now, as God would, when the ſouldiour beforeſaid upon his hurt received by the dog, was readie to fall into that ſymptome of Hydrophobie, and began to feare water; there came a letter from his mother, advertiſing him to obey the will of God, and to doe according to that which was revealed unto her by the viſion. Whereupon hee dranke the root of the ſaid ſweet brier, or Eglantine, and not only recovered himſelfe beyond all mens expectation: but alſo afterwards as many as in that caſe tooke the like receit, found the ſame remedie. Before this time, the writers in Phyſicke knew of no medicinable vertue in the Eglantine, but onely of the ſponge or little ball, growing amid the prickie braunches therof, which being burnt and reduced into aſhes, and incorporat with honey into a liniment, maketh haire to come again where it was ſhed by any infirmitie. But ſeeing I am fallen into the mention of Spain, it commeth to my mind, what I my ſelfe knew and ſaw in the ſame province, within the lands and domaines belonging to an hoſt of mine; namely, a certaine plant or hearbe there lately found, called * Dracunculus, which carried a maine ſtem or ſtalke an inch or thumbe thicke, beſet with ſpots of ſundrie colours, reſembling thoſe of vipers and ſerpents: and I was told, that it was a ſingular remedie againſt the ſting or biting of any ſerpents. This Dracunculus differeth from another hearbe of that name, whereof I ſpake in the book going next before, for this hath a diſtinct forme from that, and beſides, another ſtrange & wonderfull propertie, namely, to ſhew two foot or thereabout above ground in the Spring time, when ſerpents firſt doe caſt their ſloughes or skins: and the ſame is no more ſeene, at the very time that ſerpents alſo retire into their holes and take up their Winter harbour within the ground. Let this plant bee gone once into the earth and hidden, you ſhall not ſee a ſnake, adder, or any other ſerpent ſtirring abroad. Wherby we may ſee what a kind and tender mother Nature is unto us (if there were nothing els to teſtifie her love) in giving us warning beforehand of daunger: and pointing unto us the very time when we are to be afraid and to take heed of ſerpents.

*or Luſitania.

*our common Dragons.

Chap. 111.

Of a certaine venomous fountaine in Germanie: of the hearbe Britannica. What diſeaſes they be that put men to the greateſt paine.

SO unfortunate is our condition, and ſo much expoſed are wee to manifold calamities, that the earth is not peſtered with wicked beaſts onely for to doe us harme: but alſo there bee otherwhiles venomous waters and peſtilent tracts to worke us more woe and miſerie. In that voiage or expedition which prince *Cæſar Germanicus* made into Germanie, after hee had paſſed over the river Rhene, and had given order to advance forward with his armie, he encamped upon the ſeacoaſts along Friſeland, where there was to be found but one ſpring of freſh water; and the ſame ſo daungerous, that whoſoever dranke of that water, within two years loſt all their teeth, and were beſides ſo feeble and looſe jointed in their knees, that unneth they were able to ſtand. Theſe diſeaſes the Phyſicians tearmed *Stomacace and Sceletyrbe: as one would ſay, the maladie of the mouth, and palſie of the legs. Yet they found a remedie for theſe infirmities, and that was a certain hearbe called *Brittannica, which is very medicinable, not only for the accidents of the ſinewes and mouth, but alſo for the Squinancie and ſtinging of ſerpents. It hath leaves growing ſomewhat long, and thoſe enclining to a browniſh or darke greene colour, and the root is blacke; out of which, as alſo from the leaves, there is a juice drawne and preſſed. The flowers by a peculiar name be called Vibones: which being gathered before any thunder bee heard, and ſo eaten, doe aſſure and ſecure the parties altogether from that infirmitie. The Friſians, neare unto whom we lay encamped, ſhewed our men this hearb. But I muſe much & wonder what ſhould be the reaſon of that name, unleſſe the Friſians bordring upon the narrow race of the Ocean, which lieth onely between them and England (called in thoſe daies Britanica) ſhould therupon for the neighbourhead & propinquitie of that Iſland, give it the name Britannica. For certain it is, that it took not that name becauſe there grew ſuch plentie thereof in that country of England, that it ſhould be tranſported over from thence to our camp; for as yet that Iſland was not wholly ſubject unto us & reduced under the Roman ſignorie. For an ordinary thing it was in old time practiſed by thoſe that found out any hearbs, to affect the adoption (as it were) of the ſame, and to call them by

*Some thinke this diſeaſe to bee the Schorbuck or Scorbute, which raigneth yet at this day.

*Which is taken to be our Cochlearia, i. Spoonwort, commonly called Scorbutgraſſe or Scorvy-graſſe.

A by their owne names, wherein verely men tooke no ſmall contentment: according as I purpoſe to ſhew by the example of certaine kings and princes, whoſe names live and continue yet in their hearbes; ſo honourable a thing it was thought in thoſe daies to find and it were but an hearb that might doe good unto man. Whereas in this age wherein we now live, I doubt not but there bee ſome who will mocke us for the pains taken in that behalfe, and thinke us very ſimple for writing
2 thus as wee doe of Simples; ſo baſe and contemptible in the eyes of our fine fooles and delicat
2 perſons, are even the beſt things that ſerve for the benefit & common utilitie of mankind. Howbeit, for all that, good reaſon it is and meet that the authours and inventours of them, as many as can be found, ſhould be named and praiſed with the beſt; yea, and that the operations and effects of ſuch hearbs ſhould bee digeſted and reduced into ſome method, according as they be appro-
B priat to every kind of diſeaſe. In the meditation whereof, I cannot chuſe nor containe my ſelfe, but deplore and pitie the poore eſtate and miſerable caſe of man: who over and beſides the manifold accidents and caſualties which may befall unto him, is otherwiſe ſubject to many thouſands of maladies, which we have much adoe to deviſe names for, every houre of the day happening as they doe, and whereof no man can account himſelfe free, but every one is for his part to feare them. Of theſe diſeaſes ſo infinite as they bee in number, to determine preciſely and diſtinctly which bee moſt greevous, might ſeeme meere follie, conſidering that every one who is ſicke for the preſent, imagineth his owne ſickneſſe to bee worſt and fulleſt of anguiſh. And yet our forefathers have given their judgement in this caſe, and by experience have found, That the moſt extreame paine and torment that a man can endure by any diſeaſe, is the Strangurie,
C 3 2 or piſſing dropmeale, occaſioned by the ſtone or gravell in the bladder. The next is the greefe 2 and anguiſh of the Stomacke: and the third, Head-ach: for ſetting theſe three maladies aſide, 3
3 lightly there are no paines that can kill a man or woman ſo ſoone. And here by the way, I cannot for mine owne part but marvell much at the Greekes, who have publiſhed in their writings venomous and peſtilent hearbes, as well as thoſe that bee good and holeſome. And yet there is an apparence and ſhew of reaſon, why ſome poyſons ſhould bee knowne: for otherwhiles it falleth out that men live in ſuch extremitie, as better it were to die, than ſo to lie in anguiſh and torment, inſomuch, as death is the beſt port and harbor of refuge that they have. Certes, *Marcus Varro* reporteth of one *Servius Clodius* a gentleman or knight of Rome, who for the extreame paine of the gout, was forced to annoint his legs and feet all over with a narcoticke or
D cold poyſon, whereby he ſo mortified the ſpirits of the muskles and ſinewes, that hee became paralyticke in that part: and ever after unto his dying day, was rid as well of all ſence, as of the pain of the gout. But ſay, that in theſe caſes it might bee tollerable to ſet downe in their bookes ſome poyſons: what reaſon, nay what leave had thoſe Greekes to ſhew the meanes how the brains and underſtanding of men ſhould bee intoxicat and troubled? What colour and pretence had they to ſet downe medicines and receits to cauſe women to ſlip the untimely fruit of their womb, and a thouſand ſuch like caſts & deviſes that may be practiſed by hearbs of their penning? For mine owne part, I am not for them that would ſend the conception out of the body unnaturally before the due time: they ſhall learne no ſuch receits of me. Neither will I teach any how to temper and ſpice an amatorious cup, to draw either man or woman into love, it is no part of my profeſſion:
E For well I remember, that *Lucullus* a moſt brave Generall, and a captain of great execution, loſt his life by ſuch a love-potion. Much leſſe then ſhall yee have me to write of Magicke, witchcraft, charmes, enchantments and ſorceries, unleſſe it be to give warning that folke ſhould not meddle with them, or to diſprove thoſe courſes for their vanities, and principally to give an Item, how little truſt and aſſurance there is to bee had in ſuch tromperie. It ſufficeth mee and contenteth my mind, yea and I thinke that I have done well for mankind, in recording thoſe hearbes which bee good and holeſome, found out by men of wit and learning for the benefit of poſteritie.

Chap. iiii.

Of Moly, and Dodecatheos: of Pæonie, otherwiſe called Pentorobus or Glycyſide. Of Panaces, Aſclepium, Heraclium, and Chironium. Of Panaces Centarium or Pharnaceum. Of Heraclium, Siderium. Of Henbane, called Hyoſcyamus, Apollinaris, or Altercangenus.

F

Homer is of opinion, That the principall and ſoveraigne hearb of all others, is Moly; ſo called (as hee thinketh) by the gods themſelves. The invention or finding of this hearbe hee

*aſcri-

*Odyſſ.10.

*aſcribeth unto *Mercurie*: and ſheweth that it is ſingular againſt the mightieſt witchcraft and G
enchauntments that bee. Some ſay, that this hearbe Moly, even according to *Homers* deſcription, with a round and blacke bulbous root to the bigneſſe of an onion, and with a leafe or blade like that of Squilla, groweth at this day about the river or lake Peneus and upon the mountaine Cylleum in Arcadia: alſo that it is hard to be digged out of the ground. The Grecian Simplifts deſcribe this Moly with a yellow flower, whereas *Homer* hath written, that it is white. I met with one Phyſician, a skilfull Herbariſt, who affirmed unto me, That this Moly grew in Italie alſo: and in very truth he brought and ſhewed me a plant which came out of Campain, about the digging up whereof among hard and ſtonie rocks, he had been certaine daies: but get hee could not the entire root whole and ſound, but was forced to breake it off, and yet the root which he ſhewed me was thirtie foot long. H

Next unto Moly in account and reputation, is that plant which they call Dodecatheos, for that it doth repreſent and comprehend the majeſtie of all the cheefe gods. They ſay if it be drunk in water, it is a ſoveraigne medicine for all maladies. Seven leaves it hath, reſembling very much thoſe of Lectuce, and the ſame ſpring from a yellow root.

*Pæon, who was equall in time to *Hercules*, and lived 10g before the Troian war.

As touching Pæonie, it is one of the firſt hearbes that were ever known and brought to light, as may appeare by the author or inventor thereof, whoſe name it beareth ſtill. Some call it Pentorobos: others Glycyſide. [Where by the way I am to advertiſe the reader of the difficultie in the knowledge of hearbes by their names, conſidering that the ſame hearbe hath in ſundrie places diverſe appellations.] But to proceed forward with our Pæonie: it groweth among bleake and ſhadie mountaines, riſing up with a ſtem betweene the leaves, *foure fingers high, and bearing in I
the top foure or five heads, faſhioned ſomewhat like to Filberds, within which there is plentie of ſeed both red and blacke. This hearb is good againſt the fantaſticall illuſions of the *Fauni which appeare in ſleepe. It is ſaid, that this hearbe muſt be gathered in the night ſeaſon: for if the Rainbird, Woodpeck or Hickway, called Picus Martius, ſhould chaunce to ſpie it gathered, he would flie in the face, and be readie to pecke out the eyes of him or her that had it.

* *Seſquipedali. Dioſco, i.* a foot and halfe.

*I ſuppoſe he meaneth the diſeaſes called *Ephialtes* or *Incubus, i.* the night-Mare.

The hearbe *Pananos, promiſeth by the very name a remedie of all diſeaſes. A number there be of hearbes ſo called: and all aſcribed to ſome god or other for the invention of them: for one of them hath the addition of *Aſclepion*, for that *Æſculapius* had a daughter named alſo *Panacea*. As touching the concrete juice named Opopanox, it is drawne from the root of this plant (beeing of the Ferula or Fennell kind, ſuch as I have heretofore ſhewed) by way of inciſion, the which K
root hath a thicke rind, and of a ſaltiſh ſavour. When the root is pulled out of the ground, there is a religious ceremonie obſerved to fill up the hole againe with all ſorts of corne, as it were in ſatisfaction to the earth for the violence offered in tearing it up. As for the ſaid juice Opopanax, where and how it ſhould be made, and which is the beſt kind thereof and not ſophiſticat, I have declared alreadie in my Treatiſe of forraine and ſtraunge plants. That which is brought out of Macedonie, they call Bucolicum, becauſe the Neat-heards of the countrey marke when the liquour breaketh foorth and runneth out of it ſelfe, and ſo receive and gather it from the plant: This will not laſt, but of all the reſt ſooneſt looſeth the force. Moreover, in all ſorts of it, that is rejected principally, which is blacke and ſoft; for theſe be markes to know that it is corrupted and ſophiſticat with wax. A ſecond kind there is of Panaces, which they call Heraclium: the invention L
of the vertues and properties whereof is attributed unto *Hercules*. Some there be who call it Origanum Heracleaticum the wild, becauſe it is like unto Origan, wherof I have heretofore written: but the root of this Panaces is good for nothing. A third kind of Panaces took the name of *Chiron* the Centaur, who was the firſt that gave intelligence of the hearbe and the vertues thereof. The leafe is like unto the Docke, but that it is bigger and more hairie: the flower is of a golden yellow colour: the root but ſmall: it loveth to grow in rich, fat, and battle grounds. The flower of this Panaces is moſt effectuall in Phyſicke; in which regard there is more uſe and profit thereof than of all the former kinds. A fourth Panaces ther is beſides, found out alſo by the ſame *Chiron*, whereupon it hath the denomination of Centaureum: called alſo it is Pharnaceum: The occaſion of this two-fold name is this: becauſe there is ſome controverſie in the firſt invention ther- M
of; whiles ſome attribute it to the Centaur *Chiron*, others to K. *Pharnaces*. This Panaces is uſually ſet and planted, bearing leaves indented in the edges like a ſaw, and thoſe longer than any of the reſt. The root is odoriferous, which they uſe to drie in the ſhaddow, and therewith to aromatize their wine, for a pleaſant and delectable taſt it giveth unto it. Hereof they have made two ſpeciall kinds:

* *πᾶν* and *ἄκος, i.* [a medicine for] all greefs; as one would ſay, All-heale.

A kinds: the one with a *thicker leafe: the other with a thinner and ſmaller. *Craſſioris, παχυφύλλου, Ex Theophraſt.

As for Heracleon Siderion, a plant it is alſo fathered upon *Hercules*. It riſeth up with a ſlender ſtalke to the height of four fingers, bearing a red flower, and leaves in manner of the Coriander. Found it is growing neare to pooles and rivers: and for a wound-hearb there is not the like, eſpecially if the bodie be hurt by ſword, or any edged weapon made of yron and ſteele.

There is a wild Vine, named Ampelos Chironia, for that *Chiron* was the firſt author thereof. Of this plant I have written in my diſcourſe of Vines [under the name of Vitis Nigra] like as alſo of another *hearbe, which hath the goddeſſe *Minerva* for the inventreſſe. *Matricaria or Parthenium, i. Mother wort.

Moreover, unto *Hercules* is aſcribed Henbane, which the Latines call Apollinaris; the Arabians Altercum or Altercangenon; but the Greekes Hyoſcyamus. Many kinds there be of it. The
B one beareth blacke ſeed, flowers ſtanding much upon purple; and this hearbe is full of prickes. And in very truth, ſuch is the Henbane that groweth in Galatia. The common Henbane is whiter and brauncheth more than the other: taller alſo than the Poppie. The third kind bringeth forth ſeed like unto the graine of Irio. All the ſort of theſe alreadie named, trouble the braine, and put men beſides their right wits: beſides that, they breed dizzineſſe of the head. As touching the fourth, it carieth leaves ſoft, full of down, fuller and fatter than the reſt: the ſeed alſo is white: & it groweth by the ſea ſide: Phyſicians are not afraid to uſe this in their compoſitions, no more than that which hath red ſeed. Howbeit, otherwhiles this white kind eſpecially, if it bee not throughly ripe, prooveth to bee reddiſh, and then it is rejected by the Phyſicians. For otherwiſe none of them all would bee gathered, but when they bee fully drie. Henbane is of the nature of
C *wine, and therefore offenſive to the underſtanding, and troubleth the head. Howbeit, good uſe there is both of the ſeed it ſelfe as it is in ſubſtance, and alſo of the oile or juice drawne out of it apart. And yet the ſtalkes, leaves, and roots, are emploied in ſome purpoſes. For mine owne part, I hold it to be a daungerous medicine, and not to be uſed but with great heed and diſcretion. For this is certainely knowne, That if one take in drinke more than foure leaves thereof, it will put him beſide himſelfe. Notwithſtanding the Phyſicians in old time were of opinion, That if it were drunke in wine, it would drive away an ague. An oile (I ſay) is made of the ſeed thereof, which if it be but dropped into the eares, is ynough to trouble the braine. But ſtrange it is of this oile, That if it be taken in drinke, it ſerveth for a countrepoyſon. See how induſtrious men have ben to prove experiments, and made no end of trying all things, inſomuch as they have found meanes and
D forced very poyſons to be remedies. *Vini. Some read Veneni, i. poyſon.

Chap. v.

Of Mercurie, called Linozoſtis, Parthenium, Hermupoa, or rather, Mercurialis: of Achilleum, Panaces, Heracleum, Sideritis and Milleſoile: of Scoparegia, Hemionium, Teucrium, and Splenium: of Melampodium or Ellebore, and how many kinds there be of it: of the blacke or white Ellebore, and their medicinable vertues: how Ellebore is to be given, how to be taken, unto whom and when it is not to be given: and how it killeth Mice and Rats.

E THe hearbe Mercurie, called by the Greekes Linozoſtis and Parthenion, was thought to be firſt found out by *Mercurie*: whereupon many of the Greekes call it Hermu-poa: and wee all in Latine name it Mercurialis. Of it be two kinds, the male and the female: howbeit, the female Mercurie is of better operation than the other. It riſeth up with a ſtem a cubit high, which otherwhile brancheth in the top: the leaves bee like unto Baſill, but that they are narrower: full of knots or joints the ſtalke is; and thoſe have many hollow concavities like arme-pits. The ſeed hangeth downe from thoſe joints. In the female the ſame is white, looſe, and in great plentie: in the male it ſtandeth cloſe unto thoſe joints, but thinner: and the ſame is ſmall & as it were wreathed. The leaves of the male Mercurie be of a darke and blacker greene: whereas in the female they be more white. The root is altogether ſuperfluous, and very little. Both the one & the other
F delight to grow in plaines and champion fields well ordered and husbanded. It is wonderfull if it be true, that is reported of both theſe kinds, namely, That the male Mercurie, cauſeth women to beare boies: and the female, girles. For which purpoſe the woman muſt preſently after that ſhee is conceived, drinke the juice of which Mercurie ſhe will, in ſweet wine cuit, and eat the leaves either ſodden with oile and ſalt, or els greene and raw in a ſallad with vinegre. Some there bee who

boile

boile it in a new earthen veſſell never uſed before, together with the hearbe Heliotropium or Turnſol, and two or three cloves of Garlicke, untill it bee throughly ſodden. Which decoction they preſcribe to be given unto women, as alſo the hearbe it ſelfe to bee eaten the ſecond day of their monthly ſickneſſe, and ſo to continue for three daies together: and then upon the fourth day, after they have bathed, to companie with their husbands. *Hippocrates* giveth woonderfull praiſe unto Mercurie, as well the male as the female, for all thoſe accidents which follow women: But the manner of uſing it, which he preſcribed, there is no Phyſician hath skill of. He appointed to make paſſaries thereof with Hony, oile of Roſes, oile of Ireos or Lillies, and ſo to put them up into the ſecret parts: and in this manner he ſaith that the hearbe is excellent good for to provoke the monthly termes of women, and to fetch away the after birth. He affirmeth alſo, that a potion or fomentation therewith will doe as much. Moreover, by his ſaying, the juice of Mercurie infuſed into the eares, or applied by way of liniment with old wine, is ſingular for them when they run with ſtinking matter. He ordained likewiſe a cataplaſme of Mercurie to be laid unto the bellie, for to ſtay the violent flux of humours thither: for the ſtrangurie alſo and infirmities of the bladder. In which caſes, he gave the decoction thereof with Myrrhe and Frankincenſe. And verely for to looſen the bellie, although the patient were in a fever, there is a potion of Mercurie ſingular good, made in this wiſe: Take a good handfull of Mercurie, ſeeth the ſame in two ſextars of water, untill one halfe bee conſumed: let the partie drinke the ſame with ſalt and honey mixed therewith: But the ſaid decoction if it be made with an Hogs foot, with a Hen, Capon, or Cocke boiled withall, is the holeſomer. Some Phyſicians were of opinion, That for to purge the bodie, both Mercuries, as well the male as the female are to be given, either boiled alone by themſelves or elſe with Mallowes. They cleanſe the breaſt parts, and evacuat choller, but they hurt the ſtomacke. Touching all the other properties of Mercurie, I will write in place convenient. G H I

As *Chiron* the Centaure found out the medicinable vertues of certaine hearbs, ſo we are beholden to his ſcholler *Achilles* for one, which is ſingular to heale wounds, and of his name is called Achilleos. This is that wound-hearbe, wherewith (by report) he cured prince *Telephus*. Some have thought that he deviſed firſt the ruſt of braſſe or verdigreece, which is ſo excellent for ſalves and plaſtres: and therefore you ſhall ſee *Achilles* commonly painted ſcraping off the ruſt of his ſpeare head with his ſword into the wound of the ſaid *Telephus*. Others ſay, that he tooke both the ſaid ruſt or verdegreece, and alſo the hearbe Achilleos to worke his cure. Some would have this Achillea to be Panaces Heracleon; and others, Sideritis: we in Latin call it Millefolia. An hearb it is growing with a ſtalke or ſtem to the height of a cubit, ſpreading into many braunches, clad from the very root up to the top, with leaves ſmaller than thoſe of Fenell. Others confeſſe indeed that this hearbe is ſingular good for wounds: but the true Achilleos (ſay they) hath a blewiſh ſtalke a foot high and no more, bare and naked without any braunches at all, howbeit finely decked and garniſhed on every ſide with round leaves, ſtanding one by one in excellent order & making a faire ſight. There be againe who deſcribe it with a foureſquare ſtem, bearing heads in the top in manner of Horehound, and leaved like unto an Oke. And this they ſay is of that efficacie, that it will conglutinat and unite ſinewes againe, if they were cut quite aſunder. Moreover, you ſhall have ſome who take for Achillea that kind of Sideritis growing upon mud wals, which if it be bruſed or ſtamped, yeeldeth a ſtinking ſent. Moreover, there is another going under the name Achilleos, like to this laſt deſcribed, but that the leaves bee whiter and fattier, the little ſtalkes or ſprigs more tender, and it groweth in vineyards. Laſt of all, there is one more called Achilleos, which riſeth up to the height of two cubits, bearing prettie fine and ſlender braunches and thoſe three ſquare, leaves reſembling Fearne hanging by a long ſtele, and the ſeed is much like unto that of the Beet. In one word, they bee all of them moſt excellent for healing wounds. And as for that eſpecially, which hath the largeſt leaves, our countreymen in Latine have called it Scopa Regia. And the ſame is holden to be good for to heale the Squinancie or Gargle in ſwine. K L

In the ſame age wherein *Achilles* lived, prince *Teucer* alſo gave the firſt name and credit to one ſpeciall hearbe, called after him Teucrion, which ſome nominat Hemionium. This plant putteth forth little ſtalkes in manner of ruſhes or bents, and ſpreadeth low: the leaves bee ſmall: it loveth to grow in rough and untoiled places: a hard and unpleaſant ſavour it hath in taſt: it never floureth, and ſeed it hath none. Soveraigne it is for the ſwollen and hard ſpleene: The knowledge of which propertie came by this occaſion, as it is credibly and conſtantly reported. It fortuned upon a time when the inwards of a beaſt killed for ſacrifice, were caſt upon the ground where this hearb M

grew,

A grew, it tooke hold of the ſplene or milt, and clave faſt unto it, ſo as in the end it was ſeen to have conſumed and waſted it cleane: hereupon ſome there be that call it Splenion, *i.* Splene-woort. And there goeth a common ſpeach of it, That if ſwine doe eat the root of this hearbe, they ſhall be found without a milt when they are opened. Some there be, who take for Teucrium and by that name do call, another hearb full of branches in manner of hyſſope, leafed like unto beans; and they give order, that it ſhould be gathered whiles it is the floure; as if they made no doubt but that it would floure. The beſt kind of this hearbe they hold to be that which commeth from the mountains of Cilicia and Piſidia.

Who hath not heard of *Melampus* that famous divinour and prophet? he it was of whome one of the Ellebores tooke the name, and was called Melampodion: and yet ſome there be who
B attribute the finding of that hearbe unto a ſhepheard or heardman of that name, who obſerving well that his ſhee goats feeding thereupon, fell a ſcouring, gave their milke unto the daughters of K. *Prætus*, whereby they were cured of their furious melancholie, and brought againe to their right wits. This hearbe then being of ſo excellent operation, it ſhall not be amiſſe to diſcourſe at once of all the kinds of Ellebore, whereof this maketh one. And to begin withall, two principall ſorts there be of it; namely, the white and the blacke: which diſtinction of colour, moſt writers would have to be meant and underſtood of the roots onely, and no part els: others there be, who would have the root of the blacke Ellebore to be faſhioned like unto thoſe of the Plane tree, but that they be ſmaller and of a more darke and duskiſh greene, divided alſo into more jags and cuts; but thoſe of the white Ellebore, to reſemble the young Beet new appearing above the
C ground, ſave onely that they be of a more blackiſh colour, and along the backpart of their concavitie enclining to red. Both the one and the other bringeth forth a ſtalk in faſhion like the Ferula or Fenell-geant, a ſpan or good hand-breadth high, and the ſame conſiſteth of certain tunicles or skins folded one within another in manner of bulbous plants, riſing from the like root; and the ſaid root is full of ſtrings or fringes, as is the head of an onion. The blacke Ellebore is a very poiſon to horſes, kine, oxen, and ſwine, for it killeth them; and therfore naturally theſe beaſts beware how they eat of it, whereas confidently they feed upon the white. The right ſeaſon of gathering the Ellebores, is in harveſt time. Great ſtore thereof groweth upon the hill Oeta, but the beſt is that which is found in one only place therof neare about * Pyra. The black Ellebore com-
D meth up every where; but the beſt is in Helicon, a mountaine much renowmed and praiſed for other hearbs beſide it, wherewith it is well furniſhed. As touching the white, that of the mount Oeta is counted the principall: in a ſecond degree, is the white Ellebore of Pontus: in the third place is to be raunged, that which commeth from Elæa, which (they ſay) groweth among vines; in the fourth and laſt place, for goodneſſe, is that of the mount Pernaſſus, which is ſophiſticated with the Ellebore of Ætolia neare by. The blacke Ellebore is called Melampodium, wherewith folke uſe to hallow their houſes for to drive away ill ſpirits, by ſtrewing or perfuming the ſame, and uſing a ſolemne praier withall: it ſerveth alſo to bleſſe their cattaile after the ſame order. But for theſe purpoſes they gather it very devoutly and with certaine ceremonies: for firſt and foremoſt, they make a round circle about it with a ſword or knife, before they goe in hand to take it foorth of the ground: then the partie who is to cut or dig it up, turneth his face into the Eaſt, with an
E humble prayer unto the gods, That they would vouchſafe to give him leave with their favour to doe the deed; and with that, hee marketh and obſerveth the flight of the Ægle; for lightly while they be cutting up of this root, ye ſhall ſee an Ægle ſoaring aloft in the aire: now in caſe the ſaid Ægle flie neare unto him or her that is cutting up Ellebore, it is a certain preſage and foretoken, that he or ſhe ſhall ſurely die before that yeare goe about. Much adoe alſo there is about the gathering of the white Ellebore; for unleſſe the partie do eat ſome garlicke before, and eftſoons in the gathering ſup off ſome wine, and withall make haſt to dig it up quickly, it will ſtuffe and offend the head. The blacke Ellebore ſome call Eutomon, others Polyrrhizon; it purgeth downward: the white, by vomit upward, and doth evacuat the offenſive humours which cauſe diſeaſes. In times paſt it was thought to be a daungerous purgative, and men were afraid to uſe it: but af-
F terwards it became familiar and common, inſomuch as many ſtudents tooke it ordinarily for to cleanſe the eyes of thoſe fumes which troubled their ſight, to the end that whiles they read or wrate, they might ſee the better and more clearely. It is well knowne, that *Carneades* the Philoſopher purpoſing to anſwer the books of *Zeno*, prepared his wits and quickened his ſpirits, by purging his head with this Ellebore. And *Druſus* our countreyman, one of the moſt famous and

* Where *Hercules* fried to death as it were, in a funerall fire, which the Greeks call *Pyra*.

renowmed Tribunes of the Commons that were ever knowne at Rome (a man who above all G
others woon the favour and applause of the comminaltie, howsoever the nobilitie charged him
to have been the cause of the Marsians warre) was perfitly cured of the falling sickness in the
Isle Anticyra, by this onely medicine: and indeed those Islanders have a way by themselves to
prepare their Ellebore with the mixture of Sesamoeides (as I have said before) whereby the ta-
king of it is most safe. Ellebore is called in Latine * Veratrum: the powder as well of the one as
the other snuffed up into the nosthrils, either alone by it selfe, or mixed with the powder of the
Fullers hearbe Radicula, wherewith they wash and scoure their woollen cloth, * provoketh snee-
zing; and yet both of them procure sleepe. Now for use in Physicke, there would be chosen the
smallest roots of Ellebor, such as be short also, and as it were curtailed, and not sharpe pointed
in the botome: and the best part is that which is toward the nether end; for the uppermost part H
of the root which is the thickest and bulbous like to an onion head, is good for dogs onely, and
given unto them for to make them scummer. In old time they used to chuse the Ellebore root by
the barke, and tooke that for the best which had the most fleshie or thickest rind, to the end that
they might take out the finer pith or marow within; which they used to lap and cover with moist
spunges, and when it began to swell, they divided or slived it longwise into small filaments with
the point of a needle or bodkin. These filaments or strings, they dried in the shade, and laid them
up to serve as need should require. But now adaies they cut the small shoots or slips braunching
from the root, such as are most charged with barke, and those the Physicians give unto their Pa-
tients. The best white Ellebore is that, which in tast is hot and biting at the tongues end, and in
the breaking seemeth to smoke or send dust from it: it is commonly said, that it will continue in I
force thirtie yeers. The blacke is good for the palsie, for those that be lunaticke and bestraught
in their wits, for such as be in a dropsie (so they be cleare of a fever,) for inveterat gouts as well of
feet and hands as other joynts: it purgeth downward by the belly, both choller and fleame: being
taken in water, it gently mollifieth and looseneth the bodie: and from foure oboli (which is a
small or meane dose) you may rise to a full dram, so you exceed not that weight. Some were wont
to mingle Scammonium therewith; but the safer way is to put salt onely thereto: beeing given
in any sweet liquor to some great quantitie, it is daungerous: and yet a fomentation therewith,
is good to rid away and dispatch the mistinesse that troubleth the eies: and therefore some use to
beat it into powder, and when it is reduced into a liniment or eyesalve, therwith to annoint them
for the said purpose. This propertie moreover it hath, to bring to maturation the swelling wens K
called the Kings evill, to mollifie any hard tumors, to mundifie also the foresaid wens and any bot-
ches or impostumes that be suppurat and broken. It cleanseth likewise the hollow ulcers called
fistuloes, provided alwaies that it be not taken out of the sore in two daies and two nights, but
the third day it ought to be remooved. Incorporat with the skales of brasse and red orpiment, it
taketh away werts. Made into a pultesse or cataplasme with barley meale and wine, it is singular
good for the dropsie, if it be applied unto the bellie: take a sliving or slip of the root and draw it
through the eare of sheepe or horse in manner of rowelling, and the morrow after take it foorth
againe at the same houre; this healeth the gid or wood-evill in sheepe, and cureth the glandres in
horses: incorporat with frankincense or wax, togither with pitch or oile of pitch, it it singular
good for the farcins or scab in any foure-footed beast. Touching white Ellebore, the best is that L
which most speedily provoketh sneezing: it is without comparison farre more terrible than the
blacke, especially if a man read what adoe and preparation there went unto it in the old time,
when they were to drinke it against shiverings and shakings, against the rising of the mother and
daunger of suffocation: in case also of immoderat and extraordinarie drowsinesse, of excessive
hicquets and yexing without intermission, and of continuall sneezing: moreover, when they
were troubled with weakenesse and feeblenesse of stomacke: in like manner in case of vomits,
when they came either too fast or over-slow, either too little or too much: for this was a rule ob-
served among them, To give with Ellebore some other drugs, for to cause it worke the sooner,
and to hasten vomit more speedily: also they used means to fetch away the very Ellebore againe
if it lay over-long in the bodie, either by other purgative medicines, or by clysters: oftentimes M
also by opening a veine or bloud-letting. And say that Ellebore taken in manner aforesaid,
wrought very well, yet they used to observe every vomit, the divers colours of humors that came
away, which many times were fearefull to behold: yea and when the Patient had done casting,
they considered also the ordure and excrements that passed away by the belly: they gave order
besides,

* *à verando, unde veratores & veraculi:* and because such prophets were counted mad & out of their wits, therefore it was so called, for that it cured such.

* *Sternutamentū facit, amboq; somnū:* I doubt whether this be true: I suppose it should be read according to the old copie [*Somnum discutitur*] *id est*, they discusse or shake off sleepe, used to that purpose in lethargies & such drowsie diseases.

A beſides, for * bathing either before or after the taking of Ellebore, as occaſion beſt required; yea and they tooke great heed and regard of the whole bodie beſides: and yet, did what they could, the terrible name and report that went of this medicine, paſſed all their care and circumſpection whatſoever: for it was an opinion generally held and received, That Ellebore doth eat away and conſume the fleſh ſeething in the pot, if it bee boiled therewith. But herein were the auncient Phyſicians much too blame and greatly in fault, in that they were over-timorous, and for feare of ſuch accidents enſuing upon this medicine, gave it in too ſmall a doſe: whereas indeed, the greater quantitie that one taketh of it, the more ſpeedily it worketh, and the ſooner paſſeth out of the bodie, when it hath once done the errand. *Themiſon* uſed to preſcribe two drams, and not above. The Phyſicians who followed after, allowed the doſe of foure drams;

B grounding upon a notable and famous apothegme or ſpeech of *Herophylus*, who was woont to ſay, That Ellebore was like unto a valiant and hardie captaine: For when (quoth he) it hath ſtirred all the humors within the bodie, it ſelfe iſſueth forth firſt and maketh way before them. Moreover, there is a ſtraunge and ſingular deviſe, To clip the root of Ellebore with ſmall ſizzers or ſheares into little peeces; then, to ſift them through a ſercer, that the barke or rind may remaine ſtill; and when it is cleanſed and purged from the pith or marow within, the ſame may fall thorow and paſſe away: which is paſſing good to ſtay vomits, in caſe the Ellebore doe worke too extreamely. Furthermore, if wee looke for good ſucceſſe in our cure by miniſtring of Ellebore, in any wiſe wee muſt take heed and be carefull, how we give it in cloſe weather, and upon a darke and clowdie day; for certeinly it putteth the Patient to a jumpe or great hazzard, and cauſeth

C moſt grievous and intollerable pains and torments. For that it ſhould be taken in ſummer rather than in winter, no man doubteth thereof. Over and beſides, the bodie ought to bee prepared a ſeven-night before; during which time, the Patient is to eat tart and ſharpe * meats and poignant ſauces; to abſtaine from wine altogither; and the fourth and third day before, to aſſay by little and little to vomit gently: laſt of all, to forbeare ſupper over-night, when hee is to take his Ellebore the morrow. As touching the manner of giving Ellebore: the white may be drunke in ſome ſweet wine; but the beſt and chiefeſt way of taking it, is in milke, grewell, or pottage. Of late dayes there is come up a pretie invention, To ſlit or cut radiſh roots, and within thoſe gaſhes to ſticke or entetlace peeces of white Ellebore; which done, to bind them cloſe up againe, that the ſtrength and vertue thereof may be incorporat in the foreſaid roots: and thus

D by the means of this kind temperature with the radiſh, to give it unto the Patient. Ordinarily this medicine of Ellebore continueth not above foure hours within the bodie, but it commeth up againe, and within ſeven it hath done working. And thus beeing uſed as is beforeſaid, it is a moſt ſoveraigne remedie for the falling ſickneſſe, the ſwimming or dizzineſſe of the head: it cureth melancholicke perſons troubled in mind; ſuch as be brainſicke, mad, lunaticke, phrantick, and furious: it is ſingular good for the Elephantie, the foule and daungerous morphew called Leuce, the filthie leproſie, and the generall convulſion whereby the bodie continueth ſtiffe and ſtarke, as if it were all one peece without any joynt. It helpeth thoſe that be troubled with trembling, ſhivering, and ſhaking of their limbs, with the gout, and the dropſie, and namely ſuch as be entring into a tympanie: ſingular it is for thoſe that have weake and feeble ſtomacks and

E can keepe nothing that they take; for ſuch as are given to ſpaſmes or cramps, lie * bedrid of the dead palſie or ſuch chronicke diſeaſes, encumbred with the ſciatica, haunted with the quartane ague, which will not be rid away by any other means; troubled with an old cough, vexed with ventoſities and griping wrings and torments which be periodicall, and uſe to come and goe at certaine ſet times: howbeit, Phyſicians forbid the giving of Ellebore to old folke and young children: *Item*, to ſuch as be of a fœminine and delicat bodie; as alſo to thoſe that be in mind effeminat: likewiſe to thoſe who are thin and ſlender, ſoft and tender: in which regards, we may not bee altogither ſo bold to give it unto women as unto men. In like manner, this is a medicine that would not bee miniſtred inwardly to fearefull, timorous, and faint-hearted perſons, neither to thoſe who have any ulcer in the precordiall region about the midriffe, ne yet unto

F ſuch as uſually bee given to ſwell in thoſe parts; and leaſt of all to thoſe that ſpit or reach up bloud; no more than to ſickely and craſie perſons who have ſome tedious and lingering maladie, as phthyſicke, &c. hanging upon them, and namely, if they be grieved and diſeaſed in their ſides or throat. Nevertheleſſe, applied without the bodie in manner of a liniment with ſalted hogs greaſe, it cureth the breaking forth of flegmaticke wheals and pimples; as alſo healeth old

* *Hippocrates* appointeth them to bath before, who purge not eaſily with Ellebore: & in caſe of convulſions occaſioned by the taking therof, he preſcribeth likewiſe the bain.

* As radiſh roots and oxymell.

* *Clinick*, ſome read *Cynics*, & then it ſignifieth thoſe that have their mouths drawn awrie to their ears: the diſeaſe is called *Cynicus ſpaſmus*.

ſores remaining after impoſtumes ſuppurat and broken: mixed with parched or fried barley-groats, it is a very rats-bane, and killeth both them & mice. The Gauls or Frenchmen when they ride a hunting into the chaſe, uſe to dip their arrow heads in the juice of Ellebore, and they have this opinion, That the veniſon which they take will eat the tenderer; but then they cut away the fleſh round about the wound made by the foreſaid arrows. Furthermore it is ſaid, That if white Ellebore be beaten to powder and ſtrewed upon milke, all the flies that taſt thereof will die. To conclude, the ſaid milke is good to rid away lice, nits, and ſuch like vermine out of the head and other parts of the bodie. G

Chap. vi.

Of the hearbe Mithridation. Of Scordotis or Scordium. Of Polemonia, and Philetæria, otherwiſe called Chiliodynama. Of Eupatorie or Agrimonie. Of great Centaurie, otherwiſe named Chironea. Of the little Centaurie, named alſo Libadion and Fel terræ. Of Triorches: and the medicinable vertues upon theſe Simples depending. H

Ratevas hath aſcribed the invention of one hearbe to king *Mithridates* himſelfe, called after his name Mithridation: This plant putteth foorth no more than two leaves, and thoſe directly and immediatly from the root, reſembling the leaves of Branc-urſine. There riſeth up a ſtem between them both in the mids, carrying an incarnat floure in the head like a roſe.

Pompeius Lenæus (who by the commaundement of *Pompey* the Great tranſlated into Latine the Phyſicke notes and receits of king *Mithridates*) ſaith moreover, That the ſaid prince found out another hearbe named Scordotis or Scordium; and that among other his writings he met with the deſcription of the ſaid hearbe, ſet downe under the kings owne hand in this manner; namely, That it grew a cubit high, with a maine ſtem foure ſquare, and the ſame full of braunches garniſhed with downie or furred leaves, indented and cut like to thoſe of the oke. This herb is found ordinarily growing within the region of Pontus, in battle and moiſt champian grounds, and in taſt is very bitter. There is another kind of Scordium, with larger & broader leaves, and like it is unto wild Minth or Calamint: both the one and the other be of great uſe in Phyſicke, either by themſelves alone, or els put into opiats and antidots among other ingredients. I

* Of πόλεμος, which ſignifieth, war or debate.

Touching * Polemonia, which others call Philetæria, it tooke the name upon occaſion of the ſtrife and controverſie between certain princes which debated about the firſt invention thereof. The Cappadocians know it by the name Chiliodynama, *i.* as one would ſay, endued with a thouſand vertues. This plant hath a thicke and groſſe root, but ſmall and ſlender branches, from the tops whereof there hang downe certaine berries in tufts and cluſters, encloſing within them blacke ſeed: in all other reſpects it reſembleth rue, and groweth commonly upon mountains. K

Eupator.

As for Agrimonie, called otherwiſe Eupatoria, it hath gotten credit & reputation by a * king, as it may appeare by the name. The ſtalke or ſtem of this hearbe is of a woodie ſubſtance, blackiſh in colour, hairie, and of a cubit in heigth or rather more. The leaves grow diſpoſed and diſtant by certain ſpaces aſunder, much like unto thoſe of cinquefoile or hempe, ſnipped and cut about the edges ordinarily in five parts; the ſame are of a blackiſh or darke greene, and full of a kind of plume or downe. The root is ſuperfluous for any operation that it hath in Phyſick: the ſeed of this hearb drunke in wine, is a ſingular remedie for the dyſenterie or bloudie flix. L

Rha-pontick.

The greater * Centaurie is that famous hearb wherewith *Chiron* the Centaure (as the report goeth) was cured, at what time as having entertained *Hercules* in his cabin, hee would needs be handling and tempering with the weapons of his ſaid gueſt, ſo long untill one of his arrows light upon his foot and wounded him dangerouſly: wherupon ſome there be who name it Chironion. The leaves grow large, broad, and long, endented or cut rather, like a ſaw round about the edges: neare unto the root they come up very thicke: the ſtems run up three cubits high, full of knots and joynts all the way: knobbed in the top like unto Poppie heads: the root is of a mightie bigneſſe, enclining to a red colour, howbeit tender and eaſie to breake or knap in ſunder: two cubits it beareth in length; full of a liquid juice: bitter in taſt, and yet ſweet withall: it loveth to grow upon banks and pretie hills, where the ground is fat and battle. The beſt Centaurie of this greater kind, commeth out of Arcadie, Elis, Meſſenia, Pholoe, and mount Lycæus: and yet there is good found upon the Alpes, and in many other places. Some there be, who out of this plant M

draw

A draw a juice in manner of Lycium. Of such efficacie it is to incarnat wounds, that (by report) if it be put into the pot to seeth among many gobbets or peeces of flesh, it will cause them to grow togither and unite. The root only is to be given inwardly, and namely in drinke, to the weight of two drams, in such cases as I will shew hereafter: with this charge, That if the Patient have an ague hanging upon him, it be stamped and taken in water: others may drinke it well enough in wine. Also the juice drawne forth of it when it is boiled, is good for the diseases or rot of sheepe.

Another Centaurie there is, surnamed also in Greeke Lepton, [*i.* Small] for that it hath little leaves in comparison of the other: some name it Libadion, for that it loveth to grow neare unto springs or fountaines: it is somewhat like unto Origan, save that the leaves bee narrowet and longer: the stalke is cornered, rising up to a small heigth, to wit, a hand-breadth or a span at
B most: the same also putteth forth little braunches: the floure hath some resemblance of the *red-rose campion: the root is small, & needlesse for any Physick use: but the juice of the herb it selfe, is of singular operation. This herb would be gathered in Autumne, when it is fresh, full of leaves and flours, for then it yeeldeth best juice. Some take the stalks and braunches, shred them small, let them lie infused in water eighteen daies, and then presse forth the juice. This is that * Centaurie, which we here in Italie call Fel Terræ, *i.* the Gall of the earth, by reason of the exceeding bitternesse which it hath: the Gauls tearme it Exacos, because if it be drunke it sendeth downward by seege out of the bodie, any hurtfull poison whatsoever.

*Lychnidis.

*Our common Centaurie.

There is a third Centaurie, named Centauris, knowne by the addition Triorches: whosoever commeth to cut this hearbe, he quits himselfe well and escapeth faire, if he wound not himselfe.
C This plant yeeldeth forth a certaine red juice like unto bloud. *Theophrastus* hath delivered in his historie of Plants, That the hawks* Triorchides protect and defend this hearbe, and are readie to encounter and fight with them that come to gather it; wherupon it tooke the foresaid name Triorchis. But many ignorant and unskilfull persons there be, who write confusedly of all these Centauries, and attribute this last propertie and name, to the first Centaurie the great.

*Our Buzzards (as *Turner* thinketh.)

Chap. VII.

Of Clymenos, Gentian, Lysimachia, Parthenius or Artemisia, Ambrosia, Nymphæa, Heraclium, and Euphorbium, with their operations in Physicke.

D THe hearbe Clymenos beareth the name of K. *Clymenus*, the first inventor and finder out thereof: Leafed it is like unto Ivie, full of braunches: the stalkes or stems bee hollow and emptie within, divided by joynts and partitions: of a strong and unpleasant smell: the seed resembleth the grains or berries of Ivie; and it taketh pleasure to grow in wild woods and among mountains. As touching the operations which it hath, and namely what diseases it cureth being taken in drinke, I will shew hereafter: meane while, I will not put off any longer, but advertise the reader even in this place, That this hearbe as it doth good one way, so it hurteth another; for if they be men that drinke it, well may it cure them of the maladies for which it is given, but surely it killeth their naturall seed and disableth them for getting children, so long as they use it. The
E Grecian writers described it to be like in leafe unto Plantaine: in stem four square, bringing forth certaine little cods full of seed, enfolded and enterlaced one within another after the manner of the tufted and curled hairs about the Pourcuttle fishes called Polypi. But bee it what it will, the juice of the hearbe is refrigerative, and of great use in Physicke.

As for the hearbe Gentian, wee must acknowledge *Gentius* K. of the Illyrians for the authour and patron thereof, for he brought it first into name and credit: and howsoever it grow in all places, yet the best is that which is found in Illyricum or Sclavonia. The leaves come neare in fashion and forme to those of the Ash tree, but that they be small in manner of Lettuce: the stem is tender, of a thumbe thickenesse, hollow as a kex and void within: leafed here and there with certaine spaces between, growing up otherwhile three cubits high. The root is pliable and will wind
F every way, somewhat blacke or duskish, without any smell at all: it groweth in great plentie upon waterish hillocks that lie at the foot of great mountaines, such as the alps be. The juice of the hearbe is medicinable, like as the root it selfe also, which is very hot of nature and not to be given in drinke to women with child.

Lysimachia, the hearbe so much commended by *Erasistratus*, beareth the name of K. *Lysi-*

machus, who first gave light of the vertues that it hath: greene leaves it beareth like unto those of the willow: the flours be purple: given much it is to braunch from the root, and those stalkes grow upright: a* sharpe smell it carrieth with it, and delighteth to live in waterie places. Of so effectuall vertue it is, that if it be laid upon the yoke of two beasts which will not draw gently together, it staieth their strife and maketh them agree well enough. G

* *Odore acri*: Surely our herb Willow or *Lysimachia* hath a kind of sharpe coole sent not unpleasant: although *Plinie* use the word (*acri*) for hot and biting, in other places. Hereupon it might well be called λυσιμαδα, i. Lustre, and not of K. *Lysimachus*.

Not men onely and great kings, but women also and queens have affected this kind of glorie, To give names unto hearbs. Thus queene *Artemisia* wife to *Mausolus* king of Caria, eternized her owne name by adopting (as it were) the hearbe Mugwort unto her selfe, calling it Artemisia, whereas before, it was named Parthemis. Some there be who attribute this denomination unto *Diana* (called in Greeke Artemis Ilithyia) because it is of speciall operation to cure the maladies incident to women. It brauncheth and busheth thicke much like unto wormwood, but that the leaves be bigger, fat and well liking withall. Of this Mugwort there be two kinds: The one carieth broad leaves; the other is tender and the leaves smaller: this groweth no where but along the sea coasts. There be writers who call by this name Artemisia, another hearb, growing in the midland parts of the maine and far from the sea, with one simple stem, bearing very small leaves and plentie of flours, which commonly breake forth and blow when grapes begin to ripen, and those cast no unpleasant smell, which hearbe some thereupon name * Botrys, others Ambrosia: and of this kind there is great store in Cappadocia. H

* Or rather, *Botrys* (i. oke of Ierusalem) is of some called *Artemisia*, of others *Ambrosia*, as saith *Dioscorides*.

* Nemphar is called in Greeke Nymphæa; the originall of which hearb and name also, arose by occasion of a certain maiden nymph or young ladie, who died for jealousie that she had conceived of prince *Hercules* whome she loved: and therefore by some it is named also Heraclion, of others Rhipalos, for the resemblance that the root hath to a club or mace. But to come again to our first name Nymphæa, this qualitie it hath alluding and respective thereunto, That whosoever doe take it in drinke, shall for twelve daies after find no pricke of the flesh, no disposition (I say) to the act of venerie or companie of women, as being deprived for that time of all naturall seed. The best Nemphar or Nymphæa, is found in the lake Orchomenus, and about the plaine of Marathon. The people of Bœotia, who also use to eat the seed therof, commonly call it Madon. It taketh great contentment to grow in waters: the leaves floting upon the face of the water, be broad and large, whiles others put foorth from the root. The floure resembleth the Lillie, which when it is once shed, there be certain knobs remaining like unto the bolls or heads of Poppie. The proper season to cut the stems and heads of this plant, is in Autumne. The root is black, which being gathered and dried in the Sunne, is counted a soveraigne remedie for those that be vexed with the flux or fretting of the belly. A second * Nemphar or Nymphæa there is, growing in Thessalie, within the river Peneus, with a white root, but a yellow floure in the head about the bigneſſe of a rose. I K

* Water rose.

No longer agoe than in our forefathers daies, *Iuba* king of Mauritania, found out the hearb Euphorbia, which hee so called after the name of his owne Physician *Euphorbus*, brother to that learned *Musa* Physician to *Augustus Cæsar*, who saved the life of the said Emperor, as heretofore I have declared. These two brethren Physicians, joyned togither in counsell, and gave direction for to wash the bodie all over in much cold water, after the hote baine or stouve, thereby to knit and bind the pores of the skin: for before their time, the manner was to bathe in hot water onely, as we may see plainely in the Poët *Homer*. But now to returne unto our hearbe Euphorbia, the foresaid king *Iuba* wrote one entire booke (at this day extant) wherein hee doth nothing else but expressely set forth the commendable vertues and properties of this one hearbe. Hee found the same first upon the mountain Atlas, where it was to be seene (saith he) bearing leaves resembling Branc-ursine: so strong and forcible it is, that those who receive the juice or liquor issuing from it, must stand a good way off; for the manner is to launce or wound it first, and then presently to retire backe, and so at the end of a long pole to put under it a paile or trey made of kids or goats leather for a receptorie; into which there runneth forth out of the plant, a white liquor like unto milke: which when it is dried and growne togither, resembleth in shew a lumpe or masse of frankincense. They that have the gathering of this juice called Euphorbium, find this benefit therby, That they see more clearely than they did before. An excellent remedie this is against the venom of serpents, for what part soever is stung or wounded by them, make a light incision upon the * crowne [of the head] and apply thereto this medicinable liquor, it will surely cure it. But in that country, the Getulians (who commonly doe gather Euphorbium, for that they border upon the L M

* Or the upper part of the hurt place.

mount

A mount Atlas) ſophiſticat it with Goats milk. Howbeit, fire will ſoon detect this impoſure of theirs, for that which is not right but corrupt, when it burneth, doth yeeld a lothſome fume and ſtinking ſent. The juice or liquor which in Fraunce is drawne out the hearbe Chamælea (the ſame that beareth the red graine, named by the Latines Coccum) commeth farre ſhort of this Euphorbium. The ſame being growne thicke and hard, if a man breake it, reſembleth gum Ammoniacke. Taſt it never ſo little at the tongues end, it ſetteth all the mouth on a fire, and ſo continueth it a long time hote, but more by fits, untill in the end it parcheth and drieth the chawes and throat alſo farre within.

Chap. viii.

B *Of Plantain, Bugloſſe, and Borrage. Of Cynogloſſa or Hounds tongue. Of Buphthalmus, i. Ox eye or Many-weed. Of Scythica, Hippice, and Iſchæmon. Of Vettonica and Cantabrica. Of *Conſiligo and Hiberis. Of Celendine the great, Canaria and Elaphoboſcos. Of Dictamnum, Ariſtolochie or Hert-wort: That fiſh are delighted ſo much therwith, that they will make haſt unto it, and be ſoon taken. Alſo the medicinable vertues of thoſe hearbes abovenamed.*

* Setterwort or Bears foot, as ſome think.

Themiſon, a famous Phyſician, ſet forth a whole booke of the hearbe Waibread or Plantain, wherein he highly praiſeth it: and challengeth to himſelfe the honour of firſt finding it out; notwithſtanding it be a triviall and common hearbe, trodden under every mans foot. Two kinds of it bee found: The one which is the leſſer, hath alſo narrower leaves, and enclining more
C to a blackiſh greene, reſembling for all the world ſheepe *or lambes tongues, the ſtalke is cornered bending downeward to the ground, & it groweth ordinarily in meddowes. The other is greater, with leaves encloſed (as it were) within certaine ribs reſembling the ſides of our body: which being in number ſeven, gave occaſion to ſome Herbariſts for to call it Heptapleuron, as a man would ſay, the ſeven ribbed hearbe. The ſtem of this Plantaine riſeth to a cubit in height, much like to that of the Naphew. That which groweth in moiſt and waterie places, is of greater vertue than the other. Of wonderfull power and efficacie it is by the aſtringent qualitie that it hath, for to drie and condenſite any part of the bodie, and ſerveth many times in ſtead of a cauterie or fearing yron. And there is nothing in the world comparable unto it, in ſtaying of fluxes and deſtillations, which the Greekes call Rheumatiſmes.

* Whereupon it ſeemeth to be called in Greek ἀρὴς λαιὰν.

D To Plantaine may he joined the hearbe *Bugloſſos, ſo called, for that the leafe is like an Oxe tongue. This hearbe hath one ſpeciall propertie above the reſt, that if it be put into a cup of wine it cheareth the heart, and maketh them that drinke it, pleaſant and merrie; whereupon it is called Euphroſynon.

* Our Borrage.

Vnto this for affinitie of name, it were good to annex Cynogloſſos, *i.* Hounds tongue, for the reſemblance that the leaves have to a dogs tongue: a proper hearbe for vinet-workes and knots in gardens. It is commonly ſaid, That the root of that Cynogloſſos which putteth foorth three ſtems or ſtalkes, and thoſe bearing ſeed, if it bee given to drinke, cureth Tertian agues: but the root of that which hath foure, is as good for the Quartanes. Another *Cynogloſſos there is like unto it, which carieth ſmall burres: the root whereof being drunke in water, is a ſingular countre-
E poyſon againſt the venome of toads and ſerpents.

* This is our cõmon Hound-tongue with little burs.

An hearbe there is with flowers like unto Oxe eyes, whereupon it tooke the name in Greeke *Buphthalmos: the leaves reſemble Fennell: & it groweth about towne ſides: it ſhutteth forth ſtalkes from the root plentifully, which being boiled, are good to be eaten. Some there bee who call it Cachla. This hearbe made into a ſalve with wax, reſolveth all *ſchirrhous & hard ſwellings.

* Somecal them Moones.

* *Schirrhomata*, otherwiſe *Stecomata*, which be bunches or ſwellings in the fleſh full of a greaſie matter.

Other plants there bee, which beare the names not of men but of whole nations, which firſt found them and their vertues out. And to begin withall, beholden wee are to Scythia for that which is called Scythica. It groweth notwithſtanding in Bœotia, and is exceeding ſweet in taſt. Alſo there is another of that name, ſingular good for the crampes, called by the Greekes Spaſmata. An excellent propertie it hath beſides, for that whoſoever holds it in their mouth, ſhall for
F the time be neither hungrie nor thirſtie. Of the ſame operation there is another hearbe among the Scythians or Tartars, called *Hippice, becauſe it worketh the like effect in horſes, keeping them from hunger and thirſt. And if it bee true that is reported, the Scythians with theſe hearbs will endure without meat or drinke for twelve daies together.

* *Theophraſtus* writeth the like of the ſweet root or Liquirice and Hippace, which is cheeſe made of Mares milk: but not of any hearb Hippice

Touching the hearbe Iſchæmon, the Thracians firſt found out the rare vertue that it hath in ſtanching

ſtanching bloud, according as the very name implieth. For (ſay they) it will ſtop the flux of bloud running and guſhing out of a veine not onely opened, but alſo if it were cut through. It coucheth and creepeth low by the ground, and is like unto Millet, but that the leaves bee rough and hairie. The manner is to ſtuffe the noſthrils therewith for to ſtay the bleeding at noſe. And that which groweth in Italie ſtancheth bloud, if it be but hanged about the necke, or tied to any part of the bodie. G

Betonie. The people in Spaine named Vettones, were the firſt authors of that hearbe, which is called in Fraunce *Vettonica, in Italy Serratula, and by the Greekes Ceſtron or Pſychotrophon: Surely an excellent hearbe this is, and above all other Simples moſt worthie of praiſe. It commeth forth of the ground, and riſeth up with a cornered ſtalke, to the height of two cubits, ſpreading from the very root leaves of the bigneſſe of Sorrell, cut in the edges or toothed in manner of a ſaw, with flowers of a purple colour growing in a ſpike, & ſeed correſpondent thereto. The leaves dried and brought into pouder, be good for very many uſes. There is a wine and vinegre made or condite rather with Betonie, ſoveraigne for to ſtrengthen the ſtomacke, and clarifie the eyeſight. This glorious prerogative hath Betonie, that looke about what houſe ſoever it is ſet or ſowed, the ſame is thought to be in the protection of the gods, & ſafe ynough for committing any offence, which may deſerve their vengeance and need any expiation or propitiatorie ſacrifice. H

A kind of wild Gilloſre. In the ſame Spaine groweth *Cantabrica, lately found by the people Cantabri, and no longer ſince than in the daies of *Auguſtus Ceſar*. This hearbe is to bee ſeene every where, riſing up with a bentie or ruſhie ſtalke a foot high, upon which you may behold ſmall long flowers, like unto cups or beakers, wherein lie encloſed very ſmall ſeeds. Certes, to ſpeake the truth of Spaine, it hath been alwaies a nation curious in ſeeking after Simples. And even at this day in their great feaſts where they meet to make merrie Sans-nombre, they have a certaine Waſſaile or Bragat, which goeth round about the table, made of honied wine or ſweet mead, with a hundred diſtinct hearbes in it: and they are perſuaded that it is the moſt pleaſant and wholeſomeſt drinke that can bee deviſed: yet there is not one amongſt them all who knoweth preciſely what ſpeciall hearbs there bee in all that number; in this onely they bee all perfect, that there goe a hundred ſeverall kinds thereto, according as the name doth import. I

Much like to the Welch Metheglin.

In our age we remember well, that there was an hearbe diſcovered in the Marſians countrey: and yet it groweth alſo amongſt the people named Æquiccolæ, neare unto the borrough Nerveſia, and they call it * Conſiligo: this is a ſoveraign plant, as we ſhall ſhew hereafter in place convenient, for thoſe that be ſo farre gone in a Phthiſicke or Conſumption, as no man would hight them life and recoverie.

Bearefoot. K

Written in Iambicke verſes as appeareth in *Galen.* Of late daies *Servilius Danocritus*, a famous practitioner in Phyſick, brought to light an hearbe, which he tearmed Hiberis, a deviſed and fained name for his owne pleaſure, and nothing ſignificant, as may appear by a certain *Poëme that he made as touching the diſcoverie of that hearb. It commeth up moſt willingly about old tombes and ſepulchres, decaied walls, and ruinat buildings, in untoiled and neglected places, and namely, common high waies. It beareth flowers at all times, and is leaved like to Creſſes: the maine ſtalke is a cubit high: but the ſeed ſo fine and ſmall, that hardly they can diſcerne it. The root alſo hath the very ſmell of Creſſes: it ſerveth to many good purpoſes, but with moſt ſucceſſe in Summer time, and never but when it is green and freſh gathered. Much adoe and trouble there is about the punning and ſtamping of it. Beeing tempered and incorporat with a little Hogs greaſe, it is ſingular to be applied to the paine of the hucklebone called Sciatica, as alſo to the gout of any joints whatſoever. If the patient be a man, it muſt lie bound faſt unto the place foure houres at the moſt: but women may abide it but halfe ſo long, provided alwaies, that preſently upon this medicine they goe downe into an hot baine, and after they have bathed, annoint their bodies all over with wine and oyle. Thus muſt the patient doe once every twentie daies, ſo long as there remaineth any grudging or minding of the foreſaid paine. And ſurely in this ſort it drieth up and cureth all ſecret and inward rheumes running neare unto the bones. Howbeit, this caveat would bee given, not to lay this plaſtre too in the very heat and furie of the paine or diſeaſe; but the time muſt bee waited when the extremitie is ſomewhat ſlaked and overpaſt. L M

our Celendine. Moreover, other living creatures alſo there be beſides men, unto which we are to attribute the invention of hearbes: as firſt and principally, the great *Celendine, called in Greek Chelidonia, for that the old Swallowes with the helpe of this hearbe helpe their young ones to ſee again, yea

though

A though their eyes were plucked out of their head, as some are of opinion. Of this heatbe there be two kinds: The greater, which putteth forth many stems, and those full of braunches, beareth leaves like unto the wild *Parsenep, but that they be larger. The hearbe it selfe groweth up to the height of two cubits. The leaves bee whitish or hoarie, like as the whole plant it selfe, all save the flower, which is yellow. The whole hearb yeeldeth a biting and fretting juice, of the colour of Saffron: and it bringeth forth seed resembling that of Poppie. The lesse *Celendine is seene with leaves fashioned much after the Ivie, but that they be rounder. Both Celendines doe flower in the Spring, about the time that the Swallowes come abroad and shew themselves unto us, and those flowers begin to fade again upon the departure of that bird from us. The only time to draw or presse their juice from them, is whiles they bee in the flower: Which if it bee put into a brasen
B pan, and seeth gently upon hote embers or ashes onely, together with the best Atticke honey, is a singular medicine to discusse and scatter the cloudie filmes that dim the eyesight. The said juice alone without any other preparations, goeth to the making of many collyries or eyesalves, which be called Chelidonia, by reason of that ingredient.

Touching the dogs grasse Canaria, it took that name in Latin, because dogs use therwith to dis-
3 charge their gorge & whet their stomacks when their appetite to meat is gone. A strange thing of these dogs; we see them chew this hearbe in our sight ordinarily every day, yet so, as we never can tell which *hearbe it is that they have bitten: for we may perceive it onely when it is eaten down. But no marvell if this creature be so spightfull as to conceale from us a purgative hearbe, consi-
C dering a greater malice that he sheweth in another: For it is said, that if a dog bee bitten by a serpent, he hath recourse by and by to a certaine hearbe that cureth him presently, but hee will bee sure that no man shall see him when he croppeth that hearbe.

Yet the poore hinds (simple and harmelesse creatures they) are not so coy and dainty of their knowledge, for they have shewed us the plant * Elaphoboscon, whereof I have already written: like as the hearbe *Seseli also, which presently after they have calved, they feed upon in our sight, and make it not straunge. Nay, they have not thought much to impart unto us the vertue of the hearbe Dictamnus (as I have partly declared heretofore) for we may evidently see them after they be shot or wounded, to go forthwith unto this hearbe, and no sooner have they eat of it, but im-
5 mediatly the arrows or darts wherewith they were hurt and sticking in them, fall out of their bo-
D dies. This plant is found growing no where but in the Island Candie. The braunches bee exceeding fine and slender: It resembleth in some sort Penyroiall. At the tongues end hot it is and biting. And the leaves onely are in use: for *neither flower nor seed it hath, ne yet any stem or stalk. As for the root, as it is small and little, so is it *needlesse for any good it doth in Physicke. A rare plant this Dictamnus is, for even in Candie (the natural place therof) it groweth not every where, but within some small compasse of ground within that Isle: and there Goats have a wonderfull desire to be feeding upon it. Mary in lieu of this true Dictamnus, there is a bastard kind found in many countries, called Pseudodictamnum: In leafe it resembleth the other, the branches be lesse: and some there be who name it Chondris. That it is of weaker operation, and nothing so effectuall as the former, a man shall soone find by the tast: for take never so little of the right Dictam-
E num into the mouth, it setteth it presently on a fire. They that use to gather these Dictamnes, bestow them close wrapped within the stems of Ferula or reeds, and then bind them fast together, for feare that their vertue and strength should exhale and vanish away. Writers there be who affirme, That both the one and the other Dictamnum doe grow in many countries: but the worst is that which commeth up in rich and fat grounds. Therfore they that would meet with the right Dictamnum, must seeke it in rough places, for no where els it loveth to grow. A third kind there is of Dictamnum, and so called: but neither in shape answerable, nor in effect comparable to the other. In leafe it resembleth water Mints, but that the braunches be greater. Moreover, this setled and deepe persuasion men have of Candie, that what Simples soever grow there, they be infinitly better than all others of the same kind whatsoever. Next unto which Island there goeth a
F great name and opinion of the mountaine Pernassus, for excellent hearbs: howsoever otherwise mount Pelius in Thessalie, the hill Telechrius in Eubœa: and generally, all Arcadia, & the countrey of Laconica throughout, be renowned much for plentie of good Simples. And yet the Arcadians verely use no other Physicke but milke onely, and that about the Spring, at what time all hearbs there, be in their best verdure and fullest of sap; so as the udders of beasts be their Physicians, yeelding them medicines out of the pastures. But above all, they use to drinke Cow milke, for

Pastinacæ erraticæ. Some read *Ranunculi*, i. Crowfoot, out of *Dioscor.*

* *Scrophularia*, i. Pilewort or Figwort. This floureth sooner, to wit, in Februarie.

* With us they doe eat the common Quich-grasse.

* *Gratia dei.*

* Which the old Romanes called *Silì*: whereof *Festus* thinketh that *Silutũ* (i. a breakfast) tooke the name: because they used before dinner or noon refection, to drinke a draught of wine aromatized with this hearbe.

* In *Dioscorides*, whom *Plinie* seemeth here to translate, it should be read thus, οὔτε ἄνθος, οὔτε σπερμὰ συμφέρει, not φέρει, that is, Neither floure nor seed is medicinable: for, that it hath floures, appeareth by *Virgil* 12 Æneid. in these verses: *Dictamnum genitrix Cretæa carpit ab Ida, Puberibus caulem foliis, & flore comantem. Purpureo, &c.*

* Yet *Dioscorides* saith, that it helpeth women to speedie childbirth.

for that thoſe kind of cattell, feed indifferently in manner of all kind of hearbes. Certes, of what power and efficacie hearbes are, and namely, what effects they may worke even by the milke of fourefooted beaſts graſing and paſturing therupon, appeareth manifeſtly by two notable examples which I will report unto you. About Abdera, and along the ſtreet or high way called *Diomedes* cauſey, there lie certaine paſtures, wherein all the horſes that feed, become enraged, and ſtark wood thereby. Semblably, the hearbage belonging to Potniæ, a town in Magneſia, driveth aſſes to a kind of madneſſe. G

Leaving now thoſe hearbs which tooke their appellations of beaſts, let us proceed to others. Among which, Ariſtolochia deſerveth to bee raunged with the beſt and principall: an hearbe which ſeemeth to have had that name given it by great bellied women, for that it is * ἀρίστη λεχέσαις. Our countreymen of Italie call this hearbe in Latine Malum terræ, which is as much to ſay, as the * apple of the earth: and they doe make foure kinds thereof. The firſt hath a round root ſwelling and bunching out: leaves reſembling the Mallow, and partly thoſe of Ivie, but that they bee of a more browne and duskiſh colour, and withall, ſofter in the hand. The ſecond Ariſtolochia or Birthwort is taken to be the male, and hath a root as thicke as a good baſton or ſtaffe, growing longwiſe to the length of foure fingers. The third, which by ſome is called Clematis, by others, Ariſtolochie of Candie, hath a root exceeding long and ſlender, like to that of a yong Vine: and this is reputed of all others for the beſt and moſt effectuall. The roots of them all be of a box colour, the ſtalkes ſmall, and the flowers purple. They beare little prettie berries, much like to capers. But it is the root alone which is medicinable. A fourth kind there is alſo, which they call Piſtolochia, ſmaller and ſlenderer than the laſt before, named Clematis. A root it hath divided into many fibres or ſtrings, growing thicke one by another, to the thickneſſe of big and well growne ruſhes: whereupon ſome have given it the name of Polyrrhizon. All the ſort of theſe Ariſtolochies yeeld an aromaticall odour: but the long and ſmaller root is that which is moſt pleaſant to ſmell unto: for it hath a fleſhie rind, and is one of the principall ingredients which enter into thoſe odoriferous perfumes and ointments which ſtand moſt upon Nard. Theſe Birthworts delight all of them to grow upon plaines and battle grounds. The right ſeaſon to dig or draw them out of the earth, is in harveſt time: and then after they be rid and skaled (as it were) from the earth or mould ſticking unto them, they uſe to lay them up ſafe. Howbeit the beſt ſimply are thoſe which come out of Pontus. And take this for a generall rule, That in every kind, the weightieſt is alwaies moſt medicinable. The round rooted Ariſtolochie hath a ſpeciall propertie againſt the poyſon of ſerpents. Yet there goeth the greateſt name of the long, for this excellent qualitie, if it bee true that is reported thereof: namely, That if a woman newly conceived with child, applie the root thereof to her naturall parts within a morcell of raw bœufe, it will cauſe her to breed and forme in her wombe a man child. Our Fiſhers here by in Campaine, do tearme the round root, The poyſon of the earth. In very truth I have ſeene them with mine owne eyes to ſtampe the ſaid root, and incorporat it with lime into a paſte, and ſo to caſt it into the ſea in ſmall pellets or gobbets, for to catch fiſhes: and I aſſure you they will skud amaine, and make haſt to this bait, and bee very eager of bit: but no ſooner have they taſted thereof, but they will turne up their bellies, and lie floating aloft upon the water ſtarke dead. As for that Ariſtolochie, which for the manifold roots that it hath is called Polyrrhizos, it is thought to bee ſoveraigne for convulſions or crampes, contuſions, or bruiſes; for ſuch alſo as have fallen from ſome ſteepe and high place, if the root bee drunke in water. Likewiſe, the ſeed of this kind, is ſuppoſed ſingular good for the pleuriſie: and to corroborat, ſtrengthen and heat weake and diſtempered ſinewes. The ſame likewiſe may bee reckoned for a * Satyrion. H I K L

*i, Excellent good for women in childbed. Wherein *Plinie* is ſomewhat overſeen, but the error is not great, ſeeing that women with child uſe ordinarily alſo to bee brought a bed and lie in.

* Meant by Ariſtolochie or Birthwort the round.

*Any hearbe good to provoke ſtirring luſt. For although there be a ſpeciall hearbe of that vertue, ſo called, yet by a kind of Synecdoche, all others of like operation may be tearmed Satyria.

It remaineth now to knit up this diſcourſe with a rehearſall of all the operations and effects of the plants beforenamed. To begin then with the moſt daungerous accident of all other, to wit, the ſting of ſerpents, theſe hearbes following are very medicinable and effectuall in that caſe: namely, Brittannica, and the roots of all the kinds of Panaces taken in wine. The flower and ſeed beſides (of Chironium eſpecially) if it be drunk, or otherwiſe applied as a liniment with wine and oile. Alſo the wild Origan or Marjeram called Cunila Eubula, hath a ſingular property by it ſelfe that way: like as Polomonia, otherwiſe called Philetœria, if one take foure drams weight of the root in wine. Semblably, Teucrion, Sideritis, and Scordotis, given in wine. But more particularly againſt ſnakes, adders, and ſuch like, the ſaid hearbs bee right ſoveraigne, either inwardly taken or M

out-

A outwardly applied upon the wound, be it in juice, ſubſtance of leaſe, or decoction, it skilleth not whether: for which purpoſe a dram weight of the root of great Centaurie drunke in three cyaths of white wine is excellent. As for Gentian, it ſerveth properly againſt ſnakes, if it be taken to the poiſe of two drams with Pepper and Rue, in ſix cyaths of wine, greene or drie, it makes no matter. Touching hearbe Willow or Lyſimachia, ſerpents cannot abide the very ſmell thereof, but flie from it. If any bodie chance to be ſtung alreadie by them, there is not a better medicine than to give Celendine in drinke. But of Betonie above all the reſt there is made a moſt ſoveraigne ſalve to bee laid unto the place that is ſtung. And ſuch a contrarietie in nature or Antipathie there is (by folkes report) betweene them and this hearbe, that if the leaves thereof be ſtrewed in a circle round about them, the ſerpents within will never give over flapping with their tailes, and
B beating their owne ſides, untill they have killed themſelves. Now for their ſting, it is an uſuall practiſe to give inwardly one dram weight of the ſeed of Betonie in three cyaths of wine, or elſe to incorporat three drams of the pouder in one ſextar of water, and lay it as a cataplaſme to the ſore. Cantabrica, Dictamnum, and Ariſtolochia, ſerve likewiſe for good countrepoyſons, in caſe a dram weight of their root bee given in one hemine of wine. But then the patient muſt uſe to drinke it often. And verely Ariſtolochia worketh the ſame effect, if it be reduced into a liniment and ſo applied: ſo doth Piſtolochia, which hearbe is ſo adverſative unto ſerpents, that if you do but hang it up in the chimney over the hearth, it will chaſe away all kind of ſerpents out of the houſe.

Chap. IX.

C *Of Argemonie, Agarick, and Echium. Of Henbane and Vervaine. Of Blattaria and Lemonia. Of Cinquefoile, Carot, and the Clot or great Bur. Of Cyclaminus or Sowbread, and Harſtrang: hearbs all ſingular againſt the ſting of ſerpents.*

THe root of Argemonia taken to the weight of one Romane denier in three cyaths of wine, is ſingular againſt the ſting of ſerpents. And ſince I am come to mention this hearb, I think it convenient to diſcourſe farther thereof: like as of other ſimples alſo, which I meane to name firſt, before that I treat of their vertues and effects. And in this courſe of ſetting down medicines, ever as I meet with any hearbe of any ſingularitie, I will raunge it there whereas I know it
D to be moſt ſoveraigne and effectuall. Well, this *Argemonie aforeſaid hath leaves like unto Anemonie, *An hearbe like to the wild Poppie. Roſe Perſeley or Windflower: jagged they be in manner of garden Perſeley. Heads it beareth in the top of every ſtalke or branch, reſembling thoſe of wild Poppie or Corne-roſe: and a root alſo not unlike to that of the ſaid hearbe. A juice it yeeldeth, yellow as Saffron, hot, ſharp, and biting in taſt. With us here in Italie it groweth upon corne lands. Our countrymen have deſcribed three kinds thereof, but they allow and commend that onely, which hath a root ſenting much of Frankincenſe.

Touching Agaricke, it is a fungous excreſcence growing out of certaine trees neare unto the ſtreights of Boſphorus, much like unto a white Mulhrome. The ordinarie doſe or receit thereof, to be given, bruiſed, and beaten ſmall into pouder, is to the weight of two drams in two cyaths of
E Oxymell or honied vinegre. That which is found in Gaule or Fraunce, is thought to bee weaker in operation. Moreover, that Agaricke is counted the male which is more maſſive or compact, and bitterer withall: But one ill qualitie it hath, namely, to make the head to ake. The female is of a more looſe and ſofter ſubſtance: which at the firſt when you taſt it ſeemeth ſweet, but within a while it turneth to be bitter.

Echium is of two kinds. One of them is like unto Peniroyall, garniſhed & crowned (as it were) with tufts of leaves in the head: which being given to the weight of two drams in foure cyaths of wine, is ſingular good for the venome of ſerpents, inflicted by their ſting. The like effect hath the other alſo, which is diſtinctly knowne from the other by the rough and prickie downe that the leaves doe beare, and it carieth in the top little knobs reſembling vipers heads: and this may be
F taken either in wine or in vinegre, chuſe you whether.

The great Clot-bur, called in Greek Arcion, ſome have named in Latine Perſonata. There is not a plant in the field that carieth a broader leaſe, and beſides, furniſhed it is with as big Burres. The root of this hearbe boiled, the Phyſicians preſcribe to be given in vinegre to drinke againſt the ſting of ſerpents.

Hen-

Henbane, ſtamped leaves and all, is ſingular to bee taken in wine, eſpecially againſt the ſting of the Aſpides. G

*Vervaine. But of all other hearbes, there is none more honoured among the Romanes than *Hierobotane, called alſo otherwiſe in Greeke Periſtereon: which we in Latine name Verbenaca. This is that hearbe, which (as I have declared heretofore) our Embaſſadors uſe to carie with them when they goe to denounce warre, and to give defiance unto our enemies. With this hearbe the feaſtivall table of *Iupiter* is wont to be ſwept and cleanſed with great ſolemnitie; our houſes alſo to be rubbed and hallowed, for to drive away ill ſpirits. And hereof be two kinds. That which they take to bee the female, is ſtored well with leaves; the male hath them growing but thin: yet both of them put forth many ſmall and ſlender braunches, commonly a cubit long, and cornered. The leaves be leſſer and narrower than thoſe of the Oke, but deeper they be indented, and the partition wider: the flowers be of a *gray colour, the root long and ſmall. It groweth every where upon plaines ſubject unto waters. Some writers make no diſtinction at all of male and femele, but hold them all to be of one and the ſame kind, becauſe they worke the ſame effects. In France the Druidæ uſe them both indifferently, in caſting lots, telling fortunes, & foreſhewing future events by way of propheſie. But the Wiſe men or Sages called Magi, overpaſſe themſelves mightily in this hearbe, and ſhew their foolerie and vanitie without all ſence and reaſon: They would beare us in hand forſooth, that whoſoever bee rubbed all over the bodie therewith, ſhall obtaine whatſoever their heart deſireth, bee able to cure and drive away all manner of agues, reconcile them that be fallen out, make freindſhip betweene whom they liſt, and in one word, give remedie to any diſeaſe whatſoever. They give moreover expreſſe order, that it bee gathered about the riſing of the great Dogſtarre, but ſo, as neither Sunne nor Moone be at that time above the earth to ſee it; with this eſpeciall charge beſides, that before they take up the hearbe, they beſtow upon the ground where it groweth, honey with the combes, in token of ſatisfaction and amends for the wrong and violence done in depriving her of ſo worthie an hearbe. They reſt not ſo, but when thoſe ceremonious circumſtances be performed, they enjoine them alſo who are to dig it up, for to make a circle round about the place with ſome inſtrument of yron, and then to draw & plucke it up with the left hand in any wiſe, and ſo to fling it aloft over their heads up into the aire: which done, they appoint preciſely that it bee dried in the ſhade, leaves, ſtalkes, and roots, every one apart by themſelves. To conclude, they adde moreover and ſay, that if the hall or dining chamber bee ſprinckled with the water wherein Vervaine lay ſteeped, all that ſit at the table ſhall bee very pleaſant, and make merrie more jocundly. Well, to leave theſe toies and fooleries, the truth is this, ſtampe and beat it, give the juice or pouder therof in wine, it is a good defenſative againſt the poyſon of ſerpents. H K

*Dapalis. Arnob. lib. 2.

*Flos Glaucus.

An hearbe there is much reſembling Mullen or Langwort, and indeed ſo like, as oftentimes one is taken for the other; howbeit, the leaves be not altogether ſo white, and more little braunches it putteth foorth, bearing likewiſe a pale yellow flower. Caſt this hearbe or ſtrew it in any place, all the moths thereabout will gather to it, whereupon at Rome they call it Blattaria.

The hearbe Lemonium yeeldeth a white juice much like unto milke, which will harden and grow together in manner of a gum: and it groweth in moiſt places. The weight of one denarius given in wine, is a ſingular preſervative againſt the daungerous ſting of ſerpents. L

As for Cinque-foile or five leaved graſſe, there is not one but knoweth it: ſo common it is, and commendable beſides for the *ſtrawberries which it beareth. The Greekes call it Pentapetes, Chamæzelon, or Pentaphyllon: the Latines Quinqueſolium. The root when it is new digged, looketh red: but as it beginneth to drie above ground, ſo it waxeth blacke, and becommeth alſo cornered. It tooke the common name both in Greeke and Latine, of the number of leaves which it beareth. This hearbe herein is of great affinitie with the vine, that they both bud, ſpring leafe, and ſhed the ſame together. It is uſed alſo about purging and bleſſing of the houſe, againſt naughtie ſpirits or enchauntments.

Plinie herein erreth groſſely. Indeed the leaves of Cinque-foile are much like to the Strawberrie leafe: But as the one hath no fruit or berrie at all, ſo the other (to wit, the Strawberrie-wire) puts forth but three leaves. * The tame and the wild.

As for Sparganium, an hearbe ſo called by the Greekes, the root thereof is good to be given in white wine againſt venomous ſerpents. M

Of Carrots, *Petronius Diodotus* hath ſet downe foure ſeverall kinds. But what need I to goe through them all foure, ſeeing they may be reduced well ynough into *twaine, and do require no other diſtinctions. The beſt and moſt approoved Carrots be thoſe of Candie: the next to which in goodneſſe come out of Achaia. But generally in what countrey ſoever they grow, the better

be

A be ſuch as come up in the ſounder and drier grounds. As touching the Candie Carot, it reſembleth Fennell, but that the leaves ſtand more upon the white; they bee ſmaller alſo and hairie withall. The ſtem groweth upright a foot high, and hath a root odoriferous to ſmell unto, and of a moſt pleaſant taſt: this joyeth in ſtonie places expoſed to the South quarter of the world. As for the other Carots of a wild nature, In what countrey grow they not? you ſhall find them upon earthie banks and hills, you ſhall have them about high waies, but never ſhall a man meet with them in a leane and hungrie ground; they love a battle and fat ſoile: their leaves come near to the Coriander: their ſtem ariſeth to a cubit heigth, bearing round heads, three ordinarily, and otherwhiles more: the root is of a woodie ſubſtance, and being once dried, it ſerveth to no purpoſe. The ſeed of this kind is like unto Cumin; but of the former, to Millet graine, white, quicke,
B and ſharpe; and they bee all odoriferous and hot in the mouth. The ſeed of the ſecond is more ægre and biting than the former, and therefore ought to be taken in leſſe quantitie. As for the third kind (if we liſt to make ſo many) it is much like unto the wild Parſnep, called in Greeke Staphylinos, and in Latine Paſtinaca Erratica: the ſame beareth a ſeed ſomwhat long in forme, and a ſweet root. All the ſort of theſe Dauci or Carots, are ſafe enough from the bit of foure-footed beaſts both winter and ſummer, unleſſe it be after they have caſt their abortive fruit before time [for then they ſeeke thereto, to be cleanſed of their gleane.] Of all Carots, the ſeeds be uſed only: but that of Candie affourdeth the root alſo, which is ſweet: but both the ſeed of the one ſort and the root of the other, be moſt appropriat remedies againſt ſerpents: a dram weight in wine is a ſufficient doſe at a time: which alſo may bee given in a drench to four-footed beaſts that be
C ſtung by them.

Touching the hearbe Therionarca (I mean not that which the magicians uſe) it groweth alſo in this part of the world here with us in Italy: many branches it putteth forth, and ſpringeth thick with divers ſhoots from the root: the leaves be of a light greene, and the floure of a red-roſe colour: it killeth ſerpents outright: beſides, it hath this propertie, That if it be brought neare unto any wild beaſt whatſoever, it benummeth their ſenſes, [whereupon it tooke that name.]

Perſolata, which the Greeke writers call * Arcion, there is not one but knoweth: large leaves it hath, and bigger than the very Gourds; more hairie, blacker alſo and thicker; a white root and a great: this root taken in wine to the weight of two deniers Roman, is good likewiſe againſt the venom of ſerpents. In like manner, the root of Cyclaminus or Sow-bread is as effectuall againſt
D them all: leaves it hath ſomewhat reſembling thoſe of Ivie, but that they be of a more duskiſh and ſad greene, ſmaller alſo and without corners, wherein a man may perceive certaine whitiſh ſpecks. The ſtem is little, and hollow within: the flours of a purple colour; the root broad (ſo as a man would take it for a Turnep) and covered over with a blacke rind: it groweth in ſhadowie places. Our countreymen here in Italie call it in Latine Tuber terræ, that is to ſay, The knur or bunch of the ground. Sowne and planted it would be in every garden about an houſe, if ſo be it be true that is reported of it; namely, That whereſoever it groweth, it is as good as a countrecharme againſt all witchcraft and ſorceries: which kind of defenſative is called properly Amuletum. Moreover, this root (they ſay) if it be put into a cup of wine, turneth the braine preſently,
E and maketh as many drunke as drinke therof. For the better keeping and preſerving of this root, it muſt be ordered after the manner of Squilla or Sea onion roots, that is to ſay, cut into thin ſlices or roundles, then dried, and ſo laid up: the ſame alſo is uſually ſodden to the conſiſtence or thickneſſe of hony. As good as this root is in thoſe former reſpects, yet it is not without ſome venomous qualitie; for it is commonly ſaid, That if a woman with child chaunce to ſtep over it, ſhe will fall preſently to labour before her time, and looſe the fruit of her wombe. A ſecond kind of Cyclaminus or Swinebread I find, ſurnamed by the Greeks * Ciſſanthemos, growing with ſtems full of knots or joynts, hollow within and good for nothing; far different from the former, winding & claſping about trees; bearing berries much like to thoſe of Ivie, but they are ſoft; a white
F floure faire and lovely to ſee too, but a needleſſe root for any goodneſſe in it: the berries that it beareth be only in uſe, and thoſe are of a ſharpe and biting taſt, and yet they be viſcous & clammie to the tongue: theſe being dried in the ſhadow and ſtamped, are afterwards reduced into certain balls or troſches. My ſelfe have ſeen a third kind alſo of Cyclaminos, carrying the name beſides of Chamæciſſos, which brought forth but one only leafe: the root was much forked and divided into branches, wherwith folke uſed to kill fiſhes. But among all other hearbs of name, Peucedanum is much talked of and commended: principally, that which groweth in Arcadie: next

* Some take it to be the Clot bur, or Butterbur.

* κισσανθεμος, *Dioſcor. id eſt,* Leafed like to Ivie.

to it, moſt account is made of that in Samothrace: a ſlender ſtalke it carrieth and a long, reſembling the ſtem of Fennell: neare unto the ground it is repleniſhed well with leaves: the root is blacke, thicke, full of ſap, and of a ſtrong and unpleaſant ſmell: it delighteth to come up and grow among ſhadie mountains. The proper time to dig it out of the ground, is in the latter end of Autumne: the tendereſt roots and thoſe that run deepeſt down into the earth, are moſt commendable. The manner is to cut theſe roots overthwart into certain cantels or peeces of foure fingers in length, with knives made of bone; wherout there iſſueth a juice which ought to be dried and kept in the ſhade: but the partie who hath the cutting of them, had need firſt to annoint his head all over and his noſthrils with oile roſat, for feare of the gid, and leaſt he ſhould fall into a dizzineſſe or ſwimming of the braine. There is another juice or liquor found in this plant, lying faſt within the ſtems thereof; which they yeeld forth after inciſion made in them. The beſt juice is knowne by theſe marks; It carieth the conſiſtence of honey, the colour is red, the ſmell ſtrong and yet pleaſant, and in the mouth it is very hote and ſtinging. Much uſe there is of it in many medicines, as alſo of the root and decoction thereof: but the juice is of moſt operation; which being diſſolved with bitter almonds or rue, people uſe to drinke againſt the poiſon of ſerpents; and in caſe the bodie be annointed all over with oile, it preſerveth them ſafe againſt their ſtings. G H

Chap. X.

Of ground Elder or Wallwort. Of Mullen or Taper-wort. Of the Aconit called Thelyphonos. Of remedies againſt the pricke of Scorpions, the venome of Hedge-toads, the biting of mad Dogs: and generally againſt all poyſons.

I

*Sauge de bois.

THe ſmoke or perfume alſo of Walwort (a common hearbe and known to every man) chaſeth and putteth to flight any ſerpents. The juice of *Polemonia, is a proper defenſative eſpecially againſt ſcorpions, if one have it tied about him or hanging at his necke: likewiſe it reſiſteth the pricke of the ſpiders Phalangia, and any other of theſe venomous vermins of the ſmaller ſort. Ariſtolochia hath a ſingular vertue contrarie unto ſerpents: ſo hath Agaricke, if foure oboli thereof be drunke in as many cyaths of ſome artificiall or compound aromatized wine. Vervaine is a ſoveraigne hearbe alſo againſt the venomous ſpider Phalangium, being taken in wine or oxycrat, that is to ſay, vinegre and water: ſo is Cinquefoile, and the yellow Carot.

That hearb which the Latins call Verbaſcum, *i.* Lungwort or Hightaper, is named in Greeke Phlomos. Two ſpeciall kinds there be of it: the one is whiter, which you muſt take for the male; the other black, and that may go for the female. There is a third ſort alſo, but it is found no where but in the wild woods. The leaves of all the former, be broader than thoſe of the Colewort, and hairie withall: they beare a maine upright ſtem, a cubit in heigth with the vantage: the ſeed is black and of no uſe in Phyſick: a ſingle root they have, of a finger thickneſſe. Theſe grow alſo upon plains and champion grounds. The wild kind beareth leaves reſembling Sauge: the branches be of a woodie ſubſtance, & the ſame grow high. There be moreover of this kind two other herbs named * Phlomides, both of them hairie; their leaves be round, and they grow but low. A third ſort there is beſides, named by ſome Lychnitis, and by others Thryallis: it ſheweth three leaves or foure at the moſt, and thoſe be thicke and fat, good to make wieks or matches for lights. It is ſaid, that if figs be kept in the leaves of that which I named the female, they will not rot. To diſtinguiſh theſe hearbs into ſeverall kinds, is a needleſſe peece of worke, conſidering they agree all in the ſame effects: their root togither with rue, is to be drunke in water againſt the poiſon of ſcorpions: true it is, that the drinke is very bitter, but the effect that it worketh maketh amends.

* Some take theſe for the Cowſlip and Primroſe.

K L

*Aconitum Pardalianches, Libard-baine.

There is an hearbe called by ſome *Thelyphonon, by others Scorpion, for the reſemblance that the root hath to the Scorpion; and yet if ſcorpions be but touched therewith, they will die thereupon: no marveile therfore if there be an ordinarie drinke made of it againſt their poiſon: [and here commeth to my mind that which I have heard, namely, that if a dead ſcorpion be rubbed with the white Ellebore root, it will revive and quicken againe.] The ſaid Thelyphonon hath ſuch a ſpightfull nature againſt the four-footed beaſts [of the female ſex] that if the root be laid unto their ſhap or naturall place, it killeth them: and if the leafe, which is like unto the Cyclamin or Sowbread leafe above-named, be applied in that manner, they will not live one day to an end. This hearbe is parted and divided into knots or joynts, taking pleaſure to grow in coole and ſhadie places. To conclude and knit up theſe remedies againſt ſcorpions; the juice of Betonie, and

M

of

A of Plantaine likewiſe, is a ſingular remedie for their poiſon.

Moreover, Frogs (ſuch eſpecially as keepe in buſhes and hedges, and be called in Latine Rubetæ, *i.* Toads) are not without their venom: I my ſelfe have ſeen theſe vaunting Montebanks calling themſelves Pſylli, as comming from the race of thoſe people Pſylli who feared no kind of poiſon; I have ſeen them (I ſay) in a braverie (becauſe they would ſeeme to ſurpaſſe all others of that profeſſion) to eat thoſe toads baked red hot between two platters; but what became of them? they caught their bane by it, and died more ſodainly than if they had ben ſtung by the Aſpis: but what is the helpe for this ranke poiſon? ſurely the hearb *Phrynion drunke in wine. Some call it Neuras, others Poterion: prettie flours it beareth: the roots be many in number, full of ſtrings like unto ſinews, and the ſame of a ſweet and pleaſant ſent. Likewiſe Aliſura is counted another re-

B medie in this caſe: an herb it is, called by ſome Damaſorium, by others Lyron: the leaves might be taken for Plantaine, but that they be narrower, more jagged and plaited, bending alſo toward the ground; for otherwiſe ribbed they be and full of veins, as like as may be to Plantaine. As for the ſtalke, it is likewiſe one and no more, plain and ſlender, of a cubit in heigth; in the head wherof it hath knobs; roots growing many and thicke togither and thoſe but ſmall, like unto thoſe of the blacke Ellebore, but they be hot and biting, of a ſweet and odoriferous ſmell, and of a fattie ſubſtance withall: it groweth ordinarily in waterie & moiſt places. And yet there is a ſecond kind of it which commeth up in woods, of a more duskiſh and blacker colour than the former, bearing bigger leaves. The root of them both is of ſingular operation againſt the venomous frogs or toads aboveſaid: alſo againſt the Sea-hare, if it be taken in wine to the weight of one dram. And

C ſince we have mentioned the Sea-hares, take this withall, That Cyclaminos alſo is ſoveraigne againſt their venome. Moreover, a mad dog letteth in a daungerous poiſon by the wound that his tooth maketh, againſt which there is not a better thing than dog-roſe of the Eglantine called Cynorrhodon, as I have before declared. Plantaine is a ſingular hearb againſt the biting of any venomous beaſt whatſoever, whether it be taken inwardly in drinke or outwardly applied. Betonie is likewiſe good therefore if it be drunke in old wine. Vervain, which the Greeks call Periſtereos, is an hearb bearing one main ſtalke of a good heigth, furniſhed well with leaves, ſpreading forth toward the head into other braunches, much ſought unto by doves and pigeons, whereupon it tooke the foreſaid name Periſtereos. They ſay, whoſoever carie this herb about them, there dare not a dog bark at them. Thus much as touching the dangers proceeding from venimous beaſts.

D What remaineth now but in the next place, to treat as well of ſuch ſorceries and maleficiall poiſons, as men have deviſed and practiſed to the miſchiefe of their owne kind, as of their remedies? where in the firſt place there preſenteth it ſelfe unto us that noble herb Moly, ſo much commended by the Poët *Homer*, as a ſoveraigne preſervative not only againſt all thoſe wicked inventions, but alſo againſt the ſecret and deviliſh practiſes, to wit, charms & enchantments, wrought by Art magick and witchcraft. Next unto which, the hearbs *Mithridation, Scordotis, and Centaurie: alſo the ſeed of Betonie drunke in honied wine or ſweet cuit: the powder alſo of the dried hearb it ſelfe, to the weight of one dram taken in foure cyaths of old wine, doth expell out of the bodie and evacuat by the ſeege any poiſon whatſoever; but the Patient muſt be forced to vomit up the firſt potion, and then to recharge againe and take another draught of the foreſaid medi-

E cine. And verely it is a common ſpeech, That whoſoever uſe to taſt everie day a little of Betonie, ſhall never catch harme by any poiſoned cup. If a man or woman chance to have drunke downe any poiſon, the root of Ariſtolochia is a preſent remedie, uſed in that order as I have preſcribed before in caſe of ſtinging by venomous ſerpents. The like effect hath the juice of Cinquefoile. Semblably Agaricke, if it be taken to the weight of one denier Roman in three cyaths of honied water or mead, is of the ſame operation; with this charge, That the partie do lay up his ſtomacke or caſt before. There is an hearb called Calves-ſnout, in Greeke Antirrhinon or Anarrhinon, a kind of wild Lychnis like unto Line or Flax, with little or no root at all, carrying a floure reſembling the Hyacinth or Crowtoes, and the ſeed much like unto a Calves ſnout or muzzle: The Magicians have a great opinion of this hearb, That whoſoever be rubbed all over with it, or an-

F nointed throughly with the juice thereof, ſhall looke more beautifull, lovely, and amiable: and whoſoever weareth it in a bracelet about the wreſt or arme, ſhall take no harme by charme, ſorcerie, witchcraft, or poiſon. The like conceit they have of another hearb called *Euploea; and they affirme, That if any man or woman be annointed therewith, they ſhall grow in great credit and reputation with the people. Moreover, they ſay, that the herb Artemiſia or Mugwort will preſerve

* Some take it for *Ruta muralis*, or *Salvia vita*, a kind of Saxifrage, or rather Maiden-haire.

* Whereof he writeth in the beginning of the ſixt chapter of this booke.

* *Euploea* in deed ſignifieth in *Homer*, a bon-voiage, or proſperous navigatiõ: but what is that to this place? No doubt *Plinie* ſhould have read in *Theophraſtus* εὐκλειὰ, which is no hearb, but the happineſſe of a good name among men, whereof *Plinie* ſpeaketh here; & which *Theophraſtus* attributeth to Antirrhinon, as one of the effects of that hearb. But lay the fault (I pray you) as well here as elſewhere, upõ *Plinies* Anagnoſts or Readers, who either read wrong or pronounced not their words diſtinctly and plainly unto him.

all thoſe who have it about them, from witchcraft, ſorcerie, and poiſon, from daunger by venomous beaſts, yea and from the hurtfull and maligne aſpect of the very Sun. The ſame, if it be taken in wine, helpeth and ſaveth thoſe that are poiſoned with Opium: being either drunke, or worne about the necke, or but tied to any part of the bodie, it hath a peculiar vertue againſt the venome of todes. There is an hearbe of the bulbous or onion-root kind named * Pericarpum: whereof be two ſorts, the one hath a red barke or rind [about the root;] the other a blacke, and is like unto the poppie: of greater operation this is, than the former; but both of them be very hot: which is the reaſon, they ſerve to good purpoſe for to be given unto them that have drunk hemlocke: againſt which venomous hearbe, Frankincenſe, and Panaces (eſpecially that which they call Chironium) be counted ſingular: and this Panaces alſo laſt named, is an excellent antidot for them that are poiſoned with venomous muſhroms. G H

* So called, becauſe the fruit claſpeth round about the ſtem or ſtalke of the hearbe.

Chap. xi.

Proper receits and remedies for the diſeaſes of the head.

SInce we are waded ſo far into the deepe ſecrets of Phyſicke, it will not be amiſſe to proceed forward and to ſet downe many good medicines for all the maladies incident either in generall to the whole bodie, or particularly to every ſpeciall part and member therof, beginning firſt at the head.

There is an unſeemely accident happening otherwhiles to the head, and diſgraceth it much, called * Alopecia, when as the haire unnaturally falleth off. The cure of this inconvenience, is to make a liniment with the roots of Nymphæa and Hemlocke ſtamped togither, and therewith to annoint the bald and naked places, for it will cauſe the haire to come up again and grow thick. Polytricha and Callitrica [both capillare herbs] differ one from another; for that Polytrica hath white bentie filaments or threads, the leaves alſo be more in number & greater withall: beſides, the verie plant it ſelfe ſpreadeth and brauncheth more than the other: This hearbe is ſingular to faſten the haire of the head at the root, and to make it buſh and grow thicke, beeing otherwiſe readie to ſhed. In like manner, there is an hearbe called in Latine * Lingulaca, which loveth to grow about ſprings or fountains, and is ſingular for the ſame imperfection of ſhedding haire, if the root togither with the leafe burnt and beaten to powder, be incorporat with the greaſe of a blacke ſow (but in any wiſe ſhee muſt be a young guilt that never farrowed or had pigs) and ſo brought into a liniment, and the head rubbed and annointed therwith: with this charge beſides, That after the annointing, the Patient ſit bareheaded in the ſun; for that helpeth forward the cure very much. And in the ſame caſe there is the like uſe of the Cyclamine or Sowbread root. I K

* Becauſe foxes are much ſubiect unto it, who are called in Greeke *Alopekes.*

* *Capillus Veneris*, or Maiden-haire.

* Adders-tongue.

Touching the ſcurfe or brannie ſcales called Dandruffe, the root of Veratrum or Ellebore, ſodden either in oile or water, maketh a moſt excellent medicine to rid it away, and to cleanſe the head thereof.

As for head-ach, the roots of all the kinds of Panaces, ſtamped and tempered with oile, doe cure the ſame: ſo doth Ariſtolochia and Iberis, if they be applied in manner of a frontall and bound to the forehead, the ſpace of an houre or longer if the Patient can abide it, ſo that a bath be uſed preſently upon it. The yellow Carot alſo called in Latine Daucum, is a good remedie for the paine in the head. Moreover, the foreſaid hearbe or root Cyclaminos, if it bee mixed with hony and put up as an errhin or naſall into the noſthrils, purgeth the brain: & the ſame brought into an ointment, healeth the ſcalls and ſores in the head. Of the like operation is Vervain, which they call in Greeke Periſtereos. The wild Caraway, named Cacalia or Leontine, beareth certaine graines reſembling ſmall ſeed-pearls, which a man ſhall ſee hanging betweene the leaves, which be big and large, and it groweth lightly upon hills: take fifteene of thoſe grains or ſeeds, ſteepe them well in oile, and make thereof a liniment, it is paſſing good to rub and annoint the head withall, ſo it bee done upward againſt the haire. Furthermore, the hearbe Callitriche, is ſingular good to provoke ſneezing: it beareth leaves much like unto thoſe of Lentils or Ducks-meat: the ſtalkes be verie ſmall like fine bents, and the root is as little: it delighteth to grow in coole, ſhadie, and moiſt grounds, and is of a ſharpe and hot taſt. L M

For the lowſie diſeaſe, wherein lice and ſuch vermin crawle in exceeding abundance all over the head, there is not a better medicine than an ointment made of hyſſope and oile ſtamped and incorporat togither: the ſame likewiſe killeth the itch in the head. Now the beſt hyſſope is

that

A that of Cilicia, growing upon the mountaine Taurus: and in a ſecond degree, there is reckoning made of that which commeth out of Pamphylia and Smyrna. An hearb this is, nothing friendly to the ſtomacke: being taken with figs, it purgeth downward; with honey, by vomit: howbeit, ſtamped with honey, ſalt, and cumin, and ſo reduced into a plaſtre, it is thought to be a proper remedie for the ſting of ſerpents.

Lonchitis is not the ſame hearbe (as moſt men have thought) that Xiphion or Phaſganion, although the ſeed be pointed like to a ſpeare head; for it beareth leaves reſembling leeke blades, which toward the root bee red, and more in number than about the ſtem it ſelfe: it carrieth little heads in the top, made after the faſhion of maskes or viſors, ſuch as players in Comœdies are woont to weare, lilling out prettie little tongues, and the roots bee exceeding long, and yet it
B groweth in drie grounds far from water. Contrariwiſe, * Xiphion or Phaſganion delighteth in wateriſh and moiſt places: at the firſt comming up, it maketh a ſhew of a ſword-blade: the ſtem ariſeth up to the heigth of two cubits: the root hath beards or fringes as it were hanging about it, and is in faſhion ſhaped to a filberd nut: which ought to be digged out of the ground before harveſt, and to be dried in the ſhade: the upper part of this root (for it groweth double) ſtamped with frankincenſe and mixed with wine of equall weight, and ſo made into a ſalve, draweth out the ſpills or broken skales in the braine-pan or ſcull: the ſame is good likewiſe to draw any impoſtume that is broken, and to fetch out corruption in any part of the bodie: and it is ſingular for the bones that be broken and cruſhed * under cart or waggon wheels: laſtly, the ſame is an effectuall remedie againſt poiſons.

* Our Glader or Flags.

* *Carpentis.*

C But to returne againe to the head-ach; the ſaid Ellebore boiled either in common oile, or els in oile roſat, and applied in manner of a liniment, doth aſſuage the ſame; ſo doth Peucedanum, [*id eſt*, Har-ſtrange] being incorporat in oile of roſes and vinegre. The ſame alſo beeing laid unto the head warme, doth mitigat the paine called the migraine, when as the one halfe of the head doth ake; and it cureth beſide, the dizzineſſe of the braine. The root of Peucedanum made into an ointment and uſed accordingly, provoketh ſweat, by reaſon of the hote nature that it hath, which is burning and cauſticke. The hearbe Fleawoort, which ſome call Pſyllion, others Cynoïdes, Chryſtallion, Sicelion, and Cynomyia, hath a ſmall root, whereof there is little or no uſe in Phyſicke. The braunches that it bringeth foorth, be ſlender and pliable in manner of vine ſhoots, bearing in the top certain big berries or knobs like unto beans; the leaves not un-
D like to * dogs heads; the ſeed reſembleth dogs fleas, whereupon it hath that name Cynomyia, and the ſame lieth within the foreſaid berries. The hearbe it ſelfe is ordinarily growing in vineyards: of great vertue it is to refrigerat and to diſcuſſe or reſolve withall: but the ſeed it is which yeeldeth moſt uſe in Phyſicke; and the ſame is applied in a frontall to the forehead and temples, with vinegre and oile of roſes, or elſe with vinegre and water togither, for to allay the pain of the head. For other accidents, when it is applied in forme of a liniment, the manner is to take the meaſure of one acetable, and to infuſe it in a ſextar of water untill it gather togither into a thicke and clammie ſubſtance; then it would be ſtamped, and the mucilage or ſlime drawn out thereof ſerveth for any paine, impoſtume, and inflammation. Over and beſides, Ariſtolochia is a ſingular hearbe for the wounds of the head: it draweth foorth broken bones and ſpills
E in any part of the head; and ſo doth Piſtolochia. To conclude, there is an hearbe called * Thyſſelium, not unlike to garden Perſley: the root whereof if it be but chewed in the mouth, purgeth the head of phlegmaticke humors.

* Whereupon it is called *Cynoïdes.*

* *Hydroſelynum, Dodonæi, id eſt*, Water perſley.

Chap. XII.

Receits for the diſeaſes of the eyes, made of Centaurie, Celendine, Panaces, Henbane, and Euphorbium.

IT is thought that the Rha-ponticke (which is the greater Centaurie) helpeth the eye-ſight verie much, if a fomentation be made therewith and water togither. The juice of the leſſe Cen-
F taurie tempered with honey and applyed, helpeth the imperfections of the eyes, namely, when there ſeeme gnats to flie before them, or when they are over-caſt with a clowd; for it ſcattereth the dimneſſe and web which darkeneth the ſight and doth ſubtiliat the cataract or cicatrices that overgrow the ball or apple. The hearbe Sideritis is ſo appropriat unto the eyes, that it cureth the very haw that groweth in horſes eyes. But ſo excellent is the herb Celendine, that it

passeth them all, and is a soveraigne medicine for all such imperfections. The root of Panaces G
mixed with parched or fried barly meale, maketh a good cataplasme for to represse the rheume
of waterie and weeping eies. And there is a singular drinke commended for the staying of such
humors, made of henbane seed one obolus, of Opium or the juice of poppie and wine as much:
Some put thereto the like quantitie of the juice of Gentian, which also they used to mingle with
collyries and eye-salves (that require some sharpenesse and acrimonie) * in stead of the foresaid
Opium or poppie juice. Moreover, Euphorbium clarifieth the eye-sight, if there be an inunction
made therewith. For bleered eyes, it is good to drop the juice of Plantaine into them. As for the
thicke mists that hinder the eye-sight, Aristolochia doth discusse and resolve them. The hearbe
Iberis bound unto the forhead, togither with Cinquefoile, stoppeth the fall of humors into the
eyes, and cureth all other maladies incident unto them. Mullen or Lungwort is likewise a great H
defensative against the foresaid rheums which have taken a course to the eies and cause them to
water: so doth Vervain, if it be applied with oile rosat or vinegre. For the cataract or suffusion of
the eies, for the pin and web which offend the eye-sight, the Troches of Cyclamine beeing dis-
solved and so applied, are soveraigne. As for the juice of Peucedanum (that is to say, Har-strange)
it is (as I said before) a notable medicine for to cleare the sight, and rid away the muddie mists
before the eies, if it be laid too with Opium and oile rosat. Finally, Flea-wort staieth and keepeth
up the flux of humors into the eyes, if the forehead be annointed with the mucilage thereof.

*Pro Meconio: and yet in Dioscorides it is μετὰ μυκανίς.

Chap. XIII.

Of Pimpernell, named Anagallis and Corchoros. Of Mandragoras or Circeium. Of Hemlocke, Creſtmarine or Sampire, named in Greeke Crithmos agria. Of the hearbe Molybdæna. Of Fumiterre. Of Acorus or Galangale. Of Floure-de-lis. Of Cotyledon or Venus navill. Of Sengreene, and Purcellane. Of Groundſwell. Of Ephemeron. Of the Taxill, and of Crowfoot: with the medicinable vertues of the ſaid hearbs, appropriat to the diſeaſes of eyes, ears, noſthrils, teeth, and mouth. I

THe hearbe Pimpernell, some call Anagallis, others Corchoros. Of it be found two kinds; the male with a red floure, the female with a blew: neither of them both be taller than the hand-breadth or a span at most: tender they be likewise in all parts: the leaves be very small, round, and lying upon the ground: they grow as well the one as the other in gardens and waterie K
places: that with the blew floure bloweth first: the juice of them both tempered with honey, dispatcheth the mist and dimnesse of the eies, consumeth the rednesse occasioned by a stripe or bruise, and taketh away the red spots in the white of the eye; and so much the sooner, if the hony be of the best and made about Athens, wherewith the eyes be annointed. The said medicine likewise is good for to extend and dilate the tunicles that make the ball or apple of the eye: and therefore it is an ordinarie course that their eyes be annointed therewith beforehand, who are to be pricked with a needle for couching of a cataract. These hearbs be singular good likewise for the haw in horses or beasts eies. The juice of Pimpernell conveighed up into the nosthrils, cleanseth the braine by the emunctorie of the nose, so that afterwards the Patient doe draw up wine into the nosthrils for a collution to wash them. A dram of the said juice drunke in wine, is a coun- L
trepoison against the venome of snakes. But this is strange, and I cannot chuse but marveile of it, that sheepe should so much hate and abhor the female Pimpernell as they doe: howbeit, in case they should mistake the one for the other because they are so like (for in floure onely they differ) and tast the Pimpernell with the blew floure, presently they have recourse (by a naturall instinct) to an hearbe for remedie called in Greeke Asyla, and by us in Latine Ferus oculus, [*i.* the wild and cruell eye, or Margellane.] Some there be, who set downe certaine ceremonies and circumstances to be observed by them who are to dig or plucke up this hearbe, namely, That they goe to this businesse before the sunrising, and salute or bid good morrow to it three time, before they speake any other word that morning; and then to take it up and cast it on high: which done, to presse forth the juice of it. Thus ordered forsooth, they say it is of better operation, and will do M
the deed surely.

Touching Euphorbium, what it is I have sufficiently spoken. The juice thereof is singular for bleered eyes, especially if they be swelled withall: likewise wormewood stamped and incorporat with honey: as also the powder of Betonie. There groweth many times a fistulous ulcer be-

tweene

A tweene the corner of the eye and the noſe, called Ægilops; for to heale which ſore, there is a ſoveraigne hearbe of that *name growing among Barley: In blade or leafe it reſembleth that of Wheat: the ſeed or graine whereof, beaten into pouder and mixed with meale or flower, or the juice drawne out of the hearbe, they uſe for the ſaid purpoſe to applie unto the affected place in manner of a ſalve or liniment. Now the ſaid juice muſt bee preſſed out of the ſtalke and leaves thereof, whiles they bee freſh and fulleſt of ſap: but then the haw or eare that it beareth, ought to be taken away, which beeing incorporat with the flower of three-month corne, is made up into bals or troſches. Some were wont in this cure to uſe the juice alſo of Mandragoras, but they gave it over afterwards. Howbeit, for certaine, the root of Mandragoras bruiſed or ſtamped, and tempered with the oile of roſes and wine, cureth weeping and watering eyes, yea, and aſſuageth their
B pain: and the ſaid juice, howſoever it be rejected in the former caſe, goeth into many collyries or eyeſalves.

This hearb Mandragoras, ſome writers call Circeium; and two kinds there be of it: the white, which is ſuppoſed the male; and the black, which you muſt take for the female. The leaves of this female reſemble thoſe of the *Lectuce, but that they be narrower: hairie alſo they are, and all of an*equall bigneſſe. Two or three roots it hath, and thoſe of a reddiſh or ruſſet colour without, but white within: of a fleſhie ſubſtance and tender, running downe into the earth almoſt a cubit in length. A certaine fruit or apple they beare, of the bigneſſe of Filberds or Hazel-nuts, within which there be ſeeds like unto the pippens of Peares. The white Mandrage ſome name Arſen, that is to ſay, the male; others *Morion: and there be again who call it Hypophtomos. The white
C leaves of this Mandrage bee broader than the other, and in deed equall to the garden Docke or Patience. In the digging up of the root of Mandrage, there are ſome ceremonies obſerved: Firſt they that goe about this worke, look eſpecially to this, that the wind be not in their face, but blow upon their backes: then, with the point of a ſword they draw three circles round about the plant: which done, they dig it up afterwards with their face into the Weſt. There is a juice preſſed forth both of the fruit, and alſo of the leaves ſhred and minced; of the*ſtem likewiſe being firſt headed or the top cut off; and alſo of the root, which ſometime they do pounce and pricke for to let out the liquor, otherwhiles they boile it: and the root ſo prepared, it as good as the juice. The ſame alſo being cut into certaine thin rundles they uſe to*preſerve in wine. Howbeit, Mandrage is not found alwaies & every where full of juice: but in what place ſoever ſuch may be gotten, the right
D ſeaſon to ſeeke for it is about Vintage time: the ſent thereof is ſtrong, but the root and fruit doe ſmell the ſtronger. The apples of the white, when they be ripe, the manner is to drie in the ſhaddow: but the juice drawne out of them, is permitted to ſtand in the Sunne for to gather and harden. In like ſort, the juice of the root whether it bee bruiſed and ſtamped, or ſodden in groſſe red wine to the conſumption of a third part. The leaves moreover of Mandrage are commonly kept and condite in a kind of pickle or ſalt brine: for otherwiſe the juice of them whiles they bee freſh and greene, is peſtiferous and a very poyſon. And yet order them ſo well as you can, hurtfull they bee every way: the onely ſmell of them ſtuffeth the head, and breedeth the murre and the poſe. Howbeit, in ſome countries they venture to eat the apples or fruit thereof: but thoſe that know
E not how to dreſſe and order them aright, looſe the uſe of their tongue thereby, and prove dumbe for the time, ſurpriſed and overtaken with the exceeding ſtrong ſavour that they have. And verely if they bee ſo bold as to take a great quantitie thereof in drinke, they are ſure to die for it. Yet it may be uſed ſafely ynough for to procure ſleepe, if there be a good regard had in the doſe, that it be anſwerable in proportion to the ſtrength and complexion of the patient: one cyath thereof is thought to be a moderat and ſufficient draught. Alſo it is an ordinarie thing to drinke it againſt the poyſon of ſerpents: likewiſe, before the cutting, cauterizing, pricking or launcing of any member, to take away the ſence and feeling of ſuch extreame cures. And ſufficient it is in ſome bodies to caſt them into a ſleepe with the ſmell of Mandrage, againſt the time of ſuch Chirurgerie. There be that drinke it in lieu of Ellebore, for to purge the bodie of melancholicke humours, taking two oboles thereof in honied wine. Howbeit, Ellebore is ſtronger in operation for to evacuat blacke choler out of the bodie, and to provoke vomit.
F

As touching Hemlocke, it is alſo a ranke poyſon, witneſſe the publicke ordinance and law of the Athenians, whereby malefactors, who have deſerved to die, were forced to drink that odious potion of Hemlocke. Howbeit, many good vertues hath this hearbe, and would not bee rejected and caſt aſide for the ſundrie uſes therof in Phyſick. The ſeed is every way hurtfull and venomous.

As

*Ægilops. Some take it for wild Otes, others for Darnell.

*Whereupon it is called *Thridacias.*

*Æqualibus, not *caulibus*, for Mandrage beareth no ſtems.

**i. Membrum virile vel Genitale.*

* Other Herbariſts deſcribe Mandrages without a ſtem or ſtalke.

**Servatur in vino*; according to *Crateuas*, ἐν ὄξει ἕψῳ, whereas *Dioſcorides* ſaith ἐναβληθεὶς λίνῳ, *i traijcitur lino*, that is to ſay, they file them up hanging by little threads drawn through them.

As for the ſtems and ſtalkes, many there be that doe eat it both greene and alſo boiled or ſtewed between two platters. Light theſe ſtems be as kexes, and full of joints like Reeds and Canes: of a darke gray or ſullen colour, riſing up many times above two cubitss high: and toward the top they ſpread and braunch. The leaves in ſome ſort reſemble Coriander, but that they be more tender, and a ſtrong ſtinking ſmell they have with them. The ſeed is thicker and groſſer than that of the Anniſe. The root likewiſe hollow, and of no uſe at all in Phyſicke. The leaves and ſeed both are exceeding refrigerative: which if they have gotten the maiſtrie and upper hand of any that hath taken them, ſo as there is no way but one without helpe, they ſhall feele themſelves begin to wax cold in their extreame or outward parts, & ſo to die inward. Howbeit there is a remedy even then, before the cold have taken to the vitall parts: namely to take a good draught of wine, which may ſet the bodie in a heat, and chaufe it againe: mary if they drinke it with wine, there are no means in the world to ſave their lives. There is a juice preſſed out of the leaves & flowers both together: for that is the right reaſon, namely whiles it is in floure. That which is preſſed out of the ſeed ſtamped, being afterwards dried in the Sunne and made into bals or troſches, killeth them that take it inwardly by congealing and cluttering their bloud: for this is a ſecond venomous and deadly qualitie that it hath: which is the cauſe, that whoſoever die by this means, there appeare certain ſpots or ſpecks in their bodies after they bee dead. And yet there is a uſe of this juice, to diſſolve hot and biting medicines therein in ſtead of water: moreover, there is made of it a very convenient cataplaſme to be applied unto the ſtomacke, for to coole the extreame heat thereof. But the principall vertue that it hath, is to repreſſe and ſtay the flux of hot humors into the eies* in Summer time, and to aſſuage their paines if they be annointed therewith. It entreth beſides into collyries or medicines deviſed to eaſe paine: and verely there is no rheumaticke flux in any part of the bodie but it ſtoppeth it. The leaves alſo of Hemlocke doe keepe downe all tumours, appeaſe paines, and cure watering eyes. *Anaxilaus* mine author ſaith, That if a pure maiden doe in her virginitie annoint her breaſts with this juice, her dugs will never grow afterwards, but continue ſtill in the ſame ſtate. True it is indeed, that being kept unto the paps of women in child-bed, it drieth up their milke: as alſo extinguiſheth naturall ſeed, if the cods and ſhare bee annointed therewith. What remedies they ſhould uſe to ſave themſelves who are adjudged by law to drink it, I for my part purpoſe not to ſet downe. The ſtrongeſt Hemlocke and of ſpeedieſt operation is that which groweth about Suſa in the confines of Parthia. Next to it for fearefull working, is that which commeth out of Laconica, Candie, and Natolia. In Greece the Hemlocke of Megara is counted the quickeſt, and then that of Attica.

*Epiphoras æſtivas, or rather æſtuoſas, i. hot rheumes,

Creſtmarine or Sampier, called the wild Cuthmos, riddeth the eyes of the gummie & viſcous water that ſticketh in them, if it be applied thereto: and if it be made into a cataplaſme with fried Barley meale, it aſſuageth alſo their ſwelling.

There groweth commonly an hearbe named in Greeke Molybdæna, that is to ſay in Latine, Plumbago, even upon every corne land; in leafe reſembling the Docke or Sorrell, with a thicke root, and the ſame rough and prickie. Let one chew this hearbe firſt in his mouth, and then eftſoones licke with his tongue the eye, it conſumeth and taketh away the *Plumbum, which is a kind of diſeaſe or infirmitie incident to the eyes.

*Some take it for a Cataract.

As touching the firſt* Capnos, which in Latine is commonly called Pedes Gallinarei, *i.* Hens feet: it groweth about decaied walls and ruinat buildings, among rubbiſh, and in hedges: the branches bee very ſmall, and ſpread looſely or ſcattering, the flower of a purple colour, the leaves greene, the juice wherof diſcuſſeth the dimneſſe and thickneſſe about the eyes, and clarifieth the ſight: and therefore it is uſually put into eyeſalves. There is another hearbe of the ſame *name, and like in effect, but different in forme from it, which dooth braunch thicke, and is of a tender ſubſtance: the leaves for ſhape reſembling Coriander, and thoſe of a wan or aſhie colour, but it beareth a purple flower: It groweth in Gardens, Hort-yards, and Barley lands. If the eyes bee therewith annointed, it cleanſeth and cleareth them: but it cauſeth them to weepe and water, like as ſmoke doth, whereupon it tooke the name Capnos in Greeke. If the haire of the eye-lids be once pulled forth, and then the edges or brims be annointed therewith, it will keepe them for ever comming up againe.

*This *Fuchſius* thinketh to be Piſtolochia or our Ariſtolochia the rounder.

*It ſeemeth to be our Fumitorie, called in Greek Capnos

*Galangale.

*Acornes hath leaves like to the Flour-de-lis, but that they be only narrower, & growing unto a longer ſtele or taile: the roots be blacke & not ſo full of veins nor grained, otherwiſe they agree well with the Ileos root, hot & biting at the tongues end. To ſmell unto they are not unpleaſant:

and

A and beeing taken inwardly, they doe gently move rifting, and cause the stomacke to breake wind upward. The best Acorne roots be those which come from Pontus: then they of Galatia: and in a third ranke are they to be set which are brought out of Candie. Howbeit, the principall and the greatest plentie are those esteemed which grow in the region Colchis neare to the river Phasis: and generally in what countrey soever, they that come up in waterie grounds be cheefe. The fresher that the roots be and more newly drawne, the stronger sent and lesse pleasant tast they have with them, than after they have been long kept above ground. Those of Candie bee whiter than the other of Pontus. They use to cut them into gobbets as big as a mans finger, and then hang them within bags or pouches of leather a drying in the shade. I find in certaine writers, that the root of Oxymyrsine is called Acaros; and therfore some (alluding to the name of Acoros) chuse
B rather to call this plant Acaron the wild. Well, the root of Acorus is of great operation and effect to heat and extenuat: and therefore the juice thereof taken in drinke, is singular against catarracts or any accidents of the eyes that cause dimnesse. Soveraigne likewise it is taken to bee against the venome of serpents.

Cotyledon, named in Latine Vmbilicus veneris, is a pretie little hearbe, having a tender and a small stem, a leafe thicke and fattie, growing hollow, like to the concavitie wherein the huckle-bone turneth, and thereupon it tooke the foresaid name in Greek. It groweth by the sea side and in rockie or stonie grounds: of a lively greene colour, and the root round, much like to an Olive. The juice is thought to cure the eyes. Another kind there is of Cotyledon, with grosse and *fat-
C tie leaves likewise, but broader than the former. Toward the root they grow thicker, which they seeme to compasse and enclose, as it were an eye. A most harsh and unpleasant tast it hath: the stem is high, but very slender. This hearbe hath the same properties which the Floure-de-lis.

Of Sengreene or Housleeke, which the Greekes call Arizoon, there be two kinds. The greater is ordinarily planted in earthen pans or vessels set out before the windows of houses: which some name Buphthalmon, others Zoophthalmon, and Stergethron, becaus it is thought so good in love-drinkes or amorous medicines: others againe give it the name Hypoglesson, for that it is seene to grow under the eaves of houses. There are also who love to tearme it Ambrosia & Amerimnos. Here in Italie they call it Sedum the greater, Oculus also, and Digitellus. For the second kind is somewhat lesse, which the Grecians distinguish by the name *Erithales or Trithales (be-
D cause it beareth flowers thrice in the yeare;) others Chrysothales; and some againe, Isoëtes. But both the one and the other they call Arizoon, because they bee alwaies fresh and greene: according to which name in Greeke, some give it the Latine name Sempervivum. The greater kind beareth a stem a cubit high and more, and the same of the thicknesse of a mans thumbe, with the better. The leaves in the head or top whereof, be like unto a tongue, fleshie and fat, full of juice, a good inch broad; some bending downe and coping toward the earth, others standing upright, but so, as if a man marke their round circle or compasse wherein they lie couched, hee shall observe the very proportion of an eye. The lesse Sengreen or Iubarbe groweth upon walls, and specially such as be ruinat and broken downe; likewise upon the tiles of house-rouses. This hearbe is tufted with leaves from the very root even to the top of the branches. The leaves be narrow and sharpe pointed, and full of juice. The stalke groweth a good handbreadth or span high. The root
E is not medicinable nor of any use.

Much like to this is that hearbe which the Greekes call Andrachne Agria, i. wild Purcellane; the Italians, Illecebra. The leaves bee but small to speake of, howbeit broader than those of the hearbe beforenamed, and shorter toward the top. It groweth upon rockes and stonie places: and folke use to gather it for to eat. All these last rehearsed have the same operation, for they bee exceeding cold and astringent withall. Good they bee to stay the rheume that falleth into the eyes and causeth them to water; whether the leaves be applied to them, or the juice in manner of a liniment: moreover, they cleanse and mundifie the ulcers of the eyes, they do also incarnat, heale and skin them up: singular good besides to loose and open the eye-lids, when they are glued and closed up with viscous gum. The same doe allay the head-ach, if either the temples be annointed
F with the juice therof, or the leaves be applied unto them. Moreover, they mortifie or kill the poyson inflicted by the pricke of the venomous spiders Phalangia: but the greater Sengreene hath this pecular vertue, to resist the deadly poyson of the hearbe Aconitum. Furthermore it is said, that whosoever carie it about them, shall not be stung by scorpions.

All the kinds of them are proper remedies for the paine in the eares. Like as the juice of Henbane

*λπαρῆις, out of *Dioscor.* not ἰσὰ παρῆις, as *Plinie* seemeth to read, when he translated it [*Sordidis.*]

*Which some take to bee Prick-madame of the French Trique-madame.

bane alſo, if it be applied moderatly; of Achillea and the beſt Centaurie; of Plantaine and Harſtrang, together with oile Roſat and Opium: finally, the juice of Acornes or Galangale uſed with Roſes, is much commended in that caſe. But this would be noted, that the manner of preparing of all theſe juices, is to heat them firſt, and then to conveigh or infuſe them into the ear by a *pipe for the purpoſe [called an Otenchyte.] Semblably, the hearbe Vmbilicus Veneris or Cotyledon is much commended for mundifying the eares, when they run with filthie matter eſpecially, if it be tempered with deare ſewet, and namely of a Stag or Hind, and ſo inſtilled hot. The juice of the Wallwort root clarified and ſtrained through a fine linnen cloth, and ſoone after dried and hardened in the Sunne, healeth the ſwelling impoſtumations under the eares, if as need requireth, it be diſſolved in oile of Roſes, and ſo applied hote. The like effect in that caſe hath Vervaine and Plantaine; Sideritis alſo being incorporat in old Hogs greaſe. H

*Silla.

After the ſame manner Ariſtolochia together with Cyperus, healeth the ſtinking and illfavored ulcer of the noſe, called Noli-me-tangere.

The root of Panaces, eſpecially that which is called Chironia, if it be chewed in the mouth, aſſuageth the toothach, ſo doth the juice thereof, if there bee a collution made therewith. The root of Henbane hath the like vertue, if one chew it with vinegre: as alſo of Polemonia or Sauge de bois: for which purpoſe it is paſſing good to chew the Plantaine root, or to waſh the mouth and teeth with the juice or decoction thereof boiled in vinegre. And the very leaves of Plantain be ſingular for the paine of the teeth: yea, though the gums were putrified with ranke and corrupt bloud, or in caſe there owſed or iſſued out of them filthie bloudie matter. And the ſeed of Plantaine cureth the impoſtumations of the gums, albeit they gathered to ſuppuration and ran matter. I Moreover, Ariſtolochia doth knit and conſolidat the gums, yea, and faſteneth the teeth in the head. For theſe infirmities of gums and teeth, the root of Vervaine is highly commended, if it be chewed: or if it bee boiled in wine or vinegre, and the mouth waſhed with that decoction. The roots of Cinque-foile ſodden likewiſe either in wine or vinegre to the conſumption of a third part, worke the ſame effect. But looke that before you boile them, they bee well rinced and waſhed either in ſea water or ſalt water at the leaſt: and when you uſe this collution, ſee you hold the liquor or decoction in your mouth a long time. But ſome there be who thinke it better to rub the teeth with the aſhes of Cinque-foile burnt, leaves, root, and all. Moreover, the root of Mullen or Taperwort ſodden in wine, maketh a ſingular collution for the teeth. Likewiſe, if the teeth bee waſhed with the decoction of Hyſſope or the juice of Harſtrang, together with Opium or Poppie juice, much good and eaſe will enſue thereupon. K As alſo by the juice of a Pimpernell root: and the rather of that which is counted the female, if the ſame bee conveighed up into the noſthrill of the contrary ſide to the tooth that aketh. There is an hearbe called Groundſwell, which the Greekes name Erigeron, and wee the Latines Senecio: they ſay if a man make a circle round about it with ſome inſtrument of yron, and then dig it out of the ground, and therewith touch the tooth that is pained, three ſeverall times, and betweene every touching ſpit upon the ground, and then beſtow the ſaid hearbe root and all in the very ſame place where hee drew it, ſo as it may live and grow againe, the ſaid tooth ſhall never ake afterwards.

This Groundſwell is an hearbe much like in ſhape to Germander, as ſoft alſo and tender as it, the ſmall ſtalkes or braunches whereof encline to a reddiſh colour: and it loveth to grow upon tiled houſes and walls. The Greekes impoſed that name Erigeron, becauſe in the Spring it looketh hoarie, like an old grey beard: in the top it devideth it ſelfe into a number of heads, betweene which there commeth foorth a light plume, much like to Thiſtle-downe: which is the reaſon that *Callimachus* calleth it Acanthius; and others, Pappos. But in the farther deſcription of this hearbe, it ſeemeth that the Greekes agreed not: for ſome ſaid that it is leafed like to Rocket, others to an Oke, but that they be much leſſe. There bee writers alſo who hold the root to bee good for nothing in Phyſicke: and there bee againe that commend it to be ſingular for the ſinewes: beſides, ſome others are of opinion, That it ſtrangleth and choaketh as many as drinke it. Contrariwiſe, certaine Phyſicians preſcribe it for the jaundiſe to bee taken in wine: for all the diſeaſes likewiſe of the bladder, and againſt the infirmities of the heart and liver: And they aſſure us, that it ſcoureth the reines or kidneies of all gravell. In caſe of the Sciatica they have ordained it to bee drunke to the weight of a dram with Oxymell, preſently after ſome exerciſe by walking: giving out, that there is not a better thing in the world for the gripes and tor-

L

M

and

ments

A ments of the guts, if it bee taken in ſweet wine cuit: eſteeming it a ſingular hearbe for the greeſe of the midriffe and precordiall parts about the heart, if it bee eaten with meat in a ſallad with vinegre: and in regard of theſe manifold commodities, they ſow and nouriſh it in their gardens for to bee alwaies readie at hand. And ſome authours I find who have made a ſecond kind thereof: but they have not deſcribed what manner of hearbe it is, onely they appoint it to be given in water againſt the ſting of ſerpents, and to be eaten for the falling ſickneſſe. For mine owne part, I will ſet downe the uſe thereof in ſome caſes, according as I have found it by experience to worke in the practiſe here at Rome. The plume or downe which it beareth, if it be ſtamped and reduced into a liniment with Saffron and a few drops of cold water, and ſo applied, cureth the inordinat flux of wateriſh humours into the eyes. The ſame dried and parched againſt the fire, or
B otherwiſe fried with ſome cornes of ſalt, and laid to the ſwelling wens called the Kings evill, healeth them.

The May-Lillie (called in Greeke Ephemeron) is leafed like unto the Lillie, but that the leaves bee leſſe: the ſtem is ſemblable and equall unto it, upon which it beareth a *blew flower. The ſeed which it carieth is nothing medicinable. One ſingle root it hath of a finger thickeneſſe, which is ſoveraigne for the teeth, if it bee cut and minced ſmall, and afterwards ſodden in vinegre for a collution to waſh the teeth with it warme. The very ſubſtance alſo of the root is ſingular good to confirme the teeth ſtanding looſe in the head: and to be put into thoſe that bee hollow and worme-eaten. Moreover, the root of Celendine is good for the teeth, if it bee bruiſed or ſtamped, and ſo with vinegre held in the mouth. If teeth bee rotten and corrupt, the blacke
C Ellebore is ſingular to bee put into their concavities. And both of them (as well the blacke as the white) ſerve in a collution to ſtrengthen and keepe them faſt in their ſockets, if they be boyled in vinegre. As touching the Tazill (which is called in Latine Labrum Veneris) it groweth in rivers and *waters: Within the heads or burres which it beareth, there is found a little woorme or grub, which for the toothach they uſe to bind about the teeth, or to put it in their holes, and cloſe them up with wax. But when that hearbe is pulled out of the ground, great heed muſt be taken that it touch not the earth. The hearbe Crow-foot is called in Latine Ranunculus, in Greeke Batrachion; whereof bee foure kinds, The firſt beareth leaves like unto Coriander, but that they be fatter, and as broad as thoſe of the Mallow, of a ſwert colour: the ſtalke is whitiſh,
D or griſled and ſlender, the root alſo white: it groweth ordinarily along great rode waies, eſpecially in cold, ſhadowie, and moiſt places. The ſecond is better furniſhed with leaves, and thoſe more cut and endented than the former, and riſeth up with greater and higher ſtalkes. The third is the leaſt, having a ſtrong ſent, and bearing a yellow flower like unto gold. The fourth is like to this, and hath likewiſe a yellow flower. They be all of them of a cauſticke and burning qualitie. For lay but the leaves raw and greene (as they grow) upon any place, they will raiſe bliſters in the skin, as well as a light coale of fire: which is the reaſon, that they bee much uſed for leproſies and foule skabs; alſo to take out any markes imprinted in the skin, or unſeemely ſcarre. In ſumme, it is one of the ingredients that goe to the making of all potentiall cauteries or cauſticke medicines. Where the haire is gone, and the place bare and naked, they uſe commonly to applie theſe hearbes for to recover the haire againe: but they muſt bee ſoone remooved. For
E tooth-ach alſo it is an ordinarie thing to chew of their roots, but if one continue ſo long, it will burſt their teeth in peeces. The ſame beeing cut into roundles, and dried, and ſo beaten into pouder, ſerveth to provoke ſneeſing. Our Herbariſts here in Italie call this hearbe Strumea: becauſe it helpeth and cureth the wens named Strumæ or the Kings evill, and the flat biles or puſhes called Pani, if the ſame be hanged up afterwards in the chimney to take ſmoake. For this opinion they have, and be verely perſuaded, That if it be ſet again into the ground, the wens and biles aforeſaid which were healed, will returne and bee ſore againe. The like ſorcerie and witchcraft they uſe with Plantaine: But in truth, the juice of Plantaine is ſingular good for the cankers or ulcers within the mouth: ſo are the leaves and roots, if they be onely chewed, yea though the patient or diſeaſed perſon were troubled with the ſpitting rheume; for they intercept all
F thoſe defluxions, which take a courſe into the mouth. Cinque-foile is a very ſoveraigne hearb for the ſores of the mouth, and for ſtinking breath. Pſyllium, *i.* Fleawort, is good for the ulcers thereof.

But ſince I have named a ſtinking breath, which is a foule and naſtie diſeaſe, putting man or woman to ſhame, as no infirmitie more; I will ſet downe one or two compound receits for that

Dioſcorides ſaith white.

*It containeth water indeed within the concavities or arme-pits (as it were) of the leaves where they ioine to the ſtem, but ſurely in rivers it groweth not

Lafteo. Dioſcor. i. white.

that imperfection. Take Myrtle and Lentiske leaves, of each a like weight; of the Gall nuts growing in Syria, halfe as much in quantitie: stampe them all together, and in the stamping, sprinckle them with good old wine: give the patient this composition in bole to chew and eat in the morning, there is not the like medicine unto it for a sweet breath. Also take Ivie berries, Casia or Canell, and Myrrhe, of each an equall weight, incorporat them with wine in manner aforesaid, and use this confection accordingly. For the sores that bee incident to the nose, the seed of Dragons made into pouder, and tempered with honey, is singular to be applied therunto, yea though they were very cankers, and had eaten deepe. Where the skin looketh blacke and blew, whether it be under the eyes, or otherwise in any part of the visage, a salve made of Hyssope applied therto, restoreth it to the fresh and native colour. To conclude, a liniment of Mandragoras taketh out the markes or prints that bee branded or seared in the face [if it bee applied presently while they be fresh.]

THE XXVI. BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

¶ The Proëme.

Chap. I.

¶ Of medicines appropriat and respective to all other parts and members of the bodie. Of certaine new maladies: and namely, of the illfavored tettar called Lichenes: what kind of infection it is, and when it first entred into Italie. Of the blaine or sore called the Carbuncle. Of the filthie leprosie or wild scab named Elephantiasis. And of the Collicke.

LOng it is not since the face and visage of men began to bee annoied with certaine new and straunge diseases, unknowne in our forefathers daies, and never heard of before in Italie, nor almost in any part of Europe. And even of late daies when these maladies set first foot in these parts, they were not seen for to spread throughout all Italie, ne yet to raunge greatly in Illyricum, Fraunce, or Spaine, although some little sprinckling there was in those countries: but about Rome onely and those quarters adjoining, as they raigned first, so they raged most. These newcome diseases verely were nothing painefull to the patients, nor daungerous any waies and deadly; but so foule and filthie, so loathsome and ougly, that a man would have chosen rather to die any death, than to bee so disfigured. But of them all, the worst and most detestable was that, which by a Greeke name they called Lichenes, and in Latine (because ordinarily it began about the chin) *Mentagra. A tearme given unto it (I assure you) at the first by way of jeast and in a meriment (as commonly we see many are disposed to play and make good game at other mens miseries) but afterwards it went currant in every mans mouth: and by no other name than Mentagra was it knowne, notwithstanding the disease possessed not the chin alone, but in many that had it, tooke up the whole visage, all save the eyes, yea, and ran downeward to the neck and breast, spreading also to the armes and the very hands: and in such sort was the skin of the poore wretches

*For *Mentum* in Latine is a chin.

bepainted

A bepainted and beraied with foule scurfe and filthie scales, as it would have pitied one at the heart to see them. This contagious disease, our fathers and aunce stors in times past never heard of, nor knew what it meant: for the first time that ever it crept into Italie, was in the daies of *Tiberius Claudius* late Emperour of Rome, even about the middle of his reigne; and that was by the means of a certaine knight or gentleman of Rome borne at Perusium, who being secretarie or clerke unto the treasurer under the Romans in Asia, and giving attendance according to his place, chaunced there to be infected, and so he brought the disease over with him to Rome. But will you heare the straunge nature of this foule evill? women were not subject unto it; no more were slaves, base and poore commoners, no nor citizens of mean state and condition: the greatest gentlemen and those of the nobilitie, it made choise of, and picked them from among the
B rest: very catching it was, and soon passed from one to another, especially by the mouth, and * by the means of a kisse were it never so short: foule and illfavoured enough was the disease it selfe, but the skar, remaining after it was healed (for many there were who came under the Chirurgians hand and endured the cure) looked a hundred times worse: and why? no way there was to rid it, but by caustick medicines or potentiall cauteries; and unlesse the flesh were eaten away to the verie bones, it was not possible to kill and root it out cleane, but it would revive and spring again. And verely there came Physicians and Chirurgians out of Ægypt (a countrey apt to breed the like diseases and where they bee common) such as professed onely the skill in this kind of cure, who filled their purses well, and mightily enriched themselves by their practise at Rome: for well knowne it is, that *Manilius Cornutus* (late L. Pretour, and lieutenant generall for the state in
C the province of Guienne or Aquitane in Fraunce) dealt with one of these Ægyptian leeches for to be cured of this disease, and agreed to pay him 200000 sesterces for his paine. And thus much of Mentagra.

* *Veloci transitu oscula*: for men used to salute one another by a kisse.

Moreover, what a wonderfull thing is this observed in these new kind of maladies, that many times (contrarie to the course of other sicknesses) they come togither in troups; that some of them should all on a suddaine light upon a particular country; that they should take to one certaine member of mans bodie; assaile those of such an age and no other; have a spight to persons of this or that qualitie, and spare the rest: as if they made choise, some to plague young children, others elder folke; some to punish none but the rich and mightie, others to be doing with the poore and needy? In our Annals or Chronicles we find upon record, That while *Lucius*
D *Paulus* and *Q. Marcius* were Censors of Rome, the pestilent carbuncle (a disease appropriat to Provance and Languedoc in Fraunce) came first into Italie. Of which maladie, there died within the compasse of one yeere (about that verie time when I compiled this worke and historie of mine) two noble men of Rome and late Consuls, to wit, *Iulius Rufus* and *Q. Levanius Bassus*: of which two, the former was cut for it by the counsell of unskilfull Physicians, and * by that means lost his life. As for the other, having it upon the thumbe of his left hand, he chaunced * to prick it himselfe with a needle; and although the wound was so small, that hardly it could be seene and discerned, * yet it cost him his life. This carbuncle riseth ordinarily in the most hidden and secret parts of the bodie, and for the most part under the tongue: it is hard and red in manner of the swelling veins called in Latine Varices: and yet in the head it looketh blackish,
E the skin also about it seemeth swert and dead: it stretcheth the skin and the flesh in some sort stiffe, but without any great swelling; no paine at all, no itching, no other symptome but sleepe, wherewith it so possesseth the Patients, that in three daies it will make an end of them. Otherwhiles it causeth the partie to fall into a quivering and shaking as it were for cold, and raiseth certaine blisters or angrie pimples round about it; and verie seldome causeth an ague: but looke in whomsoever it taketh to the stomacke or throat, it quickly dispatcheth and maketh an end of them.

* Either by some mortification or effusion of blond.
* *Pollici acu impulsa.*
* It seemeth by a gangrene.
* Most of these signes shew a gangrene and canker, rather than our carbuncle.

As touching the white leprosie, called Elephantiasis (according as I have before shewed) it was not seene in Italie before the time of *Pompey* the Great. This disease also began for the most part in the face, and namely it tooke the nose first, where it put forth a little specke or pimple no
F bigger than a small Lentill; but soone after, as it spread farther and ran over the whole bodie, a man should perceive the skin to be painted and spotted with divers and sundrie colours, and the same uneven, bearing out higher in one place than another, thicke here but thin there, and hard every where; rough also, like as if a scurfe or scab overran it, untill in the end it would grow to be blackish, bearing downe the flesh flat to the bones, whiles the fingers of the hands, and toes of

the feet were puffed up and swelled againe. A peculiar maladie is this and naturall to the Ægyptians; but looke when any of their kings fell into it, woe worth the subjects and poore people: for then were the tubs and bathing vessels wherein they sate in the baine, filled with mens bloud for their cure. But surely this disease continued not long in Italie, before it was quite extinguished: like as another before it, in old time called *Gemursa, which began between the toes: and so long agoe it is since any have been troubled therewith, that the very name also is forgotten and growne out of use. Where by the way, this is to be noted as a straunge and wonderfull thing, That some of our diseases should have an end and loose their course for ever; and others againe continue still: as for example, the cholique passion; which came among us no longer agoe than in the daies of *Tiberius Cæsar* the Emperour: and the first that ever felt it, was the prince himselfe; whereupon arose no small question throughout the whole citie of Rome: for when as the said Emperour published a certaine proclamation, wherein hee excused himselfe for not comming abroad to manage the affairs of the State, because he was sicke of the cholique; the Senat and people reading this straunge name of an unknowne maladie, entred into a deepe discourse with themselves, What to thinke and make of it? But what should we say of all these kind of diseases? and what an anger and displeasure of the gods is this, thus to plague and punish us? Was it not enough to have sent amongst men into the world a certaine number of maladies otherwise, and those not so few as three hundred, but wee must be in feare and daunger still every day of new? And yet see! as many as there be of them comming by the hand of God, yet men thorow their owne excesse and disorders, bring as many more upon themselves, and be causes still of farther troubles and miseries. Well, thus you see by that which I have written in the former books, what was the old Physicke in times past, namely, consisting of the simples onely found in dame Natures garden, and how she alone at the first and for a long time, was our Physician and furnished us with remedies for all diseases.

Some thinke it was an inflammation resembling our Carbuncle or Anthrax.

Chap. II.

The praise of Hippocrates, and other Physicians meere Simplists.

Hippocrates verely had this honour above all men, That hee was the first who wrote with most perspicuitie of Physicke, and reduced the precepts and rules thereof into the bodie of an Art: howbeit, in all his books we find no other receits, but hearbs. Semblably, the writings of *Diocles* the Carystian, were no lesse stored with the like medicines, and yet a famous Physician he was, and both in time and reputation next and second to *Hippocrates*. *Praxagoras* also, and *Chrysippus*, yea and after them *Erasistratus* held on the same course. As for *Herophilus*, although hee was the first that went more exquisitly to worke and brought in a more subtile and fine method of Physicke, yet none esteemed better of Simples than he. But surely, practise and experience (which as in all things else is found to be most effectuall, so in the profession of Physicke especially) began in his daies by little and little to slake, untill in the end all their Physicke prooved nothing but words and bibble babbles: for beleeve me, his schollers and disciples thought it more for their ease and pleasure to sit close in the schooles and heare their doctours out of the chaire discourse of the points of Physicke, than to goe a simpling into the desarts and forrests to seeke and gather hearbs at all seasons of the yeere, some at one time and some at another.

Chap. III.

Of the new practise in Physicke: of Asclepiades the Physician: and what course he tooke to alter and abolish the old Physicke for to bring in the new.

WHat cunning means soever these new Physicians could devise to overthrow the auncient manner of working by simples, yet it maintained still the remnants of the former credit, built surely upon the undoubted grounds of long experience; and so it continued till the dayes of *Pompey* the Great, at what time *Asclepiades* a great Oratour and professor of Rhetoricke went in hand to pervert and reject the same: for seeing that he gained not by the said Art sufficiently, and was not like to arise by pleading causes at the bar, to that wealth which he

A he desired (as he was a man otherwise of a prompt wit and quicke spirit) he resolved to give over the law, and sodainly applied himselfe to a new course of Physicke. This man having no skill at all, and as little practise, considering he neither was well studied in the Theoricke part of this science, nor furnished with knowledge of remedies which required continuall inspection and use of simples, wrought so with his smooth and flowing tongue and by his daily premeditat orations gained so much, that hee withdrew mens minds from the opinion they had of former practise, and overthrew all. In which discourses of his, reducing all Physicke to the first and primitive causes, he made it a meere conjecturall Art; bearing men in hand, that there were but five principall remedies which served indifferently for all diseases; to wit, In diet, Abstinence in meat, Forbearing wine otherwhiles, Rubbing of the bodie, and the *Exercise of gestations. In summe,

B so far he prevailed with his eloquent speech, that every man was willing to give eare & applause unto his words; for being readie enough to beleeve those things for true, which were most easie; and seeing withall, that whatsoever he commended unto them, was in each mans power to performe, he had the generall voice of them: so as by this new doctrine of his, he drew all the world into a singular admiration of him, as of a man sent and descended from heaven above, to cure their griefs and maladies. Moreover, a wonderfull dexteritie and artificiall grace he had to follow mens humors and content their appetits in promising and allowing the sicke to drinke wine, in giving them eftsoons cold water when he saw his time, and all to gratifie his Patients. Now for that *Herophylus* before him had the honour of beeing the first Physician who searched into the causes of maladies: and because *Cleophantus* had the name among the auncients, for bringing

C wine into request and setting out the vertues theteof: this man for his part also, desirous to grow into credit and reputation by some new invention of his owne, brought up first the allowing of cold water beforesaid, to sicke persons; and (as *M. Varro* doth report) tooke pleasure to be called the Cold-water Physician. He had besides other pretie devises to flatter and please his Patients, one while causing them to have hanging litters or beds like cradles, by the mooving and rocking whereof too and fro, hee might either bring them asleepe, or ease the pains of their sickenesse; otherwhiles ordaining the use of bains, a thing that he knew folke were most desirous of: besides many other fine conceits very plausible in hearing, and agreeable to mans nature. And to the end that no man might thinke this so great alteration and chaunge in the practise of Physick, to have been a blind course and a matter of small consequence, one thing above the rest that woon

D himselfe a great fame, and gave no lesse credit and authoritie to his profession, was this, That meeting upon a time by chaunce with one he knew not, caried forth as a dead corse in a biere for to be burned, he caused the bodie to be carried home from the funerall fire, and restored the man to health againe. Certes this one thing, we that are Romans may be well ashamed of and take in great indignation, That such an old fellow as he, comming out of Greece (the vainest nation under the sunne) and beginning as he did of nothing, should onely (for to enrich himselfe) lead the whole world in a string, and on a suddaine set downe rules and orders for the health of mankind, notwithstanding many that came after him, repealed as it were and annulled those laws of his. And verely, many helps had *Asclepiades*, which much favoured his opinion and new Physicke, namely, the manner of curing diseases in those daies, which was exceeding rude, trou-

E blesome, and painfull; such adoe there was in lapping and covering the sicke with a deale of cloaths, and causing them to sweat by all means possible: such a worke they made sometime in chafing and frying their bodies against a good fire, but every foot in bringing them abroad into the hot sun, which hardly could be found within a shadie and close cittie as Rome was. In lieu whereof, not onely there but throughout all Italy (which now commaunded the whole world and might have what it list) hee followed mens humors in approoving the artificiall baines and vaulted stouves and hote-houses, which then were newly come up and used excessively in everie place by his approbation. Moreover, he found means to alter the painfull curing of some maladies, and namely of the squinancie; in the healing whereof, other Physicians before him went to worke with a certaine instrument which they thrust downe into the throat. He condemned also

F (and worthily) that dog-physicke which was in those daies so ordinarie, that if one ailed never so little, by and by he must cast and vomit. He blamed also the use of purgative potions, as contrary and offensive to the stomacke; wherein hee had great reason and truth on his side: for to speake truly, such drinks are by most Physicians forbidden, considering our chiefe care and drift is in all the course of our physick, to use those means which be comfortable & holesome for the stomack.

* *i.* Riding on horsebacke, carrying in coach, litter, barge, &c.

G

Chap. iiii.

The foolish superstition of Art Magicke, which here is derided. Of the tettar called Lichen: the remedies proper for it, and the diseases of the throat.

ABove all other things, the superstitious vanities of Magicians made much to the establishing of *Asclepiades* his new Physicke hearbs; for they in the heigth of their vanitie, attributed so strange and incredible operations to some simples, that it was enough to discredit the vertues of them all. First, they vaunted much of Æthiopus, an hearb which (by their saying) if it were but cast into any great river or poole, it would draw the same drie; and was of power (by touching only) to open locks, or unbolt any dore whatsoever. Of Achœmenius also H another hearbe, they made this boast, That being throwne against an armie of enemies ranged in battaile array, it would drive the troups and squadrons into feare, disorder their ranks, and put them to flight. Semblably, they gave out and said, That when the King of Persia dispatched his Embassadors to any forrein States and Princes, he was woont to give them an hearbe called Latace, which so long as they had about them (come where they would) they should want nothing, but have plentie of all that they desired: Besides a number of such fooleries wherewith their books be pestred. But where, I beseech you, were these hearbs when the Cimbrians and Teutons were defeated in a most cruell and terrible battaile, so as they cried and yelled againe? What became of these Magicians and their powerfull hearbs, when *Lucullus* with a small armie consisting of some few legions, overthrew and vanquished their owne kings? If herbs were so mighI tie, what is the reason (I pray you) that our Romane captains provided evermore above all things how to be furnished with victuals for their campe, and to have all the waies and passages open for their purveiours? In the expedition of Pharsalia, how came it to passe that the souldiers were at the point to be famished for want of victuall, if *Cæsar* by the happie having of one hearbe in his campe, might have enjoyed the abundance of all things? Had it not been better (thinke yee) for *Scipio Aemilianus* to have caused the gates of Carthage to flie open with the helpe of one hearbe, than to lie so many yeers as he did in leaguer before the cittie, and with his engins and ordenance to shake their walls & batter their gates. Were there such vertue in Æthiopus aforesaid, why do we not at this day drie up the Pontine lakes, and recover so much good ground unto the territorie about Rome? Moreover, if that composition which *Democritus* hath set downe K and his books maketh praise of, to be so effectuall, as to procure men to haue faire, vertuous, and fortunat children, how happeneth it that the kings of Persia themselves could never attaine to that felicitie? And verely we might marveile well enough at the credulitie of our aunceſtors in doting so much upon these inventions (howsoever at the first they were devised and brought in, to right good purpose) in case the mind and wit of man knew how to stay and keepe a meane in any thing els besides: or if I could not proove (as I suppose to doe in due place) that even this new leech-craft brought in by *Asclepiades* which checketh those vanities, is growne to farther abuses and absurdities than are broched by the verie Magicians themselves. But this hath been alwaies and ever will be, the nature of mans mind, To exceed in the end and go beyond all measure in every thing which at the beginning arose upon good respects and necessarie occasions. L

But to leave this discourse: let us proceed to the effects and properties remaining behind of those hearbs which were described in the former booke; with a supplement also and addition of some others, as by occasion shall be offered and presented unto us. Howbeit, to begin first with the remedies of the said Tettars (so foule and unseemly diseases) I meane to gather a heape of as many medicines as I know appropriat for that maladie, notwithstanding I have shewed alreadie of that kind, not a few. Well then, in this case, Plantaine stamped is verie commendable: so is Cinquefoile and the root of the white Daffodill, punned and applied with vinegre. The young shoots or tender braunches of the figg-tree boiled in vinegre: likewise the root of the * marsh Mallow sodden with glew in a strong and sharpe vinegre to the consumption of a fourth part. Moreover, it is singular good to rub tettars throughly with a pumish stone first, to the end that M the root of Sorrell stamped and reduced into a liniment with vinegre, might bee applied afterwards thereupon with better successe; as also the floure of *Misselto tempered and incorporat with quicke-lime: the decoction likewise of Tithymale togither with rosin, is much praised for this cure: but the hearbe Liverwort excelleth all the rest, which therupon tooke the name Lichen: it groweth

* *Hibisci*, some take it for the Hollyhocke.

* *Visci*, some read *Hibisci*.

A groweth upon ſtonie grounds, with broad leaves beneath about the root, having one ſtalke and the ſame ſmall, at which there hang downe long leaves: and ſurely this a proper hearbe alſo to wipe away all markes and cicatrices in the skin, if it be bruiſed and laid upon them with honey. Another kind of * Lichen or Liverwort there is, cleaving wholly faſt upon rocks and ſtones in manner of moſſe, which alſo is ſingular for thoſe tettars, beeing reduced into a liniment. This hearbe likewiſe ſtaunceth the flux of bloud in greene wounds, if the juice be dropped into them: and in a liniment, it ſerveth well to be applied unto apoſtumat places: the jaundiſe it healeth, in caſe the mouth and tongue be rubbed and annointed with it and hony togither: but in this cure the Patients muſt have in charge, To bath in ſalt water, to annoint themſelves with oile of almonds, and in any caſe to abſtaine from all ſalads and pothearbs of the garden. For to heale tettars, the root of Thapſia ſtamped with honey, is much uſed.

* Our common Liverwort.

B As for the Squinſie, * Argemonia is a ſoveraign remedie if it be drunke in wine: Hyſſope alſo boiled in wine and ſo gargarized: likewiſe Harſtrang with the rennet of a Seale or Sea-calfe, taken both of them in equall portion: moreover, Knotgraſſe ſtamped with the pickle made of Cackrebs and oile, and ſo gargled; or els but held onely under the tongue: Semblably, the juice of Cinquefoile, being taken in drinke to the quantitie of three cyaths: this juice beſides, in a gargariſme, cureth all other infirmities of the throat. And to conclude with Mullen; if it bee drunke in water, it hath a ſpeciall vertue to cure the inflammation of the amygdals or almond kernels of the throat.

* Which ſome take to be wild Poppie, called *Rhœas*.

C

Chap. V.

Receits for the ſcrophules or wens called the Kings evill: for the pains and griefs of the fingers: for the diſeaſes of the breaſt, and namely for the cough.

PLantaine is a ſoveraigne hearbe to cure the Kings evill: alſo Celendine applied with honey and hogs lard: ſo is Cinquefoile. The root of the great Clot-bur ſerveth for the ſame purpoſe, if it be incorporat with hogs greaſe, ſo that the place after it is annointed therewith, be covered with a leafe of the ſaid Bur laid faſt upon it: in like manner Artemiſia or Mugwoort: alſo a Mandrage root applyed with water, is good for that purpoſe. The broad leafed Sideritis

D or Stone-ſatuge, being digged round about with a ſpike of yron and taken up with the left hand, and ſo applyed unto the place, cureth the Kings evill; provided alwaies, that the Patients when they be healed, keepe the ſame hearbe ſtill by them, for feare leaſt it being replanted againe by theſe Herbariſts (ſuch is the malicious ſorcerie of ſome of them as I have alreadie ſhewed) the maladie returne and be as bad as it was before: The like caveat I find given unto them, who are cured of this diſeaſe either by Mugwort or Plantaine. The hearbe Damaſonium, called likewiſe * Aliſma, if it be gathered about the Summer ſolſtead, applied unto the foreſaid wens with raine water, is ſingular good for them: for which purpoſe, the leaves are to be ſtamped, or the root bruiſed and incorporat with hogs greaſe, and ſo applied in a liniment; with charge, That the place be covered with a leafe of the ſame: in which manner prepared and uſed, it ſerveth to allay

E all pains in the nape of the necke, and to keepe downe or diſſipat the ſwelling in any part of the bodie. There is an hearbe growing commonly in medows called the Daiſie, with a white floure and partly enclining to a red, which if it be joyned with Mugwort in an ointment, is thought to make the medicine farre more effectuall for the Kings evill. Condurdum is an hearbe of ſmall continuance, for about the Summer ſolſtice it ſheweth a red floure and ſoon ſheddeth the ſame: which (as they ſay) if it bee hanged about the necke, repreſſeth and keepeth under the foreſaid diſeaſe: the like doth Vervaine togither with Plantaine, uſed and worne in the ſame manner.

* *Alcea* in ſome readings.

Touching all the accidents happening to the fingers, and namely the excreſcences and riſings of the skin about the roots of the nailes, called in Greeke Pterygia, Cinquefoile is a ſingular good hearbe for them.

F Among all the infirmities of the breaſt, the cough is moſt troubleſome and grievous; for which, the root of Panaces in ſweet wine is a ſoveraigne remedie. The juice of Henbane is excellent for them alſo that reach up bloud out of the breaſt: and the very ſmoke thereof as it burneth, is as proper for them that cough. In like manner, Scordotis being dried and made into powder; afterwards mingled with creſſes and roſin, and ſo reduced into a liquid confection or

Iohoch, cureth the cough. The ſaid hearbe taken ſimply by it ſelfe alone, raiſeth tough fleame out of the breaſt, and cauſeth it to breake from the Patient with eaſe. The like effect hath Centaurie the greater, yea though a man did bring up bloud: for which infirmitie, the juice of Plantain alſo is thought to be ſingular. Betonie taken in water to the weight of three oboli, is of great force againſt the ſpitting of bloud, and raiſing up of filthie matter out of the cheſt. The root of the great bur hath the like vertue, if it be eaten to the weight of one dram with eleven Pine-nuts. The juice of Harſtrang, as alſo Galangale, is good for the paine in the breaſt; and therfore they goe both of them into preſervatives and antidots which ſerve for countrepoiſons. The Carot likewiſe helpeth thoſe that cough; like as the hearb Scythica (which is the wild caraway:) for being drunke to the weight of three cyaths in ſweet wine cuit, it is generally good for all diſeaſes of the breaſt, for the cough, and helpeth ſuch as fetch up filthie and rotten matter. H

Chap VI.

Of Mullen or Lungwort: of Cacalia: of Folefoot called Tuſsilago or Bechium: and of Sauge: hearbs all appropriat for the cough.

MVllen or Lungwort with the yellow golden floure, being in like manner taken to the ſame quantitie, eaſeth the foreſaid infirmities. Certes this hearbe is of that efficacie in theſe caſes, that if a drench thereof be given to horſes, which not onely have the cough but alſo be broken winded, it will helpe them. The ſame effects I find attributed to Gentian. The root of Cacalia ſoked in wine and chewed, is good not onely for the cough but alſo for the infirmities in the throat. Take five braunches or ſlips of hyſſope, and two ſprigs of rue, with three figs, ſeeth theſe togither, it is an excellent drinke for to diſcharge the breaſt of fleame that ſtuffeth it. Folefoot, called in Greeke Bechion, that is to ſay in Latine* Tuſſilago, doth appeaſe the violence of the cough. Two kinds there be of this hearb: the wild, which wherſoever it is ſeen to grow, ſheweth that there is water under it: a thing that they know well enough who ſeeke for ſprings, for they take it to be an aſſured ſigne and direction to water: it beareth leaves like to Ivie, but ſomewhat bigger, either five or ſeven in number, which underneath or toward the ground be ſomewhat whitiſh, but above in the upper ſide, of a pale colour, without floure, ſtem, or ſeed, and the root is but ſmall. Some would have it and Chamæleuce both, to be one and the ſame hearbe called by divers names. Take this hearbe, leafe and root togither when they be dried, ſet all on fire and receive the ſmoke by a pipe, as if you would ſucke or drinke it down, it is (they ſay) a notable medicine to cure an old cough; but between every pipe you muſt ſip a pretie draught of ſweet wine. The ſecond Bechion ſome would have to be called Salvia, an hearbe like unto Mullen: ſtampe the ſame, and let the juice run through a ſtreiner; which being made hot, drinke it for the cough and paine in the ſides. This hearbe likewiſe is very effectuall againſt ſcorpions and ſea-dragons. Alſo an inunction made therewith and oile togither, is commended much for the ſting of ſerpents. A bunch of hyſſope ſodden with three ounces of honey, is a fine medicine for the cough.

* *i.* Cough-wort.

Chap. VII.

For the paine of the ſides and breaſt: for thoſe that cannot draw their wind but ſetting upright: for the paine of the liver: the heart ach: for the lights: difficultie of urine: the cough: the breaſt: ulcers: for the eyes: for the flux of the belly, occaſioned by a feeble liver: againſt immoderat vomits: for the yex, the pleuriſie, and all griefes of the ſide. L

LVngwort or Mullen drunke in water with rue, is very good for the paine of the ſides and the breaſt: for which purpoſe alſo, they ſay, that powder of Betonie is as good, if it be taken in water well warmed. The juice of Scordotisis holden to be a great corroborative of the ſtomacke: ſo is Centaurie alſo & Gentian, drunke in a draught of water. Plantain either eaten alone by it ſelfe, or with a gruell and broth of Lentils, or els in a frumentie potage made with wheat, is comfortable to the ſtomack. Betonie, although otherwiſe it lie heavie in the ſtomack: yet if one either chew the leaves, or drinke them in ſome broth, it helpeth much the defects and infirmities thereof. In like caſe Ariſtolochia if it be taken in drinke. Alſo A garicke chewed drie, ſo as between whiles the patient ſup a little of pure wine of the grape, hath the like vertue. As for Nym- M

phæa

A phæa or Nemphar ſurnamed Heraclia, it ſtrengtheneth the ſtomacke, applied outwardly in a liniment: even ſo doth the juice of Harſtrang. For the hot diſtemperature of the ſtomacke, it is good to lay unto it the hearbe Flea-wort, or Cotyledon, otherwiſe called Vmbilicus veneris, ſtamped with fried Barley meale into a cataplaſme: or els to take Iubarbe, *i.* Sengreene, to the ſame effect. The hearbe Molon hath a ſtem *chamfered or channelled along: ſoft leaves, & thoſe ſmall: a root foure fingers long, in the *end whereof it beareth an head like unto Garlicke. Some call it Syron. Taken in wine, it helpeth the ſtomacke and difficultie of drawing breath: In which caſes the greater Centaurie is ſingular, if it bee reduced into a lohoch or liquid electuarie. Plantaine alſo eaten any way, either in a green-ſauce or ſallad. This compoſition is reputed a ſoveraign medicine, Take of Betonie ſtamped the weight of one pound, of Atticke honey as much, incor-

B porat them together, and hereof drinke every day the quantitie of halfe an ounce in ſome convenient liquor, or in water warme. Ariſtolochia or Agaricke are ſoveraigne meanes to be uſed in theſe infirmities, if one drinke the weight of three oboli thereof, either in warme water or aſſes milke. The hearbe Ciſſanthemos is good to be drunke for thoſe that be ſtreight winded, & muſt ſit upright when they draw their breath. In the like caſe Hyſſope is commended: as alſo for purſiveneſſe and ſhortneſſe of wind. The juice of Harſtrang is an ordinarie medicine for the greeſe of the liver, the paines alſo of breaſt and ſides, in caſe the patient be cleare of the ague. As for Agaricke, it helpeth all ſuch as ſpit bloud, if the pouder thereof, to the weight of one Victoriat, be given in five cyaths of honied wine. Of the ſame operation is Amomum. But particularly for the liver, the hearbe Teucria is thought to be ſoveraigne, if it be taken freſh and greene to the weight

C of foure drams in one hemine of water and vinegre mixed together. One dram of Betonie given in three cyaths of warme water, or in twain of cold, is thought to be a ſingular cordiall. The juice of Cinquefoile helpeth all the imperfections of the liver and lights, it cureth them that void or reach up bloud, and generally it ſerveth for all inward corruptions and diſtemperatures of the whole maſſe of bloud. Both Pimpernels bee wonderfull medicinable for the liver. Fumiterrie the hearbe whoſoever do eat, ſhall purge choller by urine. Galangale is helpefull likewiſe to the liver, to the cheſt alſo, and the midriffe or precordiall parts. The hearbe Caucon, named alſo *Ephedra, and by ſome Anabaſis, groweth ordinarily in open tracts expoſed to the wind: it will climbe upon trees, and hang downe from their boughs and braunches. Leafe it hath none, but is garniſhed with a number of haires, which are no other but ruſhes indeed full of joints and knots: the

D root is of a pale colour. Let this hearbe be beaten to pouder, and given in red wine that is greene and hard, it is good for the cough; for the ſhortneſſe of wind, and the wrings of the bellie: it may be taken alſo in ſome other ſupping, whereto it were convenient to put wine. In like ſort the infuſion of one dram of Gentian which hath lien ſteeped the day before, may bee very well taken in three cyaths of wine for thoſe purpoſes. Hearbe Benet or Avens hath a ſmall root of a blackiſh colour, which hath a good ſent: This hearbe not only cureth the paines of the breaſt & ſide, but alſo diſcuſſeth all crudities proceeding of unperfect digeſtion, by reaſon of the pleaſant favour that it hath. As for Vervaine, it is medicinable unto all the principall and noble parts within the bodie: good for the ſides, the lungs, the liver, and the breaſt: But moſt properly it reſpecteth the lungs, and namely, when the patient is in a phthyſicke or conſumption, by meanes of

E their ulcer. The root of Bearefoot, an hearbe which I ſaid was but lately found out, is a preſent remedie for ſwine, ſheepe, goats, and all ſuch cattell, in caſe they bee diſeaſed in the lights, if it bee but drawne croſſe through any one of their eares. The ſame ought to bee drunke in water, and a peece thereof continually held under the tongue. As for any other part of this hearbe above ground, be it leafe, ſtalke, flower, or ſeed, it is not yet certainly knowne, whether it bee good or no for any purpoſe in Phyſicke. As for the kidneies, the hearbe Plantaine is good to bee eaten; Betonie to be drunke; Agaricke alſo to be taken in drinke, like as for the cough. *Tripolium groweth upon the rockes by the ſea ſide, on which the ſea-water beateth: ſo as a man cannot ſay, that it is

F either in the ſea or the drie land: In leafe it reſembleth woad, but that it is thicker: the ſtem is a ſpan or hand-breadth high, forked, and devided at the point: the root white, odoriferous, groſſe, and hote in taſt: when it is ſodden in a frumentie pottage of wheat, they give it with good ſucceſſe to thoſe that bee diſeaſed in the liver: This is thought of ſome to bee all one with Polium, whereof I have ſpoken in due place. Symphonia or Gromphena, an hearbe having leaves ſome red, others greene, growing to the ſtem in order, one red and another greene, is a ſoveraigne medicine for ſuch as reach and void up bloud, if it be taken in oxycrat, or vinegre and water mingled

together.

*Seriato, haply for *ſtricto*, *i.* ſlender, as *Oribaſius* deſcribeth it, κεκλὸν λεπτὸν.

*Dioſcorides deſcribeth his Moly with ſuch a head upon the top of the ſtem.

* By theſe names he calleth alſo Horſe-taile.

* A kind of Turbit.

together. Melandryum is an hearbe found growing in corne fields and meddowes, with a white flower, and the same of a sweet and pleasant sent: the small stems thereof be commended for the liver, in case they be stamped & given in old wine. Chalcetum commeth up in vineyards: which if it be pruned, serveth for a good cataplasme to be applied unto the region of the liver. The root of Betonie taken to the weight of foure drams in wine cuit or honied wine, provoketh vomit readily, as well as Ellebore. But for this purpose Hyssope is better, beeing beaten in pouder, and given with honey: but order would be given before unto the patient, to eat Cresses or Irio. *Molemonium also is of the like effect, if it be taken to the weight of one denier. Moreover, the hearbe Silybum hath a white juice like unto milke: which after it is thickened to the substance of a gum, is usually taken to the foresaid weight, with honey, for a vomitorie; and doth evacuat chollericke humours especially. On the contrarie side, wild Cumin and the pouder of Betonie, if they bee drunke with water, doe stay vomiting. For to digest the crudities of the stomacke, and to rid away the loathing to meat, Carrot is thought to be very good: so is the pouder of Betonie, if it be taken in honied water: and Plantaine also boiled in pottage after the manner of Coleworts or such like pothearbes. *Hemonium staieth the painefull yex or hocquet. In like sort Aristolochia. Clymenos giveth libertie to draw the wind more freely. The greater Centaurie and Hyssope are singular in drinke for the pleurisie and inflammation of the lungs. The juice of Harstrang principally is a proper remedie for those that have the plurisie. Touching that plant, which the French call *Halarin: the Venetians Cotonea: it is holden excellent for the greese of the sides, for the reines, those that bee plucked with the crampe, and bursten by any inward rupture: This hearbe somwhat resembleth wild Origan or Marjeram, save that in the head it is like rather unto Thyme: sweet it is in tast, and quencheth thirst: a spungeous and light root it hath, in one place white, in another blacke. Of the same operation for the paines of the side, is Chamærops, an hearb which hath leaves growing double about the stalke, and those like unto the Myrtle leaves: and bearing certaine buttons or heads, much after the manner of the Greekish Rose; and the way to take it is in wine. Agaricke drunke in that order as it was prescribed for the cough, doth assuage the paine of the Sciatica and the backe bone. Semblably, doth the pouder of dried Stœchas or Betonie, if it be taken in mead or honied water.

*or Polemonium.

*Ceterach.

*Bugle, or *Symphytum Pentæum.*

G H I

Chap. viii.

Of all the infirmities and remedies of the bellie, and those parts that either bee adjoining to it, or within contained. The meanes how to loosen and bind the bellie.

K

TOuching the paunch or bellie, much adoe there is with it: and although most men care for nothing els in this life, but to content and please the bellie, yet of all other parts it putteth them to most trouble: For one while it is so costive, as that it will give no passage to the meat; another while so slipperie, as it will keepe none of it: one time you shall have it so peevish, as that it can receive no food; and another time so weake and feeble, that it is able to make no good concoction of it. And verely now adaies the world is growne to that passe, that the mouth and paunch together are the cheefe meanes to worke our death. The wombe (I say) the wickedest vessell belonging to our bodies, is evermore urgent, like an importunat creditour, demaunding debt, and oftentimes in a day calleth unto us for victuals: For the bellies sake especially wee are so covetous to gather good; for the bellie, we lay up so many dainties and superfluities; to content the bellie, wee sticke not to saile as farre as the river Phasis; and to please the bellie, wee seeke and sound the bottome of the deepe seas: and when all is done, no man ever thinketh how base and abject this part of the bodie is, considering that filthie ordure & excrement which passeth from it in the end. No marvell then if Physicians bee much troubled about it, and bee forced to devise the greatest number of medicines for the helpe and cure thereof. And to begin with the staying and binding of it: a dram of Scordotis the hearbe, stamped greene and taken in wine, dooth the feat: so doth the decoction thereof, if it be drunke. Also Polemonia is a soveraigne hearbe to bee given in wine for the bloudie flix. The root of Mullen or Lungwort, taken to the quantitie of two fingers in water, worketh the same effect. The seed of Nymphæa Heraclea drunke in wine, is of the like operation: so is the upper part of the double root of Glader or the Flag, ministred to the weight of two drams in vinegre. To this purpose serveth also Plantain seed, done into pouder

L M

and

A and put into a cup of wine: or the hearbe it ſelfe boiled with vinegre, or els frumentie pottage taken with the juice thereof. Plantaine ſodden with Lentils, or the pouder of the drie hearb ſtrewed like ſpice into drinke, together with the pouder of parched Poppie. The juice alſo of Plantaine or of Bettonie put into wine that hath been heat with a red hote gad of ſteele, either miniſtred by clyſtre or drunke, in the ſaid caſe is very commendable. Moreover, the ſame Plantaine or Bettonie is ſingular to bee given in ſome greene or auſtere wine, for thoſe who are troubled with the laske proceeding from a weake ſtomacke: and for that purpoſe Iberis may bee applied unto the region of their bellie, as I have before ſaid.

In the diſeaſe Tineſmus, (which is an inordinat quarrell to the ſtoole, and a ſtraining upon it, without doing any thing) the root of Nemphar or Nymphæa Heraclia, is ſingular good to bee
B drunke in wine: likewiſe Fleawort taken in water, & the decoction of *Galangale root. The juice of Houſleeke or Sengreene, ſtoppeth the flux of the wombe, ſtaieth the bloudie flux, and chaſeth out of the bodie the round wormes. The root of Camfrey and of the Carot, ſtoppeth likewiſe the bloudie flix. The leaves of Houſleeke ſtamped and taken in wine, are ſingular good againſt the wringing torments of the bellie. The pouder of dried Alcæa drunke, cureth the ſaid wrings. Aſtragalus, or Peaſe Earthmot, an hearbe bearing long leaves, indented with many cuts or jags, and thoſe which be about the root made bias: riſeth up with three or foure ſtems full of leaves: carrieth a flower like unto the Hyacinth or Crow-toes: the roots are bearded and full of ſtrings, enfolded one within another, red of colour, and exceeding hard in ſubſtance: it groweth in rockes and ſtonie grounds expoſed to the Sunne, and yet charged or covered with ſnow the moſt part of
C the yeare, ſuch as is the mountaine Pheneus in Arcadia. This hearbe hath an aſtringent power. The root if it be drunke in wine, bindeth the bellie, by which meanes it provoketh urine, namely by driving backe the ſerous and waterie humours to the reines; like as moſt of thoſe ſimples that be aſtringent that way, are diuretical. The ſame root ſtamped and taken in red wine, healeth the exulceration of the guts, & thereby ſtaieth the bloudie flix: but ſurely hard it is to bruiſe or ſtamp it: The ſame is ſingular for the apoſtumation of the gums, if they be fomented therwith. The right ſeaſon to draw and gather thoſe roots, is in the end of Autumne, when the hearbe hath loſt the leaves, and then they ought to bee dried in the ſhade. Both ſorts of Ladanum growing among corne, be excellent for to knit the bellie, if they be ſtamped and ſearced. The manner is to drink them in mead: likewiſe in wine* for to repreſſe choller. Now the hearb wherof Ladanum is made,
D is called Lada, and groweth in the Iſland Cypros, the liquor wherof ſticketh commonly to goats beards. The excellent Ladanum commeth out of Arabia. There is a kind of it made now adaies in Syria and Affricke, which they call Toxicon: for that in thoſe countriees the people uſe to take their bowſtrings lapped about with wooll, and traile the ſame after them among thoſe plants which beare Ladanum, and ſo the* fattie dew cleaveth thereto. Of this Ladanum I have written more at large in my Treatiſe of ointments & redolent compoſitions. But this latter kind is ſtrongeſt in ſavor and hardeſt in hand; and no marvell, for it gathereth much groſſe and earthly ſubſtance, whereas indeed the beſt Ladanum is commended and choſen, when it is pure, cleare, odoriferous, ſoft, greene, and full of roſin. The nature thereof is to ſoften, to drie, to concoct, and to procure ſleepe: it retaineth the haire of the head being given to ſhed, and maintaineth the ſame
E blacke ſtill, that it turne not hoarie: holeſome it is for the eares, if it bee inſtilled into them with Hydromel, (that is to ſay, mead or honied water) or els with oile Roſat. It cleanſeth the skin of dandruffe, and when it ſeemeth to pill: and withall, healeth the running ſcals of the head, if ſalt be mixed therewith. And beeing taken with Storax [Calamita] it cureth an inveterat cough: but moſt proper it is for thoſe who belch ſoure and ſtrong. Moreover, Chondris, which alſo is called baſtard Dictamnum, is a great binder of the bellie: ſo is Hypociſthis, named by ſome Orobathion, much reſembling a green or unripe Pomgranat. This plant groweth (as I have ſaid) under Ciſthus, whereupon it tooke the name. Both kinds of it (for twaine there be, to wit, the white and the red) being dried in the ſhade, ſtay a laske, if they be drunke in thicke auſtere or greene wine.
F The juice onely is uſed in Phyſicke, the which is aſtringent and deſiccative: and the red kind is of the twaine more appropriat for the ſtaying or drying up of rheumes; which if it bee drunke to the weight of three oboli, is ſoveraigne for them that reach and raiſe up bloud. Either drunke or clyſterized with Amyl, it cureth the bloudie flix. The like effects hath Vervaine given in water, yea, and in Amminean wine, if the patient have no ague hanging upon him: with this proportion, that there be the quantitie of five ſpoonefuls of the hearb put to three cyaths of wine. Moreover,

* *Acorũ*, which ſome take for our *Calamus Aromaticus*.

* *Ad bilẽ*. Some read *nobile*.

* *Pinguedine roſcida*.

over, the hearbe Laver, which loveth to grow in brookes and rivers, beeing either condite and G
preſerved, or els ſodden, allaieth the wrings of the bellie. Waterſpeeke or Pondweed called in Greeke Potamogeton, is ſingular good for the dyſenterie or bloudie flix; for the flux alſo, which proceedeth from a weake ſtomacke. This hearbe beareth leaves like unto Beets, but that they bee leſſe onely and more hairie, or furred with a downe. A little it beareth above the water, and hath a peculiar propertie, which is refrigerative and aſtringent. The leaves alone be medicinable, and thoſe be good for the morimals in the legs: for cancerous and corroding ulcers, if they be applied in a cataplaſme with honey or vinegre. *Caſtor* the Phyſician deſcribeth this hearbe * Potamogeton after another ſort, namely with a ſmall ſlender long leafe like unto horſe haires, putting forth a long ſtem likewiſe and the ſame ſmooth, growing alſo in waters. Hee uſed with the root of this hearbe to cure the Kings evill, and heale all hard tumours. This Potamogeton hath an adver- H
ſative nature to Crocodiles alſo, and therefore they who hunt after them, carie this hearbe ordinarily about them. In like manner Achillea ſtoppeth a laske. And the ſame effects worketh Statice, an hearbe running up commonly in ſeven ſtems, in the top bearing buttons or heads reſembling Roſes. *Ceratia beareth but one leafe, and hath a knottie and great root, which is good to bee eaten for to cure the laske, occaſioned by the feeble ſtomacke, and the bloudie flix, proceeding from the ulcer of the guts. Lions-paw, commonly called *Leontopodion, by ſome Leuceoron, by others Dorypetron, and Thorybetron, hath a root which *bindeth the bellie, and yet notwithſtanding purgeth choller: if it be taken to the weight of two denarij Roman, in mead or honied water. This hearbe groweth in light and leane champion grounds. It is ſaid, that if the ſeed thereof bee taken in drinke, it cauſeth ſtraunge viſions and fantaſticall dreames. Harefoot, I
which the Greekes name Lagopus, drunke in wine, bindeth the bellie: but if the patient bee in an ague, it would be taken with water: being applied and bound unto the ſhare, it repreſſeth the tumors and riſings in thoſe parts: An hearbe this is growing uſually among corne. Many there bee, who for the daungerous bloudie flix that is thought incurable, commend highly above all other hearbes, Cinquefoile, in caſe the patient drinke the roots thereof boiled in milke: and the like opinion they have of Ariſtolochia, in caſe there be taken of the root to the weight of one victoriat in three cyaths of wine. Now, this would be noted by the way, that in theſe caſes of aſtringencie and binding, all the medicines beforenamed which are to be taken warme, ought to bee heat with a gad of ſteele, quenched in the liquor. Thus much of thoſe Simples that bind the bellie.

Myriophyllon aquaticum. Dodonæi.

Dodonæi Ophioglosſon or Adders tongue.

*Our ladies Mantle.

* *Dalechampius* marvelleth how this may ſtand: and yet we ſee it ordinarie in the cure of dyſenteries and outragious Diarrhæs, to purge choller with Rubarbe, Myrabolanes, &c. and with them alſo to bind.

K

Contrariwiſe, the juice of Centaurie the leſſe is a purgative, if a dram thereof bee taken in one hemine of water, together with ſome few cornes of ſalt and drops of vinegre; for it dooth evacuat choller. The greater Centaurie, commonly called Rhaponticke, ſtilleth the wrings and griping paines of the bellie. Betonie maketh the bodie looſe and ſoluble, taken to the weight of foure drams in nine cyaths of Hydromell or Mead. In like manner Euphorbium is laxative, and ſo is Agaricke, if two drams thereof be drunke in water with a little ſalt, or to the weight of three oboli in mead or honied water. Sowbread alſo, named by the Greekes Cyclaminos, taken inwardly with water, or put up by ſuppoſitories, provoketh to the ſeege: ſo dooth a ſuppoſitorie made with the root of *Chamæciſſus. Take a good bunch or handfull of Hyſſope, ſeeth it in water with a little ſalt to the conſumption of a third part: it ſerveth to evacuat fleagme, if it bee but L
applied as a liniment to the bellie: or ſtamped and incorporat with Oxymel and ſalt, in which manner uſed, it driveth wormes out of the bodie. The root of Harſtrang purgeth both fleagmaticke and chollericke humors alſo. Pimpernell taken in mead, is a good purgative: ſo is Epithymum, which you muſt take to bee the *flower of a kind of Thyme that reſembleth Saverie: here is the difference onely, that this flower is of a graſſe greene colour, but that of the other Thyme is white. Some call this Epithymum, Hippopheon: a ſimple not very wholeſome for the ſtomacke, ne yet good to provoke vomit; howbeit, ſingular to appeaſe the wringing pains in the bellie, and to carminat or diſſolve ventoſities. The ſame alſo may bee taken by way of lohoch or liquid electuarie, confected with honey, and ſometimes with the Ireos root, for the ſtuffing and other imperfections of the breaſt. Epithymum looſeneth the bellie, if it be taken from M
foure drams to ſix, with honey, a little ſalt and vinegre. Some Herbariſts deſcribe Epithymum otherwiſe, namely, that it groweth without any root, and that it reſembleth a little ſmall ſtring or thread like unto haire, of a red colour: which if it be dried in the ſhade and drunke in water to the weight or meaſure of halfe an acetable, purgeth downeward fleagme and choller both.

* Which ſome take for groũd Ivie.

*Here *Plinie* is deceived: for it is a kind of lace winding about Thyme, as Doder about Flax.

Nem-

A Nemphar taken in ſome aſtringent or hard wine, *gently purgeth the bellie. Alſo, Pycnocomon is laxative: An hearbe this is like unto Rocket, but that the leaves bee thicker in ſubſtance, and *grow more thin: it hath a round root, and the ſame yellowiſh, and ſenting much of the earth: the ſtem is foure cornered, of a meane height, ſmall and ſlender, and the flower much like to that of Baſill. Found it is ordinarily in ſtonie grounds. The root of this hearbe drunke in mead, to the weight of two deniers, doth evacuat downeward by the bellie, both chollericke and alſo flegmaticke humors. The ſeed cauſeth troubleſome and unquiet dreames, if one drinke a dram thereof in wine. Fumiterrie alſo *conſumeth and diſpatcheth the Kings evill. Polypodium (which we call in Latine Fidicula) becauſe it is like unto fearne, purgeth choller. The root, which is onely me-

B dicinable and in uſe, is full of haires, of a greeniſh colour within, as big commonly as a mans little finger: full of hollow concavities it is, repreſenting thoſe holes that the fiſhes called Polypi have about their feet or clees: ſweetiſh it is in taſt, and groweth either upon rockes, or *els at the foot of old trees. After that this root hath beene well ſoaked in water, they uſe to preſſe the juice forth of it; or the ſame may be ſhred & minced ſmall, ſtrewed among pothearbes either of Beets or Mallowes, yea, and put into the pot with them; or els tempered in ſome ſalt ſauce, or ſodden in broth: a fine medicine and a ſafe, gently looſing the bellie, though the patient were in an ague. It doth evacuat choller and fleagme both: but ſomewhat offenſive it is to the ſtomacke. The pouder of it dried, conveighed up into the noſthrils, conſumeth the illfavored ſore within, called Polypus or Noli-me-tangere. It *floureth, but ſeedeth not. Moreover, Scammonie alſo overturnes and hurteth the ſtomacke, unleſſe two drams of Aloe be put unto as many oboli of it: for then it

C purgeth choller, and ſendeth it down by the bellie. Now this Scammonie is the juice of a certain hearbe (called likewiſe Scammonea) which brancheth and tufteth immediatly from the root: the leaves be fat, white, and made trianglewiſe: the root thick, moiſt, and in handling will make ones ſtomacke to riſe, and be readie to heave. It loveth to grow in battle grounds, and thoſe of a white leere. About the riſing of the great dog ſtar they uſe to make an hollow trough in the root as it groweth, to the end, that all the moiſture thereof may fall and gather into it: which liquor beeing dried in the Sunne, is wrought and made into bals or trochiskes. The root it ſelfe alſo is commonly dried, or at leaſtwiſe the rind thereof. In regard of the countrey where it groweth, that is commended moſt which commeth from Colophon, Myſia, and Priene: but if you reſpect the forme and looke of it, chuſe that which is neat and cleane, reſembling as neare as poſſibly may

D be, ſtrong Ox glue, ſpungeous or fiſtulous, full of holes or paſſing ſmall pipes. If you go by other qualities, take that which will ſoone diſſolve or melt: which alſo hath a ſtrong and ſtinking ſmell, clammie and gummie, turning into a whitiſh liquour like milke, if you taſt it at the tongues end, exceeding light in the hand, and when it is reſolved, growing to a whitiſh colour. And yet this propertie you ſhall ſee in that Scammonie which is ſophiſticat: and that ywis may ſoone bee done, for doe but take the meale or flower of Ervile and the juice of the ſea Tithymal (and ſuch is that commonly which commeth from Iudæa) it will counterfeit the right Scammonie: but ſuch ſtuffe as this offendeth the throat, and is readie to choake or ſtrangle as many as uſe it. Howbeit this may be ſoone found by the very taſt onely: for the Tithymal ſetteth the tongue in a heat as if it were a bulbe root: and is not good to purge, whether a man take it faſting or full. As for the

E true and ſyncere Scammonie, they were wont to exhibit it for a purgation even ſimply by it ſelfe alone in a draught of mead with ſome ſalt, and the doſe was foure oboli. But it was found to doe the deed beſt, and moſt effectually taken with Aloe: ſo that the patient, when it began once to worke, tooke a pretie draught of ſweet honied wine. Furthermore, the root if it be boiled in vinegre to the conſiſtence of honey, maketh a ſingular liniment for to annoint the leproſie: yea, and in caſe of headach it is found good to annoint the head with it and oile together. As for the Tithymall aforeſaid, our countreymen here in Italie, ſome call it Lactaria, as one would ſay, the Milke hearbe; other Lactuca caprina, *i.* Goats Lectuce. It is commonly ſaid, that with the milke or juice of theſe Tithymals, a man may write upon the skin of the bodie: for draw any letters therewith and ſtrew aſhes or duſt thereupon, when they bee drie, they will appeare very legible.

F And this is a tricke practiſed by thoſe that make court unto other mens wives their miſtreſſes, delivering their minds ſecretly unto them by this meanes, which they dare not ſet downe in paper or miſſive letters. Many kinds there bee of theſe *Tithymals. The firſt is known by the addition of Characias, which alſo is called the male Tithymall: the *braunches be of a finger thicknes, red, *riveled, five or ſix in number, running up to the height of a cubit: and leaved they bee immediatly

Cuius contrarium verum eſt, for it is a binder.

*How is it then called *Pycnocomon*?

*I ſee not how this ſhould ſtand here.

* Yea & in the head of old doddle Okes.

* It beareth neither flower nor ſeed.

*or Spurges.

**Ramis*, rather *caulibus*, *i.* the ſtems, out of *Dioſcor.*

**Rugoſis. Dioſc.* hath *ſuccoſis*, *i.* full of ſap.

atly from the root, which hang downeward enclining to the earth: but in the top it hath an hairie tuft or head in manner of rushes. This groweth in rough places and rockes by the seas side. G
The seed together with the hairie bush that it hath, they use commonly to gather in Autumne: which after it be dried in the Sunne, they stampe and then lay up against their need. As for the juice, men draw it about the time that Quinces begin to ripen and gather a downe about them: for then they breake the sprigs and tender crops of the plant, out of which there issueth the juice or milke, which they receive either in Ervile flower, or els upon Figgs, that it may drie with them together. Now, it is sufficient to let five drops fall upon every such figge: For this opinion they have, that looke how many drops light upon a figge, so many stooles shall hee have who taketh that figg in a dropsie, to purge waterish humors. But in the gathering of this juice or liquor, great heed must be taken, that no drop of it touch the eyes. There is a juice also pressed out of the leaves H
being bruised and stamped, but not so effectuall as the former. The decoction of the braunches also is used to the same purpose. And the seed being sodden, serveth to the making of certain pils confected with honey, which are highly commended for purgatives. The same seed * enclosed within wax, is good to bee put into hollow teeth when they ake: In which case also, a collution made of the root boiled in wine or oile, is singular good, if they bee washed therewith. With the juice of this hearbe there is a liniment made for tettars and ringworms. And some there be who drinke the same for to purge both upward and downward, for otherwise an enemie it is to the stomacke: in which potion if there bee put some salt, it doth evacuat fleagme, but with saltpetre it voideth chollericke humors. If the patient have a mind to purge by seege, hee shall doe well to drinke the juice of Tithymall in water and vinegre mingled together: but if hee bee disposed to I
vomit, it is better to drinke it in cuit or mead. The ordinarie dose is three oboles thereof in a potion. But the better way is to take the figges prepared as is beforesaid after meat: and even so taken, in some sort the juice doth sting the throat and set it on fire. For to say a truth, of so hot a nature it is, that alone of it selfe, being applied outwardly unto any part of the bodie, it raiseth pimples and blisters no lesse than fire; in which regard, it is used for a caustick or potentiall cauterie.

*or rather the seed or milke is to be put into the faultie and hollow teeth: and the rest which bee found are to be defended with wax, according to *Dioscorides*.

The second kind of the Tithymall, is knowne by the name Myrsinites, which others call Caryites: The reason of the one name is this, for that it beareth sharpe pointed and prickie leaves in manner of the Myrtle, but that they bee somewhat more tender: and the same groweth in rough places like as the former. The bushie heads or tufts of this Tithymall, would bee gathered when Barley beginneth to swell in the eare: & so they be let to take their drying in the shade nine daies K
together: for in the Sunne they will be withered in that space. The fruit which this plant beareth, dooth not ripen all together in one season, but some part thereof remaineth against the next yeare: and the said fruit is called the Tithymall nut, which is the cause, that the Greekes have imposed upon it that second name Caryites. The proper time to gather and cut down this hearbe, is when corne is ripe in the field and readie to be reaped or mowed. Which being washed, must afterwards be laid forth a drying: & so they use to give it with two parts or twice as much of blacke Poppie, yet so as the whole dose may not exceed one acetable. This Tithymall is nothing so strong a vomitorie as the former, no more be the rest whereof I will speake anone. Some there be who give the leaves also with blacke Poppie after the foresaid proportion: & the very nut or fruit it selfe alone in mead or cuit, or elfe if they put any thing thereto, it must be Sesama: and truly in L
this manner it sendeth flegmatick and chollerick humors away by seege. This Tithymal is singular for the sores in the mouth: But for the cankerous and corrosive ulcers indeed which corrode deepe in the mouth, it is good to chew and eat the same with honey. The third kind of Tithymall is called Paralius or Tithymalis. This hearbe putteth forth round leaves: riseth up with a stalke a span or handfull high: the branches be red and the seed white, which ought to be gathered when the grape beginneth to shew [blacke] upon the vine. And being dried and made into pouder, is a sufficient purgation, so it be taken inwardly to the measure of one acetable. The fourth kind is named Helioscopium: the leaves whereof, resemble Purcellane, and from the root it putteth foorth foure or five small upright braunches, which be likewise red and halfe a foot high: the same also be full of juice or milke. This hearbe delighteth to grow about towne sides, bearing a white seed, M
wherein Doves & Pigeons take exceeding great pleasure: which also is ordinarily gathered when the grape maketh some shew of ripening. It took this name Helioscopium, for that it turneth the heads which it beareth, round about with the Sunne. Halfe an acetable thereof taken in Oxymell, purgeth choller downeward. And in other cases used it is, like as the former Tithymall named

Ex Theophrast.

Characias.

A Characias. The fifth, men call Cypariſſias, for the reſemblance that the leaves have to thoſe of the Cypreſſe tree: it riſeth up with a double or threefold ſtem, and loveth to grow in champion places: of the ſame operation and vertue it is, that Helioſcopium and Characias before named. The ſixt Tithymall, is commonly called Platyphyllos, although ſome name it Corymbites, others Amygdalites, for the reſemblance that it hath to the almond tree: there is not a Tithymall hath broader leaves than it, which is the reaſon of the firſt and uſuall name Platyphyllos: it is good * to kill fiſh: it purgeth the bellie, if either the root, leaves, or juice, be taken in honeyed wine or in mead, to the weight of foure drams: a ſpeciall vertue it hath to draw water downward from all other humors. The ſeventh is called commonly Dendroïdes, and yet ſome give it the name Cobion, others Leptophyllon: ordinarily it is found growing upon rocks, & of all others
B carrieth the faireſt head: likewiſe the ſtems be reddeſt, and the ſeed ſheweth in moſt plentie: the effects be all one with thoſe of Characias. As touching the plant called Apios Iſchas or Rhaphanos-agria, *i.* the wild Radiſh: it putteth forth two or three ſtalkes like bents or ruſhes, ſpreading along the ground, and thoſe be red, and the leaves reſemble rue: the root is like an onion head, but that it is larger, which is the reaſon that ſome have called it the wild Radiſh: this root hath a white fleſhie ſubſtance within, but the skin or rind thereof is blacke: it groweth uſually upon rough mountains, and otherwiſe in faire greens * full of graſſe. The right ſeaſon to dig up this root, is in the Spring; which being ſtamped and ſtrained, they uſe to put in an earthen pot, where it is permitted to ſtand, and looke what it caſteth up and ſwimmeth aloft, they ſcum off and throw away: the reſt of the juice thus clarified, purgeth both waies, if it be taken to the weight of
C one obolus & a halfe in mead or honied water: and in that manner prepared, it is given to thoſe that be in a dropſie, the full meaſure of one acetable: the powder alſo of the root dried, is good to ſpice a cup for a purgation: and (as they ſay) the upper part of the root purgeth * choller upward by vomit, whereas the nether part doth it by ſeege downward.

Now for the pains and wrings which often times torment the poore belly: all the kinds of Panaces and Betonie are ſingular to aſſuage and allay them clean, unleſſe they be ſuch as are occaſioned by cruditie and indigeſtion. As for the juice of Harſtrang, it diſſolveth ventoſities, for it breaketh wind upward and cauſeth one to rift: ſo do the roots of * Acorus: alſo Carots, if they be eaten in a ſalad after the manner of * Lettuce. For the infirmities proper to the guts, and namely
D the worms there breeding, Ladanum of Cypreſſe is ſoveraign to be taken in drinke: in like manner the powder of Gentian drunke in warme water, to the quantitie of a beane: Plantain likewiſe hath the ſame effect, if ther be taken of it firſt in a morning to the quantitie of two ſpoonfuls, and of Poppie one ſpoonfull, in foure cyaths of wine not very old: the ſame medicine may be given alſo laſt at a night to bedward; with ſome addition of ſal-nitre or fried barly meale, if it be long after meat: and one hemine of the juice thereof is ſingular for the cholique, if it be miniſtred in a clyſter, though the Patient were in an ague. In caſes of the Splene, it is good to drinke three oboles weight of Agarick in one cyath of old wine, for it cureth the ſplene: and of the ſame operation is the root of all ſorts of Panaces, taken in honied wine: but for the accidents of the ſplene, Teucrion hath no fellow, if it bee taken either drie in powder, or boiled, to the quantitie of one handfull in three hemines of vinegre: and the ſame hearbe maketh a ſoveraigne ſalve for green
E wounds to be applied with vinegre; or if the Patient cannot endure it, with a fig or water in ſtead of vinegre. Polemonia likewiſe is a good herb for the ſplene, to be drunke in wine: ſo is Betonie, taken to the poiſe of one dram in three cyaths of oxymell: and Ariſtolochia is likewiſe reſpective to this part, in caſe it bee given unto the Patient as againſt the poiſon of ſerpents. If the Patient continue the eating of Argemonia ſeven daies togither with his meat, it will (as they ſay) in that time conſume and waſt the ſwelling ſplene: and Agarick taken to the weight of two oboli in oxymell, is effectuall that way. The root of Nymphæa Heraclia or Nenuphar drunke in wine, is able of it ſelfe to conſume the ſame. Ciſſanthemos is an excellent hearbe for the ſplene or milt: if a man take a dram of it twiſe a day in two cyaths of white wine, and hold on that courſe for fortie
F daies togither, it will (by report) rid away the diſeaſed ſplene by urine: to which purpoſe, the decoction of hyſſope with figs ſerveth verie well: even ſo doth the decoction of Lonchitis, if it be taken before it ſpindle and run up to ſeed: alſo the root of Harſtrang boiled, is good for ſplene and kidnies. Acorum, if it be taken in drinke, conſumeth the milt.

For the Midriffe and Hypochondriall parts, or the ſmall guts lying in the flanke under the ſhort ribs, * Radiſh roots be ſingular. The ſeed of water Betonie, if it be drunke thirtie daies to-

* If it be punned into pouder & ſtrewed upō the water, as ſaith *Dioſc.*

* *Herbōſis: Theophraſtus* hath κιχλακώδη: that is to ſay, craggie or flintie: it ſeemeth that *Plinie* tranſlated χλοώδη.

* And fleame, ſaith *Dioſcor.*

* Which ſome take for Galangale, others for our Calamus.

* *i.* With vinegre and oile.

* *Radices.*

gither, the weight of one denarius at once in white wine, is ſingular in that caſe: the powder of G
Betonie taken in drinke with honey and vinegre of Squilla, is commended for that purpoſe: as alſo the root of Lonchitis drunke in water; and Teucrium applied as a liniment.

Scordum incorporat with wax, and Agaricke with the powder or floure of Fenigreeke, helpe the infirmities of the bladder, and namely, the intollerable paines of the ſtone and gravell, as I have beforeſaid. Polemonia drunke in wine; and in like manner Agaricke, is good for that purpoſe: the root or leaves of Plantaine taken in ſweet wine cuit; alſo Betonie, prepared in that manner as it was appointed for the diſeaſe of the liver, bee remedies for the infirmities of that part. Betonie alſo given in drinke and applied in a liniment, healeth a rupture; and the ſame is moſt effectuall in curing the ſtrangurie: ſome preſcribe and give counſell to drinke Betonie, Vervaine, Yarrow, or Millefoile, of each a like portion in water, as an excellent remedie for the ſtone H
and gravell. And well knowne it is, that for to eaſe the ſtrangurie and remoove the cauſe therof, Dictamnus is an approoved medicine: ſo is the decoction of Cinquefoile, if it be boiled in wine to the conſumption of a third part, found by experience to be an undoubted remedie in that infirmitie: the ſame alſo is ſingular good to bee applied in that rupture where the guts bee falne downe. The upper root of Glader or Flags, cauſeth young infants to make water, if it be laid to the bottom of the belly: the ſame given inwardly with water, cureth thoſe that are burſt and have their guts ſlipped downe; and helpeth the infirmities of the bladder in an outward liniment. The juice of Harſtrang healeth little children who are burſten; and of Fleawort there is made a good ointment to anoint their navell, when it beareth out overmuch. Both the Pimpernels doe provoke urine: ſo doth the decoction of Acorus root: the very root it ſelfe alſo beaten into powder, and taken in drinke, worketh the like effect; and beſides, healeth all the accidents of the bladder. Cotyledon or Vmbilicus Veneris, both hearbe and root, breaketh the ſtone and expelleth I
it by gravell; being otherwiſe ſingular good for all inflammations of the genitall parts or members of generation, if the ſtalks and ſeed be taken with myrrhe, of each a like quantitie: Walwort ſtamped togither with the tender leaves therof, and ſo drunke in wine, driveth out the ſtone: the
* To wit, when they be hard or ſwolne.
ſame applied outwardly, cureth the * accidents befalling to the cods. Groundſwell, with the powder of frankincenſe and ſweet wine reduced into an ointment, cureth the inflammation of the ſaid cods. The root of Camfrey brought into a liniment, ſtaieth the rupture whereby the guts come downe: and white Hypociſthis, repreſſeth the cancerous ſores in thoſe parts. Semblably Mugwort is ſingular to bee given in ſweet wine, for the ſtone and ſtrangurie. The root of
Nenuphar or Nymphæa Heraclia taken in wine, aſſuageth the paine and griefe of the bladder: K
* Or *Creſtmarine.*
of the ſame power is * Sampier, ſo highly commended by *Hippocrates:* now is this one of the wild woorts which are uſually eaten in ſalads: and certes, this is that very hearbe which the good
* To prince *Theſeus.*
countrey wife *Hecate* forgat not to ſet upon her bourd in a feaſt that ſhe * made (as we may read in *Callimachus* the Poët:) And what is it but a kind of garden Batis? It groweth up with one ſtem halfe a foot high, or a ſpan at moſt: the ſeed is exceeding hote, round, and odoriferous like unto Roſemarie: if it be dried, it burſteth, and hath within a white kernell, which ſome call Cachrys. The leaves be fattie, and of a greyiſh white in manner of the olive leafe, but that they be thicker, and ſaltiſh in taſt: roots it hath three or foure, of a finger thickneſſe: it groweth upon the ſea coaſt among rocks and cliſts. This hearbe may be eaten, raw or boiled, it skilleth not how, with Beets, L
Coles, and other ſuch woorts; and in taſt likewiſe it is aromaticall and pleaſant: it is uſually preſerved and kept condite in a kind of pickle: and the principall uſe that it hath, is to cure the ſtrangurie, if either leafe, ſtalke, or root, be drunke in wine: alſo, being thus taken, it maketh folke look with a more lovely and cheerefull colour: but if one be too bold with it, and uſe it not with moderation, it breedeth ventoſities. The decoction of Sampier, maketh the bodie ſoluble, and is diuretically, for it mightily draweth water from the kidnies. In like manner, the powder of dried Althæa or marſh Mallow, drunke in wine, cureth the ſtrangurie, and eaſeth them that piſſe dropmeale; which it will doe more effectually, if the Carot be joyned withall: the ſame is holeſome for the ſplene; and a countrepoiſon againſt ſerpents, if it be taken in drinke. If the powder therof be ſtrewed and mingled among the barly which is given in provander unto cart-horſes and ſuch M
like, it helpeth them when they run at noſe with the glanders, and ſtale drop by drop. Touching the hearbe Anthyllion, it is as like as may be unto Lentils, which if it bee drunke in wine, cureth all the infirmities of the bladder, and namely, when there iſſueth forth bloud with urine. There is another hearbe comming neare to it in name, to wit, Anthyllis, like unto Iva muſcata, or Chamæpitys,

A mæpitys, carrying purple flours, ſenting ſtrong, and hath a root like to Cichorie, which is good in theſe caſes. But it ſeemeth that * Brookelime, called otherwiſe Cepæa (an hearbe reſembling Purcellane, but that the root is blacker, and good for nothing in Phyſicke, growing upon the ſandie ſhore, and having a bitter taſt) is better for the ſaid infirmities than the former named Anthyllis; for if it bee taken in wine with the root of Sperage, it is excellent for the diſeaſes of the bladder: of the ſame operation is * Hypericon, which ſome call Chamæpitys, others Corion. This hearbe * ſhooteth forth many braunches, which be ſmall and ſlender, of a cubit in length, and red withall: in leafe it reſembleth rue; the ſmell is quicke, hot, and piercing: the ſeed which it beareth within certaine cods, is blacke, and the ſame ripeneth togither with barley. The nature of the ſeed is aſtringent: it doth incraſſat and thicken humors, and ſtoppeth a laske: urine it pro-

B voketh; and being drunke in wine, ſcoureth away the ſtone and gravell in the bladder. A ſecond Hypericon there is, which ſome call Coris, in leafe it reſembleth * Tamarix, under which it gladly groweth, but that the leaves bee more fat, and not ſo red: it groweth not * above a ſpan high: odoriferous to ſmell unto, and of a mild ſweet taſt, and yet * ſharpe withall. The ſeed is hot, and therefore cauſeth ventoſities, and * inflation in ruptures: howbeit, unto the ſtomacke it is not hurtfull: and ſingular good for the ſtrangurie, in caſe the bladder bee not exulcerat: drunke in wine, it cureth the pleuriſie. Moreover, for the bladder and the diſeaſes thereof, Maidenhaire made into powder togither with Cumin, and given in white wine, is a ſoveraigne remedie: alſo Vervaine, ſodden leaves and all, untill the third part of the liquor be conſumed: or the very root only thereof taken in honeyed wine hote, expelleth the ſtones and gravell in the bladder. In like

C manner the hearbe Perpreſſa, which groweth at Aretium and in Sclavonia, being boiled in water from three hemines to one, and ſo taken inwardly as a drinke, is an appropriat medicine for the bladder. Claver or three-leafed graſſe taken in wine; Camomile likewiſe * drunke, is good for the ſame. Moreover, Anthemum expelleth the ſtone: an hearbe this is, which putteth forth immediatly from the root five ſmall leaves, and two long ſtems, with a red-roſe colour floure: the roots ſtamped alone, are as effectuall in this caſe as greene * Laver. As for Silaus, it groweth along thoſe rivers which run continually and be never drie, eſpecially ſuch as glide upon ſand and gravell: it riſeth to the heigth of a cubit, and reſembleth garden Perſley: they uſe to ſeeth it after the manner of * Soure-docke, and ſo prepared, it doth much good to the bladder; which, if it be excoriat and ſcabbed, the root of Panaces will heale it: for otherwiſe it is hurtfull to that part.

D The hearbe called * Malum Erraticum, [*i.* as one would ſay, the wandring poiſon, or apple] it expelleth the ſtone, if one pound of the root be throughly ſodden in a congius or gallon of wine, unto the conſumption of the halfe, ſo that the Patient take thereof for three daies togither one hemine at a time; and that which remaineth of the decoction, in wine, with Laver & Sea-nettles. Alſo Carots and Plantaine ſeed taken in wine, driveth downe ſtone and gravell. The nettle called Fulviana (an hearbe well known to them eſpecially that handle it, and which tooke that name of him who firſt found out the vertue therof) if it be ſtamped and drunke in wine, provoketh urine.

Scordium is ſingular for the ſwelling of the genetoirs or cods. Henbane is good for the diſeaſes of the members ſerving to generation. The juice of Peucedanum, [*i.* Hartſtrang] incorporat with honey, like as the ſeed alſo taken inwardly, helpeth thoſe who are pained with the ſtran-

E gurie: likewiſe Agaricke, if three oboli thereof be drunke in one cyath of old wine: the root of Trifoile or Claver given to the poiſe of two drams in ſweet wine: and one dram of Daucum [*id eſt*, Carot] either the hearbe, root, or ſeed, have the like effect.

Such as be troubled with the Sciatica or gout in the hucklebone, find remedie by a plaſtre or cataplaſme, made with the ſeed and leaves both, of Madder; alſo with a drinke of Panaces: likewiſe if the place be well rubbed with Polemonia, and bathed with the decoction of the leaves of Ariſtolochia, it findeth much eaſe thereby. The broad ſinew or cord at the end of the muſcles which is called in Greeke Platys; likewiſe the ſhoulders if they bee pained, feele ſenſible alleviation, by Agaricke, if the weight of three oboli be drunke in one cyath of old wine. Cinquefoile both taken in drinke, and alſo applyed as a plaſtre, allayeth the paine of the Sciatica: ſo doth the

F hearbe Scammonie boiled with barley meale. The ſeed of both the Hypericons drunke in wine, is proper for that maladie.

The accidents of the ſeat or fundement, eſpecially when that part is fretted or galled, a ſalve of Plantaine healeth moſt ſpeedily.

The ſwellings or blind piles appearing like bigs or knuckles within the fundement, are cured

* *Becabunga.*

* *S. Johns* wort.

* *Sarculacto frutice.*

* *Tamaricis*: but *Dioſc.* ſaith *Ericæ*, *i.* Heath.

* *Palmo non altius*, *Ex Dioſc.*

* *Acutum.*

* *Inflationem facit*: *aliter*, *ad inflationem facit.*

* *Potum.*

* Water Creſſes.

* *Olus acidum*, or rather, *Olus atrum*, *i.* Aliſanders.

* Some take it for *Ariſtolochia* the round, (which in the 8 chap. of the 25 booke hee named *Venenũ terræ*,) others for wildings or crabs.

with five-leafe grasse: and if the said part be turned the insight outward, or displaced, there is not a better thing to settle and reduce it to the former state, than a fomentation with the Cyclamin or Sowbread root and vinegre togither. Pimpernell with the blew floure, restoreth the tiwill or fundement into the right place, if it be falne down and hang out of the bodie: and contrariwise, that with the red floure, driveth it downe. Vmbilicus Veneris is of wonderfull operation in the cure both of the blind piles, and the running hæmorrhoids. The root of Acorus, [*i.* Galangale] sodden in wine, stamped and brought into a liniment, assuageth the tumors or swellings of the cods. And *Cato* affirmeth, That whosoever have the Ponticke wormewood about them, shall not be galled betweene their legs.

* Or, *Calamus Aromaticus.*

Chap. IX.

Of Peniroyall, and Argemone.

Others add moreover Peniroyall to the foresaid wormwood, and say, That if a man gather Peniroyall fasting and bind it fast to the reins and small of the back, he shall feele no griefe in the share, or if he were pained alreadie in that part, shall find ease thereby. * Inguinaria, which some name Argemone, is an hearbe growing every where among bushes, briers, and brambles, which if it be but held in the hand, is thought to be excellent good for the accidents that befall the groine. Panaces made into a cataplasme with honey, healeth the flat biles and botches that arise in the emunctories of the share: and the like effect hath Plantaine, applied with salt, five-leafe, and the root of the great clot-bur, like as in case of the Kings evill: even so is *Damasonium to be used. As for Taperwoort or Mullen, if leafe root and all be stamped, with some sprinkling of wine among, and be afterwards lapped within a leafe of the owne, and so heat under the embres & laid to the grieved place hot, it is very good for the same purpose. And some affirm upon their owne knowledge, by the experience that they have seene, that this cataplasme will worke much more effectually, if a yong maiden all naked have the applying of it to the said bile; provided alwaies, that both she and he the Patient be fasting: also that shee touch the sore or impostume with the backe-side of her hand, & in so doing say these words following, *Negat Apollo pestem posse crescere quam nuda virgo restinguat*: that is to say, *Apollo* will never suffer, that a botch which a naked virgin thus cureth, shall possibly grow farther: which charm she must pronounce thrice, after she hath withdrawne her hand backe; and withall, both he and shee are to spit as often upon the floore, that is to say, every time that shee repeateth the foresaid spell. Furthermore, the root of Mandragoras being applied with water, healeth these botches: so doth the decoction of the Scammonium root, reduced into a pulteſſe with honey. Also the hearb Sideritis laid too, with old hogs grease: last of all, Chrysippea, incorporat with fat figgs: where, by the way note, that this hearbe retaineth the name of him who first brought it to light.

* Some call it Sharewort or Codwort, others take it to be wild Tansie, and some for *Rhœas.*

* Some take it for *Fistula pastoris.*

* *Pestem*, hap'ly he meaneth *bubonem pestilentialem*, a plague sore.

Chap. X.

Of Water-rose, otherwise called Nenuphar. Of such hearbs as either heat or coole the appetite to lust and venerie. Of Satyrion or Ragwort, * with the red roots of Crategis and Sideritis.

* *Erythraick.*

Nymphæa, which also is named Heraclea, if it be but once taken in drinke, disableth a man altogither for the act of generation (as I have said before) fortie daies after: the same if a man drinke fasting, or eat with his meat, freeth him from the dreams of imaginarie *Venus*, which cause pollution. The root applied in a liniment to the genitoirs, doth not only coole lust, but also keepe downe and represse the abundance of naturall seed: in which regard, it is thought good to nourish the bodie and maintaine a cleare voice. On the contrarie side, the upper root of Glader given to drinke in wine, kindleth the heat of lust: like as the hearbe which they call Sampier savage: as also wild Clarie, being stamped and incorporat with parched barly meale. But in this case wonderfull is the hearbe Orchis both male and female, and few be like unto it; for two kinds there be of it: the one beareth leaves like unto the olive, but that they are longer, riseth up with a stem foure fingers high, carrying purple floures, a double bulbous root formed like to a mans genitoirs, whereof the one swelleth and the other falleth by turns ech other yeare; and ordinarily it groweth neare the sea side. The other is knowne by the name of Orchis Serapias, and

* ὄρτεγόροτος.

is

A is taken to bee the female: the leaves resemble leeke blades, the stalke is a span or hand-breadth high, and the flours be purple; the root likewise is bulbous and twofold, fashioned like to a mans stones or cullions; of which, the bigger, or (as some say) the harder, drunke in water, provoketh the desire to venerie: the lesser or the softer taken in goats milke, represseth the foresaid appetit. Some say it is leafed after the manner of Squilla or Sea-onion, save that the leaves be smoother and smaller, and it putteth up a stalke full of pricks or thorns: the roots whereof, doe heale the sores in the mouth, and discharge the chest of fleame; but drunke in wine, doe stop a laske. A power it hath also to stir up fleshly lust, like as Satyrion: but this hearbe differeth from the other in that it is divided by joynts or knots, and besides busheth more, and is fuller of branches: the root is thought to be good for sorcerie and witchcraft: the same also, either by it selfe alone re-
B duced into powder, or els stamped and incorporat with fried barley groats into a liniment, is singular good for the tumors and other risings and impostumes in the said privie parts or members of generation. The root of the former Orchis given to drinke in the milke of an ewe bred up at home of a cade lambe, causeth a mans member to rise and stand; but the same taken in water, maketh it to goe down againe and lie. As for the Greeks, they describe Satyrion with leaves like unto the red Lillie, but that they be smaller, and no more in number than three, which spring directly from the root: the stem smooth, a cubit high, naked and bare without leaves, and it hath withall two bulbous roots; of which the nethermore, which also is the bigger, serveth to get bois; the upper (and that is the lesse) is as good to engender girles. They have likewise another kind of Satyrion, which they name Erythraicon, and it beareth certaine grains or seeds resembling that
C of * Chast-tree, or Agnus Castus, but that they be bigger and smooth: the root is hard & white within, the rind whereof is red, and in tast is somewhat sweetish: an hearbe ordinarily found (as they say) upon mountains: and by their saying, the root is of that vertue, that if it be held onely in a mans hand, it will cause the flesh to rise & incite him to the companie of women; but much more will it set him in a heat if he drinke it in some hard and green wine: in regard of which propertie, the manner is to give it in drinke to goats and rams, if they bee unlustie and nothing forward to leape the females. The Sarmatians likewise ministred a drench made with this hearbe unto their stone-horses or stallions, when by reason that they are overtravailed and tired out of heart by continuall labour, they perceive them to be slow and unapt to cover mares, which defect the Greeks call by a proper & fit tearme Prosedamon. But say that one by taking of this root
D is over lustie and too much provoked that way, the meanes to abate and quench the heat and strength thereof, is to drinke mead or the juice of lettuce. In summe, the Greeks generally when they would signifie any extraordinarie wanton lust or appetit to venerie, have a prettie name for it and call it Satyrion. And even so they have given a denomination to Cratæogonon, which is an hearbe divided by knots or joynts, busheth and spreadeth with a number of braunches, the seed whereof is hot, and the root of no validitie or use in Physicke: likewise they imposed upon other the names of Arrhenogonum and Thelygonum, the seeds or graines of which resemble cods or cullions. Moreover, it is said, That whosoever have about them the marow or pith of the Tithymall braunches, shall be very prone and forward to the sports of *Venus*. *Theophrastus*, a renowmed author, and otherwise a grave and modest writer, exceedeth in this point, and telleth us
E of straunge and incredible wonders, and namely, of a man who was able to companie with women seventie times togither, by touching or handling one only hearb; but he hath not put down either the name or portraiture of that hearbe.

Sideritis the hearbe, if it be bound to the swelling and painfull veins called Varices in Latine, doth not only diminish their tumor, but also appease and take away their dolour.

Touching the Gout, the time hath been when it was not so common a disease as now it is; and not onely in our fathers and grandsires daies, but even in our age and within my remembrance it was no ordinarie sickenesse here in Italie, as being a forrein maladie and come out of straunge countries hither to us: for certainly if it had been knowne to the Italians in old time, I doubt not
F but it would have found a Latine name to be called by. Neither is the gout a disease incurable, as some have beleeved, for knowne it hath been in some to have worne away of it selfe without any medicines; but in many more, to have been cured by the means of Physicke. Among the appropriat remedies for this maladie, are to bee raunged the roots of Panaces, applied in a cataplasme with raisins; the juice of Henbane or the seed, with the floure or powder of Sesama; Scordium laid too in a pultesse with vinegre; and the hearbe Iberis, as hath been said before: also

Howsoever *Dalecampius*, and others have laboured to restore this place after this manner, yet there remaineth some confusion: by intermingling *Orchis* and *Satyrion* togither, both in their descriptions & properties.

* *Vitices*, *Dioscorides* hath λύγος, *id est*, Line or Flax, not ἄγνος.

Podagra (used ordinarily in Latine for the gout) is a Greeke name, and signifieth the griefe or maladie of the feet.

Vervaine ſtamped and incorporat with hogs greaſe, is good for the gout: ſo is the root of Sow-bread, the decoction wherof healeth kibed heels, if they be bathed therein: the root of *Xiphion cooleth the hot gout; the ſeed of *Pſyllium doth the ſame: Hemlocke alſo, incorporat with Litharge or hogs greaſe: but above all other, Houſleeke or Sengreene is right ſoveraigne to be applied at the firſt aſſault or fit of the red gout, that is to ſay, when it is occaſioned by a flux of hot humors: and whether it be hot or cold gout, Groundſwell tempered into a liniment with ſwines greaſe, and ſo applied, is a verie fit and convenient medicine: as alſo Plantaine leaves ſtamped, with a little ſalt mixed among: and Argemonia punned in a mortar & applied with hony: moreover, Vervaine reduced into an unguent, is ſingular in that caſe; yea and if the goutie feet be well ſoked in the decoction therof, much eaſe will enſue thereupon: alſo Lappago, an hearbe reſembling *Pimpernell, but that it is fuller of braunches, and tufted more with leaves, which alſo be rough, rugged, and wrinkled, yeelding a juice in taſt more harſh, and in ſmell ſtrong and unpleaſant: as for that of this kind which is *ſoft, they call Mollugo: like unto which (but for the leaves that be more rough in handling) is Aſperugo, whereupon it tooke the name. Now for the gout, let the Patient take every day eleven deniers weight of the juice preſſed forth of the former Lappago in two cyaths of wine: but for this diſeaſe, the moſt excellent remedie and that which rid-deth it quite, is the Sea-weed, which in Greeke they call Phycos Thalaſſion, and in Latin Fucus Marinus; an hearbe like unto Lettuce, and commonly Murets and other ſhell-fiſhes lye bedded upon theſe weeds; which beeing applied before they are dried, doe cure not the gout of the feet onely, but alſo any diſeaſe of all other joynts. Now of this Sea-graſſe ſo named, there be found three kinds: the firſt is broad and large; the ſecond longer, and ſomwhat red; the third hath curled and frizled leaves, which in Candie they do uſe in dying of their clothes; but all are of one and the ſame operation in Phyſicke. *Nicander* was woont to give them in wine, as a countrepoiſon againſt the venome of ſerpents. Moreover, the ſeed of that hearbe which I named Pſyllium, is ſingular good for the gout, if the ſame be well ſteeped in water; ſo that in every hemine of the ſeed there be mingled the quantitie of two ſpoonfuls of Colophonian roſin, and one of frankincenſe. Finally, the leaves of Mandragoras be highly commended in this caſe, if they be ſtamped and incorporat with fried barley groats into a cataplaſme.

* Glader or Flags.
* *i.* Fleawort.
* *Anagallidi*, *Dioſcor.* ſaith *Galio. i.* Cheeſrunnell.
* *Mollis*, ſo readeth *Dodonæus*. Some take all theſe for Tazils.

Chap. xi.

Generall medicines and receits for all the infirmities incident to the Feet, the Ankles, Joynts, and Sinews: Item, the remedies for thoſe diſeaſes which poſſeſſe and trouble the whole bodie. Of the hearbe Mirthryda. Medicines for thoſe that cannot ſleepe: and for the palſie. Of cold fevers: and the ague that is incident to horſes: of the Phrenſie. Of the hearbs Walwort and Houſleeke. Laſt of all, of the Shingles or S. Anthonies fire.

IF the feet be ſwolne about the ankles, the mud that is found in the botome of waters wrought and concorporat togither with oile, is of wonderfull operation to allay the ſame. For the pain in the joynts, or griefe of ſinews, the juice drawne out of Centaurie is paſſing good: in like manner, the hearbe Centauris. As for Betonie, it is comfortable unto the nerves, which run and ſpread behind over the ſhoulder-blades, the ſhoulders, the backbone, the loins and hanches, if it be *taken in drinke, after the manner as it was ordained for the liver. Cinquefoile, is ſoveraigne for the paine of the joynts, if it be applied outwardly: likewiſe the leaves of Mandragoras made into a pulteſſe with parched barley meale; or the root it ſelfe newly drawn out of the ground and ſtamped with the wild cucumber; or elſe boiled in water: for the chaps that appeare in the feet or upon the elbows, the root of Polypodie is ſingular good: for the griefe of the joynts, the juice of Henbane reduced into an ointment with ſwines greaſe, is a proper remedie: likewiſe the juice of the hearbe *Amomum, togither with the decoction: alſo Cotton-weed or Cudwort, boiled in water: or freſh gathered moſſe ſoked in water and bound to the grieved place, and there kept faſt without remooving, untill it be drie: as alſo the root of the Bur called Lappa Boaria, drunke in wine. Sow-bread ſodden in water, cureth the elviſh and angrie kibes beginning to riſe upon the heels, and all other chilblanes and bloudyfals occaſioned by cold. Semblably, Vmbilicus Veneris applied with hogs greaſe, healeth the foreſaid kibed heels: ſo doe Crowfoot leaves, and the juice of Epithymum. Ladanum made into a ſalve with Caſtoreum, and ſo applied, fetcheth out the core of agnels or corns by the roots: the like effect hath Vervaine, if it be laid too with wine.

* *Pota*, otherwiſe *Poſita*, *i.* applied.
* Roſe of Iericho.

A wine. And now that I have run through those maladies which are offensive to every particular member, I purpose to write in the next place of such as occupie the whole bodie: and of the remedies common to them all, which I find to be these ensuing.

And first there presenteth it selfe unto me the noble hearb *Dodecatheos, whereof I have spoken before as a soveraigne remedie for those universall diseases, if it be taken in drinke. Next to it are the roots of all kinds of the Panaces, which are thought to bee excellent, and principally for long and languishing maladies: like as their seed for the obstructions of the bowels and the inward accidents of the guts: for the paines generally of the whole bodie, the juice of Scordium is right commendable, and so is that of Betonie: which hearbe taken in drinke, hath a peculiar propertie to mend the wan and leaden hew of body, reducing it to a more fresh and pleasant colour.

B The hearbe *Geranion, which some call Myrrhis, others Merthrys, is like unto Hemlocke, save that it hath smaller leaves, and a shorter stem, which also is round, of a sweet sent to the nose, and good savour in the mouth; for so we Latines doe describe it: but according to the description of the Greekes, the leaves rather resemble the Mallow, but that they are whiter somewhat, the stalks slender and hairie: *it brancheth out big at the distance of every two handbreadths, howbeit, full of leaves betweene: and among the leaves are to be seene in the top of the braunches and sprigs little buttons or heads like unto Crane bils. Another kind there is of them leafed after the manner of passe-flowers or wind-flowers, but that they be entailed or endented deeper: and a round root it hath fashioned like an apple, which is sweet in tast, and is an excellent restorative for all such as have been weakened and decaied in nature by long sickness: And this I take to bee the

C true Geranion, which is a rare hearbe. A dram weight thereof drunke twice a day [first and last] in three cyaths of wine, is a singular medicine for the phthysick. And in that order it is good for ventosities: and hath the same effect though it be taken raw. The juice of the root is soveraign for the infirmities of the eares. The seed given in drinke to the quantitie of foure drams with Pepper and Myrrhe, cureth the crampe which pulleth the head and bodie all backward. The juice of Plantain if it be drunke, or the hearbe it selfe boiled and so eaten, is holesome for those that be in a Phthisicke. Plantaine eaten with salt and oile in a morning, so soon as a man is awakened, is a great cooler. The same is an ordinarie medicine for those that mislike, and whose meat is not seene upon them, if they take it each other day. Of Betonie and honey there is a liquid confection or lohoch made, which being licked and let downe leasurely, to the quantitie at a time of a good big Bean,

D helpeth those that are in a phthysicke or consumption of the lungs. Also Agarick, if it be drunk to the weight of two oboli in wine cuit, is good in the like case: so is Daucum also taken in wine with Rhaponticke. For the hungrie wormes Phagedænæ (a name in this place signifying an inordinat *disposition, to be alwaies eating and never satisfied, although otherwise I use it for cankerous and corroding ulcers) the Tithymals or Spurges taken inwardly with Sesama seeds, is counted soveraigne. Among the maladies which affect and infest the whole bodie, want of sleepe, or an indisposition thereto, is by most Physicians counted one: For which defect, they shew us these hearbes following, to wit, Panaces, water Betonie, and Aristolochia, which they prescribe unto the patient both for to smell too, and also to annoint his head all over withall. Likewise Housleek called Aeizoon and also Sedum, giving direction to wrap it within a blacke cloth, and so to lay it

E under the pillow or boulster of the sicke person, but in no wise to let him or her know so much. Likewise Oenothera, otherwise named Onuris, is effectuall for this purpose: an hearbe good also in wine to make the heart merrie. It groweth with leaves resembling those of the Almond tree, and beareth flowers like unto Roses. Store of braunches it putteth foorth, and hath a long root, which being dried, senteth much of wine. Of such vertue is this hearbe, that if it be given in drink to the wildest beast that is, it will tame the same and make it gentle. As for the crudities or raw humors lying in the stomacke, which cause loathing and abhorring of meat, Betonie is singular to digest them: the same drunke immediatly after supper, helpeth concoction, namely, if one dram weight of the hearbe be taken in three cyaths of Oxymell: and so it resolveth and scattereth the fumes arising up into the head, occasioned by strong wine. Of the same operation is Agaricke,

F drunke at the end of a meale in hote water. The foresaid Betonie hath the name of a speciall remedie for the palsie: so is Iberis also reputed, as I have shewed once before; the same hearbe reviveth the lims which are benummed and in manner dead. And verely, Argemon is of that vertue, that it discusseth all those cold humors which mortifie any member, and put them in danger to be cut off or launced. The root of that Panaces which I named Heraclia, drunke with the ren-

net

So called, for that it representeth the maiestie of the twelve principall gods and goddesses, called *Majorum gentium*, or *Consentes*, whom the Painims imagined to sit in counsell together with *Iupiter* their President: & these hath *Ennius* comprised in this Distichon. *Juno, Vesta, Minerva, Ceres, Diana, Venus: Mars, Mercurius, Jovis, Neptunus, Vulcanus, Apollo.*

* Hearbe Robart, as some thinke, or the first kind by *Dodoneus*.

* Doves foot, or Momordica.

The Carrot. *βάυκος.

net of a Seale, so as there bee in proportion three parts of the said root to one of the rennet, cureth the falling sickneſſe. And of the same effect is Plantaine, taken in drinke. The said diſeaſe is healed by Betonie, if a dram thereof bee taken in Oxymell: by Agaricke also, to the quantitie of three oboli: and by a drinke made with Cinquefoile. Moreover, Brionium called likewiſe Archezoſtis, wariſheth this infirmitie, but it muſt bee given in Amminean wine. Furthermore, the root of Baccharis dried and beaten into pouder, taken with Coriander in three cyaths of hote water, is a ſoveraign meane to helpe that maladie. *Cudweed made into pouder, and taken with vinegre, honey, or hot water: Vervaine drunke in wine: three *berries of Hyſſope ſtamped and drunk in water for ſixteen daies together: Harſtrang, and the rennet in the maw of a Seale, of each a like quantitie taken in drinke: the leaves of Cinquefoile, if they bee ſtamped and drunke in wine for one and thirtie daies: the pouder of Betonie, to the weight of three deniers, concorporat with one cyath of Sqnilliticke vinegre, and an ounce of Atticke honey: laſtly, two obols of Scammonie, with foure drams of Caſtor, be all appropriat medicines for the falling ſickneſſe. G H

*Centunculus.

*Baccæ. Some read *faſces*, *i.* bunches: but in mine opinion, *cymæ*, *i.* tops or ſpikes, agree beſt to the ſence.

In all *cold agues, if the patient drinke Agaricke in hot water, the fits will be the lighter. And more particularly, the hearbe Sideritis drunke with oile, ſhorteneth the cold fit in a Tertian: ſo doth that *Ladanum which groweth among corn, if it be ſtamped and ſo given. Likewiſe, Plantaine, if the patient drinke the weight of two drams in mead two houres before the fit; or the very juice of the root either after it hath lien a time infuſed, or ſimply ſtamped without any ſuch preparation; yea, and the ſubſtance of the root reduced into pouder, and given in a draught of water, made hot with a gad of ſteele quenched it. Some have appointed in this kind of ague three of thoſe roots, and three cyaths of water preciſely: and the ſame Phyſicians for a Quartane have I preſcribed foure of either: & by their saying, if when Borage beginneth to fade upon the ground, one take out the pith or marow within the ſtem, and whiles he is ſo doing, name withall the ſicke partie, and ſay he doth it for to rid him or her from the ague; and withall beſtow it in ſeven leaves neither more nor leſſe of the ſaid hearb, and hang all tied faſt about the patient before the time that the fit ſhould come, the fever will never returne againe. Alſo a dram of Betonie or Agaricke taken in three cyaths of mead, driveth away any intermittent ague, eſpecially thoſe that begin with *quivering and quaking. Some are wont to give of Cinquefoile three leaves in a Terrian, and foure in a Quartane, and ſo riſe to more according to the period or type of the *reſt: Others ordaine indifferently for all agues the weight of three oboli, with ſome pepper, in mead or honied water. Vervaine verely given in wine as a drench to horſes, cureth them of their feavers: but in K Tertians it muſt bee cut juſt above the third joint where it brauncheth: but for Quartanes at the fourth. The ſeed of both kinds of Hypericon is good to be drunke in Quartans. And the pouder of Betonie dried, is ſingular for the quaking fits: and in very deed the hearbe it ſelfe repreſſeth all ſhivering and whatſoever proceeding of cold. In like manner, Panaces is of ſo hot a nature, that Phyſicians give direction to them who are to travell over high mountaines covered with ſnow, for to drinke it, and annoint their bodies all over with it. Semblably, Ariſtolochia doth withſtand all chilling and through colds. The beſt cure of thoſe who bee in a frenſie, is by ſleepe: and that may bee procured eaſily by the juice of Pucedanum and vinegre together infuſed upon the head by way of embrocation, or by rubbing the ſame with it: likewiſe with the juice of both the Pimpernels. Contrariwiſe, there is more adoe with thoſe that are in a lethargie to awaken them & keepe L them from drowſineſſe: and yet may that be affected ſome ſay by rubbing their noſthrils with the juice of the ſaid *Harſtrang in vinegre. For thoſe that be out of their right wits or beſtraught, Betonie is ſingular good to be given in drinke. Panaces breaketh the carbuncle. Alſo the pouder of Betonie in water, healeth it: or the Colewort with Frankincenſe, if the patient drinke often thereof hote. Some take a burning coale of fire, and when it is extinguiſhed or gone out in the preſence of the patient, with their finger gather up the cindres or light aſhes which ſettle thereupon, and applie them unto the carbuncle: others ſtampe Plantaine and lay it to the ſore. The Tithymall called Characites, cureth the dropſie. Alſo Panaces and Plantaine taken as meat in bole, with this regard, That the patient have eaten ſome drie bread before, without any drinke at all. In which caſe Betonie likewiſe is ſingular, if two drams thereof bee given in as many M cyaths of wine ſimply, or wine honied. Moreover, Agaricke, or the ſeed of Lonchitis, drunke to the quantitie of two Ligulæ or ſpoones full, in water. Flea-wort beeing uſed with wine: the juice of Pimpernels, both the red and the blew: the root of Vmbilicus Veneris in honied wine: the root of Walwort newly drawne out of the ground, ſo that the earth bee onely ſhaken off

without

*Herba Iudaica.

*Horrore, as Quartanes.

*namely Quintans, Sextanes, Septimanes & Nonanes, &c.

Harſtrang.

Or rather with Euphorbium, as ſome have corrected the place.

A without any waſhing at all; in caſe as much thereof as two fingers will comprehend, bee taken in one hemine of old wine hot: the root of Claver or Trefoile drunke in wine to the weight of two drams: Tithymall, named Platyphyllon: the ſeed of Hypericon, and namely that which otherwiſe is called Coris: Chamæacte, which ſome thinke to be Walwort, if either the root be beaten to pouder and miniſtred in three cyaths of wine, ſo the patient have no fever hanging upon him, or the ſeed given in thicke red wine; bee appropriat remedies every one, for a dropſie. In like manner Vervaine, if a good handfull thereof bee boiled in water unto the conſumption of the one halfe. But principally the juice of Walwort is thought to be the meeteſt medicine for to fit this maladie. *i.* Broad leafed.

For the bleach or breaking out in wheales, for ſmall pockes, ſwine pockes, and ſuch like erup-
B tions of fleagmaticke humors, Plantaine is a proper remedie to rid them away: ſo is the root of Sowbread applied with honey. The leaves of Walwort or ground Elder ſtamped, incorporat in old wine and ſo laid too, doe heale the meazils, purples, or red bliſters, which ſome call Boa. The juice of Nightſhade or petie Morell, uſed as a liniment, killeth the itch. The ſhingles and ſuch hot pimples called S. *Anthonies* fire, are cured by nothing better than by Houſleek, by the leaves of Hemlocke ſtamped into an unguent, or the root of Mandragoras. Now the manner of preparing and ordering it thus: Take the ſaid root, drie it abroad in the open aire, like as they doe Cucumbers; but principally let it hang firſt over new wine; afterwards in the ſmoake: this done, ſtampe it and temper it with wine or vinegre. Good it is alſo in this caſe to make a fomentation with wine of Myrtles, and therewith to bath the greeved place. Alſo take of Mints two ounces, of
C ſulphur-vif one ounce, pouder them both, and mingle them together with vinegre, uſe this mixture for the ſaid S. *Anohonies* fire. And ſome take ſoot & vinegre tempered together for the ſame purpoſe. Now of this diſeaſe which wee tearme * S. *Anthonies* fire, there bee many kinds, whereof there is one more daungerous than the reſt, which is called *Zoſter, for that it coveteth to goe round about the middle of a man or woman in manner of a girdle; and in caſe both ends meet together indeed, it is deadly and incurable. To meet with it therefore by the way and to prevent this extremitie, Plantaine is thought to be a ſoveraigne remedie, if it be incorporat with Fullers earth. Alſo Vervaine alone by it ſelfe, and the root of the great Bur. Now for other corroſive ulcers and tettars, it is very good to uſe the root of Vmbilicus veneris with honied wine: Sengreen, the juice of Mercurie alſo with vinegre. *Eriſypelas.* *i.* A girdle, and] it is our ſhingles. *Terra Cimolia.*¶

D

Chap. xii.

For diſlocations or members out of joint. Againſt the Iaundiſe, fellons, hollow ſores called fiſtulaes, tumors, burnes, and ſcaldings. Againſt other diſeaſes. For to comfort the ſinewes, and ſtanch bloud.

The root of Polypodium brought into a liniment, is a proper remedie for any diſlocation. The ſeed of Fleawort: the leaves of Plantain punned with ſome few cornes of ſalt put thereto: the ſeed of Mullen boiled in wine, ſtamped and reduced into a cataplaſme: Hemlocke, incorporat with hogs greaſe. All theſe applied accordingly, doe aſſuage paine and bring downe
E any ſwelling, occaſioned by diſlocation. The leaves of Ephemerum brought into a liniment, are good for any bunches or tumors cauſed by thoſe accidents, if they be taken betimes whiles they may be diſcuſſed and reſolved. Some take it for the May Lillie or Lilly-Convalley.

As touching the Iaundiſe, I cannot but wonder at it, eſpecially appearing as it dooth in the eyes; namely, how the gall ſhould get under thoſe fine membranes and tunicles, lying ſo cloſe couched as they doe. *Hippocrates* hath taught us a rule, That if the Iaundiſe ſhew in a feaver *after the ſeventh day from the beginning thereof, it is a deadly ſigne. Howbeit, I my ſelfe have knowne ſome to have eſcaped and lived ſtill, notwithſtanding that deſperat ſigne. But this is not alwaies a ſymptome incident to an ague, but happeneth otherwhiles without a feaver: and then a drinke made of the greater Centaurie, as I have before ſhewed, doth withſtand and ſtay the courſe ther-
F of. Alſo Betonie riddeth away the Iaundiſe, if the patient doe drinke three oboli thereof in one cyath of old wine. The leaves of Vervaine likewiſe have the like effect, if the ſame quantitie bee drunke foure daies together in one hemine of wine hote. But the ſpeedieſt cure of this diſeaſe, is by Cinque-foile or five leafed graſſe, if three cyaths of the juice bee taken with ſalt and honey in drinke. The root of Sowbread is a ſoveraigne medicine for this infirmitie, if the patient drinke the *Nay rather before the 7 day: for then it is Symptomaticall, and ſignifieth irregular humors: whereas upon the 7, 9, 11, and ſuch Decretorie daies, it is criticall, and] giveth hope of recoverie. As *Hippocrates* himſelfe teacheth. *Aphoriſ.* 62 and 64, *lib.* 4

the weight of three drams: but this care ought to be had, that the roume be hote, and ſo cloſe G
that no wind may come in,for feare of catching cold: and then it will drive out the jaundiſe by ſweat,luſtily. The leaves of Folefoot taken in water: the ſeed of Mercuries,both the male and female,if a cup of drinke be ſpiced therewith,or if it bee ſodden with Wormewood or cich peaſe: the*berries of Hyſſope drunke with water: the hearbe Liverwort,ſo that the patient abſtain from all worts or pothearbes,ſo long as hee taketh it: Capillus veneris given in wine: and the Fullers hearbe in wine honied,be all of them good medicines for the jaundiſe.

Baccæ, rather *cymæ*,i. the tops, as before.

As for the ſores called Fellons or Cats-hairs, they will breed every where in any part of the bodie,and put folke to great anguiſh and trouble who have them, yea, and otherwhiles endaunger their life,eſpecially if they meet with leane and worne bodies. But what remedie? Take the leaves of the hearbe Pycnocomos,let them be ſtamped and incorporat with fried Barley meale, and ſo H
applied, in caſe the ſaid fellons are not drawne to a pointed or ſharpe head. The leaves alſo of *Ephedros brought into a liniment and laid too, doe diſcuſſe and diſſolve them,if they be taken in the beginning.

Hippuris, Horſtaile.

Moreover,you ſhall not ſee a part of the bodie but it is ſubject to the Fiſtulaes,which creepe inwardly and hollow as they goe: but eſpecially, when by the unskilfull direction of Phyſicians, or the leaud hand of chyrurgians there bee an inciſion untowardly made in the bodie. The helpe is to make tents of Centaurie the leſſe,with honey boiled,and put them into the concavitie. Alſo to uſe an injection of Plantaine juice. To applie Cinquefoile with ſalt and honey. Ladanum alſo with Caſtoreum: to lay unto the ſore,Vmbilicus veneris,with deere marow, eſpecially of Stag or Hind,hot. The ſtring or pith of a Mullen root faſhioned ſlender to the forme of a tent put in- I
to the ulcer,or the root of Ariſtolochia in that manner uſed, or the juice of Tithymall conveyed into it,ſerve all to cure the Fiſtula.

All inflammations,biles,& impoſtumes,are healed by a liniment made of Argemonie leaves: So be all hard and ſchirrous tumors,occaſioned by the gathering of humors, with Vervaine or Cinquefoile ſodden in vinegre: with the leaves and roots of Mullen: with Hyſſope applied in wine: with the root of Acorus, ſo that there bee a fomentation withall made of the decoction of the ſaid hearbe: and finally with Houſleeke. In like manner, theſe hearbs before rehearſed do heale bruiſes,hard tumors,or bunches and hollow ſores. The leaves of *Illecebra draw forth any arrow heads and whatſoever ſticketh within the bodie:ſo doe the leaves of Folefoot:the Carot alſo,and the leaves of *Lions paw, ſtamped and incorporat with fried Barley meale in water. The K
leaves of Pycnocomos punned,or the ſeed beaten to pouder,and with Barly meale parched,and ſo reduced into a cataplaſme,are good to be applied to biles and impoſtumes broken & running matter. In like manner the Ragworts are to be uſed.

A kind of Houſleeke.

Our Ladies Mantle.

As touching the accidents that happen in the bones,the root of Satyrion if it be laid outwardly upon them,are thought to worke a moſt effectuall and ſpeedie cure. All cankerous and eating ſores,likewiſe impoſtumes growing to ſuppuration,are healed with the ſea weeds,if they bee applied before they be dried and withered. Alſo the root of marſh Mallow,doth diſſipate and ſcatter all gatherings of humors to an impoſtume,before it be come to an head and to ſuppurat.

Plantaine and the Clot Bur are ſingular for burnes or ſcalds,healing them up ſo cleane without a skar,that a man ſhall not perceive the place: The manner is to take the leaves,ſeeth them in L
water,ſtampe them into a liniment,and ſo to applie them. Likewiſe the roots of Sowbread,togewith Houſleeke:the hearbe it ſelfe Hypericon,which I called before*Corion,have the like effect.

Or *Coris*.

For the infirmities incident to ſinewes and joints,Plantaine is a ſoveraigne hearb,if it be ſtamped with ſalt: ſo is Argemonia punned and incorporat with honey. The juice of Harſtrang is ſingular to annoint thoſe that bee ſprained, ſuch alſo as be ſtretched with an univerſall crampe as if they were all of a peece. For to mollifie the hardneſſe of ſinewes that be ſhrunke up,there is not a better thing than the juice of Ægilops. And to aſſuage their pain,a liniment made with Groundſwell and vinegre, is excellent. For thoſe that be ſprained and troubled with that crampe which draweth their necke backward, it is good to rub and annoint them well with Epithymum; with the ſeed of *S. Johns* wort, which alſo is called Coris, and to drinke the ſame. As for the hearbe M
Phrynion,they ſay it hath vertue to conglutinat and unite ſinewes againe,if they were cut in ſunder,if it be laid too preſently, either ſtamped or chewed in the mouth. For ſuch likewiſe as bee ſpaſinaticke,plucked backward with the crampe, or troubled with trembling and ſhaking of the lims,it is good to give them the root of the marſh Mallow to drinke in mead: And in that maner

Darnell,as ſome thinke.

taken

A taken, it healeth thoſe that be ſtiffe and ſtarke for cold. Finally, the red ſeed of the hearbe Pæonie ſtancheth any flux of bloud, the root thereof hath the like operation. As for Cyclaminos, that is to ſay Sowbread, it ſtaieth any bleeding, whether it bee at the mouth raught up from out of the bodie, or at the noſthrils, whether it run by the fundament, or guſh from the matrice of women. Likewiſe Lyſimachia ſtancheth bloud either in drinke, liniment, or Errhine put up into the noſe. The like effect hath Plantaine ſeed. Cinquefoile alſo both taken inwardly and applied outwardly. Moreover, if the noſe bleed, take the ſeed of Hemlocke, beat it into pouder, mix it with water, and ſo put it up handſomely into the noſthrils. Alſo Sengreene and the root of Aſtragulus. To conclude, wild Hirſe called in Greeke *Iſchæmon and Achillæa, doe ſtay any iſſue of bloud.

* *i.* Stanchbloud, a kind of Yarrow.

B

Chap. xiii.

Of the hearbe Equiſetum: of Nenuphar, Harſtrang, Sideritis, and many more effectuall to ſtanch bloud. Of Stephanomelis and Eriſithale. Alſo remedies againſt wormes and vermine.

HOrſe-taile, named in Latine Equiſetum, and by the Greekes Hippuris, an hearbe which heretofore I diſallowed to grow in any meddowes (and it is eſteemed the very haire, proceeding out of the earth, like for all the world to the haire of an Horſetaile) if it be boiled in a new earthen pot never occupied before, ſo as the pot be brim full when it is ſet on the fire and ſo to continue ſeething, untill a third part be conſumed, doth waſt the ſpleene of lackies & foot-
C men, if for three daies together they drinke one hemine of the decoction at a time: and beſides this charge they ought to have in any wiſe, to forbeare all fat and oilie meats for foure and twenty houres before they begin this diet drinke. In deſcribing of this hearbe, the Greekes do not agree, but are of divers opinions: Some give that name to a certain hearbe with blackiſh leaves reſembling thoſe of the Pine tree; and they report a wonderfull vertue thereof, namely, that if it do but touch a man, it will ſtanch any iſſue of bloud. And as ſome name it Hippuris, ſo others call it *Ephedros, and there be againe who give it the name Anabaſis: becauſe forſooth as they ſay, it climbeth upon trees, and hangeth downe from thence, with many blackiſh ſlender haires in maner of riſhes, reſembling horſe tailes. Small branches it hath full of joints, and few leaves, which be alſo fine and ſmall. The * ſeed that it beareth is round, like unto Coriander; and the root, of a
D woodie ſubſtance: this kind they ſay groweth principally in thickets and groves. An aſtringent and binding power it hath. The juice if it bee conveighed up into the noſthrils, ſtenteth bleeding at noſe, though it guſhed out from thence: it knitteth alſo the bellie, and ſtoppeth a laske. Taken in *ſweet wine to the quantitie of three cyaths, it helpeth the bloudie flix. Vrine it provoketh, the cough it ſtaieth, and cureth ſtreightneſſe of wind when the patient is forced to ſit upright for to draw his breath. It healeth ruptures, and repreſſeth thoſe ſores that love to ſpread and run over the bodie. The leaves are good to bee drunke for the infirmities that offend guts and bladder. A ſpeciall vertue it hath to cure thoſe that be burſten bellied and have their guts ſlipped downe in the bag of their cods. The ſaid Greeke writers deſcribe alſo another horſetaile, by the name of Hippuris, with ſhorter, ſofter, and whiter haires than the former; and they commend it as a ſove-
E raigne hearbe for the Sciatica and for wounds, to bee applied unto the place with vinegre; and namely for to ſtaunch bloud: in which caſe the root of Nenuphar ſerveth very well, if it be ſtamped and laid upon a greene wound. If a man or woman void bloud at the mouth, which doth riſe from the parts below, there is not a better thing than Harſtrang taken in drinke with the ſeed or berries of the Cypreſſe tree. And as for Sideritis the hearb, it is ſo powerfull that way, that it ſtancheth bloud out of hand, if it be applied and kept faſt to the wounds of theſe ſwordfencers that fight at ſharpe, bleed they never ſo freſh: the which effect we may ſee in the aſhes and coales of Fennell-geant: but the Toadſtoles or Muſhroms growing about the root of the ſaid plant, doth the feat more ſurely. In caſe the noſe guſh out with bloud, Hemlocke ſeed alſo beaten to pouder tempered with water and ſo put up, is counted very effectuall to ſtay the bleeding: In like manner
F *Stephanomelis, if it bee applied with water. The pouder of Betonie dried and drunke in Goats milke, ſtancheth bloud iſſuing out of womens breaſts by the neppils. The ſame dooth Plantaine bruiſed and laid too in a pulteſſe. The juice of Plantaine is good to bee given them that vomite bloud. For a bloud that runneth upand downe, breaking out one while here and another while there, a liniment made of a Burre root and a little ſwines greaſe, is commended to be excellent.

Or rather *Ephydros*.

And that is iuſt none.

* *Dulci*: rather *auſtero*, *i.* hard or green wine.

Which ſome take to be *Argentina*, *i.* white Tanſey.

For

For ſuch as bee burſten or have any rupture within, bee plucked with convulſions, or have fallen from on high; Centaurie the greater, the root of Gentian beeing ſtamped into pouder or boiled, the juice of Betonie, bee counted ſingular meanes to recover: and more than that, if a vaine bee broken by overmuch ſtraining the voice, or the ſides. Likewiſe, Panaces, Scordium, and Ariſtolochia taken in drinke, ſerve well for the ſame purpoſe. Moreover, if any bee bruiſed within the bodie, or have been overturned backward and throwne downe, it is good for them to drinke the weight of two oboli of Agaricke in three cyaths of honied wine; or in caſe an ague follow them withall, in honied water: for which purpoſe ſerveth alſo that kind of Verbaſcum or Mullen, the flower whereof reſembleth gold: the root alſo of Acorus. All the kinds of Houſleek, to wit, Prick-madame, Horſe-taile, or Stone-crop: but indeed the juice of the biggeſt is moſt effectuall. In like manner the decoction of Comfrey root and Carot taken raw. There is an hearbe called Eriſithales with a yellow flower, and leafed much after the maner of Brankurſine: the ſame ought to be drunke in wine, as alſo Chamerops in the ſame caſe. As for Irio, it would be given in ſome ſupping: and Plantaine may bee uſed any way, it matters not how: which hearbe hath this good propertie over and beſides, to cure the lowſie diſeaſe, whereof *Scylla* the Dictatour died, who was eaten with lice. A wonderfull thing that in the very maſſe of bloud there ſhould be engendred ſuch creatures to conſume mans bodie. But the juice of the wild Vine called *Vva Taminia, as alſo of Ellebor, is ſoveraigne againſt this foule and filthie maladie, in caſe the bodie be annointed all over with a liniment made of it and oile together. As for the ſaid Taminia, if it be boiled in vinegre, it killeth ſuch vermine breeding in cloths or apparell, ſo they bee waſhed or rubbed therewith.

*He meaneth *Staphiſagre*, although he attribute unto it this wrong name.

Chap. XIIII.

For ulcers and wounds. To take away warts. Of the hearbe Polycnemon.

VLcers as they be of many ſorts, ſo they are cured after divers manners. If they bee ſuch as run and yeeld filthie matter, a liniment or ſalve made of the root of all kinds of Panaces and wine together, are thought to bee a ſoveraigne meanes to heale them. But that Panaces, which they call Chironia, hath a ſingular propertie above the reſt to drie up ſuch ſores. The ſame root beaten to pouder and incorporat with honey, breaketh and openeth any ſwelling impoſtumes. This hearbe tempered with wine, it makes no matter whether you take flower, ſeed, or root, ſo it be applied with Verdegreece or the ruſt of braſſe, healeth any ſores, bee they never ſo deſperat, and principally ſuch ulcers as bee corroſive and eat as they goe. The ſame if it be mingled with fried Barley meale, is good for old feſtered ulcers. Alſo Heraclion, Siderion, Henbane, Fleawort, Tragacanth, and Scordotis, incorporat accordingly with honey, cleanſe the ſaid ſores. As for this laſt named, the very pouder of it alone ſtrewed upon ulcers, eateth away the excreſcence of proud fleſh. *Polemonia healeth thoſe malignant ſores which be called morimals, and are hard to bee cured. Centaurie the greater reduced either into a pouder, and ſo caſt upon the ſore, or brought into a liniment and applied accordingly: the tops alſo of the leſſe Centaurie either ſodden or beaten to pouder, doe mundifie and heale up all inveterat and cankered ulcers. The *tender crops or huskes of *Clymenos, are good to be laid unto freſh and greene wounds. Moreover, the root of Gentian either ſtamped or boiled in water to the conſiſtence of honey, or the very juice thereof, ſerveth very well to bee applied unto corroſive and eating ulcers: like as a kind of Lycium made of it is as appropriat for wounds. Lyſimachia is an excellent wound-hearb, & healeth wounds ſpeedily, if they be taken whiles they be new. Plantaine is a great healer of any ſore whatſoever, but principally of ſuch ulcers as bee in the bodies of women, children, and old folke. If it be *made ſoft and tender at the fire firſt, it doth the cure ſo much the better: and being incorporat in ſome ordinarie cerot, it mundifieth and cleanſeth the thicke edges and ſwollen brims of any ſore, and ſtaieth the canker of corroding ulcers. But when Plantaine is thus reduced into a pouder and ſtrewed upon the ſore, you muſt not forget to cover the ſame with the owne leaves. Moreover, Celendine is ſingular for all impoſtumes and botches, whether they be broken or no, yea, it mundifieth and drieth up hollow ulcers called Fiſtulaes: and for wounds it is ſuch a ſingular deſiccative, that Chyrurgians uſe it in ſtead of Spodium. The ſame beeing incorporat with Hogs greaſe, is excellent to be applied unto them when they be in manner paſt cure and given over by the Chyrurgian. The hearbe Dictamnus taken in drinke, thruſteth out arrow-heads:

*Sauge de bois.

* *Colicuſi.*
*Some take it for water Betonie.

Mollita. Why not *Molita*, [i. ground to pouder againſt the fire] ſince that he uſeth *farina* ſo commonly for the pouder of drie hearbes?

A heads: and in a liniment outwardly, draweth foorth the ends of darts, and any ſpills whatſoever
2 ſticking within the bodie: for which effect, the leafe would be taken to the weight of one obolus in one cyath of water. Next to this in operation, is the other baſtard kind thereof, called Pſeudodictamnum: and there is neither of them both, but is good for to draw all biles & impoſtums that are broken and doe run matter. Moreover, Ariſtolochia is an excellent hearbe to eat and conſume putrified ulcers full of dead fleſh: it mundifieth alſo thoſe that bee foule and filthie, if it be applyed with honey: yea and draweth out the vermin bred of the corruption within them: the calloſities likewiſe and hard excreſcences ariſing in ſores, it fetcheth away: alſo it draweth forth any thing ſticking in the fleſh, eſpecially arrows and the ſpills of broken and skaled bones, if it be laid too with roſin. Of it ſelfe alone without any thing els, it is a good incarnative and fil-
B leth up hollow ulcers with good fleſh: but mixed with the powder of the Floure-de-lis root, and ſo incorporat with vinegre, it is ſingular for to heale up greene wounds. Moreover, for old ſores, Vervaine and Cinquefoile medled togither with ſalt and honey, do make a ſoveraigne ſalve. The roots of the great Clot-bur are good to be laid unto freſh wounds, made by the ſword or any edged tools: but the leaves are better for old wounds, if the ſame be tempered with hoggs greaſe: howbeit this charge ought to bee given, That as well the one as the other, have a leafe of the owne laid over them to cover the whole place. As for *Damaſonium, it would be uſed in theſe caſes, prepared in that manner as it is ordained for the kings evill. And the leaves of Mullen ſerve well for the ſame purpoſe, if they be applied with vinegre or wine. Vervaine is a good hearbe for all ſorts of wounds and ſores, were they overgrowne with calloſities and full of putrefaction. The
C root of Nymphæa Heraclia, healeth perfectly all running and filthie ulcers. In like manner, the root of Cyclamin, [*i.* Sowbread] either alone of it ſelfe, or incorporat with vinegre or honey. The ſame is ſingular good for thoſe wens or impoſtumes that engender within them a certaine matter like unto *fat or tallow. Like as Hyſſope is an appropriat hearb for running ulcers. Sem-
blably *Peucedanum, which is of that efficacie for the healing of greene wounds, that it will draw corruption from the verie bone. The ſame effects have both the Pimpernels: and beſides, they doe repreſſe thoſe cancerous ſores that eat deepe: they ſtay alſo the flux of a rheume to any ſore, which hindreth the healing thereof: they be good alſo for greene wounds, but eſpecially in old bodies. The freſh leaves of Mandragoras newly gathered, incorporat with the maſſe of ſome cerot, are ſingular for impoſtumes and maligne ulcers: like as the root healeth wounds
D beeing made into a plaſtre with honey, or oile. Likewiſe Hemlocke tempered with the floure of fine white wheat, and wrought into a paſt with wine. Houſleeke cureth ſhingles, ringwormes, and ſuch like wild-fires, yea if they grow to be Wolves, and begin to putrifie: like as Groundſwell healeth thoſe ulcers which be given to engender vermin: but the roots of the mountaine Cich, or peaſe earth-nut, are ſoveraigne for greene wounds: and both kinds of Hypociſthis, doe mundifie inveterat ulcers. The ſeed of Pied-de-lion, ſtamped with water, and reduced into a liniment with parched barley groats concorporat all togither, draweth foorth arrow heads: ſo doth the ſeed of Pycnocomon, in the ſame ſort uſed and applied. The juice of the Spurge called Tithymalus Characias, healeth gangrens, cankers, and putrified ſores tending to mortification. The decoction alſo of the braunches, ſodden in oile, with fried barley meale. As for *Ragworts, they
E cure morimals alſo, either drie or greene, ſo they be applied with vinegre and honey: and Oenothera by it ſelfe, healeth thoſe untoward and fretting ulcers, which are the worſe and more angrie for the handling. The Scythians are woont to heale wounds with their hearbe Scythica. And for cancerous ſores, the hearbe Argemonia incorporat with honey, is knowne to be moſt effectuall. When any wound or ſore is *over healed, an Aſphodill root boiled, as I ſaid before, then ſtamped togither with parched barley, and ſo applied, is ſingular good to rectifie that de-
3 fault: but for any ſore or wound whatſoever, Henbane leaves be ſingular. The root of Aſtragalus beaten into powder, are ſoveraigne for ſuch ulcers as doe water much, and be alwaies moiſt: likewiſe the common *Maidenhaire boiled in water: but more particularly, if the skin be newly fretted off by wearing ſome uneaſie ſhoes, there is not a better thing to heale and skin the place,
F than a ſalve made with Vervaine: alſo with hearbe Willow ſtamped; or Nenuphar dried, made into powder, and ſo ſtrewed upon the gall. As for the other Maidenhaire, it is counted better to heale the ſame raw excoriations, if they have continued ſome time, and are growne to be exulcerat. There is an hearb named Polycnemon, like unto wild Origan, howſoever the ſeed reſemble that of Peniroyall: it ſhooteth foorth many braunches, and thoſe knotted and joynted in di-

* *Fiſtula paſtoris*, or, water Plantaine.

* *Steatomata.*

* Hartſtrang.

* *Orobis.*

* *Sanatis*, that is to ſay, when the skar riſeth above the fleſh & is not even with the reſt of the skin: or, if you read *Præſanatis* skinned too ſoon, & healed onely in ſhew and apparence outwardly.

* *Callitrix*, which is *Trichomanes*, or *Capillus Veneris.*

vers places: it beareth in the head certain berries as it were in bunches and clusters odoriferous, G
and as they sent somewhat strong and hot, so the smell is not unpleasant: take this hearbe, chew it with your teeth, and then lay it to any wounds made by the edge of the sword or such like weapon, and so let it lie and remoove it not untill the fifth day, you shall see it to heale excellent well. Camfrey applied unto a greene wound, skinneth it most speedily: so doth Sideritis; as for this hearbe, it should be applied with honey. The seed and leaves of Mullen, sodden in wine & stamped to the forme of a cataplasme, draweth foorth all thorns, spills, and arrow heads, which sticke within the bodie. The like effect worke the leaves of Mandragoras, incorporat with pattched barley meale; and Sowbread roots stamped and mixed with honey. The leaves of Germander punned with oile, are excellent to be applied unto those ulcers which doe corrode the flesh under them and eat forward: like as the Reiks or Sea-weeds. Betonie is a soveraigne hearb for cancerous ulcers: also for the blacke sploches that have continued a long time upon the skin, if there be salt put thereto. Argemonia tempered with vinegre, taketh away werts: so doth the root of Crowfoot, which also is singular good to fetch off with ease, the ragged and fretted nails that be offensive. The leaves of Mercurie, the male and female both, or the juice thereof brought into a liniment, have the like operation. All the sorts of the Tithymals take away any werts whatsoever: so doe they rid the troublesome risings and impostumations like whitflaws about the naile roots, and all flecks, spots, whelks, and specks whatsoever. Ladanum reduceth any skars to looke faire and fresh coloured againe. H

Chap. xv.

Many experiments and approoved receits, for the provoking or staying of womens monethly tearms: for curing the diseases of their matrice: for sending out the birth, or retaining the same within the bodie the full time. Also sundrie devises for to amend the faults that blemish the skin of the face: to colour the haire of the head, or to fetch it off. Last of all, divers medicines for the farcins or scab in foure-footed beasts. I

IT is said, That if a travailer or wayfaring man weare fast tied about him, Mugwort or Sauge, he shall never be wearie nor thinke his journey long. But to come now unto the infirmities of women: The blacke seed of the hearbe Pæonie, is generally good for all their * maladies, if it be taken in mead: the root also is of the same operation, and besides provoketh the ordinary course of their months. The seed of Panaces drunke with wormwood, mooveth their fleurs, and procureth them to sweat: the like effect hath Scordotis either in drink or liniment. A dram of Betonie given to women in three cyaths of wine, helpeth all the maladies incident to their naturall parts, * but specially those that ensue upon their deliverie of childbirth. Achillæa being applied accordingly, staieth the exceſſive flux of their monethly tearms: for which purpose also, it is good for them to sit in a bath made with the decoction of the said hearb: and in this case, to their brests or paps, * there would be laid a plastre of Henbane seed tempered with wine: the root also applied in manner of a cataplasme to their secret parts, is counted soveraigne for that infirmitie: like as Celendine the greater laid unto the foresaid breasts. If the after-birth, when the child is borne, be loth to come away; or if the infant be dead within the mothers wombe, the roots of Panaces applied accordingly to the privie parts, fetch forth both the one and the other. The verie hearbe it selfe Panaces drunke in wine, or outwardly used to the region of the matrice, * cleanseth the same. Sauge de bois taken with wine, expelleth the after-birth; and by a suffumigation, mundifieth the matrice. The juice of Centaurie the lesse, bringeth women to their desired sickenesse, if they drinke it, or foment the parts beneath, therewith. Likewise the root of the bigger Centaurie used after the same manner, appeaseth the pains of the mother. If the same be scraped smooth, and put up into the right place as a pessarie, it draweth away the dead child within her bodie. For the griefe and anguish which women feele in their wombe, there is no better thing than to apply the juice of Plantaine in a locke of wooll: and in daunger of suffocation by rising of the mother, to give it in drinke. But Dictamnus is soveraigne and hath no peere: it provoketh monthly fleurs: it sendeth out the dead child, yea though it lay overthwart and stucke crosse in the birth: for which purpose, the woman must drinke to the weight of one obolus, in water. And verely of such power is this hearbe in such cases, that so long as women goe with child, it must not come within the chamber where they are, for feare it put them to travaile before their time. And not onely in drinke

* In their matrice, as namely, the rising of the mother, &c.

* To wit, the stay of the after-burden, after-throwes, suppression of their purgatiõ, or immoderat shifts, &c.

* Swelled and hard.

* *Purgat*, some read better (in mine opiniõ) *corrigit*, & redu-ceth it into the right place being unsetled and perverted.

G H I K L M

A drinke is it thus effectuall, but alſo in liniment; yea and the verie perfume and ſmoke thereof received in the bodie, will doe the deed. Next to it, there is not a more ſoveraigne hearbe than the baſtard Dictamne, called Pſeudodictamnus: but it muſt bee boiled to the weight of one denier, with pure wine and ſtrong of the grape, and then taken in drinke, it provoketh womens deſired ſickneſſe. And yet Ariſtolochia is many waies good for the infirmities of women: for if there be myrrhe and pepper put thereto, and then either taken in drinke or put in a peſſarie, it draweth downe their fleurs, bringeth forth the after-birth, and fetcheth away the dead infant: it keepeth up and ſtayeth the matrice readie to fall and ſlip out of the body, either in fomentation perfume, or peſſarie, eſpecially the * ſmall kind thereof. But in caſe a woman be in daunger of ſuffocation by the aſcent of the mother, or otherwiſe diſeaſed for want of her monethly purgation, let her
B drinke Agaricke to the weight of three oboli in one cyath of old wine: make a peſſarie of Vervaine incorporat with freſh hogs lard, and apply Calves-ſnout, otherwiſe called Snap-dragon with oile roſat and honey, ſhe ſhall have eaſe and be cured ſpeedily. Semblably the root of Nenuphar, eſpecially that which groweth * in Theſſalie, applied unto the naturall parts of women, eaſeth the paines thereof: and if it be drunke in groſſe red wine, it ſtaieth their ſhifts or immoderat flux of the moneths. Contrariwiſe, the Sowbread root, both taken in drinke and alſo outwardly uſed, provoketh the ſame if they doe ſtay upon a woman. Alſo a decoction thereof, if a woman doe ſit therein, helpeth the accidents of the bladder. Ciſſanthemos taken in drinke, ſendeth out the after-birth, and healeth the maladies of the matrice. The upper root of the Flag or Glader, drunke in vinegre to the weight of one dram, bringeth women to the ordinarie courſe
C of their fleurs. The fume of Harſtrang burnt, fetcheth women againe when they lie as it were ſtrangled and dead in a fit of the mother. Flea-woort taken to the weight of a dram in three cyaths of honied water, provoketh their monethly tearms, but eſpecially it maketh them ſoluble if they were coſtife. The ſeed of Mandragoras cleanſeth the matrice, if a woman take it in her drinke: the juice whereof applied to the naturall parts, provoketh her months and fetcheth away the dead child within her bodie. Againe, the ſeed taken with wine and brimſtone, ſtaieth the immoderat flux of the monthly terms. Crowfoot either drunke or eaten with meat, knitteth the bellie and ſtoppeth a laske: an hearbe otherwiſe (as I have ſaid) of a cauſticke and burning nature, if it be uſed raw; but certeinly, beeing boiled with ſalt, oile, and cumin, a commendable meat. Yellow Carots taken in drinke, doe exclude the after-birth, and provoke womens fleurs with ex-
D ceeding great facilitie. A perfume of Ladanum, ſetteth ſtreight the matrice when it is out of the right place, and turned to a ſide: and for the paine and exulceration thereof, it is of great force either applied outwardly or injected inwardly. Scammonie, either in drinke or cataplaſme, ſendeth forth of the bodie the dead fruit of the wombe. Both kinds of S. *Johns* wort, ſtirreth the iſſue of womens fleurs, onely by an outward application. But above all (in the judgement of *Hippocrates*) * Crethmos paſſeth for that, if either the ſeed or the root be taken in wine. As for the pill or rind thereof, it fetcheth away the after-birth alſo: and drunke in water, it helpeth the ſuffocation occaſioned by the riſing of the mother. The root of * Geranium likewiſe more particularly, is a verie convenient remedie for to bring away the after-birth, and to cure the inflammation of the matrice. Horſetaile hath a ſecret vertue to mundifie the naturall parts of women, ei-
E ther drunke, or applyed outwardly. Knotgraſſe given in drinke, * ſtaieth the inordinat and exceſ-
— ſive voidance of the fleurs: ſo doth the root of marſh Mallow. The leaves of Plantaine, * drive downe the ſame: ſo likewiſe Agaricke in honeyed water. Mugwort ſtamped and incorporat with oile of Ireos, Figs, and Myrrhe, hath the ſame effect, if it bee applied accordingly: The root of which hearbe, if a woman take in drinke, is ſo purgative and will bring her to ſuch a laske, that ſhe ſhall withall exclude the dead infant within her bodie. A decoction made with the braunches of Mugwoort, bringeth downe womens monethly ſickneſſe, and fetcheth away the after-birth, if they ſit therein: and a dram weight of the leaves taken in drinke, is of the like vertue and operation: if they bee but laid unto the belly in manner of a cataplaſme, eſpecially with barley meale, they will doe as much. Moreover, Acoron, both the kinds of Conyza, as alſo
F Sampier, are ſingular good for all the inward griefes and maladies whatſoever of women. Alſo both kinds of Anthyllis drunke in wine, are ſoveraigne for the accidents of the matrice, namely to aſſuage the throws and wrings thereof, and to bring away the after-birth when it ſtaieth behind. A fomentation made with Maidenhaire, is comfortable to the naturall parts of women: like as it hath vertue to cleanſe the ſcurfe and dandruffe, to rid away the white patches appearing

* *Clematis.*

* With the yellow floure.

* Sampier, or Creſtmarine.

*Herb *Robert.*

* *Siſtit.*

*I marvaile how that ſhould be, conſidering thei are aſtringent; unleſſe we have recourſe *ad cæcã proprietatem, i.* to ſome ſecret vertue.

in the skin or haire, and to colour the ſame blacke, if it bee brought into powder, and with oile made into a liniment. Hearbe Robert drunke in white wine, and Hyociſthis in red, doe ſtay the flux of reds or whites. Hyſſope is a ſoveraigne hearbe to open and relax the obſtructions of the matrice cauſing ſuffocation. The root of Vervaine taken inwardly with water, is the beſt thing in the world for all the maladies incident to women, either in their travaile or after their deliverance. To which effect, ſome there be, who togither with Harſtrang mix the graines of the Cypreſſe tree beaten to powder, and give it to drinke in groſſe red wine. For the ſeed of Fleawoort, boiled in water, and laid too warme, doth moderat and qualifie all the violent fluxes of the matrice. Camfrey ſtamped and given in groſſe wine or allegant, bringeth downe the ſickneſſe of women when it ſtaieth upon them. The juice of Scordotis taken to the quantitie of one dram in foure cyaths of honyed water, giveth women ſpeedie deliverance in childbirth: and for that purpoſe, the leaves of Dictamnus are excellent, if they be taken in water: And knowne it is for certaine, that the weight of one obolus of thoſe leaves given to a woman in hard travaile, will preſently cauſe her to be delivered with eaſe, yea though the infant were dead in the belly. The like operation hath the baſtard Dictamnum, but that it worketh more ſlowly: and in this caſe, they uſe to tie the root of Cyclamin about the woman in labour; to cauſe her alſo to drinke Ciſſanthemos; yea and the powder of Betonie in honyed water. As for Arſenogonon & Thelygonon, they be two hearbs, bearing certaine grapes or berries like to olive bloſſoms, but that they be more pale; and white ſeeds or kernels within, reſembling thoſe of white Poppie. If a woman drinke Thelygonum, ſome ſay, ſhee will thereupon conceive a maid-child. Arſenogonon differeth from the other in nothing but in the ſeed, which commeth neare unto that of the Olive: and (forſooth) if ſhe take this hearbe in drinke, ſhee ſhall have a man-child; beleeve it who that liſt. Others there be, who ſay, that both the one and the other be like unto Baſill; and that Arſenogonon carieth a double ſeed knit togither like as they were two genetoirs.

That kind of Houſleeke which I called Digitellus, is ſingular for the diſeaſes incident to womens breaſts. Groundſwell bringeth abundance of milke into womens paps, if they drinke it in wine cuit: ſo doth Sowthiſtle ſodden in frumentie. The grape called Bumaſtos, taketh away the *haires about the nipples of nources breaſts, which ſpring ſometime after they have once borne children: which alſo otherwiſe is very good to cleanſe the skales, and ſcurfe in the face, and to ſcoure away other ſpots and pimples ariſing upon the skin. Gentian, and Nymphæa called Heraclea, the root alſo of Cyclamin, riddeth all ſuch cutanean ſpecks and blemiſhes. The graines of wild Carawaies, called Cacalia, incorporat in wax melted or made liquid, lay the skin of the face plaine and even, and ſmooth all wrinckles. The root of Acorum, ſerveth likewiſe to purifie the skin from all outward deformities. Hearbe Willow giveth the haire of the head a yellow colour. Hypericon, which alſo is named Corion, dieth it blacke: likewiſe doth Ophrys, an hearbe growing with two leaves and no more, like unto jagged Beets or Coleworts. Alſo Polemonia ſetteth a blacke colour upon haire, if it be boiled in oile. As for depilatorie medicines, which are to take away the haire from any part, the proper place to treat of them is indeed among thoſe that pertaine eſpecially to women: but now adaies men alſo are come to it, and uſe ſuch deviſes as well as women. The moſt effectuall of all others be they accepted, that are made of the hearbe Archezoſtis. The juice of Tithymall is likewiſe verie good to fetch off haires: and yet there be ſome, who pluck them out firſt with pinſers, and then with the ſaid juice incorporat with oile, rub the place often in the hot ſun. Finally, Hyſſope tempered with oile into a liniment, is excellent to heale the mange or ſcab in four-footed beaſts: and Sideritis hath a peculiar vertue for to cure ſwine of their ſquinſies or ſtrangles. Now is it time to purſue all other kinds of hearbs which remaine behind.

* Some thinke this is meant of hairs within the paps, which ſhould be ſwallowed downe by chãce in a cup of drinke, and ſo rankle in the breaſt, &c. a diſeaſe called by *Ariſtotle*, *Trichia*. And *Rondeletius* is of an opinion, that ſome ſuch thing reſembling an haire may breed within the breſt, of putrified humours or corrupt milke. But it ſeemeth by that which followeth, that *Plinie* meant no ſuch matter, but rather ſome outward eye-ſore.

THE

THE XXVII. BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

¶ The Proëme.

Chap. I.

CErtes, the farther that I proceed in this discourse and history of mine, the more am I forced to admire our fore-fathers and men of old time: for, considering as I doe, what a number of Simples there yet remaine behind to be written of, I cannot sufficiently adore either their carefull industrie, in searching and finding them out; or their liberall bountie, in imparting them so friendly to posteritie. And verely, if this knowledge of Hearbs had proceeded from mans invention, doubtlesse I must needs have thought, that the munificense of those our auncestors had surpassed the goodnesse of Nature her selfe. But now apparent and well knowne it is, That the gods were authors of that skill and cunning, or at leastwise there was some divinitie and heavenly instinct therein, even when it seemed to come from the brain and head of man: and to say a truth, confesse we must, That Nature (the mother and nource of all things) both in bringing forth these Simples, and also in tevealing them with their vertues to mankind, hath shewed her admirable power as much as in any other worke of hers whatsoever. The hearbe Scythica is brought hither at this day out of the great fenns and meers of Mœotis, where it groweth: Euphorbia commeth from the mountaine Atlas, farre beyond *Hercules* pillars and the streights of Gibraltar, and those are the very utmost bounds of the earth: From another coast also, the herb Britannica we have, transported unto us out of Britaine, and the Ilands lying without the continent, and divided from the rest of the world; like as Æthiopis out as far as Æthiopia, a climat directly under the Sun, and burnt with continuall heat thereof: Besides other plants and drugs necessarie for the life and health of man, for which merchants passe from all parts too and fro, and by reciprocall commerce, impart them to the whole world; and all by the meanes of that happie peace which (through the infinit majestie of the Romane Empire) the earth enjoyeth: in such sort, as not onely people of sundrie lands and nations have recourse one unto another in their trafficke and mutuall trade, but high mountains also and the cliffes surpassing the verie clouds, meet as it were togither, and have means to communicat the commodities, even the verie hearbs which they yeeld, one to the benefit of another: Long may this blessing hold, I pray the gods, yea and continue world without end: for surely it is their heavenly gifts, that the Romans as a second Sun should give light and shine to the whole world.

Chap. II.

¶ *Of the poison Aconite, and the Panther which is killed thereby.*

AConite alone, if there were nothing els, is sufficient to induce any man to an endlesse admiration and reverence of that infinit care and diligence which our auncients emploied in searching out the secrets of Nature; considering how by their means we know there is no poison in the world so quicke in operation as it, in so much as if the shap or nature of any living

creature of female sex be but touched therewith, it will not live after it one day to an end. This G
was that poison wherewith *Calpburnius Bestia* killed two of his wives lying asleepe by his side, as
appeareth by that challenge and declaration which *M. Cæcilius* his accuser framed against him.
And hereupon it was, that in the end of his accusatorie invective, he concluded with this bitter
speech, That his wives died upon his finger. The Poëts have feigned a tale, That this herb should
be engendred first, of the fome that the dog *Cerberus* let fall upon the ground, frothing so as hee
did at the mouth for anger when *Hercules* pluckt him out of hell: and therefore it is forsooth,
that about Heraclea in Pontus (where is to be seen that hole which leadeth into hell) there grow-
eth Aconit in great plenty. Howbeit, as deadly a bane as it is, our forefathers have devised means
to use it for good, and even to save the life of man: found they have by experience, that beeing
given in hot wine, it is a countrepoison against the sting of scorpions: for of this nature it is, that H
if it meet not with some poison or other in mens bodies for to kill, it presently setteth upon them
and soone brings them to their end: But if it encountre any such, it wrestleth with it alone, as ha-
ving found within, a fit match to deale with: neither entreth it into this fight, unlesse it find this
enemie possessed alreadie of some noble and principall part of the bodie; and then beginneth
the combat: A wonderfull thing to observe, that two poisons, both of them deadly of themselves
and their own nature, should die one upon another within the bodie, and the man by that mean
only escape with life. Our aunceſtors in times past, stayed not thus, but found out and delivered
unto us proper remedies also for wild beasts; and not so contented, have shewed meanes how
those creatures should bee healed which are venomous unto other: for who knoweth not, that
scorpions if they be but touched with Aconite, presently become pale, benummed, astonied,
and bound, confessing (as it were) themselves to bee vanquished and prisoners: contrariwise, let I
them but touch the white Ellebore, they are unbound and at libertie againe; they recover (I say)
their former vigor and vertue: whereby we may see, that the Aconite also giveth the bucklers to
enemies twaine, pernicious poisons both; the one, to it selfe, and the other to all the world.
Now if haply any man should say, That the wit and head of man alone could possibly compasse
the knowledge of these things; surely hee should shew therein his ingratitude and impietie unto
the gods, in not acknowledging their beneficence. The people about Heraclea, for to kill the
Panthers which breed in those parts, use to rub with Aconite certaine gobbets of flesh, which
they doe lay about the mountains as a bait and bane for them: and unlesse by this means they
did destroy them, no doubt they would fill the whole countrey; which is the cause that some call K
it Pardalianches, *i.* Libard-bane. But they again on the other side, presently have recourse to the
excrements of a man, as I have before declared, the only countrepoison wherby they save them-
selves. Who doubteth now, but the knowledge of this secret came first to them by meer chance?
and considering that it is not possible to render a reason of the nature and usage of such wild
beasts (and whensoever we see the like to fall out, wee count it still a new and straunge accident)
we must needs attribute the finding out thereof, to Fortune.

Chap. III.

That of all Creatures and Inventions in this life, the Author is a God.

L

THis Chaunce and Fortune then, by means whereof we attaine to so many inventions that
we have, is a divine power, and no lesse indeed than a God: by which name also we under-
stand and call that great mother and mistresse of all things, dame Nature: and surely, con-
sidering that conjecturall it is and doubtfull, Whether these wild beasts come by this knowledge
day by day at a venture, or were endued naturally at the first with that perceivance? wee have as
great reason to attribute a divinitie and godhead to the one, as the other. Well, be it Chaunce,
or be it Nature, that hath thus ordered the matter, certes a great shame it had been, that all other
creatures should have knowne thus (as they doe) what is good and profitable for them, and man
onely remaine ignorant. But such was the industrie and goodnesse of those aunceſtors of ours
in times past, that they not only devised means but also delivered to posteritie, how this veno- M
mous hearbe Aconitum might be most safely and commodiously mingled in those collyries and
medicines which be ordained for the eyes: An evident argument and plaine proofe, I assure you,
that there is nothing so bad but it hath some goodnesse in it, and may be used well. And therfore
dispensed withall I looke to be, if I who hitherto have written of no poisons, put downe the de-

scription

A scription thereof; to the end that a man may know it, and by knowing, take heed and beware. This hearb hath leaves, resembling Cyclamin or the Cucumber, in number no more than four, and those toward the root in some sort rough and hairie. The root but small, and the same like unto a sea crabfish: And therefore some have named it Cammaron: wheras others, for the reason before shewed, call it *Thelyphonon. And for that the root doth turne and crooke inward in manner of a Scorpions taile, there be that give it the name Scorpion. There wanted not others who chose rather to call it *Myoctonon, because with the very sent it is able to kill mice and rats a great way off. It groweth naturally upon bare and naked rockes, which the Greekes call *Aconas: which is the reason (as some have said) why it was named Aconitum. And for that in the place where it groweth or neare unto it, there is no mould, nor so much as any dust found for to
B give it nourishment, some have thought it tooke the name thereupon. Yet there bee others who assigne another cause of that denomination, to wit, for that it is as forcible and as speedie in working the death of those whome it toucheth, as the hard stone or ragg in turning or wearing the edge of any yron toole; for no sooner commeth it near unto the bodie and is applied unto it, but the quicke operation is sensibly found.

i. Femalebane

* or *Myophonon*

Chap. iiii.

Of Æthiopis, Ageraton, Aloë, Alcea, Alypon, Alsina, Androsace, Androsæmon, Ambrosia, Anonis, Anagyron, and Anonymon.

C THe leaves of Æthiopis are great and many in number, hairie also neare unto the root, and otherwise correspondent to those of Mullen. It riseth up with a foure-cornered stem, rough in handling, and after the manner of the maine stalke of the Clot-Bur, having many concavities or holes like arme-pits in the grafting of the braunches to the said stem. It beareth seeds like unto Ervile, which ordinarily grow double two by two, and are white. The roots be many, and those long, full and well nourished, soft, and clammie in tast: being dried, they wax blacke and grow hard withall, in such sort, as a man would take them for horns. They grow ordinarily in Æthyopia, also upon the mountaine Ida in the region of Troas, and in Messenia. The right season to gather these roots, is in Autumne; and then they ought to bee laid a drying in the Sun for cer-
D taine daies together, to keepe them from moulding. Being taken in white wine, they helpe the infirmities of the matrice: And the decoction thereof drunke, is good for the Sciatica, the pleurisie, and the hoarsenesse in the throat. But that which commeth out of Æthyopia is counted best and hath no fellow, for it worketh presently.

As for Ageraton, it is an hearbe of the Ferula kind, growing up to the height of two spans, like unto Origanum, but that the flowers resemble buttons or brooches of gold. The fume of this hearbe when it burneth, provoketh urine and mundifieth the matrice, especially if a woman sit in a bath thereof, and do foment the naturall parts therewith. The reason of the name Ageraton, is this, because the flowers continue very long before they seeme to fade and wither.

Ab α, sterētica, & γῆρας, old age.

Aloë is an hearbe which hath the resemblance of the sea-oinion, but that it is bigger and the leaves be more grosse and fat, chamfered or channelled biais all along: the stem that it beareth,
E is tender, red in the middest, not unlike to Anthericon: one root it hath and no more, which runneth directly deepe into the ground in manner of a big stake: strong it is to smell unto, and bitter in tast. The best Aloe is brought out of India: but there groweth good store thereof in Asia, howbeit of no use, but that they lay the leaves fresh unto greene wounds; for they doe incarnat and healewonderfully, like as their juice also. And for that it is such an excellent woundhearb, folke use to set and sow it in barrels or pipes pointed beneath and broad above, like as they do the greater Housleeke. Some there bee who for to draw a juice or liquor out of it, stay not untill the seed be ripe, but cut the stem for that purpose: others make incision also in the leaves. Moreover, there is otherwhiles found in Aloë a certaine liquid gum issuing of it selfe, and sticking fast to the stem thereof: and therefore they hold it good to pave or ram the ground hard all about the
F place where Aloe groweth, that the earth should not drinke up the liquor which distilleth from it. *Some have written that in Iurie above Ierusalem, higher into the countrey, there is a certaine minerall Aloe to be found, growing in manner of a mettall within the ground: but there is none worse than it, neither is there any blacker or moister. If you would know the *best, chuse that which is fat and cleare, of a red colour, brittle and apt to crumble, close compact in manner of a liver,

Petronius Niger, as *Dioscorides* saith in his præface.

* It seemeth that he meanes here the concreted iuice thereof, which we also do call Aloe.

a liver, easie also to melt and resolve. If you see any that is blacke, hard, sandie, or grittie (a thing G
which may soone bee knowne betweene the teeth in tasting of it) the same is to bee rejected for naught. Many there be who do sophisticat it with other gums and the juice Acacia. Aloë is of an astringent nature, serving to make thicke, to close fast, and gently to heat any part of the bodie. Much use there is of it in many cases, but principally to loosen the bellie: being the only purgative medicine that is comfortable to the stomacke, and strengtheneth it, so farre is it from offending the same by that laxative vertue or any contrarie qualitie that it hath: And for this purpose the ordinarie dose to bee given in drinke, is one dram. But when the stomacke is feeble and will keepe nothing, the manner is to take the quantitie of one spoonefull thereof, in two cyaths of water either warme or cold, twice or thrice in a day by turns, pausing some space between as need requireth, and as the patient shall find expedient. Moreover, if occasion bee to purge the bodie H
throughly, Physicians use to give three drams thereof, and not above. And the better will it work if it be taken presently before meat. If the head be rubbed or annointed therewith and some austere or astringent wine, against the haire and in the Sunne, it retaineth the haire that is readie to fall. A liniment made of it together with vinegre and oile Rosat, applied unto the forhead & temples in manner of a frontale, easeth the headach: so doth it also, if by way of embrochation it be destilled from aloft upon the head in a more thin and liquid substance. A very convenient & singular medicine it is to heale all the diseases incident to the eyes, but especially for the itch and skab rising in the eyelids. Also when the skin looketh black and blew under the eyes, or otherwise be marked by occasion of some bruise, it taketh them all away, if it be applied thereto with hony: and namely that which commeth out of Pontus. It is a proper remedie for the amygdales, the I
gums, and all the ulcers of the mouth. Taken to the weight of a dram in water, it staieth the spitting and voiding of bloud upward, if it be not excessive: but in case it be violent and immoderat, it ought to be drunke in vinegre. The flux of bloud in wounds, or the bleeding in any part whatsoever it stancheth, either applied by it self alone or els with vinegre. In other respects also it is right soveraigne for wounds, a great healer, and that which uniteth and skinneth quickly. A singular remedie it is to be either cast upon the ulcers of a mans yard, the swelling piles, the rifts & chaps of the seat: in plaine drie pouder by it selfe alone, or els to be applied thereto with wine or with cuit, according as the greefe requireth to bee mitigated or represſed. Moreover, it gently staieth the immoderat flux of bloud by the Hæmorrhoids. And in a clyster it is excellent for to heale the exulceration of the guts in the bloudie flix. Also it is very good and wholesome for those K
who hardly digest their meat, to drinke it a prettie while after supper. And for the Iaundise it is singular to take the weight of three oboli thereof in water. It is good to swallow pils of Aloë either with boiled Hony or Turpentine for to purge the guts and inward bowels. And a salve made therewith, taketh away the whitflawes and impostumations about the naile roots. For eye-salves and other ocularie medicines, it ought to be washed, that the most sandie and grosse parts thereof may settle to the bottome and be separated from the purer substance: or els it ought to be torrefied in an earthen vessell, and plied continually with stirring with a quill or feather, that it may be burnt and calcined equally.

Touching Alcæa, it is an hearbe bearing leaves like unto Vervaine, which also is called Peristereon, rising up with three or foure stems, well garnished with leaves, and carying flowers in L
manner of Roses: it putteth forth for the most part six white roots, and those a cubit long, not directly, but crooked and bending bias. It groweth ordinarily in battle grounds, and such as stand somewhat upon water. The roots principally doe serve in Physicke, which being taken with wine or water, doe cure the dysenterie or bloudie flix, stop a laske, and knit those that are burst inwardly upon some violent straine or convulsion.

As for Alypon, a prettie hearbe it is, shooting up with a slender stem adorned with little soft and tender heads, not unlike to the Beet, quicke and sharpe in tast, biting exceedingly and burning, howbeit clammie to the tongue. Taken in mead with a little salt, it maketh the bodie soluble. The least dose that is given therof is two drams, from which they arise to four, which is counted a reasonable and indifferent potion: but never exceed the weight of six. And ordinarily this M
purgation is taken by them that have occasion to use it, in the broth of a Cock, Capon, or Pullet.

* Chickweed. * i. Mouse ear. * ἄλσος, a grove.

*Alsine, which some call *Myosoton, is an hearbe growing among *groves, whereupon it tooke that name Alsine. It begins to put forth and appeare above ground about midwinter, and by midsummer it is dried away: when it traileth and creepeth upon the ground, the leaves doe

represent

A repreſent the eares of little mice. But another hearbe there is, as I will ſhew hereafter, which more fitly and properly in that regard may be called *Myoſotis. Surely this might bee taken well ynough for *Helxine, but that the leaves be ſmaller, and thoſe leſſe haitie. It groweth uſually in gardens, and moſt of all upon walls: When it is ſtamped or bruiſed, it ſenteth of a Coucumber. Commonly uſed it is in cataplaſmes for to be applied unto impoſtumes and inflammations: and emploied it may be in all thoſe caſes whereunto Parietarie ſerveth. For the ſame effect they have both, but that Chickweed is weaker in operation. And this particular propertie it hath by it ſelfe beſides, to ſtay the flux of waterie humors into the eyes: alſo to heale all ulcers, and thoſe eſpecially which are in the privie parts, being applied thereto in a pulteſſe with Barley meale. The juice thereof is good to be dropped or poured into the eares.

*The right Mouſe-eare.
*Parietarie of the wall.

B Androſaces is a *white hearbe, bitter in taſt, without any leaves, but in ſtead thereof it hath certaine little huskes or cods hanging by ſmall bents, and thoſe containing ſeed within them. It groweth along the ſea ſide, and moſt of all upon the coaſts of Syria. The cods beeing ſtamped or boiled in water, vinegre, or wine, are good to be given (to the weight of two drams) unto them that are in a dropſie, for they provoke urine mightily. It ſerveth alſo in the cure of the gout, either taken by the mouth, or applied outwardly in a liniment. Of the ſame operation is the ſeed alſo.

*Alba. Haply *Plinie* hath tranſlated λευκάκαρφος for λεπτόκαρφος in *Dioſcor.* which is, having ſlender ſtalkes like ruſhes.

Androſæmon, or as ſome call it Aſcyron, is not unlike to Hypericon, whereof I have alreadie ſpoken: but that the ſtalkes be bigger, ſtand thicker together, and are more enclining to red: the leaves bee white or grey, faſhioned like unto thoſe of Rue: and the ſeed reſembleth that of blacke Poppie: cruſh or bruiſe the upmoſt crops or heads thereof, they yeeld from them a bloudie juice: in ſmell it ſenteth like unto roſin: and is found ordinarily growing in vineyards. The
C proper time to gather this hearbe is in mid Autumne, and ſo to hang it up a drying. The maner is to ſtampe the hearbe, ſeed and all, for to purge the bellie: wherof they drinke either firſt in the morning or laſt after ſupper, the weight of two drams in mead, wine, or ſheere water, ſo that the whole draught of the potion be a full ſextar and not above. Properly it doth evacuat choller: and is principally good for the Sciatica: but the morrow after the patient ought to ſwallow downe a dram weight of the Capers root mixed with roſin: and then after pauſing foure daies between, to doe the like again: After which courſe of purging, if the patient be of a ſtrong complexion, he may drinke wine; otherwiſe, thoſe of a weaker conſtitution ought to forbeare, and drinke water. Excellent good it is for all gouts of the feet, and for burnes, if it be applied unto the place, and a
D good vulnerarie hearbe beſides, and ſtancheth the bleeding of wounds.

Ambroſia is a name that keepeth not to any one hearbe, but is common to many. Howbeit, the true Ambroſia runneth up from the root into one ſmall ſtem, which notwithſtanding brancheth thicke, riſeth to the height of three ſpans or thereabout, and ordinarily is one third part, ſhorter than the root: & the leaves be like Rue. Toward the foot of the ſaid ſtem it bringeth forth certaine little grapes with graine or ſeeds within, and thoſe have a ſent of wine, and hang downe from the branches of the ſaid hearb: for which cauſe ſome there be who call it Botrys, although others give it the name Artemiſia. The people of Cappadocia uſe therwith to make themſelves chaplets to weare upon their heads. This hearbe is much uſed in thoſe accidents that require to be diſſolved and ſent out by the pores of the skin.

E Anonis (which ſome chuſe rather to call Ononis) is an hearbe full of braunches like unto Fenigreeke, but that it ſpringeth thicker from the root, brauncheth more, and is more hairie: of a pleaſant ſmell and prickie, after the Spring. Many uſe to keepe it condite in pickle. Being applied to any ulcer whiles it is freſh and greene, it eateth away and conſumeth the excreſcence of proud fleſh in the brims or edges thereof. The root is good for the paine of the teeth, if it bee ſodden in vinegre and water mingled together, and the mouth waſhed withall: the ſame taken in drink with honey, expelleth gravell and ſtone: boiled in Oxymell to the conſumption of the one halfe, it is a ſingular drinke for the falling ſickneſſe.

Reſta-bovis. Reſt-harrow or petie Whin.

Anagyros, which ſome call Acopos, is an hearbe which brauncheth thicke, of a ſtrong and ſtinking ſmell: it beareth flowers like unto thoſe of Beets: in certaine cods like hornes, which bee
F of a good length, it bringeth foorth ſeed reſembling kidneies in ſhape, the which in harveſt time becommeth hard. The leaves are ſingular good to be laid upon inpoſtumat ſwellings: they ſerve alſo for women which be in hard travell with child, to be hanged or tied faſt about them; with this charge, that preſently they be removed after they are delivered. But if the child be dead & ſticke ſtill in the matrice, or in caſe the afterbirth remaine behind, and will not come away after the in-

fant

fant is borne: or if a woman desire to see her monthly sickness,it is good to drink a dram weight of the leaves in wine cuit.And in that manner they are given to those who bee short winded: but in old wine against the sting of the venomous spiders Phalangia. The root is singular to bee put to those plasters which either doe resolve or maturat any impostumed place. The seed chewed, staieth immoderat vomits. G

*Some take it for Bugle or Selfe-heale. *Nameless.

*Anonymos,finding no name to be called by,got therupon the name*Anonymos. A plant this is brought out of Scythia unto us;highly commended by *Hicesius* a Physician of great name and authoritie,also by *Aristogiton*,for an excellent vulnerarie,if it be bruised or stamped in water and so applied: but taken inwardly in drinke, it is good for womens breasts and the precordiall parts about the heart,if they have gotten a stripe,or be bruised: also for such as reach up bloud. Some have ordained a vulnerarie drinke to be made therof for those that be wounded.But what is said moreover as touching this hearbe,I hold meere fabulous: and namely,that if two peeces of yron or brasse bee put into the fire and burne together with this hearbe, fresh and new gathered,they will souder and joine againe. H

Chap. v.

Of Erith or Goose grasse. Of the Clot-Bur. Of *Ceterach. Of Asclepias and Aster or Bubonium. Of Ascyrum or Ascyroides. Of Aphace, Alcibium, and Alectorolophus.

*or Scolopendrium.

ERrith is by some called in Greek Aparine, by others Omphalocarpos and Philanthropos. I An hearbe given to be full of braunches,rough and prickly,carying five or six leaves growing round together about the said branches in order like a starre,and a pretie distance there is betweene every of these roundles.The seed is round,hard, hollow, and sweetish. It groweth in corne fields,in gardens,and meddowes: rough it is,that it is readie to*catch hold of folks cloths as they passe by,and to sticke unto them. An effectuall hearbe against serpents,if a dram of the seed be drunk in wine: also for them who are pricked with the spiders Phalangia.The leaves have a singular vertue to represse the abundant flux of bloud out of wounds,if they be outwardly applied: like as the juice hath a speciall propertie to helpe the infirmities of the eares,beeing dropped or poured into them.

* Whereupon they cal it *Philanthropos*, a lover of man.

Arction,which some rather name Arcturus,is like in leafe to the great Mullen or Taperwort, K but that it is more rough: the stem tall and soft,and the seed resembling Cumin.It groweth ordinarily in stony grounds with a root tender,soft,& sweet.Being sodden in wine,it easeth the toothach,so that the patient hold the decoction in his mouth.For the Sciatica & strangurie it is good to be taken at the mouth in wine: and outwardly applied,it healeth burns and cureth kibed heels: In which cases the root is much commended, if together with the seed it bee stamped with wine, and a fomentation made with the decoction thereof.

As touching Asplenum,some there be who call it Hemionion: an hearb putting forth many * *Trientalibus.* leaves*foure inches long: the root is given to have crankes and holes, and those full of mud or durt:much what doe the leaves grow like to Fearne: the root is white and rough. It beareth neither stalke,stem,nor seed.It delighteth to grow among rockes and stones, upon wals standing in L the shade,and in moist grounds.The best is that which we have out of Candie. It is commonly said,that if the decoction of the leaves boiled in vinegre be drunke fortie daies together, it wasteth the swelled spleene.The same may be applied in a liniment for that purpose,and so also they do stay the excessive yex or hocket. This hearbe would not be given to women,for it causeth them to be barren.

Asclepias beareth leaves resembling Ivie,long braunches,many small roots, and those odoriferous: howbeit the flowers have a strong and rank stinking smell with them,the seed much like to the Axvitch.It loveth to grow upon mountaines.The roots of this hearbe not only taken inwardly in drinke,but also applied outwardly in a liniment, doe ease the wrings of the bellie, and resist the sting of serpents. Aster, is by some named Bubonium, for that it is a present remedie M for the tumours rising in the share. This hearbe putteth up a small stem, with two or three leaves somewhat long. In the top thereof it beareth certaine little heads environned with spokie leaves, and those disposed round in manner of a starre.Taken in drinke,it is thought to bee a preservative against the venome of serpents.But to make a medicine for the share beforenamed,

it

A it must(they say)be gathered with the left hand: and then kept fast bound neare unto the middle or girding place of the patient. And surely it helpeth the Sciatica, in case it be tied sure to the affected place.

Ascyron and Ascyroïdes, be hearbs resembling one another, and both like unto Hypericon: howbeit that which is named Ascyroïdes, hath the bigger braunches, and those streight and direct, much after the manner of Fennell and such like, red throughout: and in the top thereof appeare little heads or knobs, of a yellow colour. The seed contained in certain pretie cups, is smal, blacke, and gummie: bruise the said tops or knobs betweene your fingers, they seeme to staine them with bloud; which is the cause that some call this hearb* Androsæmon. The seed is singular for the Sciatica, namely if the patient drinke two drams weight thereof in a sextar of Hydromel,
B that is to say, mead or honied water: for it looseneth the bellie and purgeth choller. A liniment made therewith, is much commended for a burne.

i. Mans bloud

Apace is an hearbe which hath very fine and small leaves: and a little taller it is than the Lentill: but larger cods it beareth, wherein lie three or foure seeds, blacker, moister, and smaller than the grains of the said Lentill. It groweth upon corne lands. More astringent it is by nature than the Lentill, and bindeth stronger; for all other matters it worketh the same effects. The seed boiled, staieth vomits and laskes.

Touching *Alcibion, what manner of hearbe it should be, I never could yet find in any writer. But they give direction to stampe the roots and leaves thereof, and so in a cataplasme to applie them unto any place stung with serpents, and to drinke them also. Now they prescribe for the
C drink, To take of the leaves one good handfull, and to stampe them, and so to give them in three cyaths of meere wine full of the grape: or of the root three drams weight, with the like measure of wine.

**Plinie* hath forgotten himselfe, considering that in the 22 booke and 21 chapter, he describeth it (according to *Dioscorides*) to be like in root and leafe to Orchanet, &c. and there he nameth it *Alcibiadion.*

Alectorolophos in Greeke, called by us in Latine Crista Galli, *i.* Cocks-combe, hath leaves for all the world resembling the creast or combe of a Cocke, and those in number many: a slender stem and blacke seed, enclosed within certain cods. A soveraign hearb it is for them that cough, if it be boiled with bruised beanes, and taken in manner of an electuarie with honey. It scattereth the cloudie filmes that trouble the eyesight; and the manner is to take the seed whole and sound as it is, and to put it into the eye: it is nothing offensive nor troubleth that part one whit, but gathereth to it selfe all those grosse humors which impeached the sight. And in very truth, this seed
D whiles it is within the eye chaungeth colour, and being blacke before, beginneth to wax white; it swelleth withall, and in the end commeth out of the eye by the owne accord.

Chap. VI.

Of Alum.

THe hearbe which we name in Latine Alum, the Greekes call Symphytum Petræum, as if one would say, Comfrey of the rock: And very like it is to wild Origan. The leaves be small, and three or foure braunches spring immediatly from the root: the tops whereof resemble those of Thyme. Much branched it is otherwise, odoriferous in smell, and sweet in tast: it draweth
E downe water into the mouth and causeth spitting. The root which it putteth forth is long & red. This hearbe taketh pleasure to grow in stonie places among rockes: in which regard it tooke the addition of the name Petræum. Singular good it is for the sides and flankes, the spleene, reines, and wrings of the bellie: for the breast, the lights, for such as reject or cast up bloud, and are troubled with the asperitie and hoarsenesse in the throat: For which infirmities, the root is to be stamped, boiled in wine, and so drunke: yea, and otherwhiles to bee reduced into a liniment, and so applied. Moreover the chewing of it onely, quencheth thirst, and hath a principall vertue to coole the lungs. Being applied outwardly in the forme of a cataplasme, it knitteth dislocations, helpeth convulsions, is comfortable to the spleen, and the bowels or guts, if they be fallen by any rupture. The same root rosted or baked under the ashes, staieth a laske, in case it be first shrigged from the
F hairie strings thereof and pilled; and then after it is beaten into pouder, be drunke in water with nine Pepper-corns. And for healing of wounds, so soveraigne it is, that if it bee put into the pot and sodden with peeces of flesh, it will souder and rejoine them, whereupon the Greekes imposed upon it the name Symphytum *i.* Consound. Finally, it serveth to unite againe broken bones.

Chap.

G

Chap. vii.

Of Reits or sea-grasse, and Wallwort. Of the wild Vine, and Wormewood.

THe sea-weed that looketh red, named in Latine Alga, is very proper for the pricke and sting of Scorpions.

Touching Wallwort, it hath leaves carying a strong and stinking smell with them: the stems be rough and parted into joints: the seed blacke like to that of the Ivie, save that the berries containing the same be soft. This hearbe delighteth in shadie, coole, rough, and waterie places. Being given to the full quantitie of one Acetabulum, it is singular for the inward maladies which be proper to women. H

The wild Vine, called by the Greekes Ampe los-Agria, is an hearbe (as I have sufficiently described alreadie in my Treatise of Vines planted and well ordered by mans hand) which putteth forth hard leaves of Ash-colour, long braunches and winding rods clad with a thicke skin, and the same bee red, resembling the flower Phlox, which in the chapter and discourse of Violets, I called Iovis Flamma; and a seed it beareth much like unto the graines within a Pomegranat. The root boiled in three cyaths of water and two cyaths of the wine comming out of the Island Coos, is a gentle emollitive of the bellie, and maketh the bodie soluble, in which regard it is given with good successe to such as be in a dropsie: A very good hearbe for women, as well to rectifie the infirmities of the matrice, as also to scoure and beautifie the skin of their face. Moreover, for the Sciatica it is good to stamp it leafe and all, and to annoint the greeved place with the juice thereof. I

As for Wormewood, there be many kinds thereof. One is named Santonicum of a cittie in Fraunce called Saints: another, to wit Ponticum, taketh that name of the kingdome Pontus; where the sheepe feed fat with it, which is the cause that they bee found without gall: neither is there a better Wormewood than it: much bitterer than that of Italie, & yet the marrow or pith within of that Ponticke Wormewood, is sweet to ours. Meet and requisit it is that I should set downe the vertues and properties thereof, an hearbe (I must needs say) as common as any, and most readie at hand, howbeit, few or none so good and wholesome: to say nothing of the especiall account which the people of Rome maketh of it about their holy sacrifices and solemnities: for in those feastivall holydaies named Latinæ, at what time as there is held a great running with chariots for the best game, hee that first attaineth to the goale and winneth the prise, hath a draught of Wormewood presented unto him. And I beleeve verely, that our forefathers and aunce stours devised this honourable reward, for the good health of that victorious charioteer, as judging him worthie to live still. And in truth, a right comfortable hearbe it is for the stomacke, and doth mightily strengthen it: In which regard, there is an artificiall wine that carrieth the strength and tast thereof, named Absinthites, according as I have shewed heretofore. Moreover, there is an ordinarie drinke made of the decoction of Wormewood boiled in water: For the right making whereof, take six drams weight of the leaves and sprigs together, seeth them in three sextars of raine water, and in the end put thereto a small quantitie of salt; which done, the liquor ought to stand a day and a night afterwards to coole in the open aire, and then is it to bee used: Certes, there is not a decoction of any hearbe of *so great antiquitie as it, and knowne to have beene used so long. Moreover, the infusion of Wormewood is in great request, and a common drinke: for so we use to call the liquor wherein it lay steeped a certaine time. Now this would be considered, that be the proportion of water what it will, the said infusion ought to stand close covered for three daies together. Seldome or never is there any use of Wormewood beaten to pouder, ne yet of the juice drawne by way of expression. And yet those that presse forth a juice, take the Wormewood when the seed upon it beginneth to swell and wax full, and being newly gathered, let it lie soaking in water three daies together: but if it were drie before, to steep it a whole seven-night: which done, they set it over the fire in a brasen pan, with this proportion, namely, ten hemines of the hearbe, to five and fortie sextars of water, and suffer it to boile untill a third part of the liquor be consumed: after this the decoction must run through a strainer, with hearbe and all well pressed: then ought it to bee set upon the fire againe, and suffered to seeth gently and leisurely to the height or consistence of honey, much after the order of the syrrup made of Centaurie the lesse. But when all is done, this juleb or syrrup of Wormewood L M K

Vetustissime in usu est. Some read *Vetus sine usu est*, that is, If this drink be stale, and not used presently, it is good for nothing.

A wood, is offenſive to the ſtomacke and head both; whereas that decoction firſt above named, is moſt holeſome: for aſtringent though it be, and binding the mouth of the ſtomacke aloft, yet it doth evacuat choller downward, it provoketh urine, keepeth the bodie ſoluble, and the belly in
6 good temper, yea and if it it bee pained, giveth great eaſe: the wormes engendred therein, it expelleth: and being taken with Seſeli, and Celticke nard, ſo there be a little vinegre put thereto, it diſpatcheth all ventoſities in the ſtomacke, and cureth women with child of that inordinat deſire and ſtrange longing of theirs: it cleanſeth the ſtomacke of thoſe humors which cauſe loa-
7 thing of meat, bringeth the appetit againe and helpeth concoction: if it bee drunke with rue, pepper, and ſalt, it purgeth it of raw humors and crudities occaſioned by want of digeſtion. In old time, Phyſicians gave wormewood for a purgative; but then they tooke a ſextar of ſea water
B that had been kept long, ſix drams of the ſeed, with three drams of ſalt, and one cyath of honey: and the better will this purgation worke, in caſe the poiſe of ſalt be doubled; but it would be pulverized as fine as poſſibly may be, to the end that it might paſſe away the ſooner, and work more eaſily. Some uſed to give the weight beforeſaid in a grewell of barley groats, with an addition of Peniroyall: others againſt the palſie: and others againe had a deviſe to put the leaves of wormewood in figgs, and make little children to eat them ſo, that they might not taſt their bitterneſſe. Wormewood being taken with the root of Floure-de-lis, diſchargeth the breſt of tough fleame, and cleanſeth the pipes. For the jaundiſe, it would be given in drinke raw, with * Perſley or Mai- * *Cum apio*, not *opio*.
denhaire. Supped hot by little and little in water, it breaketh wind and reſolveth ventoſities: and togither with French Spikenard, it cureth the infirmities of the liver: and taken with vinegre, or
C ſome grewell, or els in figs, it helpeth the ſplene: given in vinegre, it helpeth thoſe that have eaten venomous muſhroms, or be poiſoned with the gum of Chamæleon called Ixia. In wine if it be taken, it ſaveth thoſe who have drunke Hemlocke: it reſiſteth the poiſon inflicted by the ſting of the hardiſhrow, the ſea-dragon, and ſcorpions. It is holden to be ſingular for the clarifying of the ſight: if the eyes be given to watering, it repreſſeth the rheume or flux of humors thither, ſo it bee applied with wine cuit: and laid unto contuſions, and the skin blacke and blew under the eies, with honey, it reduceth the place to the native colour againe. The vapour or fume of the decoction of wormewood received into the eares, aſſuageth their paine: or if they run with corrupt matter, it is good to apply the ſame, reduced into powder and incorporat in honey. Take three or foure ſprigs of wormewood, one root of Nardus Gallicus, boile them in ſix cyaths of
D water, it is a ſoveraigne medicine to drinke for to provoke urine, and bring down the deſired ſickneſſe of women: or being taken ſimply alone with honey, and withall put up in a peſſarie made with a locke of wooll, it is of ſpeciall operation to procure their monthly terms: with hony and ſal-nitre, it is ſingular for the ſquinancie: it healeth kibed heels, if they be bathed with the decoction thereof in water: applied unto freſh or green wounds in a cataplaſme, before any cold water come unto them, it healeth them: and beſides, in that manner, it cureth the ſcalls in the head: being incorporat with * Cyprian wax or figgs, and ſo applied to the flanks or hypochon- * Or the cerot *Cyprice*, after *Dioſcorides*.
driall parts, it hath a particular vertue by it ſelfe to helpe their griefes. Moreover, it killeth any
1 itch. Howbeit, this would be noted, that wormwood in no caſe muſt be given to thoſe that have an ague. Let a man or woman uſe to drinke wormewood, they ſhall not be ſea-ſicke nor given to
E heaving, as commonly they bee that are at ſea. If wormewood be worne in a truſſe to the bottome of the belly, it allayeth the ſwelling in the ſhare. The ſmell of wormewood procureth
2 ſleepe; or if it be laid under the pillow or bolſter, provided alwaies that the Patient be not ware of it. Either baſted within cloaths, or ſtrewed upon them, it keepeth away the moth. If one rub his bodie therewith and oile togither, it driveth gnats away: ſo doth the ſmoke thereof alſo when it burneth. If writing inke bee tempered with the infuſion of wormewood, it preſerveth letters
3 and bookes written therewith, from beeing gnawne by myce. The aſhes of wormewood burnt, and incorporat with oile roſat to an ointment, coloureth the haire of the head blacke. There is yet another kind of Sea wormewood, which ſome call Seriphium: and excellent good is that which groweth about the citie * Taphoſiris in Ægypt. Of this wormewood it is, that the prieſts
F of Iſis in their ſolemne marches and proceſſions, uſe to beare braunches before them. The leaves bee ſomewhat narrower than thoſe of the former, and the bitterneſſe not altogither ſo much. An enemie it is to the ſtomacke: howbeit, the belle it looſeneth, and chaſeth wormes out of the guts: for which purpoſe, it is good to drinke it with oile and ſalt: or elſe the infuſion thereof in a * ſupping or grewell made with the floure of the three-month corne. To make the de-

* So called, becauſe *Oſyris* was enterred, and his ſepulchre renewed there.

* Or rather, a kind of ſweet cuit called *Hepſema* by *Dioſc.* which ſignifieth alſo a water gruell.

coction of wormewood well, there would be taken a good handfull of wormewood, and sodden G
in a sextar of water to the consumption of the one halfe.

Chap. VIII.

Of stinking Horehound: of Mille-graine, or Oke of Ierusalem: of Brabyla, Bryon, Bupleuros, Catanance: of Calla, Circæa, and Cirsium: of Cratægonon and Thelygonum: of Crocodilium and Cynosorchis: of Chrysolachanon, Cucubalon, and Conserva.

STinking Horehound, which some Greeks call Ballote, others Melampraſion, *i.* Blacke Horehound, is an hearbe tufted full of braunches: the stems be blacke and cornered; the leaves H
wherewith they bee clad and garnished, are somewhat hairie, resembling those of sweet or white * Horehound, but that they bee bigger, blacker, and of a stinking savour: but the leaves stamped and applied with salt, be verie effectuall against the biting of a mad dog: also, if they be wrapped in a Colewort or Beet leafe, and so rosted under the embres, they are commended for the swelling piles in the fundement. This Horehound made into a salve with honey, cleanseth filthie ulcers.

* *Porri*: but it should be *marrubij*, according to the Greeke word μαρρούβιν not μάρρον.

Botrys is an hearbe full of braunches, and those of a yellowish colour, and beset round with seed: the leaves resemble Cichorie. Found it is commonly growing about the banks of brookes and riverets. Good it is for them that be straight-winded and cannot draw their breath but sitting upright. The Cappadocians call it Ambrosia, others Artemisia. I

* Some take them for Damascen plums, or rather for Bullois, Skegs, or such like wild plumbs.

As for * Brabyla, they be astringent in manner of Quinces. More than so, I find not any author to write thereof.

Bryon no doubt is a Sea-hearbe, like in leaves to Lettuce, but that they be riveled and wrinkled as if they were drawne togither in a purse: no stem it hath, and the leaves come forth at the bottom, from the root: it groweth ordinarily upon rocks bearing out of the sea: and yee shall find it also sticking to the shells of certaine fishes, especially such as have gathered any mud or earth about them. The hearbe is exceeding astringent and desiccative, by vertue whereof it is a singular repercussive in all impostumes and inflammations of the gout especially, and such as require to be represſed or cooled.

Touching Bupleuros, I read that the seed thereof is given against the sting of serpents: and K
that the wounds inflicted by them, are to be washed or fomented with the decoction of the herb, putting thereto the leaves of the Mulberrie tree, or Origan.

Catanance is a meere Thessalian hearbe, and growing no where else but in Thessalie; and for as much as it is used onely in amatorious matters, and for to spice love drinks withall, I meane not to busie my selfe in the description thereof: howbeit, thus much it would not bee amisse to note, for to detect and lay open the folly and vanities of Magicians, namely, that they went by this conjecture only, that it should be of power to win the love of women, because forsooth when it is withered, it draweth it selfe inward * like a dead Kites foot. For the same reason also, I will hold my tongue and say never a word of the hearbe * Cemos.

* As if it would catch women and hold them fast perforce.

* Cala is of two sorts: the one like to Aron, which loveth to grow in toiled and ploughed L
grounds: the time to gather this hearbe is before it begin to wither: the same operation it hath that Aron, and is used to the like purposes: the root thereof is commended to be given in drinke for a purgation of the belly, and to provoke the monethly terms of women: the stalkes boiled leafe and all togither with some pulse or other into a pottage, and so taken, cure the inordinat provocations to the stoole, and streinings thereupon without doing any thing. The seeond kind some call Anchusa, others * Rhinochisia: the leaves resemble Lettuce, but that they be longer, full of plume or downe: the root red, which being applied with the floure of barley groats, healeth shingles, or any other kind of S. *Anthonies* fire; but drunke in white wine, cureth the infirmities of the liver.

* κημὸς or χαμὸς in Greeke signifieth a bridle or bit: and it is thought to be *Leontopodium*, *Dioscor.* though others take it for Doder.

* Or rather, *Calix.*

Circæum is an hearb like to winter Cherrie or Alkakengi, but for the flours which are black: M
the seed small, as the graine of Millet, and the same groweth in huskes or bladders resembling little horns: the root is halfe a foot long, forked for the most part into three or foure grains or braunches: the same is white, odoriferous and hot in the mouth: it loveth to grow upon rocks and stonie grounds lying pleasantly upon the Sun. The infusion of this root in wine, is good to

* Rather *Onocleia*, out of *Dioscorides.*

be

A be drunke for the paine and other diſeaſes of the matrice: but of the ſaid root there ought to bee taken three ounces ſtamped, and the ſame to ſteepe a day and night in three ſextars of wine, for to make the infuſion above-named. This potion alſo ſerveth to ſend downe the after-birth, if it ſtay behind. The ſeed of this hearbe drieth up milke, if it be drunke in wine or mead.

Cirſion commeth up with a ſlender ſtalke two cubits high, and ſeemeth to be made three cornered triangle-wiſe: the ſame is beſet round about with prickie leaves: howbeit, the ſaid pricks are but tender and ſoft. The leaves in forme reſemble an ox tongue or the hearbe *Langue-de-bœuſe, but that they be ſmaller and ſomewhat white; in the top whereof there put foorth purple buttons or little heads, which in the end turne to a plume like thiſtle downe. Some writers hold, that this hearbe or the root onely, bound unto the ſwelling veines called Varices, doth allay the
B paine thereof.

Cratæogonos ſpindleth in the head like unto the eare of wheat, and out of one ſingle root yee ſhall have many ſhoots to ſpring and riſe up into blade and ſtraw, and thoſe alſo full of joynts. It gladly groweth in coole and ſhadowie places: the ſeed reſembleth the graine of the Miller, which is verie ſharpe and biting at the tongues end. If a man and his wife before they companie togither carnally, drinke before ſupper for fortie daies togither the weight of three oboli of this ſeed, either in wine, or as many cyaths of water, they ſhall have a man child betweene them, as ſome ſay. There is another *Cratæogonos, called alſo Thelygonos; and the difference from the other may ſoone be knowne by the mildneſſe in taſt. Some authors affirme, that if women uſe to drinke the flours of Cratæogonos, they ſhall within fortie daies conceive with child. But as well
C the one as the other applied with honey, doe heale old ulcers: they incarnat and fill up the hollow concavities of fiſtulous ſores: and ſuch parts as do miſlike and want nouriſhment, they cauſe to gather fleſh and fill the skin againe: foule and filthie ulcers they mundifie, the flat biles and riſings called Pani they rarifie and diſcuſſe: gouts of the feet they mitigat; and generally all impoſtumations, in womens breaſts eſpecially, they reſolve and aſſuage. *Theophraſtus* would have a kind of tree to be called Cratægonos or Cratæogon, which here in Italie they call * Aquifolia.

Crocodilion doth in ſhape reſemble the thiſtly hearbe or Artichoke called the blacke Chamæleon: the root is long and thicke in all parts alike, of an hard and unpleaſant ſmell: it groweth ordinarily in ſandie or gravelly grounds. If one drinke of it (they ſay) it will ſet the noſe a bleeding, and ſend out a deale of thick and groſſe bloud, that the ſplene will diminiſh and weare
D away by the means.

As touching Teſticulus Canis or Dogs-ſtones, which the Greeks call Cynoſorchis, & others ſimply Orchis, it hath leaves like unto thoſe of the Olive; ſoft and tender they are, and about halfe a foot long, and therefore no marveile if they lie ſpred upon the ground: the root is bulbous and growing long-wiſe, in a double ranke, or two togither; the one above, which is the harder, the other under it, and that is the ſofter: when they be ſodden, folke uſe to eat them after the manner of other bulbs: and lightly a man ſhall find them growing in vineyards. Of theſe two roots, if a man eat the bigger, it is ſaid, that hee ſhall beget boies; and if the woman eat the ſmaller, ſhee ſhall conceive a maiden-child. In Theſſalie, men uſe for to drinke in goats milke, the ſofter of theſe roots, to make themſelves luſtie for the act of generation; but the harder, when they
E would coole the heat of luſt: whereby wee may ſee, that they be contrarie, and one hindreth the operation of the other.

Chryſolachanon commeth up like a Lettuce, and commonly groweth in plots of ground ſet with Pines: the vertue of this hearbe is to heale wounds of the ſinews though they were cut quite aſunder, if it bee preſently laid too. There is another kind of * Chryſolachanon, bearing flours of a golden colour, and leafed like unto the Beet: when it is boiled, folke uſe to eat it in ſtead of meat, and it looſeneth the belly as well as Beets, Coleworts, and ſuch like: and if it bee true that is reported, whoſoever beare this hearbe tied faſt about any place of their bodies which is ever in their eye, ſo as they may ſee the ſame continually, it will cure them of the jaundiſe. Touching this hearbe Chryſolachanum, well I wot that I have not written ſufficiently, that
F men might know it by this deſcription, and yet could I never meet with any authour who hath ſaid more, or deſcribed it better. This verely hath been the fault and overſight even of our moderne Herbariſts of late daies, To write ſlightly of thoſe hearbs and ſimples which they themſelves knew and were acquainted with, as if forſooth they had been knowne to everie man; ſetting downe onely their names and no more: which is even as much as to tell us a tale and ſay,

* Or Borage, called in Greeke *Buglóſſon.*

*Some take this for our *Perſicorie*, or Arſmert.

* *i.* Holly or Hulver: nay rather, *Aquifolia* is *Agria* in Greeke: and the *Cratægus* of *Theophraſtus*, which he meaneth here, is a kind of Cervoiſe tree, now called *Torminalis.*

*I thinke hee meaneth Orach.

that with the * rennet or rundles of the earth, one might stay a laske, or give free passage to the urine in the strangurie, so it be drunke in wine or water. G

As for Cucubalum, they write of it, That if the leaves be stamped with vinegre, they heale the sting of serpents and scorpions. Some of them call this hearbe by another name, Strumus, and others give it the Greeke name Strychnos: and blacke berries (they say) it hath. The juice thereof taken to the quantitie of one cyath, with twice as much honeyed wine, is soveraigne for the loins or small of the backe: likewise it easeth the head-ach, if togither with oile of roses it be distilled upon the head by way of embrochation. The hearbe it selfe in substance made into a liniment, healeth the wens called the Kings evill.

Concerning the fresh water Spunge (for so I may more truly tearme it, than either mosse or hearbe, so thicke of shag haires it is and fistulous withall) it groweth ordinarily within the rivers H that issue from the foot of the Alps, and is named in Latin *Conferva, for that it is so good to conglutinat, in manner of a souder. Certes, I my selfe knew a poore labourer, who as he was lopping of a tall tree, fell from the top downe to the ground, and was so piteously bruised thereby, that unneth he had any sound bone in all his bodie that was unbroken: and in verie truth, lapped hee was all over with this mosse or spunge (call it whether you will) and the same was kept evermore moist and wet with sprinkling his owne water upon it, whensoever it began to drie upon him with the heat of his bodie: seldome was it undone or remooved, and never but when of necessitie for very chaunge fresh was laid too for default of the other: and by this manner of cure and no other, the poore wretch recovered perfitly, in so small a time, that it was wonderfull and almost incredible. I

*Coagulo terræ: Some thinke this place unperfit; but I guesse rather, that *Plinie* herein glanceth at the obscuritie of their writings in those daies of Simples, who put downe that hearbe many times, which no man can make any sense of no more than of *Coagulum terræ*.

* *à conferruminando.*

Chap. ix.

Of the berrie called Coccum Gnidium. Of the Tazill, and Okeferne. Of Dryophonon, and Elatine. Of Empetrum, otherwise named Calcifraga. Of Epipactis, or Elleborine. Of Epimedium, Enneaphyllon, and Ferne. Of the hearbe named Oxe-thigh. Of Galeopsis, otherwise Galeobdolon. Of Glaux or Eugalactum.

THe berrie Coccum Gnidium, in colour resembleth the Scarlet graine; in quantitie a pepper corne, but that it is bigger: of an ardent and caustick qualitie it is, and therefore they K use to lap it in the soft crum or pith of a loafe of bread, and so swallow it, for feare it should burne the throat as it passeth down. A present remedie this is for those who are empoisoned with Hemlocke; and it hath a good propertie to stop a laske.

* *Virga pastoris.* The Tazill, called in Greeke * Dipsacos, hath leaves much resembling Lectuce, saving that in the mids of the backepart, there are to be seene certaine bubbles as it were, or risings, & those be prickly: the maine stem which it beareth, is two cubits high, and the same armed with pricks: at every joynt and knot whereof, it putteth forth two leaves which doe compasse and enclose the same round about in manner of wings, making thereby a certain * concavitie or hollow receptacle, wherein alwaies there standeth a * saltish dew or water. In the top of this maine stem and other braunches proceeding from it, it beareth certaine burrie heads, beset all over with sharpe L pricks like those of an Vrchin: and it loveth to grow in waterie places. This hearb closeth up and skinneth the fissures or chaps in the fundement: also the root boiled in wine, healeth fistuloes; but the same ought to be so tender sodden, as it may be wrought like wax, that a colyrie or tent made of it may be put into the concavitie of the sore. Moreover, it cureth werts of all sorts: and some there be, who to take away werts, wash them with the liquor found in the hollow pith of the foresaid wings. The Oke ferne named in Greeke Dryopteris, is like unto other ferne, and groweth upon trees, having leaves finely slit, and those somewhat sweet in tast: the root is rough and hairie: Of a caustick and fierie nature is this hearbe; and therefore the root being punned, is a depilatorie and fetcheth off haire: for which purpose, the manner is to applie it manner of a liniment, untill it procure sweat: which course would bee reiterated twice or thrice, during which M time the sweat must not be wiped away.

* Thereupon it is called *Labrum Veneris, i. Venus* laver.

*This water is not saltish: but because the name *Dipsacos* in Greek alludeth to thirst, & salt things cause thirstinesse, *Plinie* guessed this humor to be saltish.

Dryophonon is an hearbe much like to Dryopteris: the stems whereof be small, yet growing to the length of a cubit, and those be environed on both sides an inch broad: in shape much like unto Bruscus or Butchers-broome, named in Greeke Oxymyrsine, but that they be whiter and softer,

A ſofter, bearing a white floure likewiſe in manner of the Elder. The young crops and tendrils of this herb, may be eaten when they are ſodden: and the ſeed is commonly uſed in ſtead of pepper.

Running Buckewheat or Bindweed, named in Greeke Elatine, putteth foorth ſmall leaves, round and hairie, much like unto thoſe of Parietarie of the wall; and immediatly from the root there ſpring five or ſix pretie braunches halfe a foot long, furniſhed well with leaves. This hearbe groweth among corne: ſoure it is and harſh in taſt, whereupon it is taken to be very effectuall to repreſſe the flux of humors which cauſe watering eyes, if the leaves be ſtamped with barly groats, and applied with a fine linnen cloath underneath. The ſame boiled togither with Lineſeed, cureth the bloudie flix, in caſe the Patient drinke the broth or decoction thereof.

As for Empetron, which our countreymen in Latine name Calcifraga, it groweth upon
B mountains regarding the ſea, and commonly upon rocks and ſtonie cliffs: the nearer it is to the ſea, the ſalter taſt it hath, by which means if it be taken in drinke, it purgeth choller and fleame: the farther off that it groweth from the ſea, and the more terrene and earthly ſubſtance that it hath, the bitterer is it found to bee, and this doth evacuat wateriſh humors: but the manner of taking it, is in ſome potage, or els in mead. Beeing long kept, it looſeth the force: if it be freſh and new gathered, and then either ſodden or ſtamped, it is diureticall and breaketh the ſtone. And verely they that promiſe thus much in the leafe of Empetron, and would ſeeme to juſtifie and make good their word, doe affirme for the better credit thereof, That if ſtones doe boile with it in the ſame pan, they will burſt in peeces.

* This *Empetron* is thought to be our *Saxifrage*.

Epipactis, named by ſome Elleborine, is a little hearbe bearing ſmall leaves: ſoveraigne for
C the diſeaſes of the liver, and againſt all poiſons, if it be taken in drinke.

Epimenidion putteth forth no great ſtem, bearing ten or twelve leaves reſembling the Ivie, but it never ſheweth floure: the root is ſmall, black, and of a ſtrong and ſtinking ſmell: it groweth upon moiſt grounds: of an aſtringent nature it is, and cooleth mightily: an hearbe that women *muſt beware of. The leaves ſtamped and applied to the paps of maidens, keepe them down that they ſhall not grow.

* For it hindreth conception.

Enneaphyllon hath long leaves, in number nine neither fewer nor more, and thoſe be of a burning or cauſticke nature: a ſingular hearbe for the paines of loines, and the Sciatica, but it ought to be applied enwrapped well in wooll, for feare leaſt it burne the flanks, for preſently it raiſeth bliſters.

D Of Ferne be two kinds, and they beare neither floure nor ſeed. Some of the Greeks call the one Pteris, others Blechnon: from one root whereof there ſpring many braunches repreſenting wings, and thoſe exceed two cubits in length, yeelding * no unpleaſant ſavour; and this they ſuppoſe to be the male. The ſecond kind, the ſaid Greekes ſome call Thelypteris, others Nymphæa Pteris: this groweth ſingle, and brancheth not into many ſtems; ſhorter it is than the former, ſofter alſo, and thicker of leaves, and thoſe toward the root guttered and ſomewhat hollow: there is neither of them both, but their roots will feed ſwine fat: and the leaves of the one as well as the other, are diſpoſed on both ſides ſo, as they doe repreſent birds wings, whereupon the Greeks gave them the name * Pteris. The roots of both Ferns be long, and thoſe growing byas: in colour blacke, eſpecially when they bee drie: and dried they ought to be in the Sun. Ferne
E groweth everie where, but their moſt delight is in a cold ſoile. The due time of digging them up, is about the ſetting of the ſtar Vergiliæ. There is no uſe in Phyſicke of their roots, but when they be juſt two yeers old; for both before and after that time, they ſerve for no purpoſe. Taken in this their ſeaſon, they doe expell all kind of vermin out of the guts; with honey, if they be broad and flat worms; but in ſome ſweet wine, for all the reſt, whether they bee round or ſmall, ſo that the Patient continue this drinke three daies togither. Neither of them both, but are very contrarie and offenſive to the ſtomacke: howbeit, they purge the belly, and firſt evacuat choller, then ſoon after, wateriſh humors: but the better doe they chaſe the foreſaid flat worms out of the bodie, in caſe they bee quickened with the like quantitie of Scammonie. The root of Ferne taken to the weight of two oboli in water, cureth all rheums; but the Patient ought to faſt one whole day be-
F fore, and likewiſe eat a little honey ſomewhat before that he take the ſaid drinke. As for women, neither the male nor the female Ferne would be given unto them; for if they be with child, it will drive them to travaile before their time, and ſlip an untimely birth; and if they be cleare, it hindreth conception and cauſeth them to be barraine. The powder of Ferne roots, is ſingular to be ſtrewed or caſt upon maligne ulcers; yea and the farcins or ſores in horſe necks. The leaves of

* *Non gravi odore: Dioſcor.* ſaith, *Sub graves odore*, ſomewhat unpleaſant in ſmell.

* And in *Columella*, *Filix* is called *Avia*.

Ferne kill punaises or wallice, and a serpent they will not harbour: and therefore it is good for G
those who are to lie in suspected places, to make them pallets of Ferne leaves, or at leastwise to
lay them under their beds. The verie smoke also of them when they be burned, doe chase away
serpents. Moreover, Physicians have made some difference and choise even in this herb also; for
the best is counted that of Macedonie: & the next to it in goodnesse, commeth from Cassiope.

As touching the hearbe called in Latine Femur bubulum, that is to say, Ox-thigh, it is verie
good for the sinews, if being new gathered, it be stamped and incorporat in vinegre and salt.

*Many take it for Archangell.

*Galeopsis, otherwise called by some Galeobdolon or Galion, hath a stem and leaves like unto the nettle, but that they are more smooth and mild in hand; which if they be bruised or stamped, yeeld a stinking smell; and it beareth a purple floure: it groweth every where about hedges and path-waies. The leaves and stalks both, stamped and applied with vinegre, heale all hard tumors and cancerous sores: likewise the wens called the Kings evill: they resolve flat impostumes, H
and the swellings behind the ears: now the manner is to foment the said infirmities with their decoction. Being laid too with salt, they heale ulcers tending to putrifaction, and gangrens.

As touching Glaux, in old time called Eugalacton, it is an hearbe in leafe resembling Tree-trifolie, and the Lentill, but that the backe-part of the leafe in Glaux is whiter. The braunches, which be in number five or six, and those springing directly from the root, verie small, doe creepe along the ground: the floures which it putteth foorth be of a purple colour: And this hearbe is found growing ordinarily neare the sea side. Being boiled in a grewell made of fine wheat floure, it causeth nources that drinke it, to have plentie of milke in their brests; but then they must presently goe to a baine or hot-house. I

Chap. x.

Of Glaucion. Of Pæonie, and Cudweed or Cottonwort, called also Chamæzelon. Of Galedragon, Holcus, Hyosiris, Helosteon, and Hippophæston.

GLaucion groweth naturally in Syria and Parthia: a low hearbe, tufted thicke with leaves, much like unto Poppie, but that they be smaller and looke more foule and greasie; of an unpleasant and stinking smell; bitter also in tast, stypticke, and astringent: grains it beareth of a saffron colour, whereout is drawne the juice Memithra, called by the Greeks Glaucium also, as well as the hearbe. Now for to get this juice, they use to cover the graines in mud or clay, K
and put them in an earthen pot which they set in an oven; where, after they are well heat, they use to presse out of it the foresaid juice. And not onely it, but the leaves also if they be stamped, are much used for the flux of humours to the eies, especially such as fall togither all at once in great violence. And of this hearbe or juice there is a certaine collyrie compounded, which the Physicians call Diaglaucion: a good medicine also for nources to drinke in water, if they have lost their milke and would recover it againe.

Pionie, which some in Greeke call Glycyside, others Pæonia, or Pentorobos, hath one main stem two cubits high, and the same accompanied with two or three more lesse stalks of a reddish colour, and the rind resembleth that of a Bay tree: the leaves be verie like unto Woad, were they not fatter, rounder, and smaller: seed it beareth in certaine huskes like grains, and those be partly L
red and partly blacke. Of Pæonie there bee two kinds: The female is that thought to be, to the root whereof there sticke eight long bulbs commonly, or six at least: The male hath more of them hanging to it, by reason it standeth not upon one single and entire root onely, but of many, and those run downe a span deepe, and bee white withall. These roots are found to be astringent and stypticke at the tongues end. As for the female, the leaves thereof doe sent of myrrhe, and grow somewhat thicker than those of the male. They love both, to grow in woods. It is commonly said, That the roots must bee digged up in the night season, for feare that the Wood-speight or Hickway should see them: for in the day time the said bird would flie in their faces that carie it away, and be ready to job out their eyes. In the very drawing also of those roots out of the ground, there is some daunger, least their fundament or tiwill fall out of their bodies M
who are employed about that businesse. But I suppose all this to bee but a fabulous and vaine invention, devised onely to make folke beleeve it is an hearbe of wonderfull operation. Moreover, the graines are diversly used: for the red, being taken to the number of fifteene or thereabout, in some grosse or hard wine, doe stay the monethly flux of the reds in women: whereas the blacke

drunke

A drunke to the ſame number in ſweet cuit or ſimple wine, cure the paſſions of the matrice,[and namely the riſing of the mother.] The root given in wine,appeaſeth all the paines of the bellie, cleanſeth the guts,cureth the convulſion or crampe which plucketh the necke and bodie backeward,and the jaundiſe: it pacifieth alſo the greefes of the reines and bladder. As for the wrings of the matrice and ſtomacke,the ſame boiled in wine,doth aſſuage them: the laske it ſtaieth: and being eaten with meat,it is good for thoſe that be troubled in their braines,or otherwiſe given to melancholie.But in theſe caſes foure drams is counted a ſufficient doſe. The blacke graines taken to the number aboveſaid in wine,helpe thoſe that be ridden with the night mare,and in danger thereby to have their breath ſtopped. For the gnawing in the ſtomacke,the ſame beeing either eaten,or applied in a liniment,are ſingular good: impoſtumations likewiſe growing to ſup-
B puration,if they be taken betimes,may be reſolved with a plaſtre made of the black berries:and ſay they were of long continuance,the red will doe the deed.But as well the blacke as the red,are ſoveraigne for thoſe who bee ſtung with ſerpents: as alſo for yong children who have the ſtone, and be entring into the ſtrangurie,and piſſe dropmeale.

Cudwort or Cottonweed,ſome there bee who call Gnaphalion,others Chamæzelon. The white,ſoft,and delicat downe of the leaves,many uſe in ſtead of ſlockes; and ſurely it is not much unlike.This hearbe is good to be given in ſome auſtere or ſtypticke wine,for the bloudie flix. It ſtaieth laskes,and reſtraineth the immoderat flux of womens fleurs.Being clyſterized it is ſingular for the Tineſme, that is to ſay,the continuall provocations to the ſeege without any voidance of excrements. Laſt of all,in a liniment it ſerveth well to bee applied in ulcers tending to putri-
C faction.

As touching Galedragon (an hearbe ſo called by *Xenocrates*) it reſembleth the thiſtle named Leucacanthe[*i.*S.*Marie* thyſtle]and groweth full of ſharpe prickes in moorie grounds.The ſtem riſeth up tall,in manner of Ferula or Fennell geant, in the very head and top whereof it beareth a thing reſembling an egge, in which there breed(they ſay)in proceſſe of time certaine grubs or little wormes,which are excellent for to eaſe the tooth-ach, if they bee kept in a box with bread, and as need requireth, tied faſt unto the arme of the patient on that ſide where the teeth ake; for it is wonderfull how ſoone the paine will by this meanes ceaſe. Marie they ought to bee chaunged every yeare, for after one yeare they bee of no vertue in this caſe: and in any wiſe they muſt at no time touch the ground.

D As for Holcus,it groweth upon ſtonie grounds and thoſe that be drie.It riſeth up with a ſtem like unto the ſtraw of that Barley which ſpringeth every yeare without ſowing: in the top whereof it beareth ſlender ſpikes or eares. This hearbe bound about the head,or the arme, *draweth forth of the bodie any ſpils whatſoever: whereupon ſome name it Ariſtida.

*Hyoſeris reſembleth Cichorie or Endive,but that it is leſſe,and in handling more rough. A ſoveraigne vulnerarie hearbe,ſo it be ſtamped and laid to a wound.

Holoſteon, which the Greekes ſo call by the *contrarie, is an hearbe without any hardneſſe at all,as if wee ſhould tearme*[Gall] by the name of[Sweet.] So ſmall and ſlender it groweth, that a man would take it to be all haires; foure fingers long, in manner of quich graſſe or ſtitchwort. The leaves bee narrow,and have an aſtringent taſt. It commeth up ordinarily upon banks
E and hillocks, which bee all earth and nothing ſtonie. Beeing drunke in wine, there is great uſe thereof for convulſions,ſpreines,and ruptures. It is a great healer beſides, and skinneth greene wounds: and experience hereof may bee ſoone ſeene: for if it bee put among peeces of fleſh in the pot whiles they boile,it will cauſe them to grow together and unite.

Hippophæſton is a certaine prickie buſh growing by the ſea ſide, wherewith *Fullers and Diers fill their leads and coppers;without ſtem,without flower: it bringeth forth certain little knobs or buttons onely,& thoſe hollow: leaves alſo it hath ſmall and many in number, of a graſſe green colour: the roots be white and tender; out of which there is a juice drawne by way of expreſſion in Summer time, which is ſingular good for to purge the bellie, if it bee taken to the weight of three oboli;and principally, helpeth thoſe that bee ſubject to the falling ſickneſſe, trembling of
F the members, and the dropſie: it cureth alſo thoſe that be given to the ſwimming and dizzineſſe of the braine,to ſtraightneſſe of wind,and who cannot breath but upright;and laſt of all,to ſuch as be entring into a palſie.

* And therfore it is called *Holcus* ἀπὸ τῦ ἕλκειν.

*As one would ſay, Swines Endive or Cichory.

* κατ' ἀντίφρασιν: for the word ſignifieth, All bone.

* So in Greeke χολὴ[i fell]is called χλυκὺ, as in ſome part of France (as *Dalechampius* noteth)Gallis named *le doux*.

*Some read θαφίαν, *i.*Diers: others γναφίαν, *i.*Fullers.

CHAP.

G

Chap. xi.

Of Hypogloſſa and Hypecoon, Idæa, Iſopyron, Lathyris, Leontopetalon, Lycopſis, Lithoſpermon. The vulgar ſtone. Of Limeum, Leuce, and Leucographis.

Biſlingua. Horſtoung, or Double tongue.

HYpogloſſa hath leaves faſhioned like unto Butchers broome, and thoſe turning hollow, and prickie: within which concavities there come forth certaine little leaves reſembling tongues. A guirland or chaplet made of theſe leaves, and ſet upon the head, eaſeth the paine thereof.

Hypecoon groweth amongſt corne, and is leafed like unto Rue. It hath the ſame nature and properties that Opium or the juice of Poppie. H

As for the hearbe Idæa, the leaves thereof reſemble thoſe of ground-Myrtle or Butchers broome: unto which there grow cloſe certaine tendrils, and thoſe carrie flowers. It ſtoppeth a laske, ſtaieth the immoderat flux of womens moneths, and ſtaunceth all unmeaſurable bleeding: for by nature aſtringent it is and repercuſſive.

Iſopyron, ſome there be who call it Phaſiolum, becauſe the leafe (otherwiſe like unto Anniſe) dooth turne and wryth like unto the tendrils of Phaſils. In the top of the ſtem it beareth ſmall heads or buttons full of ſeed, reſembling Nigella Romana. A ſoveraigne hearbe, taken either in honey or mead, againſt the cough and other infirmities of the breaſt: likewiſe for the accidents of the liver.

*Lathyris. * For the milkie juice haply. For *Dioſcorides* ſaith *amygdalæ*. i. of the Almõd tree. * *Purgata facilia.* Some think gentle purgatives.

*Spurge hath many leaves reſembling *Lectuce: beſides which it putteth forth as many other ſlender and ſmall braunches, containing in little tunicles or huskes certaine ſeeds in manner of capers: which beeing dried and taken foorth, reſemble for bigneſſe cornes of Pepper, white in colour, ſweet in taſt, and eaſie *to be cleanſed from their huske. Twenty of theſe ſeeds drunk either in cleare water or mead, do cure the dropſie: beſides wateriſh humors, they evacuat choller. They that deſire to be throughly purged and would have them to work ſtrongly, uſe to take them husk and all; but certainely ſo taken, they hurt the ſtomack: and therfore there is a deviſe of late found out to give them either with fiſh, or els in ſome broth of a cocke or capon. I

Leontopetalon, which ſome call Rhapeion, carieth leaves like unto Coleworts, and a ſtalke halfe a foot high, garniſhed with many braunches reſembling wings: and ſeed it beareth in the head contained within cods, after the manner of ciches. The root is made much after the faſhion of a rape or turnep, big and blacke withall. This hearbe groweth in corne grounds. The root is a ſingular counterpoyſon to be given in wine againſt the ſting or vemin of any ſerpents; and verely there is not in the world a more ſpeedie remedie. Very good alſo it is for the Sciatica. K

* Some take it for a kind of Orchanet, others for Hounds-toung

* Lycopſis hath leaves like unto Lectuce, but that they bee longer and thicker: it riſeth up with a long ſtem, and the ſame hairie, with many branches growing thereto of a cubit in length: and beareth little flowers of purple colour. It loveth to grow upon champion plaines. A liniment made with it and Barley meale, is good for the ſhingles and S. *Anthonies* fire. In agues it procureth ſweat, ſo that the patient drinke the juice thereof mingled with hot water.

But of all hearbs that be, there is none more wonderfull than Greimile: ſome call it in Greek Lithoſpermon, others Ægonychon, ſome Dioſpyron, and others Heracleos. It groweth ordinarily *five inches high: and the leaves be twice as big as thoſe of Rue. The foreſaid ſtalkes or ſtems be no thicker than bents or ruſhes, and the ſame garniſhed with ſmall and ſlender braunches. It bringeth forth cloſe joining to the leaves, certain little beards one by one, and in the top of them little ſtones white and round in manner of pearls, as big as cich peaſe, but as hard as very ſtones. Toward that ſide where they hang to their ſteles or tailes, they have certaine holes or * concavities containing ſeed within. This hearb groweth in Italie: but the beſt in the Iſland Candie. And verely of all the plants that ever I ſaw, I never wondered at any more: So ſightly it groweth, as if ſome artificiall goldſmith had ſet in an alternative courſe & order, theſe pretie beads like orient pearles among the leaves: and ſo rare a thing it is and difficult to bee conceived, that a very hard ſtone ſhould grow out of an hearbe. The Herbariſts who have written thereof, doe ſay that it lieth along and creepeth by the ground: for mine owne part, I never ſaw it growing in the plant: but ſhewed it was unto me plucked out of the ground. This is for certaine knowne, that theſe little ſtones called Gremil ſeed, drunke to the weight of one dram in white wine, breake the ſtone, L M

* *Quincuncialis ferè*: others read *Quinque caulibus ferè*, i. commonly it beareth five ſtalkes. *This ſome take to bee meant of that Greimile, called *Jobs* teares.

expell

A expell the ſame by gravell, and diſpatch thoſe cauſes that bee occaſions of ſtrangurie. Certes, a man no ſooner ſeeth this hearbe, but he may preſently know the vertues thereof, and for what it ſerveth in Phyſicke; a thing that he ſhall not obſerve againe in any other whatſoever: for at the very firſt ſight of thoſe little ſtones, his eye will tell him what it is good for, without information from any perſon at all. There be common ſtones found about rivers, bearing a certaine drie hoarie moſſe upon them. Rub one of theſe ſtones againſt another, having ſpit firſt thereupon, and then therewith touch the tettar or ringworme in any part of the bodie, it will kill the ſame: but the partie muſt as he toucheth it, utter this charme following:

* φεύγετε κανθαρίδες, λύκος ἄγριος ὄμμε διώκει.

* He tearmeth tettars or ringwormes Cantharides, and the ſaid ſtone, the wild Wolf.

B That is to ſay,

Cantharides, flie apace: for a wild Wolfe followeth in chaſe.

The Frenchmen have a certaine hearbe which they call Limeum, out of which they draw a venomous juice, named by them Stags-poyſon, wherewith they uſe to envenome their arrow heads when they goe to hunt the red Deere: Take of this as much as goeth to the poyſoning of one arrow, and put it in three meaſures or modij of a maſh wherewith they uſe to drench cattell: and make ſops thereof, and conveigh them downe the throat of ſicke oxen or kine, it will recover them. But preſently after the receit of this medicine, they muſt be tied up ſure unto their bouzies, untill the medicine have done purging: for the beaſts commonly fare all the while that it is C in working, as if they were wood. In caſe they fall a ſweating upon it, they muſt be waſhed all over with cold water.

* Leuce is an hearbe like unto Mercurie; but it tooke that name by reaſon of a certain white ſtrake or line that runneth croſſe through the mids of the leafe, for which cauſe ſome call it Meſoleucas. The juice of this hearbe healeth fiſtuloes: and the ſubſtance of the hearb it ſelfe ſtamped, cureth cancerous ſores. It may be peradventure the ſame hearbe which is named Leucas, that is ſo effectuall againſt all venomous ſtings proceeding from any ſea-fiſhes. The Herbariſts have not deſcribed this hearbe otherwiſe than thus, That the wild kind thereof with the broader leafe, is more effectuall in the leaves; and that the ſeed of the garden kind, hath more acrimonie than the other. * *Mentha Saracenica.*

D Touching Leucographis, what manner of hearbe it ſhould be, I have not found in any writer: and I wonder thereat the rather, becauſe it is reported to be ſo good for them that void & reach bloud upward, namely, if it be taken to the weight of three oboli with Saffron. Likewiſe ſtamped with water and ſo applied, it is ſingular good againſt thoſe fluxes which proceed from the imbecillitie of the ſtomacke: ſoveraigne alſo for to ſtay the immoderat flux of womens tearmes. And it entreth into thoſe medicines which are appropriat for the eyes, yea and into incarnatives, ſuch eſpecially as be fit to incarnat thoſe ulcers which are in the moſt tender and delicat parts of the bodie.

Chap. XII.

E *Of Medium, Myoſota, Myagros, Nigina, Natrix, Odontitis, Othonne, Omoſma, Onoporidos, Oſyris, Oxys, Batrachion, Polygonon, Pancration, Peplos, Periclymenos, Leucanthemon, Phyteuma, Phyllon, Phellandrion, Phalaris, Polyrrhizon, and Proſerpinaca: of Rhacoma, Reſeda, and Stœchas.*

MEdion hath leaves like unto *garden Floure-de-lis. A ſtem three foot *high, garniſhed with faire large flowers, of purple colour, and round in forme: the ſeed is ſmall, and the root halfe a foot long: it groweth willingly upon ſtonie grounds lying in the ſhade. The root taken in a liquid electuarie or lohoch made with honey to the quantitie of two drams, for certaine daies together, ſtaieth the immoderat flux of womens monthly termes. The ſeed alſo reF duced into pouder and drunke in wine, repreſſeth their extraordinarie ſhifts. * *Iridis ſativæ*: others read *Seridis*, *i.* Endive. * *Tripedalem.* But *Dioſcorides* ſaith *Tricubitalem*, *i.* three cubits high.

*Myoſota, otherwiſe called Myoſotis, is a ſmooth hearbe, ſhooting forth many ſtems from one ſingle root, and thoſe in ſome ſort of a reddiſh colour, and hollow: garniſhed with leaves, which toward the root be narrow, long, and blackiſh, having their backe part ſharpe and edged: which leaves grow along the ſtems two by two together: and out of the concavities or armepits be- * Mouſe-eare.

betweene the ſtalke and them, there put forth other ſmall branches with a blew flower. The root G
is of the thickneſſe of a mans finger, bearded with many ſmall ſtrings reſembling haires. This root is of a corroſive nature, fretting and exulcerating any place whereunto it is applied: in which regard it healeth up the fiſtulous ulcers called Ægilops, growing betweene the noſe and angles of the eyes. The Ægyptians are of opinion, That if upon the ſeven and twentieth day of that month which they call Thiatis (and which anſwereth very neare to our month Auguſt) a man or woman doe annoint themſelves with the juice of this hearbe in a morning before they have ſpoken one word, he or ſhe ſhall not be troubled with bleared eyes all that yeare long.

Myagros is an hearbe growing up with ſtems in manner of Fennell-geant, in leaves reſembling Madder, and riſeth to the height of three foot. The ſeed which it beareth is oleous, and out of it there is an oile drawne, which is good for the ſores in the mouth, if they be annointed therwith. H

The hearbe called Nigina, hath three long leaves like unto thoſe of Succorie: wherewith if skars (remaining after ulcers and wounds) be rubbed, it will reduce them to the naturall colour of the other skin.

There is an hearbe, which in Latine is named Natrix, the root whereof being pulled out of the ground, hath a ranke ſmell like unto a Goat; with this hearbe they uſe in the Picene countrey to drive away thoſe hob-goblins which they have a marvellous opinion to be ſpirits, called Fatui: but for mine owne part, I am verely perſuaded they bee nothing els but fantaſticall illuſions of ſuch as bee troubled in mind and beſtraught, the which may bee chaſed and rid away by the uſe of this medicinable hearbe.

Odontitis may be reckoned among the kinds of hey-graſſe, putting forth many ſmall ſtems I
growing thicke together from one root, and thoſe knotted and full of joints, triangled and blackiſh withall: in every joint ſmall leaves it hath, reſembling thoſe of knot graſſe, howbeit ſomewhat longer: in the concavities betweene the ſaid leaves and the ſtem there is contained a ſeed like unto Barley cornes: the flower is of a purple colour, and very ſmall. It groweth ordinarily in meddow grounds. The decoction of the braunches and tender ſtalkes of this hearbe, to the quantity of one handfull, boiled in ſome aſtringent wine, cureth the toothach, if the patient hold the ſame in the mouth.

Othonne groweth plenteouſly in Scythia, like unto Rocket: the leaves bee full of holes, and the flower reſembleth Saffron: which is the cauſe that ſome have called it Anemone. The juice of this hearbe entreth very well into thoſe medicines which are appropriat to the eyes; for it is K
ſomewhat mordicative, and heateth gently: beſides exiccative it is, and by that meanes aſtringent. It cleanſeth the eyes of thoſe filmes and clouds which darken the ſight, and removeth whatſoever hindereth the ſame. Some ordaine for this purpoſe that it ſhould be waſhed firſt, and after it is dried againe made into certaine bals or troſchisks.

Onoſma beareth leaves well neare three fingers long, and thoſe lying flat upon the ground: three in number, and indented or cut after the manner of Orchanet, without ſtem, without flour, without ſeed. If a woman with child eat thereof, or doe but ſtep over it, ſhe ſhall caſt her untimely birth out of her wombe.

As for Onopordon, they ſay if Aſſes eat thereof, they will fall a fizzeling and farting. Howbeit of vertue it is to provoke urine, and the monthly ſickneſſe of women: to ſtop a laske, to diſcuſſe and reſolve impoſtumes, and to heale them when they be broken and doe run. L

*Linaria or Toads-flax. * According to *Dioſcorides.*

*Oſyris putteth forth ſmall braunches of a browne colour, ſlender, pliable, and eaſie to wind; the ſame bee garniſhed with leaves *reſembling thoſe of Line or Flax, of a darke and duskiſh greene at firſt, but afterwards chaunging colour, and enclining to a red colour, and the ſeed is contained in thoſe braunches. Of theſe leaves are made certaine waſhing bals, to ſcoure womens skin, and make them looke faire. The decoction of the root beeing drunke, cureth thoſe that have the jaundiſe. The ſame roots, gathered before the ſeed bee ripe, cut into roundles, and dried in the Sunne, doe ſtop the laske: but drawne after that the ſeed is ripe, they repreſſe all catarrhes and fluxes of the bellie, if the patient drinke the ſupping wherein they are boiled. Alſo ſtamped ſimply, and ſo given in raine water, they have the ſame effect.

*Cuckowes meat, or Wood-ſorell.

*Oxys beareth three leaves and no more. This hearbe is ſingular to be given for a feeble ſtomacke which hath loſt all appetite to meat. They alſo who have a rupture, and whoſe guts be fallen downe, eat thereof to very good ſucceſſe. M

Polyanthemum, which ſome call Batrachion, hath a cauſticke qualitie, whereby it dooth bliſter

A ſter any unſeemely skars, by meanes wherof, reduceth them to their freſh and former colour. The ſame alſo applied, ſcoureth away the morphew, and bringeth the skin to the native hue, anſwerable to the reſt of the bodie.

Knot-graſſe is that hearbe, which the Greekes name Polygonon, and we in Latine, Sanguinaria: in leafe it reſembleth Rue, in ſeed common quich graſſe, and riſeth not from the ground but creepeth along. The juice of this hearbe conveighed up into the noſthrils, ſtaunch eth bleeding at the noſe. They who ſet downe many kinds of Polygonon, doe hold that this is to bee taken for the male, and by reaſon of the multitude of ſeed which it beareth is called *Polygonon: or for that it groweth ſo thicke in tufts, Calligonon. Others name it *Polygonaton, for the number of *knots or knees which it carieth. There be againe who give it the name Theuthalis: ſome
B call it Carcinetron, others Clema, and many Myrtopetalon. And yet I meet with ſome writers, who ſay that this is the female knot graſſe: and that the male is the greater, and not altogether ſo darke of colour, growing alſo thicker with knots, & ſwelling with ſeed under every leafe. Well; howſoever it is, the propertie of them both, the one as well as the other, is to bind and coole: and yet their ſeed *doth looſen the bellie; which if it be taken in any great quantitie, is diureticall and repreſſeth any rheums, provided alwaies that the patient be troubled therwith, otherwiſe it doth no good. The leaves are ſingular good to be applied unto the ſtomacke, for to aſſuage the heat thereof: in a liniment they mitigat the greefe of the bladder, and ſtop the courſe of ſhingles and ſuch like wild fires. The juice is ſoveraigne to be dropped alone by it ſelfe into the eares that run, and into the eyes to abate their paine. It is uſually given to the quantitie of two cyaths in Tertian
C agues, and Quartanes eſpecially, before the fit commeth: likewiſe for the feebleneſſe of the ſtomacke when it will keepe nothing: for the bloudie flix, and the rage of chollericke humours both upward and downeward. A third kind there is, which they call *Oreon, growing upon the mountaines, reſembling a tender reed: riſing up in one ſingle ſtem, but full of little knees or knots, and thoſe *couched and thruſt together. Leafed it is like the Pitch tree: the root needleſſe, and of no uſe: and generally the whole hearbe of leſſe ſtrength and operation than the former. Howbeit, this ſingular property hath it, to help the ſciatica. A fourth Polygonum there is, called the Wild; and this buſheth like a ſhrub or a pretie tree rather: the root is of a woodie ſubſtance, & the ſtock or plant of a reddiſh colour, reſembling the Cedar: it beareth braunches much like to Spart or Spaniſh broome, two ſpans long, jointed into three or four knots, and thoſe of a blackiſh colour.
D This alſo hath an aſtringent nature, and taſteth in the mouth like unto a Quince. The decoction thereof in water, untill the third part bee conſumed, or the pouder of it dried, is commended for the ſores in the mouth, and for any part that is fretted and galled. And the very ſubſtance thereof is good to be chewed, in caſe the gums be ſore. It repreſſeth the malignitie of eating corroſive ulcers and cankers: and in one word, ſtaieth the mallice of all ſores that run on end, and be untoward for to be healed: but a peculiar propertie it hath by it ſelfe to cure any ulcer occaſioned by the Snow. Our Herbariſts uſe this kind much for the Squinancie: and to eaſe the headach, make a guirland thereof, appointing it to be ſet upon the head: but to repreſſe any violent catarrhes, they preſcribe to weare it about the necke. In Tertian agues, ſome give direction to plucke it out of the ground with the left hand, and then to tie it to the arme or other part of the patient. And
E there is not an hearbe or plant that they be more carefull to keepe drie and to have alwaies ready at hand, than Polygonon, for to ſtanch any iſſue or flix of bloud whatſoever.

Pancration, which ſome chuſe rather to call the little Squilla or ſea-onion, beareth leaves reſembling the white Lillie, but that they be longer and thicker; with a great bulbous root, and the ſame in colour red. The juice of it taken with the flower of Ervile, maketh the bellie laxative: and outwardly applied, mundifieth ulcers. For the dropſie and hardneſſe of the ſpleene, it is given with honey in manner of a ſyrrup. Some take the root and boile it in water untill the liquor bee ſweet, which they poure forth; and then ſtampe the ſaid root, and reduce it into bals or troſches, which they lay to drie in the Sunne: and uſe them afterwards as occaſion ſerveth for the skals or ulcers of the head, and all other ſores that require mundification. Semblably, they give thereof
F as much as one may take up with three fingers in wine, for the cough, and in a liquid electuarie or lohoch for the pleuriſie and peripneumonie. They preſcribe it likewiſe to bee drunke in wine for the Sciatica: to allay alſo the gripes and wrings of the bellie, and to procure the monethly tearmes of women.

Peplos, called by ſome Syce, by others Meconion Aphrodes, from one ſmall root buſheth into

*of πολὺς many & γόνυ ſeeds.

*And yet *Scribonius* ſaith it is called Polygonon, becauſe it groweth every where ſo common.

*For γόνυ ſignifieth a knee or knot.

**Alvum ſolvunt.* If the place be not corrupt, as I doubt it is.

**Oreon, ab ὄρος* a mountaine. Some read ἀρεῖον, *i.* faire: others ὄρεον, for that it groweth like to an horſtaile, or the hearbe Hippuris.

**In ſefarctis.*

*A kind of Eſula.

**i.* Frothie Poppie.

into many braunches: the leaves bee like unto Rue, but that they bee ſomewhat broader: the G
ſeed appeareth under the leaves round, & (but that they be ſmaller) not unlike to the white Poppie. Ordinarily it is found among Vines, and they gather it in harveſt time. They hang it foorth ſeed and all together a drying, ſetting water underneath, that the ſaid ſeed or fruit may fall down into it. If it be taken in drinke, it purgeth the bellie, and doth evacuat both choller and fleagme. The meaſure of one acetable is counted an ordinarie and indifferent potion to be drunk in three hemines of mead or honied water. With this ſeed they uſe to pouder meats and viands, thereby to keepe the bodie ſoluble.

*Wood-bind. *Periclymenos is alſo a buſhie plant, and loveth to braunch much: it beareth whitiſh and ſoft leaves, diſpoſed two by two at certaine ſpaces and diſtances very orderly. In the top of the braunches it beareth hard ſeeds betweene the leaves, which hardly may be plucked off. It groweth in H
tilled corne fields and hedges, winding about every thing that it can catch hold of, for to ſupport and beare it up. The ſeed after it is dried in the ſhade, folke uſe to pun in a morter, and ſo to make it up into trochisks. In caſe that the ſpleene bee ſwollen or hard, they take of theſe troſches, and after they be diſſolved, give thereof a ſufficient quantitie in three cyaths of white wine for thirtie daies together: which drinke is of ſuch operation, that it will waſt and ſpend the ſpleene, partly by urine, which will appeare bloudie, and partly alſo by ſeege: and this will be perceived ſenſibly by the tenth day of the cure. The leaves alſo bee diureticall, and a decoction made with them, provoketh urine. The ſame likewiſe are good for thoſe that cannot draw their wind but ſitting with their bodie upright. Being drunke in like manner, they helpe women who are in ſore travell, to ſpeedie deliverance, and fetch away the after-birth.

*Some take it for *Securidaca*, i. Axfitch. As touching *Pelecinum, it groweth as I ſaid before among corne, braunching thicke, and I
garniſhed with leaves like unto the cich peaſe. It beareth ſeed in certaine cods, which crooke in manner of little hornes, and thoſe be foure or five in number together. The ſaid ſeed reſembleth Gith, ſo farre as ever I could ſee, and is bitter, but good for the ſtomacke: one of the ingredients that goe into antidots and preſervatives againſt poyſon.

Polygala reacheth up with a ſtem a ſpan high, in the top wherof it beareth leaves reſembling the Lentils, of an aſtringent taſt, which being drunke, cauſeth nources to have plentie of milke in their breaſts.

Poterion, or as ſome call it, Phrynion or Neurada, brauncheth and ſpreadeth much: armed it is with ſharpe prickes, and beſides, full of a kind of thicke downe: the leaves be ſmall & round: the braunches ſlender, long, ſoft, and pliable: the flower in forme long, of a graſſe green colour. K
The ſeed is of no uſe in Phyſicke, but of a quicke and ſharpe taſt, odoriferous alſo, and pleaſant to the ſmell. It is found growing as well in waterie places, as alſo upon little hils. Two or three roots it hath, which run downe two cubits deepe into the ground full of cords or ſinewes, white, and of a firme and hard ſubſtance. About Autumne they uſe to dig round about it, having before cut the plant it ſelfe above ground, which yeeldeth thereby a juice like unto a gum. The root is (by report) of wonderfull operation in healing wounds, and eſpecially of ſinewes cut in ſunder, if it be applied thereto in a liniment. Alſo the decoction thereof drunke with honey in manner of a ſyrrup, helpeth the feebleneſſe and diſſolution of the ſinewes, and namely, when they be wounded and cut.

L

Phalangites by ſome is called Phalangion, by others Leucanthemon, or, as I find in ſome copies, Leucacantha. Little braunches it putteth foorth, never fewer than twaine, and thoſe tending directly a contrarie way. The flowers white, faſhioned like the red Lillie: the ſeed blacke, broad, and flat, ſhaped after the manner of halfe a Lentill, but much leſſe: and the root is of a greeniſh colour. The leafe, flower, and ſeed of this hearbe is a ſingular remedie againſt the venomous ſting of ſcorpions, the ſpiders Phalangia, and ſerpents; alſo for the wringing torments of the bellie.

As for Phyteuma, ſomewhat elſe I have to doe rather than to deſcribe it, conſidering there is no uſe of it but in amatorious medicines to procure womens love.

There is an hearbe called by the Greekes Phyllon, growing upon ſtonie mountaines ſtan- M
ding much upon a rocke. The female of this kind is of a deepe greene colour, the ſtem is ſlender, the root ſmall, the ſeed round, and like to that of Poppie. This hearbe ſerveth for the getting and conceiving either of boies or girles, according as the male or or the female is uſed: which differ only in ſeed or fruit, which in the male reſembleth an Olive that is new come forth

and

A and beginneth onely to ſhew. But both of them are for the ſaid purpoſe to be drunke in wine.

Phellandrion groweth in moorie grounds, and in leafe commeth neare unto garden Perſley: the ſeed thereof is good to be drunke for the ſtone, and the infirmities incident to the bladder.

As for Phalaris, it hath a long ſlender ſtem like unto a reed, in the top whereof it beareth a floure bending downward; and the ſeed reſembleth that of Seſama: and this alſo breaketh the ſtone, if it be drunke in wine or vinegre, or otherwiſe with milke and honey. The ſame cureth the accidents of the bladder.

Polyrrhizon is leafed like unto the Myrtle, and hath many roots, which being bruiſed, are given in wine againſt the poiſon of ſerpents; not onely if men but alſo if foure-footed beaſts bee ſtung by them.

B *Proſerpinaca likewiſe, being otherwiſe a common hearbe, is counted a ſoveraigne remedie againſt ſcorpions: the ſame ſtamped and incorporat with fiſh-pickle and oile, is (by report) a ſingular medicine againſt the pricke of ſcorpions. Over and beſides, it is ſaid, that if it bee but held under the tongue, it refreſheth thoſe who be over-travailed or any waies wearied, ſo as they have loſt their ſpeech with verie faintneſſe: but in caſe it bee ſwallowed downe the throat, it procureth vomit, which alwaies is good and holeſome for the Patient.

* Thought to be the ſame that *Poligonia* or Knotgraſſe above-named.

As touching Rhacoma, it is brought unto us out of thoſe countries which are beyond the kingdome of Pontus: a root it is much reſembling the blacke Coſtus, but that it is ſmaller and ſomewhat redder; alſo without any ſmell; hot at the tongues end and aſtringent: being punned, it is of a wine colour inclining to ſaffron: a liniment made of this root, doth mitigat all impoſtumes and inflammations; healeth wounds, and appeaſeth the violence of any theums taking a courſe to the eyes, eſpecially if it be applied with cuit: all marks remaining after ſtripes, & other
C places of the skin blacke and blew, it taketh away, if they bee annointed with it and vinegre together: the powder therof is good to be caſt upon old morimals and ulcers untoward to be healed: and being to the weight of one dram taken in water, it is ſingular for them that caſt up bloud: moreover, in caſe of the dyſenterie and the flux proceeding from imbecillitie of the ſtomacke, it is an excellent medicine to be taken in wine, if the Patient be free of the ague; otherwiſe, it would be given in water. For to pun or ſtampe this root more eaſily, it had need to lie and ſoke in water over night: the decoction thereof is given to drinke in double meaſure or quantitie for thoſe that be plucked with the crampe, burſen, and bruiſed; or to ſuch as have tumbled downe from
D ſome high loft. In pains of the breſt, there had need ſome pepper and myrrhe to be put thereto: in caſe the ſtomacke be feeble and cleane done, it ought to be taken in cold water: and whether it be given inwardly or applied outwardly, it helpeth all thoſe that void up filthie matter from the parts beneath: likewiſe it cureth ſuch as have weake livers, hard or ſwelled ſplenes, and the Sciatica: it healeth the infirmities of the kidnies, ſhortneſſe of wind, & ſtreightneſſe of breath, namely, when a man is driven to ſit upright for it. The hoarſeneſſe and roughneſſe of the throat it cureth, if either the powder be taken to the quantitie of three oboli in cuit, or the decoction drunke. The filthy tettars called Lichenes it ſcoureth away, applied unto them in a liniment with vinegre. In drinke, it diſſolveth ventoſities, riddeth away-through colds, and namely the ſhiverings and ſhakings in cold agues: it repreſſeth the yex or hicquet, appeaſeth the wrings of the bellie, clee-
E reth the windpipes, diſpatcheth the poſe, the murre, and heavineſſe of the head; ſtilleth the dizzineſſe of the head and turning of the braine occaſioned by melancholly humors: and finally aſſuageth all painfull laſſitudes, and is ſingular good for cramps or convulſions.

About the towne Ariminum there groweth an hearbe commonly knowne by the name of Reſeda: it reſolveth and diſcuſſeth all impoſtumes: it reduceth alſo into temperature any inflammation. But they that uſe to cure with this hearbe, muſt when they lay it to the place, ſay withall theſe words following; *Reſeda, morbos Reſeda, ſciſne ſciſne, quis hic pullos egerit? Radices nec caput nec pedes habeant.* That is to ſay, *Reſeda, cauſe theſe maladies to ceaſe: knoweſt thou, knoweſt thou, who hath driven theſe pullets here? Let the roots have neither head nor foot.* This charme (I ſay) they muſt pronounce three times over, and ſpit upon the ground as often.

F To conclude, Stœchas groweth in thoſe Iſlands onely which carrie that name and be called Stœchades: an odoriferous hearbe it is, bearing leaves like unto hyſſope, and is bitter in taſt: taken in drinke, it procureth womens moneths, and doth mitigat the pains of the breaſt. Alſo it is one of the ſpecies or ingredients entring into the preſervative compoſitions called Antidots.

G

Chap. xiii.

Of Nightshade: of Smyrnium, and Telephium. Of Trichomanes, Thalictrum, and Thlaspi. Of Tragonia, Tragonis, Tragum, Tragopogon, and Spondylis. Also, that some diseases are not incident to certaine countries.

NIghtshade, called in Latine Solanum, the Greeks name Strychnos, as saith *Cornelius Celsus:* an hearbe this is which hath a vertue repercussive and refrigerative.

Loveach, named otherwise Smyrnium, hath a stem like unto Persley, and the leaves be larger: it putteth forth many sions or imps from about the stem: and out of their concavities H there spring certaine fattie leaves, and those hanging as if they were broken, toward the ground; having an aromaticall smell, joyned with a certaine acrimonie which is not unpleasant: of a colour enclining to a weake and faint yellow. The stem beareth in the head certaine round spokie tufts in manner of Dill. The seed round and blacke, which waxeth to bee drie in the beginning of summer. The root is likewise redolent; but in tast quicke and biting, full of juice, soft and tender: the rind of which root, is blacke without, but pale within: the odour which it hath, testifieth the qualitie of myrrhe, whereupon it tooke the name * Smyrnium. This hearbe groweth upon hills, as well such as be rockie as those that bee altogither earthie. The nature of it generally, is to heat and extenuat. The leaves and root both provoke urine, and the monethly terms of women. The seed knitteth the belly, and staieth a laske. The root used in a liniment, discusseth all I impostumes, as well broken as not broken, so that they bee not inveterat and of long continuance: and in one word, resolveth all hardnesse in the flesh. Soveraigne it is against the pricke of the venomous spiders Phalangia, and the sting of serpents, being drunke in wine with Cachrys, Polium, or Baulme; with this charge, That it be taken peecemeale: for if it were taken entire and whole, it would provoke vomit: and for this cause otherwhiles it is given with rue. The seed or root, chuse whether you will, cureth the cough and difficultie of breath, when the Patient cannot take his breath but sitting upright. In like manner, it helpeth those who are diseased in the chest, spleene, reines, and bladder. The root hath a particular propertie to heale ruptures and convulsions: the same giveth speedie deliverance to women in travaile of child, and expelleth the after-birth: also for the Sciatica it is given in wine togither with Crestmarine, otherwise called Sampier: it procureth sweat, breaketh wind upward, and causeth rifting; whereby it riddeth K the stomacke of the ventosities that trouble it: it healeth wounds and bringeth them to cicatrize or skin againe. Out of the root there is a juice also pressed, good in womens infirmities, and in the maladies incident to the chest and precordiall parts; for it cleanseth, encreaseth naturall heat, and helpeth digestion. The seed hath a speciall operation to cure them that have a dropsie, given in drinke; like as the juice also applied in a liniment; and the rind of the foresaid root drie, incorporat in an emollitive cataplasme. Moreover, it is much used in meats togither with honyed wine, oile, fish-sauce named Garum, but principally if flesh meats be boiled togither therewith. It helpeth concoction in the stomacke, as having a savour and tast much like unto pepper. The same is right effectuall to allay the paine of the said stomacke. L

* For *Smyrna* in Greeke is myrrhe.

* Orpine.

As touching * Telephium, it is an hearbe in leafe and stem resembling Purcellane: immediatly from the root there spring seven or eight small shoots or braunches, and those garnished with grosse and fleshie leaves. It loveth to grow in toiled grounds, but principally among vines: whiles it is greene, it serveth in a liniment to fetch out spots and freckles in the visage: for which purpose also, it is good drie, beeing brought into powder: it mundifieth the skin also from the morphew, so that the place be annointed therewith every day or night six houres togither, for the space of three moneths, and afterwards well rubbed with barley meale. It healeth wounds besides and cureth fistuloes.

The Maidenhaire called in Greeke Trichomanes, is like unto Adiantum, only it is more slender and blacker: the leaves grow thicke in manner of Lentils, one over-against another, and M the same be bitter in tast. The decoction of this hearbe sodden in white wine, and so drunke with wine or rusticke cumin, cureth the strangurie: the juice keepeth the haire on the head, which is readie to fall off; or if it be shed alreadie, causeth new to come up againe in the place. The same beeing beaten to powder and incorporat with oile into a liniment, maketh the haire to grow thicke,

A thicke, where it is thin by occaſion of the infirmitie Alopecia. If it be taſted at the tongues end, it provoketh ſneezing.

Thalictrum [otherwiſe named Thalictrum] hath leaves made like unto Coriander, ſave that they be ſomewhat fattier, and in the ſtem reſembleth Poppie: it liketh any ground, but loveth eſpecially to grow upon plains: the leaves incorporat with honey, heale any ulcers.

Thlaſpi or Thlaſpe, is of two kinds: The one with narrow leaves, a finger long, and as broad as a finger breadth: the ſame grow inclining toward the ground, and in the head divided or ſlit: the ſtem is but ſlender and halfe a foot high, howbeit not altogither naked and without braunches. In forme, the fruit or cod reſembleth a buckler, encloſing ſeed within not unlike in ſhape to Lentils, but that it ſeemeth cruſht and broken, whereupon the plant tooke the name Thlaſpi:
B the floure which it beareth, is whitiſh. This hearb growethordinarily about common foot-paths and in hedges. The ſeed in taſt is hot and unpleaſant, working upon choller and fleame, which humours it doth evacuat upward and downward: the right doſe whereof is the meaſure of one acetable for a potion. Good it is alſo for the Sciatica, being miniſtred in a clyſtre untill it bring away bloud. Moreover, it procureth women their deſired ſickneſſe; but if they bee with child, it killeth that which they goe withall. The ſecond Thlaſpi, which ſome call the Perſian * Napi, hath broad leaves and great roots: this hearbe alſo is good to be clyſterized for the Sciatica: and as well the one as the other is ſoveraigne for the tumors or riſings in the ſhare: but the partie who gathereth it muſt have in charge to plucke it up with one hand, and ſay withall, That hee taketh it for the botches in the ſhare, for all impoſtumes and wounds.

*Or rather *Sinapi*, i. Senvie.

C As for Trachinia, I find not in any writer what manner of hearbe it ſhould be: and verely, I cannot beleeve that *Democritus* reporteth truly of it as he doth: for monſtrous it is and incredible which he promiſeth of it, namely, That in three daies it will waſt the ſplene, if the Patient do but weare it tied to any part of the bodie.

Tragonus or Tragion groweth upon the ſea-coaſts of the Iſland Candie onely: an hearbe in ſeed, leafe, and braunch, verie like vnto the Iuniper: a juice or liquor it yeeldeth reſembling milke, which gathering thicke to the conſiſtence of a gum, with once laying too, draweth forth arrow heads, thorns, or whatſoever ſticking within the fleſh: for which purpoſe, it ought to bee ſtamped greene, and ſo made into a liniment with wine; or elſe the powder of it drie, muſt be incorporat with honey. The ſame cauſeth nources to have good ſtore of milke in their breaſts,
D and is beſides an excellent medicine for the ſores and diſeaſes incident to that part.

There is another hearbe called Tragos, which ſome name alſo Scorpion: it groweth halfe a foot high, putting forth many ſhoots and braunches, but without leaves; in ſtead whereof you ſhall ſee prettie little berries or grapes (as it were) of a ruddie colour, of the bigneſſe of wheat corns, and pointed ſharpe in the head. This hearbe likewiſe groweth by the ſea ſide. Of theſe berries, ten or twelve kernels dried and beaten into powder, and ſo taken in wine, doe helpe the flux proceeding from a weake and feeble ſtomacke; in like manner thoſe alſo that have a bloudie flix, and that reach up bloud. They cure likewiſe women of the extraordinarie ſhifts of their monethly fleurs.

Moreover, there is an hearbe called Tragopogon, which others name Come: the ſtem
E thereof is ſmall, the leaves like unto thoſe of Saffron, the root long and ſweet; bearing aloft upon the top of the ſtem a certaine cup, which is broad and large, with blacke ſeed within it. In rough places it groweth commonly, among greeves and buſhes; but goodneſſe there is little or none at all in it.

Thus much verely as touching Hearbs, I thought memorable and worth the writing, which either I have ſeen my ſelfe, or learned from others: howbeit, for a farewell to this treatiſe, I thinke it not amiſſe to advertiſe the reader thus much more concerning Hearbs, That ſome of them keepe their ſtrength and vertue longer than others: for, as I have before noted, Elaterium continueth a world of yeers: the blacke Chamæleon laſteth fortie yeers good: but Centaurie will not endure above twelve: Harſtrang, Ariſtolochia, and the wild vine, may be preſerved ſound one
F yeere in the ſhade. Moreover, this would be obſerved, That of the hearbs above-named, there is not a living creature whatſoever will touch the roots, unleſſe it be Spondylis (and that is a kind of ſerpent) which indeed ſpareth none.

As for this one point, namely, that the roots of hearbs bee leſſe in force and of weaker operation, in caſe the ſeed be ſuffered to ripen upon the plant, no man maketh any doubt: as alſo

that their seeds be nothing so effectuall, if incision were made in the roots for to draw juice out of them, before the said seed is fully ripe. G

Furthermore, this is knowne and found by experience, That the ordinarie use of all Simples doth alter their properties and diminish their strength; insomuch, as whosoever is daily accustomed unto them, shall not find when need requires, their vertue powerfull at all, either to doe good or to worke harme, as others shall who seldome or never were acquainted with them.

Over and besides, all hearbs be more forcible in their operations, which grow in cold parts, exposed to the Northeast winds, likewise in drie places, than in the contrarie.

Also there is no small difference to be considered between nation and nation: for, as I have heard them say who are of good credit, as touching worms and such like vermin, the people of Ægypt, Arabia, Syria, and Cilicia, be troubled and infested with them: whereas contrariwise, some Græcians and Phrygians have none at all breeding among them. But lesse marvaile there is of that, considering how among the Thebans and Bœotians (who confine upon Attica) such vermin is rife and common; and yet the Atheniens are not given at all to engender and breed them: the speculation whereof, carrieth me away againe unto a new discourse of living creatures, and their natures; and namely, to fetch from thence the medicines which Nature hath imprinted in them, of greater proofe and certaintie than any other for the remedie of all diseases. Certes, this great Mother of all things, entended not that any living creature should serve either to feed it selfe onely, or to be food for to satisfie others; but her will was and shee thought it good, to insert and engraffe in their inward bowels, holesome medicines for mans health, to countrepoise those medicinable vertues which shee had engraven and bestowed upon those surd and senslesse hearbs: nay her providence was such, that the soveraigne and excellent means for maintenance of our life, should bee had from those creatures which are endued with life: the contemplation of which divine mysterie, surpasseth all others, and is most admirable. H I

THE XXVIII. BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS. K

Chap. I. L

The medicinable vertues of living creatures.

HAving discovered as well all those things which are engendred between Heaven and Earth, as also their natures; there remained nothing for me to discourse of, save onely the Minerals digged out of the ground: but that this late Treatise of mine, as touching the medicinable properties of Hearbs, Trees, and other plants, draweth me quite aside from my purpose, and haleth me backe againe, to consider the foresaid living creatures themselves (even the subject matter of Physicke) in regard of greater meanes found out even in them, to advaunce Physicke and cure diseases. For, to say a truth, since I have described and pourtraied both Herbs & Flours, since I have discovered many other things, rare and difficult to be found out; should I conceale such meanes for the health of man, as are to bee found in man himselfe? or should I suppresse other kind of remedies which are to bee had from creatures living amongst us, as wee doe, if they may benefit us? especially seeing that our verie life is no better than torment and miserie, unlesse M

we

A we be free from paine and ſickneſſe? No verely; and far be it from me that I ſhould ſo doe. But on the contrarie ſide, I will doe my beſt endeavour to perfourme and finiſh this taske alſo, how long and tedious ſoever it may ſeeme to bee: for my full intent and reſolution is, ſo I may benefit poſteritie and doe good to the common life of man, the leſſe to reſpect the pleaſing of fine eares, or to expect thanks from any perſon. And to bring this my purpoſe about, I meane to ſearch into the cuſtoms of forrein countries, yea and to lay abroad the rites and faſhions of barbarous nations, referring the readers who ſhall make ſcruple to beleeve my words, unto thoſe authours whome I alledge for my warrant. And yet herein, this care I have ever had, To make choiſe in my reports of ſuch things as have been held and in manner adjudged true, by a generall conſent and approbation of all writers; as coveting to ſtand more upon the choiſe ſubſtance, than the
B varietie and plentie of matter. But before I enter into this argument, I thinke it verie neceſſarie to advertiſe the reader thus much, That whatſoever I have heretofore written of living creatures, concerneth the inſtinct of Nature wherewith they be endued, and certaine ſimples wherof they have giuen us the knowledge (for ſurely, as much good have they done unto us by the medicinable hearbs by them found out, as poſſibly they can by the remedies which themſelves doe afford from their owne bodies:) But now it remaineth, to ſhew ſimply the medicinable & helpfull properties in themſelves, which notwithſtanding in the former treatiſe were not altogither left out and paſſed over. And therefore this my preſent diſcourſe of thoſe creatures, howſoever it is in nature different, yet it dependeth of the other. Begin then I will at Man himſelfe, to ſee what Phyſick there may be found in him to helpe his neighbour. In which firſt entrance of mine, there
C preſenteth it ſelfe unto mine eye, one object that troubleth and offendeth my mind exceeding much. For now adaies you ſhall ſee them that are ſubject to the falling evill, for to drinke the verie bloud of Fencers and Sword-plaiers as out of living cups: a thing, that when we behold within the ſame ſhew-place, even the tygres, lyons, and other wild beaſts to doe, we have it in horrour as a moſt fearfull and odious ſpectacle. And theſe monſtrous minded perſons are of opinion, That the ſaid bloud forſooth is moſt effectuall for the cure of that diſeaſe, if they may ſucke it breathing warme out of the man himſelfe; if they may ſet their mouth (I ſay) cloſe to the veine, to draw thereby the very heart bloud, life and all: how unnaturall ſoever otherwiſe it bee holden for a man to put his lips ſo much as to the wounds of wild beaſts, for to drinke their bloud. Nay, there be others that lay for the marow-bones, the very braine alſo of young infants, and never
D make ſtraunge to find ſome good meat and medicine therein. Yee ſhall find moreover among the Greeke writers not a few, who have deſciphered diſtinctly the ſeverall taſts as well of every inward part, as outward member of mans bodie; and ſo neare they have gone, that they left not out the paring of the verie nails, but they could picke out of them ſome fine Phyſick: as if health conſiſted in this, That a man ſhould become as bloudie as a ſavadge beaſt; or that be counted a remedie, which in deed is cauſe of a miſchiefe and maladie. And well deſerve ſuch bloud-ſuckers and cruell leeches to be fruſtrat of their cure, and thereby to worke their owne bane and deſtruction: for if it be held unlawfull and abominable to prie and looke into the entrails and bowels of a mans bodie, what is it then to chew and eat them? But what monſter was hee, who firſt broched this geare, and deviſed ſuch accurſed drugs! Ah wicked wretch, the inventer and artificer
E of theſe monſtroſities; thou that haſt overthrowne all law of humanitie; for with thee will I have to doe, againſt thee will I whet my tongue and turne the edge of my ſtyle, who firſt didſt bring up this bruiſh leechcraft, for no other purpoſe but to bee ſpoken of another day, and that the world might never forget thy wicked inventions. What direction had he who thus began to devoure mans bodie lim by lim? nay, what conjecture or gueſſe moved him ſo to doe? what might the originall and foundation be, whereupon this deviliſh Phyſicke was grounded? what ſhould he be that bare men in hand, and would perſuade the world, That the thing which is uſed as a poiſon in witchcraft and ſorcerie, ſhould availe more to the health of man, than other knowne and approoved remedies? Set caſe that ſome barbarous people uſed ſo to doe: ſay that ſtraunge nations and far remooved from all civilitie, had theſe manners among them, muſt the Greekes
F take up thoſe faſhions alſo, yea & credit them ſo much as to reduce them into a method, among other their goodly arts? And yet ſee what *Democritus* one of them hath done? there be extant at this day books of his enditing and penning, wherein you ſhall read, That the ſcull of a wicked malefactor, is in ſome caſes better than that of an honeſt perſon; and in other, That of a friend and gueſt, preferred before a ſtraunger. As for *Apollonius*, another of that brood, hee hath writ-

ten, That if the gumbs be ſcarrified with the tooth of a man violently ſlaine, it is a moſt effectuall G
and preſent remedie for the tooth-ach. *Artemon* had no better receit for the falling ſickneſſe, than to draw up water out of a fountaine in the night ſeaſon, and to give the ſame unto the Patient to drinke in the brain-pan of a man who died ſome violent death, ſo he were not burnt. And *Antheus* tooke the ſcull of one that had been hanged, and made pills thereof, which hee miniſtred unto thoſe who were bitten by a mad dog, for a ſoveraigne remedie. Moreover, theſe writers not content to uſe theſe ſorceries about men, emploied the medicines alſo of the parts of man to the cure of foure-footed beaſts; and namely, if kine or oxen were dew-blowne or otherwiſe puffed up, they were woont to bore holes through their horns, and ſo to inlay or interlard them (as it were) with mens bones: finally, when ſwine were diſeaſed, they tooke the fine white wheat Siligo, being permitted to lie one whole night in the very place where ſome men were kil- H
led or burnt, and gave it them to eat. As for mee, and all us that are Latin writers, God forbid we ſhould defile our papers with ſuch filthineſſe: Our intention is to put downe in writing, thoſe good and holeſome medicines which man may affourd unto man, and not to ſet abroad any ſuch deteſtable and heinous ſorceries: As for example, to ſhew what medicinable vertue there may be in breaſt-milke of women newly delivered; what healthfull operation there is in our [faſting] ſpittle; or what the touching of a man or womans bodie may availe in the cure of any maladie; and many other ſemblable things ariſing from naturall cauſes. For mine owne part verely, I am of this mind, That we ought not ſo much to make of our health or life, as to maintain and preſerve the ſame by any indirect courſe and unlawfull means: And thou, whoſoever thou be, that doeſt addict thy ſelfe to ſuch villanies whiles thou liveſt, ſhalt die in the end a death anſwe- I
rable to thy beaſtly and execrable life. To conclude therefore, let every man for to comfort his heart, and to cure the maladies of his mind, ſet this principle before his eies, That of all thoſe good gifts which Nature hath beſtowed upon man, there is none better than to die in a fit and ſeaſonable time: And in ſo doing, this is ſimply the beſt, *That in his power it is, and the means he hath, to chuſe what death hee liſt.

* Looke for no better divinitie in *Plinie*, a meere Pagan, Epicurean, and profeſſed Atheiſt.

Chap. II.

Whether Words, Spels, or Charmes, are availeable in Phyſicke. Alſo whither wonders and ſtrange prodigies may be either wrought and procured, or put by and avoided by them, or no. K

THe firſt point, concerning the remedies medicinable drawne from out of man, which moveth the greateſt queſtion, and the ſame as yet not decided and reſolved, is this, Whether bare Words, Charmes, and Enchauntments, be of any power or no? If it be granted Yea, then no doubt ought wee to aſcribe that vertue unto man. But the wiſeſt Philoſophers and greateſt Doctors, take them one by one, doubt thereof, and give no credit at all thereto. And yet goe by the common voice of the whole world, you ſhall find it a generall beleefe, and a blind opinion alwaies received, whereof there is no reaſon or certaine experience to ground upon. For firſt and formoſt we ſee, that if any beaſt be killed for ſacrifice without a ſett forme of praier, it is to no purpoſe, and held unlawfull: ſemblably, if theſe invocations bee omitted, when as men ſeeke to L
any Oracles, and would be directed in the will of gods by beaſts bowels or otherwiſe, all booteth not, but the gods ſeeme diſpleaſed thereby. Moreover, the words uſed in craving, to obtaine any thing at their hands, run in one forme; and the exorciſmes in diverting their ire, & turning away ſome imminent plagues, are framed after another ſort: alſo there bee proper tearmes ſerving for meditation onely and contemplation. Nay, we have ſeene and obſerved, how men have come to make ſuit and tender petitions to the ſoveraigne and higheſt magiſtrats, with a preamble of certaine ſet praiers. Certes, ſo ſtrict and preciſe men are in this point about devine ſervice, that for fear leaſt ſome words ſhould be either left out, or pronounced out of order, there is one appointed of purpoſe as a prompter to read the ſame before the prieſt, out of a written booke, that hee miſſe not in a tittle; another alſo ſet neare at his elbow, as a keeper to obſerve and marke, that he M
faile not in any ceremonie or circumſtance; and a third ordained to goe before and make ſilence, ſaying thus to the whole aſſembly and congregation, *Favete linguis*, [*i.* ſpare your tongues and be ſilent:] and then the fluits and haut-bois begin to ſound and play, to the end that no other thing bee heard for to trouble his mind or interrupt him the while. And verely, there have been

A been memorable examples knowne of ſtrange accidents enſuing both waies, namely, as often as either the unluckie foules by their untoward noiſe * have diſturbed and done hurt, or if at any time there have been error committed in the preſcript praier & exorciſme: for by this meanes it falleth out oftentimes, that all on a ſuddaine as the beaſt ſtandeth there in place to be ſacrificed, the maiſter veine in the liver, named the head thereof, is found miſſing among other entrailes, and the heart likewiſe wanting: or contrariwiſe, both theſe to bee double and appeare twaine for one. And even at this day there remaineth a moſt notable precedent and example to all poſteritie, in that preſcript forme of exorciſme, whereby the two *Decij*, both the father and ſonne, betooke themſelves to all the helliſh furies and fiends infernall: Moreover, the imprecation of the veſtall Nun *Tuccia*, when ſhee was put to proove her virginitie, continueth extant upon record; by vertue of which charme ſhee carried water in a ſieve without ſhedding one drop: which happened in the yeare after the foundation of Rome citie 609. And verely, no longer agoe than of late time in our owne age, wee ſaw two Grecians, to wit a man and a woman, yea, and ſome of other nations, with whome in thoſe daies wee maintained warres, buried quicke within the beaſt market in Rome: in which manner of ſacrifice, whoſoever readeth the praier or exorciſme that is uſed, and which the Warden or principall of the Colledge of the Quindecemvirs is wont to read & pronounce to the exorciſt; he would no doubt confeſſe, that ſuch charmes & execrations be of great importance: and namely, ſeeing they have ben all approved and found effectuall by the experience and events obſerved for the ſpace of * eight hundred and thirtie yeares. As for our veſtall virgins in theſe our daies, wee are certainely perſuaded and beleeve, that by the vertue of certaine ſpels and charmes which they have, they be able to arreſt and ſtay any fugitive ſlaves for running one foot farther, provided alwaies, that they be not gone alreadie without the pourpriſe and precinct of the citie walls. Now if this be received once as an undoubted and confeſſed truth, and if we admit that the gods doe heare ſome praiers, or be moved by any words; then ſurely we may reſolve at once of theſe conjectures, and conclude affirmatively of the maine queſtion. Certes, our aunceſtours from time to time have evermore beleeved and delivered ſuch principles, yea, and that which of all other ſeemeth moſt incredible, they have affirmed conſtantly, That by the power of ſuch charms and conjurations, thunder and lightening might bee fetched downe from above (according as I have ſhewed in place convenient.) *L. Piſo* reporteth in the firſt booke of his Annales or yearly Chronicles, that *Tullus Hoſtilius* king of Rome, was ſtricken dead with lightening, for that when hee went in hand to call *Iupiter* downe out of heaven, by vertue of a ſacrifice which king *Numa* was wont to uſe in that caſe, hee had not obſerved exactly all the exorciſmes and ceremoniall words contained in thoſe books of king *Numa*, but ſwerved ſomewhat from them. And many other writers doe teſtifie, that by the power of words and oſſes, the deſtinies and prodigies of great importance preſaged to one place, have beene cleane altered and transferred to another: as it was like to have happened to the Romanes, at what time as they laid the foundation of *Iupiters* temple upon the mount or rock Tarpeius. For when they digged there for the foundation of the ſaid temple, and chaunced to find within the ground a mans head; the Senat of Rome ſent certain embaſſadours of purpoſe to the Sages and Wiſards of Tuſcane, to know the ſignification of this ſtraunge ſight and miraculous occurrent. Whereof *Olenus Calenus* (who was reputed the moſt famous devinor and prophet of all the Tuſcanes) having ſome intelligence, and foreſeeing the great felicitie and happineſſe that it imported and preſaged, intended by a ſubtile interrogative to tranſlate the benefit thereof to his owne native countrey of Tuſcane. Having therefore firſt with a ſtaffe ſet out and deſcribed (as it were) the modell and form of a temple, upon the ground which lay before him; he came about the Romane embaſſadours beforeſaid, and queſtioned with them in this wilie manner: Is it ſo Romanes as you ſay? And are theſe your words indeed? There muſt be a temple here of *Iupiter* that moſt gracious and mightie god: We have light here upon a mans head. Vnto which interrogation of his, the ſaid Roman embaſſadours according to the inſtructions which they had received beforehand from the Wiſard or Divinors ſonne, anſwered in this manner: No, not here in this very place, but at Rome (we ſay) the head was found. And verely, our auncient Chronicles doe all of them moſt conſtantly affirme, that had they not been thus forewarned and taught what to ſay, but had ſimply anſwered Yea, here we have found a head, &c. The fortune of the Romane State and Empire had gone quite away to the Tuſcanes, and been eſtabliſhed among them. The ſame had like to have happened a ſecond time, as wee may ſee in the records and monuments of old date,

* Which is called *Obnuntiatio dicarum*, as wee may read in *M. Tull. de Divinatione*, 1.

* In which yeare it ſeemeth *Plinie* wrote this worke.

date, when as a certaine chariot with foure horses, made of cley, and prepared for to be set upon the laver or lanterne of the said temple, chaunced as it lay baking in the furnace to grow into an extraordinarie bignesse. For the foresaid Wise men of Tuscane being asked what the said prodigie should betoken, practised the like, as *Olenus* did: but the Romanes beeing wise and warie in their words, saved and retained the same fortune still for the behoose of Rome, which was presaged unto them by that happie foretoken. These examples may suffice to shew & proove evidently, that the vertues and significations of these signes and presages doe lie in our owne power: and are no otherwise of force and effect, but according as every one of them is so taken * and accepted. True it is, and held for an undoubted principle in the Augures discipline and learning, That neither cursed execrations, ominous and unluckie birds, nor any other presage by their flight singing and feeding, can touch those persons who take no heed of them, and doe protest plainly, that they regard them not, what businesse soever they goe about and be entring into: A greater gift than which, and testimonie of the divine indulgence and favour of the gods unto us, we cannot have, thus to subject their secrets to our puissance. Moreover, in the lawes and ordinances of the twelve tables here at Rome, are not in one place these very words to be found, *Qui fruges occentasit*, [*i. Whosoever shall enchaunt or forespeake any corne or fruits of the earth*:] and in another place, *Qui malum carmen incantasit*, [*i. What person soever useth pernicious charmes to the hurt or mischeese of any creature*?] Over and besides, *Verrius Flaccus* doth affirme upon the credit of certaine authors which he alledgeth and beleeveth, That the first thing which the ancient Romans were wont to doe at the siege and assault of any towne or citie, was by their priests to conjure and call forth that god or goddesse which was the patron or patrones thereof; and withall to promise unto the said god or goddesse, either the same place againe, or else a greater and more spacious seat; yea, and the like divine worship, or better, among the Romanes: and even at this day our Pontifies or Bishops have the charge of this sacred ceremonie among other functions belonging to their ministerie. And hereupon well knowne it is, that for this cause and nothing else, it was never divulged abroad, what god was the protector and patrone of Rome cittie, for fear least some of our enemies should assay to conjure him forth, and deale by us as wee doe by them. Furthermore, who is ther that is not afraid of all maledictions and cursed execrations; and especially when the *names of the infernall fiends or unluckie foules are used in such bannings? For feare likewise of some harme, see wee not that it is an usuall thing to *crush and breake both egge and fish shels, so soone as ever the meat is supped and eaten out of them; or else to bore the same through with a spoone stele or bodkin? From hence came those amatorious eidyls and eclogues of *Theocritus* among Greeke Poets, of *Catullus* and *Virgil* among us, full of amorous charmes, in imitation of such exorcismes and conjurarions indeed. I assure you many folke there be of this beleefe, That by certain spels and words in manner of charmes, all the pots and vessels of earth baking in a furnace, may bee cracked and broken, without touching them at all. And there are not a few who are persuaded for certaine, that even the very serpents as they may bee burst by enchauntment, so they can unwitch themselves: and that as brutish otherwise and earthly as they be, yet in this one thing they have a quicke sence and understanding, insomuch, as at the charmes of the Marsians they will shrinke from them and draw in their bodies round into a knot, though it were in the night season when they lie asleepe. Some there be also that when a skarefire hath taken an house, write certaine *words upon the walls, and thereby limit and confine the fire, that it shall goe no farther. Certes, I am not able to say, whether straunge, forain, and ineffable words hard to bee pronounced, are more availeable to the effecting of these incredible things, or our Latin words, comming out at a venture unlooked for and spoken at randon: which must needs seem ridiculous in our judgement, seeing that the spirit and mind of man, expecteth alwaies some great and mightie matter in these conjurations and exorcismes, which may carie a majestie therewith to encline and move the gods to mercie and favour, or rather indeed to commaund their heavenly power perforce. But to proceed, *Homer* the Poet hath written, that prince *Vlyxes* being wounded in the thigh, staunched the bloud with a charme. And *Theophrastus* testifieth, that there be proper spels to cure the Sciatica. *Cato* hath left in writing, that there is a speciall charme for dislocations, whereby any bone put out of joint may be set againe. And *M. Varro* reporteth the like vertue of certaine good words for the gout. As for *Cæsar* the Dictatour, it is commonly said of him, that having beene once endaungered with the fall or overthrow of his coach wherein he rode, would never afterwards ride in coach againe, unlesse so soone as ever hee had

*Whereupon it was thought materiall to speake in this manner *Accipio omen*. For otherwise it availed not.

*As in saying thus, The Devill take thee, or, The Ravens peck out thine eies, or I had rather see thee Pie peckt: and such like.

* Because afterwards no witches might pricke them with a needle in the name and behalfe of those whom they would hurt and mischeefe, according to the practise of pricking the images of any person in wax; used in the witchcraft of these daies.

*That is to say *Avse verse*, out of *Afranius*, as *Festus* noteth, which in the old Tuscane language signifieth *Averte igneum*: Put backe the fire: * or rather the sonnes of *Autolicus*, in his *Odyssea*.

A had taken his place, and before that he ſet forward upon his way, hee had pronounced a certaine charme that he had in ſtore: and perſuaded he was, that if hee ſaid it over three times together, he ſhould come by no miſchaunce in his journey, but travell in ſecuritie. A thing that I know many now adaies to practiſe ordinarily as well as he. But for farther proofe and confirmation of this opinion, I report mee to every mans conſcience and knowledge; to that (I ſay) which there is not one but knoweth: What is the cauſe I pray you, that the *firſt day of every yeare wee ſalute one another for lucke ſake, with wiſhing a good new yeare? What is the reaſon, tell me, that in all our publicke proceſſions and generall ſolemnities every fift yeare for the health and good eſtate of the cittie, they *made choiſe of ſuch perſons for to lead the beaſts appointed to ſacrifice, whoſe *names were good and fortunat? Or how commeth it about, that for to prevent or divert witch-
B craft and ſorcerie, we obſerve a peculiar adoration, and invocat upon the Greekiſh [goddeſſe of vengeance] *Nemeſis*; in which regard onely, wee have her ſtatue or image ſet up in the Capitoll, notwithſtanding wee know not yet what name in Latine to give her? How is it, that in making mention of thoſe that be dead, we ſpeake with reverence and proteſt that we have no meaning to diſquiet their ghoſts thereby, or to ſay ought prejudiciall to their good name and memoriall? If there be nothing in words, how happeneth it I would faine know, that wee have ſuch an opinion of odde numbers, beleeving that they be more effectuall in all things than the even? A matter I may tell you of great conſequence, if we doe but obſerve the criticall daies in fevers. Alſo in the gathering of our firſt fruits, be they Peares, Apples, Figges, &c. wherefore uſe we to ſay, Theſe be old, God ſend us new? What moveth us to wiſh health and ſay, God helpe, or bleſſe, when one
C ſneezeth? for even *Tiberius Cæſar*, who otherwiſe was knowne for a grim ſir, and the moſt unſociable and melancholicke man in the world, required in that manner to bee ſalved and wiſhed well unto, whenſoever he ſneezed, though he were mounted in his chariot. And ſome there be who in this caſe ceremoniouſly doe ſalute the partie by name, and thinke there is a great point of religion lies in that. Moreover, is not this an opinion generally received, That when our ears do glow and tingle, ſome there be that in our abſence doe talke of us? *Attalus* avoucheth for a certaintie, that if a man chaunce to eſpie a ſcorpion, and doe no more but ſay this one word *Duo, the ſerpent will be ſtill and quiet, and never ſhoot forth his ſting. And now ſeeing by occaſion of mentioning a ſcorpion, I am put in mind of Affricke, you ſhall underſtand thus much, that throughout all that countrey there is not one goeth about to doe any thing, but before he begins he ſaith
D this word *Africa. As for other nations, in every enterpriſe that men take in hand, they uſe the name of their gods, and pray ordinarily, that it would pleaſe them to give a grace and bleſſing to their attempts. As for this ceremonie, namely, when the table is ſpread & furniſhed with viands, to lay a ring from the finger upon it, wee ſee it commonly and orderly practiſed; and that it is of force to put by many ſcrupules and religious doubts it is very evident. You ſhall ſee ſome men to take the ſpittle out of their mouths, and conveigh it with their fingers end behind the eare, for to rejoice the heart and drive away all penſiveneſſe and melancholicke fanſies that trouble the mind. And to bend or bow downe the thumbes when wee give aſſent unto a thing, or doe favour any perſon, is ſo uſuall, that it is growne into a proverbiall ſpeech, to bid a man put downe his thumbe in token of approbation. In adoring the gods and doing reverence to their images, wee
E uſe to *kiſſe our right hand and turne about with our whole bodie: in which geſture the *French obſerve to turne toward the left hand; and they beleeve that they ſhew more devotion in ſo doing. As touching the manner of worſhipping and adoring flaſhes of lightening, all nations with one accord and conformitie doe it with a kind of *whiſtling or chirping with the lips. If there bee mention made of skarefires at the table as we ſit at meat, we hold it ominous, but wee turne away the perilous preſage thereof, by ſpilling and caſting water under the bourd. When one riſeth from his meat and is readie to depart, if they of the houſe goe in hand preſently for to ſweepe the floore and make all cleane: as alſo to take away diſhes, trenchers, &c. upon the bourd; or to remoove the cupbourd of plate, & liverie table, whiles one of the gueſts is a drinking, are thought to be moſt unfortunat tokens, and to preſage much harme. *Servius Sulpitius* a principall perſon
F of our cittie, hath written a treatiſe of this argument, wherein hee giveth a reaſon why we ſhould not leave or ſhift our trenchers at every courſe or change of diſhes; for in thoſe dais there were no more allowed than there ſat gueſts at the tables, and thoſe were ſerved but once for all. If one chaunce to ſneeſe after repaſt, the order is to call for a diſh of meat and a trencher againe to be ſet upon the bourd: and in caſe he taſt not of ſomewhat afterward, it is thought a moſt fearefull and

*i. The firſt of March.

*Dicis cauſa, i. pro forma.

* As *Valeſius, Lucius, Salvius, Statorius, &c.* which are ſignificant, and import by the very letter ſome happines and proſperity.

*i. Two.

*i. Affricke.

*Which faſhion was afterwards taken up in doing reverence to princes and great perſons.

*Wheras other nations obſerved to turne to the right hand, as appeareth by *Plautus, Quorne veram neſcio*, B. *Si deos ſalutas Dextrorſum cenſeo.*

**Poppyſmus*, in ſetting our lips cloſe together, and drawing the breath inward, as our manner is in playing with a tame Sparrow, or chearing up and making much of an horſe.

*Of the ſpeciall providence of God: *Plinie* ſpeaketh like himſelfe, a Heathenish infidell.

and curſed preſage on his behalfe: like as to ſit at the table and eat nothing at all. *See how ceremonious thoſe men were, and what preciſe ordinances they inſtituted; who were of beleef, that in all our affaires and actions, and at all times, the divine power of God was preſent: and that by theſe meanes they left them pacified for all our ſinnes and vices. Neither is there an end heere: for over and beſides it hath beene marked, that many times all the table is huſht, and ther is not a word heard from one end to the other: but this is noted never to happen but when the gueſts make a juſt even number. But what doth this ſilence preſage? Surely, every one of them *ſhall be in daunger to looſe or empaire his credit, good name, and reputation. Moreover, if a peece of meat chaunced to fall out of the hand downe to the floore, it was taken up and delivered upon the bourd againe, where it paſſed from one to another, and went through the table: but in anie wiſe they were forbidden to blow therupon, for to cleanſe it from the duſt or filth that it caught. Furthermore, they have proceeded thus farre, as to gather preſages from ſuch things as happen juſt at the time whiles one either ſpeaketh or thinketh of the ſame. But of all others this was counted a moſt execrable token, in caſe it chaunced that the Pontifie or high Prieſt, ſitting at the table *pro forma*, and for order ſake at any ſolemne feaſt or ſacrifice, let fall a morcell of meat: but if the ſame were laid upon the bourd againe, and afterwards burnt and ſacrificed to the familiar gods of the houſe *Lares*, it was thought a ſufficient expiatorie ſatisfaction. Semblably, men are of opinion, That if any medicines purgative or others, fortune to be ſet upon a table before they bee given to the patient for to drinke, they will doe no good at all, but looſe their operation. Alſo there is a ſuperſtitious ceremonie in paring the nails of the fingers, during the market daies held at Rome, with this charge, that the partie hold his tongue and bee ſilent all the while, and begin at the forefinger: and this forſooth concerneth the money of many a man. Likewiſe, as great a matter as that, lieth in ſtroking or handling the haire of the head, either upon the ſeventeenth day after the chaunge of the Moone, or the nine and twentieth; for a ſpeciall meanes this is to keepe the haire on, which is given to fall, as alſo to eaſe the head-ach. Moreover, the peaſants in the countrey obſerve this cuſtome in many mannors and farmes of Italie, to forbid their wives and women to ſpin as they walke up and downe abroad in the ſtreet or any common way of paſſage, or to carie their rockes and diſtaves unoizened or bare: for this opinion they have, that in ſo doing they prejudice the hope of all fruits, and the corne eſpecially growing in the field for that yeare. Not long ſince, *M. Servilius Nonianus* (who in his time was a principall cittizen of Rome) to prevent the blearedneſſe of his eyes which he feared, before that either any man elſe foretold him of that diſeaſe, or himſelfe once named it, tooke a little peece of paper, and wrote therein theſe two capitall Greeke letters P and A, which he lapped round & faſt tied with a linnen thred, and ſo wore it hanging at a lace about his necke under his throat. *Mutianus* (who had been thrice Conſull of Rome) obſerved the ſame effect by wearing a flie alive within a little rag of white fine linnen cloth: and both of them did highly commend theſe medicines of theirs, reporting that by thoſe meanes they were free from bleared eyes. Finally, wee read of certaine charms and ſpels againſt ſtormes of haile: againſt ſundrie ſorts of diſeaſes, and namely for any part that is burnt or ſcalded, and verely ſome of them have ben proved by experience to be effectuall. But for mine owne part abaſhed I am and aſhamed to put them down in writing, conſidering how diverſly men are affected in mind. And therfore to conclude this matter, I leave every man to himſelfe to give credit or otherwiſe unto them at his owne pleaſure and diſcretion.

*Fœnæ labor eſt.

*Which answere to our *R.* and *A.*

Chap. iii.

Remedies proceeding from man, for the cure of diſeaſes.

IN my former Treatiſe as touching ſtraunge and woonderfull nations, I ſpake of certaine races of men which were of a monſtrous nature, and caried a venomous regard and looke in their very eyes: beſides many other properties of beaſts, which here to repeat were needleſſe. Howbeit, in this place I thinke it not amiſſe to note, that ſome people there be whoſe bodies bee from top to toe all medicinable and holeſome unto others. As for example, the men of thoſe families which doe terrifie ſerpents, and drive them away with their very preſence: who alſo are of this nature, that they be able to cure and eaſe ſuch as are ſtung alreadie either by touching onely, or elſe by a medicinable ſucking of the place: Of which kind are the Pſylli and Marſi: thoſe alſo in the Iſland *Cyprus, whom they call Ophugenes: and of this race and houſe there came an Embaſſadour

*or *Paros.*

A ſador out of the ſaid Iſland, whoſe name was *Exagon*, who by the commandement of the Con- *Euegon.
ſuls was put into a great tun or pipe wherein were many ſerpents, for to make an experiment and triall of the truth: And in very deed the ſaid ſerpents licked his body in all parts gently with their tongues, as if they had been little dogs, to the great wonder of them who beheld the manner of it. A man ſhall know thoſe of this familie (if any of them remaine at this day) by this ſigne, that they breath a ſtrong and ſtinking ſent from them, eſpecially in the Spring ſeaſon. Now, theſe people beforenamed had not onely a gift to cure folke with their ſpittle, but their very ſweat alſo had a medicinable vertue againſt the ſting of ſerpents. For as touching thoſe men who are born and bred in Tentyrus (an Iſland lying within the river Nilus) ſo terrible they be unto the Crocodiles, that they will not abide ſo much as their voice, but flie from them ſo ſoone as they heare it.
B Moreover, it is knowne for certaine, that all the ſort of theſe people, who have their bodies thus priviledged by that ſecret antipathie in nature betweene them & ſerpents, are able to eaſe thoſe who are ſtung, if they doe but come in place where they be: like as a wound will bee more angry and ſore, if they come neare who at any time before have been hurt by ſting of ſerpent or tooth of mad dog: ſuch alſo carrie about with them in their bodies ſo venomous a qualitie, that their onely preſence is ynough to marre the eggs that a brood-hen ſits upon, and make them all addle; yea, and to drive ewes and other cattaile to caſt their young before the time: ſuch a virulent propertie remaineth ſtill behind in their bodies who have beene once ſtung and bitten, that notwithſtanding they be cured thereof, yet venomous they are now and hurtfull to others, who beforetime were poyſoned themſelves. But the onely way to remedie this inconvenience, is to cauſe
C them to waſh their hands before they enter into the roume where the patients lie, and with the ſame water to be ſprinckle and waſh them who are to be cured. Again, this is to be obſerved, that whoſoever at any time have been pricked with a ſcorpion, ſhall never afterwards be ſtung by hornets, weſpes, or bees. A ſtraunge thing this is no doubt, howbeit, no great wonder to them who know, that a garment or cloth which had been uſed at funerals, will never bee afterwards moth-eaten: and how that ſerpents hardly can bee plucked out of their holes, unleſſe it bee by the left hand.

Chap. IIII.

Of certaine Sorceries: and the properties of a mans ſpittle. Alſo againſt Magicians.

D

THe inventions of *Pithagoras* as touching numbers, beare a great ſtroke in theſe matters, and lightly miſſe not: but principally in this, That the ſaid Philoſopher would give judgement by the vowels contained in the proper name of any perſon, concerning their fortunes: For in caſe the vowels were in number odd, hee pronounced, that if the partie ever proved lame of a lim, loſt an eie, or met with any ſuch like accidents, the ſame ſhould happen upon the right ſide of the bodie: but contrariwiſe, if the number of vowels were even, then theſe infirmities ſhould befall the left ſide. Furthermore, it is commonly ſaid, that if one take a ſtone, dart, or inſtrument of ſhot, wherewith a man hath killed theſe three living creatures, a man, a wild Bore, and a Bear,
E one after another, and that with one ſingle ſtroke to every one of them; and fling the ſame clean over an houſe where there is a woman in hard travell of childbirth, ſo as it light on the other ſide without touching any part thereof, the woman ſhall preſently bee delivered. More reaſon there is that a *light javelin or Pertuiſane ſhould doe this feat, which had been drawne forth of a mans bodie, ſo as it never touched the ground after: for doe but bring this murdering javelin into the place where a woman is in labour, it will forthwith procure her deliverance. *Orpheus* and *Archelaus* doe write much after the ſame manner of arrowes pulled out of mens bodies, namely, That if care be had that they touch not the earth, and then be laid under the bed where man or woman lieth, they will cauſe the parties to be enamoured upon them that beſtowed the ſaid arrowes there. And theſe authors report moreover, That the veniſon of any wild beaſt killed with the ſame weaF pon which was the death of a man before, is ſingular for to cure the falling ſickneſſe.

*Velitaris haſta, which alſo was called Celibaris

As ſome men there be whoſe bodies all throughout be medicinable, ſo there bee others who have certaine parts onely of the ſame vertue, according as I have written alreadie concerning the thumbe of king *Pyrrhus*. In the citie Elis alſo the inhabitants were wont to ſhew as a wonderfull monument the rib of *Pelops*, which they avouched to bee all of Ivorie. And even at this day,

many

many there are who make great ſcruple to ſhave or clip the haire growing in any molle or wert upon the face. As touching the faſting ſpittle eſpecially of man or woman, I have ſhewed alreadie how it is a ſoveraigne preſervative againſt the poyſon of ſerpents. But that is not all: for in many other caſes it is found by daily experience to be of great operation, and to worke effectually. For firſt and formoſt, if we ſee any ſurpriſed with the falling ſickneſſe, we ſpit upon them, and by that meanes we are perſuaded, that we our ſelves avoid the contagion of the ſaid diſeaſe. *Item*, An ordinarie thing it is with us to put by the daunger of witchcraft, by ſpitting in the eyes of a witch: ſo doe we alſo, when we meet with one that limpeth and is lame of the right leg. Likewiſe when we crave pardon of the gods for ſome audacious and preſumptuous praiers that we make, we uſe to ſpit even into our boſomes. Semblably, for to fortifie the operation of any medicines, the manner is to pronounce withall a charm or exorciſme three times over, and to ſpit upon the ground as often; and ſo we doubt not but it will doe the cure and not faile. Alſo when we perceive a fellon or ſuch like uncom ſore a breeding, the firſt thing that wee doe, is to marke it three times with our faſting ſpittle. I will tell you of a ſtrange effect, and whereof it is no hard matter ywis to make the triall. If one man hath hurt another, either by reaching him a blow neare at hand, or by letting flie ſomewhat at him farther off, and repent him when hee hath ſo done; let him preſently ſpit juſt in the middeſt of the palme of that hand which gave the ſtroke, the partie immediatly that was ſmitten, ſhall be eaſed from paine, and take no harme thereby. And verely wee find this to bee ſo, by experiments oftentimes made upon the bodies of fourefooted beaſts: for let them be ſwaied in the backe, or hipped by ſome ſtripe given them with ſtone or cudgill, doe no more then but ſpit into that hand which did the deed, & ſtreightwaies they will go upright again upon all foure. Contrariwiſe, ſome there be, who before they either ſtrike or diſcharge any thing from them againſt another, after the ſame manner firſt ſpit into the ball of their hands, & ſo they make account to doe a greater diſpleaſure, and to hurt more daungerouſly. But this wee may aſſure our ſelves, that there is not a better thing in the world for to kill tettars, ringwormes, and the foule leprie, than to rub and wet them continually with our owne faſting ſpittle: likewiſe to annoint therewith every morning our eies, keepeth them from being bleared. Alſo cankerous ſores are cured with the root of Sowbread, which we call the earth apple, if the ſame be wrought into a ſalve with our faſting ſpittle. Moreover, if a man have a cricke and ach in the nape of his necke, let him take the ſpittle of a man that is faſting, ſome in his right hand, and therewith annoint the ham of his right leg; and the reſt with his left, and doe the like to the left leg: and thereupon he ſhall find eaſe. If an earewig or ſuch like vermine be gotten into the eare, make no more ado but ſpit into the ſame, and it will come forth anone. Among countercharmes & preſervatives againſt forcerie, theſe be reckoned; namely, that a man ſpit upon his owne urine as ſoone as he hath delivered it out of his bodie: likewiſe to ſpit into the ſhoe that ſerveth his right foot, before he put it on in a morning: alſo whenſoever hee goeth over or paſſe by a place where ſometime hee was in daunger, to remember that he ſpit upon it. *Marcion* of Smyrna, who wrote a Treatiſe of the vertues and effects of Simples, reporteth, that the Scolopendres of the ſea will burſt in ſunder if one ſpit upon them: and ſo will hedge toads and other venomous Frogs. *Ophilius* writeth, that ſpittle will doe the like by ſerpents, if one ſpit into their mouths as they gape. As for the learned *Salpe*, ſhe ſaith, that if one perceive any member or part of the bodie be aſleepe and benummed, there is not a better thing to recover the ſence therof, than to ſpit into the boſome, or to touch the upper eyelids with faſting ſpittle. Now, if we beleeve theſe things to be true, we may as well give credit to all that which followeth. Wee ſee it is an ordinarie thing, that if a ſtranger come in place where a babe lieth in the cradle, or looke upon the ſaid infant whiles it is aſleepe, the nurce uſeth to ſpit thrice: although I am not ignorant that there is a religious opinion of this ſillable * Mu, that it is able to defend ſuch young ſucklings; as alſo of the fooliſh puppet *Faſcinus*; both which are of power to put backe any witchcraft from them, and returne the miſcheeſe upon the eyebiting witch. And ſince I am light upon this name, I muſt let you underſtand that this *Faſcinus* is holden to be a god forſooth, the gardian & keeper not of infants onely, but of great captains and brave generals of the field; who hath divine ſervice done unto him at Rome among other gods, and that by the veſtall Nuns: for the manner was to hang this ridiculous puppet under the chariots of noble victorers riding in triumph, not only to defend them by a medicinable power againſt the venome of envious and ſpightfull tongues, but alſo to return all envie upon them, and bid as it were to take it among them. The like vertue there is in the tongue, beſeeching fortune to bee pro-

G H I K L M

* *Mu tueatur*, As *Turnebius* found it in an old copie: And conſidering the fooleries both before & after mentioned, this will ſort well ynough with ſuch ſtuffe: and namely their *Faſcinus* in the old time (which was *turpicula res, quale membrum virile*) hanging about childrens necks to withſtand the miſcheefe that might come by the eye, called in Latine *Faſcinum* alſo: for a witch would not willingly ſettle her eye long upon ſuch a beaſtly and filthie obiect.

A propitious and favourable unto them: Fortune (I ſay) who ordinarily commeth after to whip and
punish them, as the ſcourge and tormentreſſe of glorie and honour. Over and beſides, the tooth
of a man, eſpecially when he is mad, is reckoned to be as daungerous and pernicious a biting as
any other. The excrement found in mans ears, called ear-wax, is thought in this caſe to be ſove-
raigne: and let no man marveile thereof, conſidering how it will heale the ſting of ſcorpions and
ſerpents alſo, if it be applied to the place preſently: but it is the better and more effectuall, if it
be taken out of the Patients owne ears, who is thus wounded: and in that ſort it healeth alſo the
whitflaws and impoſtumations that breed about the naile roots. Moreover, take a mans or wo-
mans tooth, and ſtampe it into powder, it is thought good for the ſting of a ſerpent. The haire of
young boy-children which is firſt clipped off, is held to be a ſingular remedie for to aſſuage the
B painfull fits of the gout, if the ſame be tied faſt about the foot that is grieved: and generally their
haire, ſo long as they be under fourteen yeers of age, eaſeth the ſaid anguiſh, if it be applied unto
the place. Likewiſe, the haire of a mans head cureth the biting of a mad dog, if it be laid to the
place with vinegre: it healeth alſo the wounds in the head, applied with oile or wine. But if it were
plucked from his head whiles he hangeth upon the gallows, then is it ſoveraigne for the quartan
ague: But we may chuſe whether we will beleeve it or no. Certainly the haire of the head burnt
to aſhes, is knowne to be verie good for a cancerous ulcer. If a woman take the firſt tooth that a
young child caſt, ſet it in a bracelet, and ſo weare it continually about her wreſt, it will preſerve her
from the pains and grievances of her matrice & naturall parts. Tie the great toe and that which
is next unto it togither, you ſhall ſee how it will allay any riſings and tumours in the ſhare. Bind
C gently the two middle fingers of the right hand, with a linnen thread, marke of what force this
remedie is to repreſſe the rheume falling into the eies, and how it will keepe them from beeing
bleared. If all be true that is commonly ſaid, the ſtone that one hath voided and thruſt out of the
bodie, eaſeth all others that be pained with the ſtone, if the ſame be kept faſt tied to the ſhare: al-
ſo it doth mitigat the griefe of the liver; and procureth ſpeedie deliverance to women in travaile
with child. *Gramus* affirmed moreover, that in all theſe caſes it would doe the better, if one were
cut for it, and that it were taken forth of the bladder by way of inciſion. If a woman be neare her
time and looks every day to fall to labour and crie out, let the man come by whome ſhe is with
child, and after he hath ungirt himſelfe, gird her about the middle with his owne girdle, and un-
looſe the ſame againe, ſaying withall this charme, *I tied the knot, and I will undoe it againe*, and
D therewith goe his waies, ſhe ſhall ſoone after fall to her buſineſſe and have more ſpeedie delive-
rance. *Orpheus* and *Archelaus* both, doe affirme, That if the ſquinancie be annointed with man
or womans bloud (it skilleth not out of what veine or part of the bodie it iſſued) it is an excellent
remedie for that diſeaſe. The like effect it hath, if their mouths bee rubbed with the ſaid bloud,
who being overtaken with the epilepſie, are falne downe, for immediatly thereupon they will riſe
and ſtand upon their feet. Some write, That if the great toes be pricked untill they bleed againe,
the drops that come forth worke the like effect in the falling ſickneſſe, ſo that the face of the Pa-
tient be ſprinkled or beſmeared therewith: or if a maiden touch the parties face that lieth in a fit
of the ſaid diſeaſe, with her bare thumbe or great toe, hee ſhall come againe to himſelfe and re-
cover. By which experiment, Phyſicians going by conjecture, are of opinion, That ſuch perſons
E ſubject to that diſeaſe, ſhould feed of the fleſh of * ſuch beaſts as never were with young. *Æſchi-*
nes a Phyſician of Athens, was woont to cure ſquinſies, the inflammations of the amygdals, the
infirmities of the uvula, and all cancerous ſores, with the aſhes of a man or womans body burnt:
and this medicine he called Botryon,

* *Virgines carnes.*

Many maladies there be, that go away the firſt time that either a man hath carnall knowledge
of a woman, or that a maiden ſeeth her monethly ſickneſſe: but if they end not at ſuch a time,
commonly they proove chronicke diſeaſes and contiue a long time, and eſpecially the falling
ſickneſſe. It is ſaid moreover, That the companie of a woman eaſeth them very much who are
ſtung with a ſcorpion: but women in the ſame caſe catch harme by that meanes. Some ſay alſo,
that if the eies bee dipped three times in that water wherein a man or woman hath waſhed their
F feet, they ſhall be troubled neither with bleerednesſe nor any other infirmitie. And others there
be who affirme, that the wens called the Kings evill, the ſwelling kernels alſo behind the ears, and
the ſquinancie, are cured with touching the hands of them that have died a violent and untimely
death. Some ſtand not ſo much upon that point, but ſay, That the backe of the hand of any one
that is dead (it skilleth not how nor by what means) if it touch the grieved part, will worke the like

effect, ſo that the dead partie and the Patient be both of one ſex. As for the toothach, it is a com- G
mon ſpeech, That if one bite off a peece of ſome tree that hath been blaſted, or ſmitten with
lightning, provided alwaies that he hold his hands behind him at his backe in ſo doing, the ſaid
morſell or peece of wood will take away the toothach if it be laid unto the tooth. Some there be
who give direction to take the perfume of a mans tooth burning in the fire, for to eaſe the tooth-
ach of a man; and ſemblably of a womans tooth to helpe women in the ſame caſe. Others you
ſhall have, that preſcribe to draw one of the eye-teeth, called in Latin Canini, out of the head of
man or woman lying dead and not yet enterred, and to weare the ſame againſt the toothach. It is
a common ſpeech, That the earth found in or about a man or womans ſcull, is a ſingular depila-
torie, and fetcheth away the haire of the eyebrows. As for the graſſe or weed that groweth there-
in (if any ſuch may be found) it cauſeth the teeth to fall out of the head with chewing only. As alſo H
that no ulcer will ſpread farther but keep at a ſtay, if there be a circle drawn about it with the bone
of a man or womans bodie. As touching the cure of a tertian ague, ſome there be who lade up
water out of three pits, as much out of one as another, and mingle all togither; which done, they
put the ſaid water into a new earthen pot that never was occupied before, and begin to the Pati-
ent out of it, giving the reſt unto him or her for to drink, when the fitt commeth. But for the quar-
tan ague, they get me a broken fragment of a wooden pin which held the ſides and croſſe-peece
of a paire of gallows togither, wrap it within a locke of wooll, and ſo hang it about the Patient:
or elſe they take a peece of the halter or rope from the gallows, and uſe it in like manner for the
foreſaid purpoſe: but wot ye what? when the Patient is by this means rid of the fever, the ſaid par-
cell of wood or cord they uſe to burie or beſtow cloſe in ſome hole within the ground, where the I
Sun may never ſhine of it, and then the acceſſe will returne no more. See the toies and vanities
of theſe Magicians! and yet theſe be not all: for they run on ſtill and ſay, that if one take a whet-
ſtone which hath ſerved a long time to whet knives and other edge-tools on, and lay the ſame un-
der the bouſter or pillow where one lieth that is readie to faint and give up the ghoſt upon ſome
indirect means, by ſorcerie, witchcraft, or poiſoning, (but this muſt bee done without the know-
ledge of the ſaid partie) you ſhall from the verie mouth of the Patient heare, what poiſon was gi-
ven, in what place, and at what time; but who it was that gave it, hee or ſhee ſhall not be able to
name. Moreover, this is knowne for a truth, That if one be ſtrucken ſpeechleſſe with lightning,
and then the bodie be bent and turned toward the wounded place, the partie ſhall recover pre-
ſently and ſpeake againe. Some there be, who to drive backe and keepe downe the biles and bot- K
ches that riſe in the ſhare, take the thread or yarne out of the weavers loome which ſerve for the
ſelvedge or liſt, making ſeven or nine knots, and in the knitting of everie one of them name
ſome widow or other, and then tie it faſt about the grieved place. Alſo for to aſſuage the paine
of any wound, they give order, that the wounded partie take a naile or ſome other thing that one
hath troden under foot, and to weare the ſame tied about the necke, arme, or other part of the
bodie. For to be rid of werts, ſome chuſe a time to plucke them up by the roots, when the moon
is twentie daies old at leaſt, and then lay themſelves along upon their backes in ſome ordinarie
high way, looking fully upon the moone, and ſtretching their armes backeward as far as they can
beyond their heads, and looke what they can catch hold of with their hands, therewith they rub
the place. If one cut and pare an agnell or corne in any part of the bodie, obſerving a time when L
a ſtarre ſeemeth to ſhoot or fall, they ſay, it will quickly weare away and be healed for ever. They
would beare us in hand, that if a man poure vinegre upon the hooks and hindges of doores, and
make a liniment with the durt that commeth of the ruſt thereof, and therewith annoint the fore-
head, it will aſſuage the head-ach. They promiſe alſo to doe as much with a withie or halter that
a man is hanged withall upon a gibbet, in caſe it be done about the temples of the head in man-
ner of a frontall. Moreover, if any fiſh-bone ſticke in the throat and will not remoove, it ſhall in-
continently goe downe, if the partie readie thus to be choked withall, put his feet into cold wa-
ter: but if ſome peece of any other bones be readie to choke one, make no more adoe, but take
ſome other little ſpils of the ſaid bone and lay them upon the head, you ſhall ſee it paſſe away and
doe no harme. If a peece of bread have gone wrong or lie in the way readie to ſtop the breath, M
take the crums of the ſame loafe & put them into both the ears, you ſhall ſee it will be ſoon gone
and do no farther harme. Furthermore, the Greeks (who were given much to make mony of eve-
rie thing, and namely of their publicke places of bodily exerciſe) made great account of certaine
excrements that came from mens bodies, as ſingular remedies for many diſeaſes: for the filth

that

A that was ſcraped and rubbed from the bodies of wreſtlers, &c. ſerved to mollifie, to heale, reſolve, and incarnat; a medicine conſiſting of ſweat & oile tempered togither: with it they uſed to cure the inflammations, contractions, diſtortions, and riſings of the matrice, by application outwardly: therewith they would draw downe the monthly fleurs of women; lenifie the intemperat heat; and diſſolve piles and ſwelling bigs in the ſeat or fundement: they uſe the ſame alſo for to aſſuage the griefe of the ſinews, to rectifie diſlocations and ſet the bones in joynt, and to diſcuſſe the nodoſities of the joynts. Howbeit, the ſcrapings that come of ſweating in banes and hote-houſes, be counted of greater validitie in all theſe infirmities, and therefore no marveile if they enter into the compoſition of maturative emplaſtres, and which bring an impoſtume to ſuppuration.
As for the foreſaid medicines which ſtood upon ſweat, oile wherewith wreſtlers were annointed,
B and ſome urine mingled among, they be good only to mollifie the nodoſities of the joynts: for as they heat and reſolve more effectually, ſo in the other reſpects nothing ſo forcible they are as thoſe that be gathered out of ſtouves and bains. Verely a man would not beleeve to what ſhameleſſe and impudent curioſitie ſome authors are growne unto (and even thoſe of all others who be moſt renowmed) who bath not with open mouth to commend unto us that, for a ſingular remedie againſt the pricke of ſcorpions, which I am not willing to name, even the filthie ſperme that paſſeth from a man by his privities. Neither could they ſtay there, but to cauſe barraine women for to teeme and beare children, they have found out a proper peſſarie to bee put up into their ſecret parts, made forſooth of the ordure that commeth away from infants ſo ſoon as they be out of their mothers wombe: and this medicine they have a prettie name for, and call it Meconion.
C Moreover, the Greeks have gone ſo neare, that they have ſcraped the very filth from the walls of their publicke halls and places of wreſtling, and ſuch like exerciſes; and the ſame (ſay they) hath a ſpeciall excalfactorie vertue, whereby it diſcuſſeth and reſolveth the biles and impoſtumes called Pani; and ſerveth as a ſoveraigne liniment to heale the ulcers in the bodies of children and old folke, yea and to skin any place that is galled, raw, & bliſtred with burning. Lo what remedies have ben found in the bodie of man! And ſurely ſince I have taken the pains to put them down, I may not omit thoſe voluntarie medicines which depend upon his mind, & proceed from his will and underſtanding. In the firſt place, you ſhall have ſome that will faſt and forbeare all kinds of meat; others drinke not at all; one while they abſtaine from wine onely, another while from all fleſh meats: and you ſhall ſee divers men never come unto bath or baine, everie one according
D as their ſickneſſe doth require. And this kind of abſtinence or regiment of themſelves, they hold to be the readieſt and ſureſt means to recover their health. In the ranke of theſe remedies, are reckoned bodily exerciſe, ſtreining of the voice, unction, ſcratching, and rubbing, as need and occaſion requireth: for hard and vehement friction doth conſtipat and bind the bodie: contrariwiſe, gentle and ſoft frictions doe mollifie and open the pores: and, as much rubbing taketh downe the bodie and cauſeth leanneſſe, ſo that which is moderat ſetteth it up and encreaſeth fatneſſe: but nothing is there more holeſome than walking and geſtation; which is an exerciſe performed many waies. If the ſtomacke be weake, and the legs feeble, riding on horſebacke is an excellent exerciſe: for the phthyſicke or conſumption, nothing ſo good as to ſaile or be rowed upon the * water: but in caſe there be a long diſeaſe hanging upon a man, what better thing in the
E world than to change the aire, and remove from place to place? In like manner to procure ſleepe, by lying in ſome pretie bed that may be rocked too & fro, is oftentimes good for a mans health: as alſo to vomit now and then, but in no wiſe to uſe it ordinarily. Lying in bed upon the backe, is commended for the infirmities of the eies; but upon the bellie, for the cough. To lie upon the ſides ſhifting from one to the other, is held to be ſingular againſt rheums and catarrhes. *Ariſtotle* and *Fabianus* doe ſay, That we be given to dreame at the Spring and Fall, more than in the other ſeaſons of the yeere: alſo, moſt when we lie with our face upward, but never groveling. And *Theophraſtus* affirmeth, That ſleeping upon the right ſide, helpeth forward the concoction of meat in the ſtomacke: whereas they that lie upon their backe ſhall not have ſo quicke digeſtion.
The manner of bathing alſo and uſing the baine and hote-houſe (which is one of the chiefe and
F principall means of our health) is in a mans power to order as hee liſt himſelfe: like as hee may chuſe what kind of friction hee will in the ſtouph or hote-houſe, either to be rubbed with linnen cloths, or well curried and ſcraped with kombs. *Item*, it is knowne to bee verie good and holeſome, to waſh ones head with hote water, before hee enter into the baine or hote-houſe; and after that hee is out of it, to doe the like with cold water: as alſo to take a draught of cold water

* Specially upon the ſea.

immediatly before meat, and to do as much between meals: likewiſe to drinke the ſame to bedward, yea and other-whiles in the verie night, ſo as we ſleepe both before and after: where, by the way this would be noted, That no living creature elſe but man alone, delighteth to drinke any drink hot; know then hereby, that ſuch kind of drinks be not naturall. Finally, to waſh the mouth with wine before one goeth to bed, for a ſweet breath: likewiſe ſo ſoone as he is up betimes, with cold water againſt the toothach, ſo as he doe it three or five times togither, or at leaſt-wiſe obſerving ſuch an odd number: as alſo to bath the eies in a morning with oxycrat, that is to ſay, with vinegre and water mingled togither, to preſerve them for beeing bleared, are ſinguſar and approoved experiments. G

Chap. v. H

Obſervations as touching Diet, and the manner of our feeding, for the regiment of health.

LIke to the former rules is this alſo, as touching our Diet, That it be not too preciſe, but ſo as we may feed indifferently of all viands, & acquaint our bodies with varietie of meats; which is obſerved to be the beſt way to maintaine our health: and in verie truth, *Hippocrates* ſaith, That to eat but one meale a day, that is to ſay, to forbeare dinners, is a diet that will dry up a mans bodie within, and bring them ſoon to age and decay. But this aphoriſme of his he pronounced as a Phyſician to reclaime us from that hungrie and ſparing diet, and not as a patron and maintainer of full feeding and gourmandiſe: for I aſſure you, a temperat and moderat uſe of our meats, is the holſomeſt thing that is for our bodily health. But *L. Lucullus* was ſo ſtrict herein, that he ſuffered himſelfe to be ordered and over-ruled by his own ſervant, who would not let him eat but as he thought good: in ſuch ſort, that it was no ſmall diſgrace unto him in his latter daies thus to make his man his maſter, and to bee governed by him rather than by his * own ſelfe: for was it not (thinke you) an approbrious ond ſhamefull ſight, to ſee a * ſlave and no better, to put his lords hand from a diſh of meat, being an aged gentleman as hee was, and who in times paſt had rode in triumph: to gage him thus (I ſay) and keepe him ſhort, though he were ſet among great States at a roiall feaſt within the capitoll of Rome? I

* For every man is to be his owne Phyſician: whereupõ might riſe this proverbe, *A foole, or a Phyſician.*

* Thought to be *Calliſthenes* his Phyſician: for in thoſe daies Phyſicians were reckoned but ſervants to ſuch perſons as *Lucullus* was.

Chap vi. K

Of Sneeſing. The uſe of Venerie: and other means which concerne mans health.

SNeeſing diſchargeth the heavineſſe of the head, and eaſeth the poſe or rheume that ſtuffeth the noſe: and it is commonly ſaid, That if one lay his mouth to the noſthrils of a mouſe or rat and touch the ſame, it will doe as much. To ſneeze alſo, is a readie way to bee rid of the yex or hicquet. And *Varro* giveth counſell, to ſcrape a braunch of a * Date tree with one hand after another by turnes, for to ſtay the ſaid hicquet. But moſt Phyſicians give direction in this caſe, to ſhift a ring from the left hand to the longeſt finger of the right; or to plunge both hands into verie hot water. *Theophraſtus* ſaith, that old men doe ſneeze with more paine and difficultie than others.

As touching carnall knowledge of man and woman, *Democritus* utterly condemned it: and why ſo? Becauſe (quoth he) in that act, one man goeth * out of another. And to ſay a truth, the leſſe one uſeth it, the better it is for bodie and mind both: and yet our profeſſed wreſtlers, runners, and ſuch gamſters at feats of activitie, when they feele themſelves heavie or dull, revive and recover their lively ſpirits again by keeping companie with women. Alſo this exerciſe clenſeth the breaſt and helpeth the voice, which beeing ſometime before cleare and neat, was now become hoarſe and ruſtie. Moreover, the temperat ſports of *Venus*, eaſe the paine of the reins and loins, mundifie and quicken the eye-ſight, and be ſingular good for ſuch as bee troubled in mind and given overmuch to melancholy. L

Moreover, it is held for witchcraft, to ſit by women in travaile, or neare unto a Patient who hath a medicine either given inwardly or applied unto him, * with hand in hand, croſſe-fingred one between another: The experience whereof was well ſeene (by report) when ladie * *Alcmena* was in labour to be delivered of *Hercules*. And the worſe is this peece of ſorcerie, in caſe the partie hold the hands thus joyned a-croſſe one finger within another about one or both knees. Alſo M

* *Palmã alterna manu ſcalpere*: unleſſe hee meaneth [to ſcratch the palm or inſide of the hand, &c.] which anſwereth ſomewhat to the remedies next following.

* *Homo alius exiliret ex homine*: which *Dalecampius* expõndeth thus, For that a man in that action, goeth beſide himſelfe.

* For it holdeth women in pain ſtill, & hindreth the operation of Phyſicke.

* There was an old witch that by this means kept her in a long and tedious travaile.

A to sit crosse-legged, with the ham of one leg riding aloft upon the knee of the other, and that by turns shifting from knee to knee. And in verie truth, our auncestors time out of mind, have expressely forbidden in all counsels of State, held by princes, potentats, and Generals of the field, to sit hand in hand or crosse-legged: for an opinion they have, That this manner of gesture hindreth the proceeding and issue of any act in hand or consulted upon. They gave out likewise a streight prohibition, That no person present at any solemnitie of sacrifices or vowes making should sit or stand crosse-legged or hand in hand in manner aforesaid.

As for veiling bonnet before great rulers and magistrats, or within their sight, *Varro* saith, it was a fashion at first not commaunded for any reverence or honour therby to be done unto governours, but for health sake; and namely, that mens heads might be more firme and hardie, by
B that ordinarie use and custome of being bare.

When a mote or any thing els is falne into one eye, it is good to shut the other hard. If there be water gotten into the right eare, the manner is to jumpe and hop with the left leg, bending and enclining the head toward the right shoulder: semblably, if the like happen to the left eare, to doe the contrarie. If one be falne into a fit of coughing, the way to stay it is to let his next fellow spit upon his forehead. If the uvula be falne, it will up againe, if the Patient suffer another to bite the haire in the crowne of his head, and so to pull him up plumbe from the ground. Hath the necke a cricke or a paine lying behind, what better remedie than to rub the hams? Be the hams pained? doe the like by the nape of the necke. Say the crampe take either feet or leggs plucking and stretching the sinews when one is in bed, the next way to be used, is to set the feet upon the
C floore or the ground where the bed standeth: or put case the crampe take the left side, then be sure with the right hand to catch hold of the great toe of the left foot: and contrariwise, if the crampe come to the right leg, doe the like by the right foot. If the bodie fall a shaking and quivering for cold, or if one bleed excessively at the nosthrils, it is passing good to bind streight and hard the extreame parts, to wit, hands and leggs, yea and the ears also. It falleth out oftentimes, that one cannot lye drie nor hold his water, but it commeth from him ever and anon; what is then to be done? mary tie the foreskin of his yard with a linnen thread or a papyr rush, & withall, bind his thighs about in the middle. If the mouth of the stomacke be readie to turne, and will neither receive nor hold any thing, it is good to presse hard and straine the feet togither, or els to thrust both hands into hot water.

D To come now unto our speech and exercise of the tongue: in many cases and for divers causes, it is holesome to speake but little. I have heard say, that *Mecænas Messius* enjoyned himselfe three yeeres silence, and during that time never spake word, for that in a fit of a convulsion or crampe, he had before time cast up bloud. In case any thing be readie to fall or rush violently against us, and that wee be in daunger of some stroke, say that wee be climbing up hill, or turned downe backeward, or lying along, there is not the like means againe to preserve our bodies, as to hold our wind: and this invention wee had from a bruit and dumbe beast, according as I have shewed before.

Moreover it is said, that to sticke downe a spike or yron naile in that verie place where a man or womans head lay during the fit of the falling sickenesse, at the verie first time that he or she fell,
E secureth the partie that so doth, for ever beeing troubled with that disease. Also it is holden for a singular thing to mitigat the intollerable torments of the reins, loins, and bladder, to pisse with the bodie bending forward and groveling in the bathing tubs within the bains. As for greene wounds, it is wonderfull how soone they will be healed, in case they be bound up and tied with a * *Hercules* knot: And verely it is thought, that to knit our girdles which we weare about us every day with such a knot, hath a great vertue in it, by reason that *Hercules* first devised the same.

* Wherein no ends are to be seene, they are so close couched, & therefore hardly to be unlooſed.

Demetrius, in a treatise that he compiled as touching the number of foure, affirmeth that it is of great efficacie; and he alledgeth reasons why it is not good to prescribe in any medicine to be drunke, the quantitie of foure sextars or foure cyaths. To rub the ears behind, is supposed to be verie good for them that are given to he bleare-eyed: like as to rub the forehead, for weeping
F or watering eyes.

Concerning the signs of life and death which may be found in man, this is one, That so long as the Patients eye is so cleare that a man may see himselfe in the apple of it, wee are not to despaire of life.

As for the Vrine of mankind, divers authors have treated of it; who as I find, have not onely

ſet downe their reaſons in nature as touching the vertue thereof, but alſo have been verie ceremonious and ſuperſtitious in handling that argument; yea and they have written diſtinctly of the ſeverall kinds of urine digeſted into certaine principall heads. And among other things, I remember, that they ſet downe the urine of * men that are unable for generation, to be ſingular good by way of injection, to make women fruitfull. But to ſpeake of ſuch remedies as we may be bold to name with honeſtie: the urine of young children who be not yet undergrowne nor fourteene yeers of age, is good againſt the venomous humour of thoſe Aſpides or Adders which the Greekes name * Ptyades, for that they ſpit their poiſon upon the eyes and faces of men and women. Alſo, the ſame is held to be ſingular for the pearle, the cataract, the filmes, the pin and web in the eyes; like as for the eye-lids alſo, and the accidents happening unto them. Being incorporat with the floure of Ervile, it is good for ſun-burnings: ſodden alſo with bolled leeks to the conſumption of the one halfe in a new earthen pot which was never occupied, it is excellent to mundifie the eares that run with matter, or that have any worms or vermin within them: and verely a ſtouph made with the vapour of this decoction, bringeth downe the deſired ſickneſſe of women. Dame *Salpe* ordaineth to foment the eies with the ſaid decoction, for to fortifie the ſight, and to ſtrengthen them that they fall not out of the head: ſhee appointeth to make a liniment with it and the white of an egg, but principally if it be of an oſtrich, and therewith to annoint the skin that hath been tanned and burnt in the Sun, for the ſpace of two houres togither: with it a man may waſh away any blots or blurrs of inke. Mans urine is much commended for the gout in the feet, as we may ſee by Fullers, who never be goutie, becauſe ordinarily their feet are in mens urine. Stale chamber-lie or urine long kept & incorporat togither with the aſhes of oyſter ſhels, cureth the red-gombe in young infants, and generally all running ulcers: The ſame ſo prepared, ſerveth in a liniment for eating cankers, burns, and ſcalds, the ſwelling piles, the chaps and rifts in the ſeat and feet, alſo for the ſting of ſerpents. The moſt expert and skilfull midwives have pronounced all with one reſolution, That for to kill an itch in any part of the bodie, to heale a ſcald head, to ſcoure away dandruffe and ſcurfe in head or beard, and to cure the corroding ulcers in any place, but in the privie members eſpecially, there is not a liquor more effectuall than urine, with a little ſal-nitre put thereto. But ſurely, everie mans owne water (if I may for reverence of manhood ſo ſay) is ſimply beſt; and namely, if the Patient that is bitten with a dog doe ſtraightwaies bath the place therewith: or in caſe there be any pricke of urchin, hedgehog, or ſuch like ſpill ſticking in the fleſh, to apply the ſame thereto in ſpunges or wooll, and ſo let it lye on. But ſay it was a mad dog that bit the Patient, or that he be ſtung with a ſerpent, it is good to temper it with aſhes and lay it unto the ſore. For as touching the vertue thereof againſt Scolopendres, it is wonderfull what is reported, namely, That whoſoever be hurt by them, if they doe wet the crowne of their heads but with one drop of their owne urine, it will preſently cure the ſame, ſo as they ſhall feele no more paine nor harme thereby. Over and beſides, by the ſpeculation of our urine, we are able to give judgement and pronounce of health and ſickneſſe; for if the firſt water made in a morning be white and cleare, and the next after it higher coloured and enclining to a deepe yellow, the former ſheweth that concoction was then begun, and the ſecond is a ſigne that digeſtion is now perfect. A red urine is naught, but the blacke is worſt of all: likewiſe if it be full of bubbles and froth aloft; and be withall of a groſſe and thicke ſubſiſtence, the ſame is but a bad water. If the Hypoſtaſis or Sediment which ſettleth heavie to the bottom, be white, it ſignifieth that there is ſome paine and greevance like to enſue about the joynts or principall parts within the bodie. Doth an urine looke greeniſh? it betokeneth ſome obſtruction or diſeaſe alreadie in the noble bowels and inwards: Is it of a pale hew? it ſaith that choller aboundeth in that bodie: If it looke red, the bloud be ſure is predominant and diſtempered. The urine is not to be liked but preſageth daunger, wherein there appeare certaine contents like brans and blackiſh clouds. Alſo a white, thin, and wateriſh urine is never good: but in caſe it be thick and of a ſtinking ſmell withall, it is a deadly ſigne, and there is no way but one with the Patient. As for children, if their water be thin and wateriſh, it is but ordinarie and naturall.

The magicians expreſſely forbid in making water, to lay bare the nakedneſſe of that part againſt Sun and Moone, or to piſſe upon the ſhadow of any perſon. And therefore *Heſiodus* giveth a precept, to make water againſt a wall, or ſomething ſtanding full before us, for feare leaſt our nakedneſſe being diſcovered, might offend ſome God or Angell. To conclude, *Hoſthanes* doth upon his warrant aſſure us, That whoſoever droppeth ſome of his owne urine everie morning

* *Spadonum.*

* Ἀπὸ τῶ πτύειν, ἀ ſpuendo, *i.* of ſpitting.

G H I K L M

A morning upon his feet, hee ſhall be ſecured againſt all charmes, ſorceries, and deadly poyſons whatſoever.

Chap. vii.

The remedies that womens bodies doe miniſter.

THe medicines which are ſaid to proceed from the bodies of women be ſuch, and the operations ſo miraculous, that they come nearer to the nature of monſtrous wonders than true reports of naturall works: to ſay nothing of much miſcheefe and many wicked parts committed by the meanes of their untimely births and infants ſtill borne, which have been diſmembred & cut in peeces for ſome abominable practiſes: to let paſſe the ſtrange expiations wrought by their monthly tearmes, and a thouſand more deviſes which have been delivered & ſet abroad not onely by midwives, but alſo by ſecret harlots that have ſlipt their conceptions, and beene delivered in corners. But to ſpeake of the foreſaid remedies which are in ure, & commonly known. The perfume that the haires of a womans head make whiles they burne, chaſeth away ſerpents. The ſmell thereof alſo raiſeth and reviveth women, who in a fit of the mother lie ſpeechleſſe and breathleſſe. The aſhes verely of the ſaid haires burnt in ſome earthen pan or fiſh ſhell, being applied alone or with litharge of ſilver, is a ſingular medicine for the aſperitie of the eyes, and the itch. *Item*, It taketh werts away, and cureth the red gum and ſores that infants bee ſubject unto, if it be uſed with honey. The ſame aſhes mingled with Honey and Frankincenſe, healeth wounds in the head, and doth incarnat or fill up with good fleſh hollow ulcers whatſoever they bee. And incorporat with ſwines lard, it is good for the broad biles called Pani, for the gout, and S. *Anthonies* fire: it ſtaieth alſo any bleeding preſently, and ſtoppeth the running of ringwormes and ſuch like.

Touching womens milke, it is holden by a generall accord, of all other to be ſweeteſt and moſt delicat: whereupon it is preſcribed by Phyſicians unto thoſe that have lien of a long and languiſhing fever; as alſo to ſuch as be troubled with a flux occaſioned by a feeble ſtomack: but in theſe caſes, that milke is reputed moſt wholeſome which a nource giveth that hath newly weaned her child: beſides, when the appetite of women is given to an inordinat longing after ſtrange things, in agues alſo, in gnawings and frettings of the ſtomacke, it is found by experience to be moſt effectuall. Likewiſe, beeing incorporat with Frankincenſe, it is ſingular good for the impoſtumes breeding in womens breaſts. If the eyes be bloudſhotten upon any ſtripe, if they bee in paine, or troubled with a violent rheume falling into them, let a nource milke it in them, they ſhall find very much eaſe thereby: howbeit for the accidents abovenamed, it is held to be more ſoveraign, in caſe it be applied to the place together with honey and the juice of the daffodill, or els with the pouder of frankincenſe: where by the way this would be obſerved, that for what uſe ſoever milke is emploied, that is ordinarily of more force which a woman giveth that bare a man child: but if ſhee was brought to bed of two twins, both boies, then it is beſt and moſt effectuall; provided alwaies, that the mother her ſelfe doe forbeare drinking of wine, and eat no meats or ſauces that be ſharpe. Moreover, this is knowne for certaine, that if womans milke be incorporat with the liquid white of an egge, and ſo applied to the forehead with wooll wet in the ſaid liquour, it ſtaieth the flux of humors into the eyes. Moreover, a ſoveraigne remedie is milke againſt the venomous ſlime or ſpittle of toads, in caſe they piſſe or ſpurt it into our eyes. Alſo if they have bitten one, there is not a better thing either to bee drunke or dropped upon the ſore, than breſt milke. It is a common ſaying, That whoſoever can meet at one time together with the milke of mother and daughter both, ſhall never need to feare all their life long any infirmities of the eyes, ſo they bee annointed or bathed therwith. Semblably, womens milke is ſingular for to cure the accidents befalling to the eares, if it be dropped in with a little* Opium put thereto: but if ſo be the eares are pained by reaſon of ſome ſtripe that they have received, the ſaid milke would have ſome Gooſe greaſe mixed with it, and ſo be inſtilled warme. And ſay that they have a ſtrong and ſtinking ſmell with them, as commonly it falleth out in all long diſeaſes, ther is nothing better than to put wooll into them, which is ſoaked in breſt milke and honey together. If it happen that the eyes looke ſtill yellow after the jaundiſe, it is good to drop milke into them with the juice of the wild Cowcumber. This peculiar vertue it hath over and beſides thoſe abovenamed, if it be taken in drinke, to helpe thoſe that have been poyſoned with the ſea-Hare, the worme Bupreſtis, and as *Ariſtotle* faith

* *Modice admiſto opio.*

faith with the deadly Dwale called Dorycnion. In that manner alſo it cureth thoſe whoſe braines G
be troubled and intoxicat with drinking Henbane. Phyſicians likewiſe have preſcribed to make a liniment with milke and Hemlocke for to be applied unto the gout. And ſome there bee who uſe it in that caſe, together with Oeſype, that is to ſay, the ſweat or fattineſſe of unwaſhed wooll, and Gooſe greeaſe: in which manner it ſerveth in a peſſarie to bee put up into the naturall parts of women, for to aſſuage the paine of the matrice. To drinke breaſt milke is a good meane to ſtop a laske, as *Rabirius* writeth, and yet the ſame doth provoke the monthly courſe of womens fleurs. What is to be ſaid now of a womans milke who hath borne a maid child? ſurely it is better than the other in theſe caſes onely, to wit, in ſcouring the skin of the face, and taking away the pimples, ſpots, and freckles which be therin. But I muſt not forget, that any breaſt milke whatſoever, cureth the maladies incident to the lights: and if there bee tempered therewith the urine of a H
young lad not full fourteene yeares old, and Atticke honey, ſo there bee of each one ſpoonefull, I find it to be an excellent remedie for to rid away the ringing and thumping within the ears. And to conclude, it is a generall ſpeech, That if dogs do lap and taſt the milke of a woman which hath borne a man child, they will never run mad.

As touching the faſting ſpittle of a woman, it is judged to bee a proper medicine for bloud-ſhotten eyes: alſo for the rheume that hath taken a courſe thither, if ſo be the corners of the eyes be ever and anone bathed and wet therewith when they bee hot and enflamed: but more effectually will this remedie worke, in caſe the woman forbeare all meat and wine the day before. I read moreover in ſome Authors, That if the head bee bound up with a womans haire-lace or fillet, it eaſeth the paine thereof. And thus much in ſome good ſort as touching the medicines proceeding from women. As for the reſt that are written and reported, they exceed all reaſon, and there I
is no end of them.

For firſt and formoſt it is ſaid, that if a woman whiles her monthly ſickneſſe is upon her, bee ſet into the wind abroad with her bellie naked, ſhe will skare away haileſtormes, whirlewinds, and lightenings; yea, and avert any violence of the weather whatſoever. And at ſea verely, any woman ſtanding openly againſt the weather bare, although ſhe have not her fleurs, is ynough to ſecure the ſailers and paſſengers from all tempeſts. As for the very monthly flux it ſelfe of women, (a thing in other reſpects and at all times, as I have ſhewed before, of a monſtrous nature) there bee writers who tell and preſage wonders thereof, ſuch as bee horrible, abhominable, and indeed not to be ſpoken: and yet ſome of thoſe things I hold it no ſhame to deliver in writing, namely, K
If it fall out juſt in the eclipſe of Sunne or Moone, that a woman hath her ſickneſſe come downe, the ſame is of a peſtilent qualitie, and apt to breed diſeaſes incurable. Likewiſe, if haply the time of the chaunge, when the Moone is in conjunction with the Sunne, and thoſe things concurre together, the man who meddleth with her during that time, ſhall not avoid his bane, but it will bring upon him ſome peſtilent maladie, remedileſſe. Moreover, the venome thereof is ſo ſtrong at that time eſpecially more than at any other, that the preſence or breath only of a woman then, will infect and ſtaine any purple cloth. And yet bad ynough it is at all times: for whenſoever they are in their fleurs, it skils not in what quarter of the Moone, if they goe about any field of corne with their nakedneſſe uncovered, yee ſhall ſee the canker wormes, caterpillers, beetles, and all ſuch wormes and hurtfull vermine, to fall from the corne as they paſſe along. This invention by the L
ſaying of *Scepſius* and *Metrodorus*, came from the Cappadocians, who being infeſted with a number of thoſe greene flies called Cantharides, deviſed this meanes to be rid of them: for they cauſed their women at the time of their monthly tearmes (ſaving the reverence of womanhood bee it ſpoken) to goe through the ſtanding corne, with their cloths tuckt up round above their waſt, and all bare beneath. In other countries yet they are more mannerly, and in a better reſpect to the honour of women, put them onely to goe barefoot for this purpoſe, with their haire hanging looſe about their eares, ungirt, unlaced, and unbraced. Howbeit, great heed muſt be taken, that they walke not thus at the Sunne-riſing, for then ſurely all the crop upon the ground will wither and drie away to nothing. Alſo if a woman during her naturall courſes doe but touch any young vines, it is ynough to marre them for ever. As for Rue and Ivie, plants otherwiſe of themſelves M
moſt medicinable and endued with ſingular vertues againſt poyſon, they will preſently die with their touch. Much I have alreadie ſaid of this ſtrong and peſtiferous venome, and yet I have not written all. For over and beſides, certaine it is, that if a menſtruous woman do no more but touch a Bee-hive, all the Bees will be gone and never come to it againe. Alſo if at ſuch a time ſhee han-

dle

A dle any skaines or ſlips of linnen yearn and ſet them over the fire to ſeeth, they will in the boiling turne blacke. Let her but take a barbers raſour in her hand, the edge will turne and become blunt: nay, if ſhe doe no more but touch any braſen veſſell, it is wonderfull what a ſtrong ſavour it will caſt, and how it will ruſt and canker therupon; and the rather, if this fall out to be in the decreaſe or wane of the Moone. Doth a woman at ſuch a time touch a Mare that is in fole, it is ynough to make her caſt the ſame before due time. And not only ſo, but the very ſight of women in that caſe, although they bee a great way off, is able to doe much harme: but principally at the firſt time that they have the ſaid fleurs after the loſſe of their maidenhead: or otherwiſe during their virginitie, when they firſt come downe by courſe of nature of the owne accord. The malignitie of this venomous humor is ſo great, that the ſlime engendred within the lake of Sodome in Iurie,
B as viſcous as it is otherwiſe, will forgoe all that lenacitie, and devide in ſunder by nothing els but a thred infected with the ſaid menſtruall bloud, according as I have declared heretofore. So forcible it is beſides, that the very fire, which is of power to overcome all things and change their nature, is not able to conquer and alter this: for burne or calcine it to aſhes, and ſtrew never ſo little thereof upon any cloths that are to bee waſhed or ſcoured in the Fullers mill, it will chaunge their colour, though they were of purple, and cauſe any die whatſoever to looſe the freſh luſtre. And more than that, ſo pernicious is the qualitie of this venome, that as naturall otherwiſe as it is to women, it is no better than a poyſon to thoſe of their owne ſex: for in caſe one woman with child be annointed about her naturall parts, with the foreſaid bloud of another, or doe but ſtep over the place where it is, ſhe will immediatly fall to labour, and ſlip an abortive birth. As for the
C famous curtiſanes, *Lais*, and *Elephantis*, who have written ſo contrarie one unto the other of this argument, and namely, as touching abortions, and of what efficacie the coale of Colewort, Myrtle, or Tamariske root is, after it hath been quenched in the ſaid bloud; as alſo, how ſhee-Aſſes will not conceive for ſo many yeares as they chaunce to eat Barley cornes infected therewith; beſides other ſtraunge deviſes that they have ſet abroach: I thinke them incredible, and I would not have any credit at all given unto their writings, conſidering the monſtruoſities and contrarieties which they have put downe; whiles the one preſcribeth medicines for to make fruitfull, and the other ordaineth the very ſame, to hinder conception and cauſe them to bee barren. Moreover,
D *Bythus* of Dyrrhachium ſaith, that for to make a mirror or looking glaſſe cleare again, which was dusked and dimmed by the aſpect of a menſtruous woman, the next way is to cauſe her to caſt her eyes backward to looke over her ſhoulders upon it againe: he ſaith moreover, That if women in that caſe have about them the fiſh called a Barbill, they ſhall not by that meanes infect or doe hurt at all, but the ſame menſtruous bloud ſhall looſe all the foreſaid ſtrength.

Well, as hurtfull and miſcheevous as it is otherwiſe, yet many there be who affirme it to bee in many diſeaſes medicinable: and namely, for the gout, if the place be annointed therewith: as alſo if women while their monthly ſickneſſe is upon them, doe handle the wens named the Kings evill, the ſwelling kernils behind the eares, the broad tumors or biles called Pani, Shingles, S. *Anthonies* fire, fellons, or violent flux of humours to the eyes or other parts, there will enſue much eaſe thereupon. *Lais* and *Salpe*, two notable ſtrumpets, have left in writing, That if the foreſaid menſtruous bloud beſtowed within a little locke of wooll that came from a blacke Ram, bee
E worne encloſed within a ſilver bracelet, it is a ſoveraigne remedie againſt the biting of mad dogs, and for Tertian and Quartane agues. *Diotimus* of Thebes reporteth, That any little peece or rag of cloth, yea, though it were but a thred ſtained therein, and ſo ſet handſomely into a braceler, is ſufficient to doe as much. *Sotira* the renowned midwife affirmed, That there was not in the world ſo good a thing againſt the Tertian and Quartane, as to rub and annoint therwith the ſoles of the
3 patients feet: but much more effectually would it doe the deed, in caſe the woman her ſelfe had the doing of it with her owne hand, ſo as the ſicke partie know not thereof in any hand. And this (quoth ſhe) is as ſoveraigne medicine to raiſe them out of a fit of the epilepſie, who are ſurpriſed and fallen therewith. *Icesidas* a worthy Phyſician among the Greekes, aſſureth us upon his word, That Quartane agues will make an end and goe away by the act of generation, at what time on-
F ly as a woman beginneth to enter into her fleurs. But this is agreed upon by all authors profeſſed and ſeene in this theame, that if one be bitten with a mad dog, and ſo farre gone, that he is *afraid of water, ſo as hee dare not ſee it or drinke at all, doe but put a clout or ſhred of cloth dipped in the ſaid menſtruall bloud under the cup whereout he is to drinke, he ſhall immediatly bee delivered from that feare: And this commeth by that powerfull and predominant ſympathie, whereof

* ὑδροφοβία

the

the Greekes write ſo much, betweene mad dogs and the ſaid bloud, conſidering, as I have before G
ſaid, that they begin firſt to run mad by taſting thereof. This is known for certaine, that the aſhes of a burnt cloth infected therewith, or of the bloud it ſelfe calcined, is a ſingular pouder to heale the farcins or ſores of horſes and all ſuch labouring beaſts, ſo it bee mixed with the ſoot of chimney or furnace, and all incorporat together with wax. Now ſay there be any garment or cloth polluted therewith, there is not any thing will take out the ſtaine, but the urine onely of the ſame woman. The aſhes beforeſaid tempered alone with oile of Roſes into a liniment, and ſo applied in manner of a frontale to the forehead, allaieth the headach of women eſpecially. This alſo would be noted, That for the firſt yeare after a woman hath knowne a man, and ſo parted from her virginitie, her fleurs are moſt ſharpe, mordant, and fretting. Furthermore, this alſo is reſolved clearely among all writers, That there is no charme or enchauntment whatſoever, of any validitie to doe H
harme to that houſe where the ſide poſts or dore cheeks are ſtriked lightly over with menſtruous bloud: an argument I aſſure you, that convinceth notably the follie of theſe Magicians, the vaineſt people under heaven, and overthroweth all their art: and a point that pleaſeth me very well, & which for mine owne part I am right willing to beleeve. And ſince I am light thus upon them, I care not much, if to detect their vanities, I ſet downe one of the moſt modeſt receits that they have given their word for, and which may ſeeme to carie ſome ſhew of truth or probabilitie. For thus they preſcribe with great warrantize, To take all the naile parings of toes and fingers of man or woman lying ſicke of an intermittent feaver, and to mix or incorporat them with wax, ſo as the partie in the doing hereof doe ſay theſe words, *I am about a remedie for the Tertian, Quotidian, or Quartane ague* (according as the patient is troubled with the one or other of theſe feavers) I
which done and ſaid, to ſticke up the ſaid wax upon the dore of another man or womans houſe that is not ſicke at all, and that before the Sunne be riſen: which no doubt (as they ſay) will cure the ſicke perſon, and ſet the ague upon another that was well before. Now would I gladly know what greater vanitie and follie there can be, if this medicine miſſe and doe not the feat? Or what more villanie and miſcheefe, than thus to transferre and remove diſeaſes from thoſe that be ſick alreadie, unto ſuch as be ſound and thinke no harme? To conclude, ſome of theſe Magicians are ſo farre gone, that after all the foreſaid nailes of fingers and toes bee pared, they ordaine them to be throwne into Ant holes, and to obſerve that Emmet that firſt begins to draw one of them into her neaſt, to catch her up quickly, and hang her about the necke of any one that is ſicke of an ague, and ſo the patient *pro certo*, ſhall ſhake off the diſeaſe and be quite rid of it. K

Chap. viii.

The medicines that are found in diverſe ſtrange and forraine beaſts, as namely, the Elephant, Lion, Camm ell, Hyæna, Crocodile, Chamæleon, Skinke, Water-horſes, and Ounces.

THeſe be the remedies which the bodies of men and women doe affourd: as many I meane as I may with ſome honeſtie relate: and yet ywis many of them be ſuch as are not to be red out and uttered, but with leave and patience firſt craved, for the reverence that wee owe to chaſt eares. I know full well there is a great deale more behind that I have not touched, but ſuch L
ſtuffe I aſſure you as is deteſtable and not fit to be ſpoken or committed to writing, which makes me rather to make haſt and leave the diſcourſe of Man and Woman, and ſo to proceed to the ſingular vertues and operations of brute beaſts.

And to begin with the Elephant, The bloud of that beaſt, eſpecially the male, ſtaieth all fluxes of humors, which the Greeks call Rheumatiſms. The ſhavings of yvorie (which is the Elephants tooth) incorporat with Atticke honey, ſcatter (as folke ſay) the duskiſh ſpots that appeare in the viſage: like as the duſt thereof, which the file or ſaw doth make, cureth the whitflaws or impoſtumations breeding at the naile roots. The trunke or muffle of an Elephant if it bee but touched onely, allaieth the headach; and the more effectuall it is, in caſe ſneezing come withall. It is ſaid moreover, if one take a peece of the right ſide of the ſame trunke, & carie it faſt about him with M
the red ocre of Lemnos (called Terra Sigillata) it will incite him mightily to carnall luſt. The bloud of an Elephant is ſingular good for thoſe that bee in a conſumption and waſt away: like as the liver helpeth ſuch as be given to the falling ſickneſſe.

The greaſe or fat of a Lion tempered with oile of Roſes into an unguent, preſerveth the skin

of

A of the face from all illfavoured ſpots, and keepeth it white and ſmooth. The ſame ointment hea-
leth the skin that is ſcorched and pilled with cold, by travelling over mountaines charged with
Snow; yea, and abateth the tumors and nodoſities upon the joints. Now, if wee liſt to beleeve the
fooleries of Magicians, they would beare us in hand, that whoſoever bee annointed all over with
the ſaid greaſe, ſhall bee gracious with princes and kings, yea, and win much favour among the
people, and any State or nation where they ſhall converſe: but principally it muſt bee the fat in
the forehead betweene the eyebrowes, (where indeed it is unpoſſible to find any at all.) The like
effects they doe promiſe of the Lions teeth, and thoſe eſpecially of the right ſide; like as of the
ſhag haire (forſooth) that ſhould hang under their nether jaw. Indeed the gall of a Lion mixed
with water, clarifieth the eyeſight, in caſe the eyes be bathed therewith. The ſame tempered with
B the owne greaſe, diſpatcheth as they ſay the falling ſickneſſe, in caſe the patient taſt never ſo little
of it, and ſo ſoone as hee hath taken it, run a while for to digeſt the ſame. A Lions heart cureth
the Quartane ague, if the ſicke perſon doe eat thereof: and their fat is a ſoveraigne remedie for
the feaver Quotidian, if it be uſed with oile roſat. There is not a beaſt ſo fell and ſavage, but it will
run away from them that be annointed with Lions greaſe: and it is thought to be a ſingular pre-
ſervative for to prevent any ſecret ambuſhes or practiſes intended againſt one.

As touching the Cammell, his braine (by report) is excellent good againſt the epilepſie or
falling ſickneſſe, if it bee dried and drunke with vinegre: ſo dooth the gall likewiſe taken in drinke
with honey: which alſo is a good medicine for the Squinancie. It is ſaid, that a Cammels taile dri-
ed, cauſeth looſeneſſe of the bellie: like as the dung reduced into aſhes and incorporat with oile,
C doth curle and frizle the haire of the head. The ſaid aſhes made into a liniment and ſo applied,
yea, & taken in drinke as much as a man may comprehend with three fingers, cureth the dyſente-
rie: ſo doth it alſo the falling ſicknes. Cammels piſſe (they ſay) is paſſing good for Fullers to ſcour
their cloth withall: and the ſame healeth any running ſores which bee bathed therein. It is well
knowne that the barbarous nations keepe this ſtale of theirs untill it be five yeares old, and then a
draught thereof to the quantitie of one hemine, is a good laxative potion: likewiſe that the hair
of their tails, twiſted into a wreath or cord, and ſo worn about the left arme in manner of a brace-
let, cureth the Quartane ague.

As for the Hyæna, there is not a wild beaſt of the field that the Magicians have ſo much in ad-
miration as it: For they hold that in the Hyæna it ſelfe there is a certaine Magicall vertue, attribu-
D ting a wonderfull power thereto, in tranſporting the mind of man or woman, and raviſhing their
ſences ſo, as that it will allure them unto her very ſtrangely. Concerning the rare property of theſe
beaſts to chaunge the ſex each other yeare, that is to ſay, to be male this yeare & female the next;
as alſo touching other monſtrous qualities obſerved in their nature; becauſe I have diſcourſed al-
readie of them, it remaineth now that I proceed to ſhew the medicinable vertues that are repor-
ted to be found in them: whereof this may bee counted for one of the cheefe, that conſidering
they be ſo terrible unto *Panthers, that they dare not quetch nor make head againſt them: who- *i. Luzernes.
ſoever hath about him but a peece of the Hyænes skin may be ſure that a Panther will not ſet up-
on him, nor once come near. And that which is a wonderfull thing to be ſpoken, in caſe the hides
of them both be hung up one againſt another, the haire of the Panther will fall off. When the
E Hyæne flieth before the hunter and would not bee taken, they wind with a cariere out of the way
toward the right hand, and wheele about untill the man be gotten before them; and this they do,
becauſe they would meet with his tracts and footing; which if they happen upon, and get be-
hind him, you ſhall ſee the hunter incontinently to be ſo intoxicat in his braine, that he is not a-
ble to beare his head nor ſit his horſe, but to fall from his backe. But in caſe that they turn on the
left hand, it is an evident ſigne that they bee readie to faint, and then will they quickly bee taken.
The ſooner alſo and with more eaſe be they caught (if we may beleeve art Magicke) if the hun ter
tie his girdle about his middle with ſeven knots, and the cord of his whip likewiſe wherewith hee
ruleth and jerketh his horſe, with as many. But ſee how ſubtle and cunning theſe Magicians be to
cloke and colour their vanities and deceits, with ſuperſtitious circumſtances! This chaſe forſooth
F after the Hyæne, muſt be juſt at the very point when the Moone is paſſing through the ſigne Ge-
mini: and then if they be taken, the huntſman muſt be ſure to ſave every haire of their skins, and
miſſe not one, ſo medicinable they are. By their ſaying alſo the skin that groweth to the head of
the Hyæne, if it be applied in manner of a frontale, is ſingular good for the headach. The gall of
the Hyæne cureth bleared eyes, if the forehead be annointed therewith: but if the ſame bee ſod-

den

den with three cyaths of Atticke honey and one ounce of Saffron, to a liniment, it is an excellent preſervative to keepe one from ever being bleare eyed, if ſo be the eyes be annointed with it. The ſaid compoſition likewiſe is ſingular for to rid away the cloudie filmes and catarracts that breed in the eye. But for to clear the ſight and quicken it, the older this medicine is, the better they hold it to be. And kept it muſt bee in a braſen or copper box: which eyeſalve they ſay, ſerveth alſo for the mailles or ſpots, for the aſperities, excreſcences, cicatrices, dents, and excavations remaining in the eyes. The gravie or dripping likewiſe of the Hyænes liver, newly taken out of the bodie and roſted, beeing incorporat with clarified honey into an unguent, riddeth away the red filme that overcaſteth the apple of the eye and darkeneth the ſight thereof. They will make us beleeve, that the Hyænes teeth are good for the toothach, if the pained teeth be but touched therewith, or if the ſaid teeth bee arraunged in order, and ſo applied faſt unto the patients teeth, as they may fit every tooth in his head. The ſhoulders alſo of the Hyæne are proper for to eaſe the paines that lie in our ſhoulders and armes both, ſo they be ſet likewiſe orderly and hanged cloſe to the greeved parts. The teeth of the ſaid Hyæne plucked out of the left ſide of the chaw, and bound up ſure within a peece of a ſheepe or goats skin, is right ſoveraigne to be worne in manner of a ſcutcheon or ſtomacher for to eaſe the intollerable paines of the ſtomacke. A diſh of meat made of their lungs and eaten, is ſoveraigne for the flux proceeding from a feeble ſtomacke. But if the ſame bee burnt and reduced into aſhes, and ſo brought into the forme of a liniment with oile, and applied accordingly, it comforteth the ſtomacke mightily. The pith or marrow taken out of the backe bone along, and incorporat with old oile and *gall, is paſſing good for the nerves. The liver of the Hyæne driveth away Quartane agues, in caſe the patient take three bits therof one after another before the acceſſe. Take the aſhes of the Hyænes ridge bone, the tongue and right foot of a Seale, put thereto a Buls gall, ſeeth them all together and make a cataplaſme thereof, ſpreading the ſame upon a peece of a Hyænes skin, and applie it accordingly, you ſhall ſee how it will eaſe the paine of the gout. The very gall likewiſe of this beaſt mixed with the pouder of the ſtone Aſius, is commended by them for to cure the ſaid maladie. They that are ſubject to trembling and to the crampe, ſuch alſo as be given to leape out of their beds, or are troubled with the beating and panting of the heart, ought to take and boile the heart of the Hyæne, and eat one part therof, and with the other being burnt to aſhes and with the braines of the ſaid Hyæne together reduced into a liniment, to annoint the greeved part. This compoſition likewiſe ſerveth to take away the haires of any place, if it be annointed either with it alone, or els with the gall, and in caſe one would not have them ever to come up againe, they ought to be plucked up before, and then the place to bee annointed. Thus they uſe to rid away the haires of the eyelids that bee troubleſome. In like manner for the paines of the loines, the fleſh about the Hyænes loines is preſcribed to be eaten, and therewith oile together, and the place alſo is to bee rubbed well and beſmeared. They ſay moreover, that if a woman which is barren, eat the eye of a Hyæne with Liquirice and Dill, ſhe ſhall prove fruitfull: and ſo neare they go, as to promiſe ſhe ſhall conceive within three daies after. And (by their report) whoſoever are haunted with ſprites in the night ſeaſon, and be affrighted with ſuch bugbeares, let them but take one of the maiſter teeth of the Hyæne, & weare it about them tied by a linnen thred, they ſhall be freed from all ſuch fantaſticall illuſions. Theſe Magicians alſo give direction to thoſe that bee out of their wits and gone beſides themſelves, to have a perfume made with the ſmoake of thoſe teeth, and to weare one of them hanging before the breaſt, with the fat growing about the kidneies, or elſe with the liver or the skin. If a woman be with child, and would gladly go out her full time, let her take a peece of the white fleſh of this beaſt, and ſeven haires, neither more nor leſſe, together with a ſtags pizzle; bind them all faſt within the skin of a Bucke or Doe, and ſo weare them hanging about her neck juſt againſt her breaſt, ſhe ſhall not ſlip an untimely fruit. Furthermore they promiſe in the behalfe of this beaſt, that if a man or woman doe eat the genitall member of a Hyæne, according to their ſex, they ſhall bee provoked to fleſhly luſt, how cold ſoever the man were before, and could not abide to embrace a woman. Over and beſides, if the ſaid pizzle and ſhap of this beaſt bee kept in any houſe, together with a joint of the ridge bone, skin & all as it groweth too, the whole familie ſhall agree together well, and live peaceably: now this joint or knot aboveſaid they call Atlantion, and it is the very firſt ſpondyle of them all. The ſame alſo they make no ſmall reckoning of, but hold it for a ſpeciall remedy for the falling ſickneſſe. Frie the greaſe or fat of an Hyæne, the fume therof (by report) will chaſe away ſerpents. A peece of the chawbone beaten ſmall into pouder and eaten together with

G H I K L M

*Felle. Some read melle, i. honey.

A with aniſe ſeed, doth mitigat the quivering and quaking in a cold ague fit. A ſuffumigation made therewith, draweth downe womens ſickneſſe, if we may beleeve magicians; who are grown to this paſſe in their vanitie, that they avouch for certaine, That if an archer doe bind unto his arme a tooth of an Hyæne, growing on the right ſide of the upper chaw, hee ſhall ſhoot point-blanke
5 and never miſſe his marke. Take the palat or rouſe of the mouth of this beaſt dried and made hot togither with Ægyptian alume, put the ſame into the mouth and chaunge it three times for new ſtill, they promiſe it ſhall correct a ſtinking breath, and heale any ulcers or cankers in the mouth. And as for thoſe that weare under the ſoles of their feet within the ſhooe, a Hyæns tongue, there is not a dog will be ſo hardie as to bay or barke at them. The brain of the Hyæne lying in the left ſide of the head, eaſeth any deadly diſeaſes of man or beaſt, if the noſthrils be annointed there-
B with. The skin of the forehead ſerveth as a countrecharme againſt all witchcraft and enchauntments. The fleſh growing to the nape of the neck, being dried and made into powder, appeaſeth the paine in the loins of the backe, either eaten or drunke, it skills not whether. For the griefe of ſinews, they give order to make a ſuffumigation with the nerves of Hyæna, which run along the ſhoulders and backe. And the hairs growing about the muzzle of this beaſt, have an amatorious vertue with them, to make a woman love a man, in caſe her lips be but touched therewith. The li-
5 ver of the Hyæna given in drinke, cureth the cholique and ſtone. As for the heart, bee it taken in meat or drinke, it eaſeth all the pains of the bodie: the milt cureth the ſpleene: the kell with the fat about it, helpeth any inflammation of ulcers if it be applied with oile: the marrow within the bones, appeaſeth the griefe of the backbone and ſinews; and finally, doth recover and refreſh the
C wearineſſe of the reins and kidnies. The ſinews of this beaſt drunke in wine with frankincenſe, reſtore women to the fruitfulneſſe of the womb, eſpecially when by indirect means of ſorcerie they are become barren and unapt for conception. The matrice of the female Hyæne given in drinke with the rind of a ſweet pomegranat, is a verie comfortable medicine for that part in a woman. A ſuffumigation made with the fat taken from the hetchill peece or loines, is ſingular for thoſe
5 women that be in hard travaile of child, and procureth them ſpeedie deliverance. The marow or pith out of the ridge-bone whoſoever carieth about them, ſhall find helpe againſt vaine illuſions and fantaſticall imaginations. The pizzle of the male Hyæna, if it be burnt, caſteth a fume which is good for them that have any ſinews plucked with the crampe. Save the feet of this beaſt, and the verie touching of them is ſoveraigne for bleared eyes, for ruptures, and inflammations: but
D this regard muſt be had, that the left foot be applied to thoſe griefs in the left ſide, and the right to the contratie. But wot yee what? if the right foot of the Hyæna chaunce to be carried over a woman whiles ſhe is in labour of child birth, ſhe ſhall ſurely die of it; but contrariwiſe, let it be the right foot, ſhee ſhall have quicke diſpatch and be delivered with eaſe. The skin or purſe that holdeth the gall, being either drunke in wine or taken with meat, helpeth thoſe that for weake-neſſe of ſtomacke be apt to faint and fall into cold ſweats: and the bladder taken with wine, cureth thoſe that cannot hold their water. Now looke what urine is found within the bladder of this beaſt, you muſt thinke it is an excellent drinke if it be mixed with oile, Seſame ſeed, and honey, for any old griefe whatſoever. The firſt rib and the eigth will make a perfume, which is paſſing good for thoſe who are burſten: the ſpondyles or joynts of the ridge-bone, are as conveni-
E ent for women in travaile of childbirth: and the Hyæns bloud taken inwardly with fried barley meale, doth mitigat the wrings and gripes of the bellie. If the ſide poſts or doore-cheeks of any houſe be ſtriked with the ſaid bloud, whereſoever magicians are buſie with their feats and jug-
3 gling caſts, they ſhall take no effect, whether they be charmes, exorciſms, or invocations: inſomuch as they ſhall not be able to raiſe up ſpirits, nor have any conference with familiars by any means of conjuration, whether it be by torch-lights, by baſon, by water, by globe, or otherwiſe. The fleſh of this beaſt eaten, is very effectuall againſt the biting of a mad dog; and yet the liver is of greater efficacie in this caſe. If there chaunce either fleſh or bone of man or woman whome this beaſt hath killed and devoured, to be found in the maw, ſurely the perfume thereof is a preſent remedie for the gout, as theſe magicians would ſeeme to perſuade us. But how if there be
F found the nails of man or woman there? then woe be to all thoſe that were at the hunting and taking of this beaſt, for it preſageth that one of them is ſure to die for it. Beſide all this, they doe affirme, That either the excrements or bones which the Hyæna diſchargeth out of the belly at the time that ſhe is killed, ſerve for countrecharms or preſervatives againſt ſorceries and practiſes of magicians. As for the ordure or dung which is found within her guts, being dried and ta-

ken in drinke, is availeable againſt the dyſenterie: and the ſame reduced into a liniment with G
gooſe greaſe and ſo applied, helpeth thoſe that by ſome poiſon are infected all the bodie over.
The greaſe likewiſe of this beaſt uſed as an ointment, hath a ſingular propertie to cure the biting
of a dog, ſo that the patient be couched upon the skin of the ſaid Hyæna, as ſay our magicians:
who affirme moreover, that a decoction made with the aſhes of the paſterne bone of the left leg,
boiled togither with the bloud of a weazill, cauſeth as many as be annointed all over therewith,
to be odious in the eyes of all men. The ſame effect doe they attribute to the decoction of the
eye. But of all the fooleries that they have broched as touching the Hyæna, this paſſeth & may
goe for the chiefe, That the hinmoſt end of the gut in this beaſt is of vertue, that no captaine,
prince, or potentat, ſhall be able to wrong or oppreſſe thoſe who have but the ſame about them:
but contrariwiſe aſſureth them of good ſpeed in all their petitions, and of happie iſſue in all H
ſuits of law and trialls of judgements. The concavitie or wrinkle thereof, if a man doe weare faſt
tied about his left arme, is ſo forcible to charme a woman, that if hee doe but ſet his eye upon
her, ſhe will leave all and follow him preſently. The aſhes of the haire growing thereabout made
into a liniment with oile, and applied accordingly, cauſeth thoſe men who before were given to
lewd wantonneſſe and lived in bad name, not onely to become chaſt and continent, but alſo to
put on gravitie and grow ſtaied in their behaviour. Thus much of Hyæna.

For fabulous tales, the Crocodile may challenge the next place: a beaſt this is which natu-
rally doth live as well on land as in water: for two kinds there bee of them; whereof the former,
(keeping thus in both elements) hath this eſpeciall vertue, if we may beleeve theſe magicians, To
provoke unto carnall luſt, if the teeth which grew in the right ſide of the chaw, bee hanged faſt I
likewiſe to the right arme of man or woman. The eye-teeth of the ſaid Crocodile, filled up with
frankincenſe (for hollow they be) and tied ro any part of the bodie, put by thoſe periodicall fe-
vers which uſe to returne at ſett and certaine hours; but then the patient muſt not for five daies
togither, ſee the partie who faſtened the ſame about him. And they report likewiſe, that the little
gravell ſtones taken out of their belly, bee of the ſame vertue to drive away the ſhaking fitts of
agues when they are comming: which is the cauſe that the Ægyptians uſe ordinarily to annoint
their ſicke folke with the fat of this beaſt. The other Crocodile reſembleth this in forme, but far
leſſe hee is, and keepeth onely upon the land, living upon moſt ſweet and redolent floures. In
which regard, much ſeeking there is after his guts, for the pleaſant ſenteurs and odours where-
with they be ſtuffed full: this dung they call Crocodilea, a ſingular remedie for all the diſeaſes K
of the eyes, and namely againſt cataracts, ſuffuſions, and miſtie filmes, if they bee annointed
with an eye-ſalve, made of it and the juice of porret mixed togither. The ſame brought into a
liniment with the oile Cyprinum, ſerveth to take away all pimples that riſe in the face, and clean-
ſeth the skin from thoſe ſpots that blemiſh the viſage. But if it be incorporat with water, it ſcou-
reth whatſoever accidents be apt to run over the face, and reduceth the skin unto the native co-
lour; for it riddeth freckles, moles, and generally any ſpots or flecks that marre the beautie or
favour. The ſame is good to be drunke in oxymell to the weight of two oboli for the falling ſick-
neſſe: and applied in forme of a peſſarie, it provoketh womens fleures. Now if you would chuſe
the beſt Crocodilea, take that which is whiteſt, brittle or eaſie to crumble, leaſt weightie in hand,
and withall ſwelling in manner of a levaine, if it be rubbed between the fingers. The manner is L
to waſh it, as they doe white lead called Ceruſſe. Sophiſticated it is with amyll, or the ſcouring
Fullers cley and Tuckers earth called Cimolia; but principally with the dung that ſterlings meut,
which are of purpoſe caught and fed onely with rice. Now there is not a better thing in the world
(ſay theſe magicians) for the cataract, than to annoint the eyes with it and honey togither. And
if a man may beleeve their words, there is a ſoveraigne perfume made of the guts and the whole
bodie beſides, for women who are ſicke of the morher, or otherwiſe diſeaſed in the matrice, if
they ſit over it whiles it ſmoketh. In like manner, it doth them good to bee lapped round about
with wooll that hath been ſo perfumed. The aſhes of the Crocodiles skin, as well the bigger as
the leſſe, brought into a liniment with vinegre, and applied unto thoſe parts of the bodie which
had need to be cut away or diſmembred, cauſeth the patient to have no ſenſe or feeling at all ei- M
ther of ſaw or launcer. The verie ſmoke alſo of the ſaid skin burning, doth the ſemblable. The
bloud of both Crocodiles mundifieth the eyes, and cauſeth them to ſee cleere which are an-
nointed therewith, removing the filmes and diſpatching the ſpots that empeach the ſame. The
verie bodie or fleſh it ſelfe of the Crocodile, all ſave head and feet, is good meat ſodden, for

thoſe

A thoſe who bee troubled with the Sciatica: the ſame cureth an old cough, eſpecially the chin-cough in children; and aſſuageth the paine of the loins. The Crocodiles have a certaine fat in them which is depilatorie; for no ſooner is the haire rubbed therewith, but preſently it ſheddeth. The ſaid fat or greaſe preſerveth thoſe who be annointed therwith, from the danger of the Crocodiles, and is excellent good to bee melted and dropped into the wounds made by their bit. The Crocodiles heart lapped within a locke of wooll which grew upon a blacke ſheepe, and hath no other colour medled therewith, ſo that the ſaid ſheepe were the firſt lambe that the dam yeaned, is ſaid to drive away quartan agues.

To this diſcourſe of Crocodiles, wee ſhall not doe amiſſe if wee annex other beaſts in ſome ſort reſembling them, and which bee likewiſe ſtraungers as well as they. And to begin with the
B Chamæleon, *Democritus* verely made ſo great reckoning of this beaſt, that hee compiled one entire booke expreſſely of it, and hath anatomized everie ſeverall member thereof. And certes I cannot chuſe but take great pleaſure therein, knowing as I doe by that means how to deſcipher and deliver abroad the lowd lies of vaine Greekes. This Chamæleon for ſhape and bigneſſe, is much anſwerable to the Crocodile laſt named, differing onely in the curbing or crookedneſſe of the ridge-bone, and largeneſſe of the taile. There is not a creature in the world thought more fearfull than it; which is the reaſon of that mutabilitie whereby it turneth into ſuch varietie of colours: howbeit of exceeding great power againſt all the ſorts of hawkes or birds of prey; for by report, let them flie and ſoare never ſo high over the Chamæleon, there is an attractive vertue that will fetch them downe, ſo as they ſhall fall upon the Chamæleon and
C yeeld themſelves willinggly as a prey to be torne, mangled, and devoured, by other beaſts. *Democritus* telleth us a tale, That if one burne the head and throat of the Chamæleon in a fire made of oken wood, there will immediatly ariſe tempeſts of rainie ſtorms and thunder togither: and the liver will doe as much (ſaith hee) if it burne upon the tiles of an houſe. As for all the other vertues which the ſaid author aſcribeth to the Chamæleon, becauſe they ſmell of witchcraft, and I hold them meere lies, I will overpaſſe them all, unleſſe they be ſome few, for which he deſerveth well to be laughed at, and would indeed be reproved by no other means better: namely, That the right eye of this beaſt if it be pulled out of the head whiles it is alive, taketh away the pearle, pin and web in man or womans eyes, ſo it be applied thereto with goats milke. The tongue likewiſe plucked forth quicke, ſecureth a woman from the daunger of childbirth, if ſhee
D have it bound to her bodie whiles ſhee is in travaile. If there be found by chaunce a Chamæleon in the houſe where a woman is in labour, ſhee ſhall be ſoone delivered in ſafetie: but if ſuch an one bee brought thither of purpoſe, the woman is ſure to die. Alſo, the Chamæleons tongue pulled out of the head whiles the Chamæleon is quicke, promiſeth good ſucceſſe in judiciall trials. The heart bound within blacke wooll of the firſt ſhearing, is a moſt ſoveraigne remedie againſt quartan agues. The right forefoot hanged faſt to the left arme within the skin of a Hyæna, is ſingular againſt the perils and daungers by theeves and robbers; as alſo to skare away hob goblins and night-ſpirits. In like manner, whoſoever carrie about them the right pap of this beaſt, may be aſſured againſt all fright and feare. But the left foot they uſe to torrifie in an oven with the hearbe called alſo Chamæleon, and with ſome convenient ointment or liquor to make
E in certaine troſches, whereof if a man doe carrie any in a box of wood about him, he ſhall goe inviſible, as ſaith *Democritus*, if wee were ſo wiſe as to beleeve him: who affirmeth moreover, That whoſoever hath about him the right ſhoulder of the Chamæleon, ſhall be able to overthrow his adverſarie at the barre, and to vanquiſh his enemie in the field: but firſt hee muſt be ſure to caſt away and make riddance of the ſtrings and ſinewes belonging thereto, and to tread them under foot. As for the left ſhoulder, I am aſhamed to relate, unto what monſtrous ſpirits hee doth conſecrat it; and namely how by the vertue thereof, a man may cauſe what dreams and fantaſticall illuſions hee liſteth, yea and make thoſe whome hee will himſelfe, to imagine the ſame apparitions. As alſo, how the right foot of the ſaid beaſt driveth away all ſuch ſtraunge viſions; even as the lethargie will goe away by the means of the left ſide of this beaſt, which lethar-
F gie was occaſioned by the right. Touching head-ach, hee ſaith plainly, that the next way to cure it, is to beſprinkle and wet the ſame with wine wherin either of the two ſides were ſoked. Take the aſhes (quoth hee) of the left thigh or foot, chuſe you whether, incorporat the ſame with the milke of a ſow, and therewith annoint the feet, it will be an occaſion, ſpeedily to bring the gout upon them. But of the Chamæleons gall, for the moſt part folke are in maner verely perſuaded,

that it will rid the pin and web, the cataract also of the eyen, with three daies annointing; chase away serpents if it bee dropped into the fire; gather all weazils in a countrey togither, onely by throwing it into the water; and fetch off haire if the bodie bee annointed therewith. It is a common saying also, That the liver of this beast is of the same effect, in case it be brought into a liniment with the lights of a hedge land toad: like as, that all amatorious drinks and love-charms become void and of none effect by the said liver. As for those who be troubled in mind & given to melancholie, they find remedie, if out of this beasts skin they drinke the juice of the hearbe Chamæleon. Furthermore, the guts, and the dung therein contained (and that is worthie to be noted, considering this beast liveth upon no meat at all) being striked upon the doore of an enemies house, togither with the urine of apes, cause him to be hated of all the world. The like wonders they report of the Chamæleons taile, namely, how it will stay any violent streame of river; stop the course and inundations of waters; and withall, bring asleepe and mortifie serpents. The same being aromatized or spiced with Cedar and Myrrhe, and tied fast to a braunch of the Date tree growing double or forked, will devide the waters that be smitten therewith, so as a man may see whatsoever is in the bottome. And would God *Democritus* himselfe had met with one crop of this branch, to have made him hold in so many lies as he hath told, considering that he hath reported this qualitie of it among other, namely, To represse intemperat speech and inordinat walking of the tongue. But evident it is, that the onely reason why *Democritus* faulted that way, (beeing otherwise a man of a singular wit and wholly addicted to the good of mankind) was an excessive and extraordinarie zeale that he had to profit and benefit the whole world.

Much like to this kind is the Skinke (whome some have named the land Crocodile) but that the skin is whiter & more fine. But the principall difference is this, For that the bristles or skales are couched so, as they tend from the taile upward to the head; whereas in a crocodile the same are set contrarie. The biggest of this sort, be those of India: the next be they which are brought out of Arabia; and transported they be unto us salted. The muffle and the feet given to drinke in white wine, doe enflame the heat of lust; but specially when they be mixed with Satyrion and Rocket seed, of each one dram, mingled with twaine of pepper; and when they be wrought into troches weighing every one a dram, one of them must be taken at once. But the verie flesh of the Skinks sides, drunk to the quantitie of two oboli, with myrrhe and pepper in like proportion, are supposed to be more effectuall for this purpose. The same (as *Apelles* reporteth) taken both before and also after meat, is a singular preservative against envenomed arrowes. Besides, it is one of the ingredients which goe to the noble compositions that be called Antidots. Howbeit, *Sextus* is of opinion and doth write, That if a man drinke above one dram-weight of it in a hemine of wine, it is enough to endaunger his life. Moreover, the juice or broth of the Skinkes flesh boiled and taken with honey, is thought to keepe downe the flesh and to coole lust.

As touching the river-horse called Hippopotamus, there is a great affinitie or kindred rather betweene him and the crocodile, in regard that they both doe haunt the same river, and participat both of land and water. This beast (as I have shewed heretofore) devised first the practise of phlebotomie or bloud-letting. Great store there be of them beyond the seignorie Saïtica in Ægypt. Take the ashes of this beasts hide, and reduce them with water into a liniment, it is singular to cure the broad biles or apostemations called Pani. The grease, and likewise the dung, is good against the cold fit of agues, if the Patient receive the perfume thereof. The teeth which grow on the left side of the mouth, doe ease the toothach, if so be the gumbs be scarrified therewith. The skin taken from the left side of the forehead, laid unto the share and kept fast thereto, staieth the provocations to venerie. The ashes of the same doth cause the haire to grow againe thicke in those places, where by disease it is shed. Take of the genetoirs of this water-horse the poise of one dram, and drinke it in water, it is a good countrepoison against the venome of serpents. As touching their bloud, it serveth painters in good stead.

The Onces be likewise taken for strange and forrein, and of all foure-footed beasts they have the quickest eye and see best. By the testimonie of all writers, there is in the Island Carpathos, a singular kind of ashes made of their houfs, burnt togither with their hide: and they hold, that if men drinke therof, they will become chast, were they never so licentious and libidinous before: againe, let women cast the same upon their nature or privie parts, it will coole their appetit of mans companie; yea and kill the itch in any part of the bodie, if it be rubbed therwith. And the urine of this beast helpeth the strangurie, to wit, the infirmitie of the bladder when the water

passeth

A paſſeth by drop-meale: which propertie they beeing by a naturall inſtinct aware of, ſo ſoone as ever they have piſſed, doe hide and cover the urine with mould, which with their feet they raiſe juſt over it, as it is commonly reported. The ſame urine is preſcribed for a good remedie in the paine or griefe of the throat. Thus much may ſuffice as touching forrein beaſts: returne therefore now I will to thoſe in this part of our world; and firſt declare the vertues and properties medicinable which are found common in all living creatures, yet making choiſe of thoſe that beeſingular above the reſt.

Chap. IX.

B *The common and ordinarie medicines drawne as well from wild beaſts as thoſe which be tame of the ſame kind. The uſe of milke in Phyſicke, with the obſervations belonging thereto. Alſo of Gheeſe, Butyr, the greaſe alſo and tallow of beaſts.*

And to begin with Milke: Theſe points following are to be obſerved: *Imprimis*, Ech living creature liketh beſt and findeth moſt good by the owne mothers milke. *Item*, For nources to conceive with child whiles they give ſucke, is a moſt hurtfull thing to their babes: for after ſuch a time, their milke will thicken and cruddle in manner of a cheeſe (a daungerous matter for ſucking infants) who thereupon be called Coloſtrati. Now the beeſtings, called in Latine Coloſtra, is that thicke and ſpungeous milke which is drawne firſt from the teat after the birth of
C the young, be it in woman or beaſt. Alſo, there is no milke ſo nutritive as that of a woman, whatſoever it be: next unto which, goats milke is thought to nouriſh moſt: whereupon haply aroſe the fable that Poets feigned, who deviſed, that *Iupiter* was ſuckled therewith. Howbeit, ſetting womans milk aſide, the ſweeteſt of all other is that which the camels give: but aſſes milk is ſuppoſed to have moſt vertue and efficacie in it. Moreover, this is to be noted, that the bigger bodied beaſts be more glad-milch, and their milk ſooner paſſeth away through the belly and is eaſier digeſted than that of the ſmaller kind. Goats milk agreeth beſt with the ſtomack; the reaſon is this, Becauſe they brouſe, rather than graze: but cow milke is held to be more aromaticall and medicinable: howbeit ewes milke is the pleaſanter, and yeeldeth more nouriſhment; notwithſtanding it be not ſo holeſom, for that it is more fattie and groſſe than any other. And generally, the milke
D which any beaſt giveth in the Spring, is more wateriſh and fuller of whey than in Summer time; like as the milke of any young thing is thinner than other. But ſimply the beſt milke is that held to be, which ſticketh to ones naile and will not run off. Milke is leaſt offenſive and hurtfull when it is ſodden, eſpecially with little gravell ſtones among. Cow milke of all other is thought meeteſt for to make the bodie ſoluble. But what milke ſoever it be, leſſe ventoſities it engendreth boiled than raw. In ſum, this propertie hath milke in generall, To heale all inward ulcerations, but principally of the kidnies, bladder, guts, throat, and lungs. Applied outwardly, after a ſpare diet or abſtinence from meat, it cureth the itch of the skin; and any wheals and breakings forth occaſioned by phlegmaticke humors. As for the diet-drinke made of cow milke (which they uſe in Arcadia for the phthyſicke or conſumption of the lungs, for thoſe that be given to colliquations
E and to weare away, as alſo in caſe of miſliking when the habit of the bodie receiveth no benefit by food) I have written alreadie in my treatiſe of Hearbs. Wee ſhall find upon record in the Chronicles, divers who by drinking aſſes milke, have been delivered from the gout, as well of hands as feet. The Greeke Phyſicians, beſides the generall kinds of milke, have made mention of one more, which is artificiall, and they name it Schioſton: The manner of making it is thus: Take what quantitie you will of any milke, but let it be of a goat eſpecially, if you can come by it, ſeeth the ſame in a new earthen pan never occupied before, with certaine branches of figg-tree, ſuch as be freſh and new gathered; but you muſt put to everie hemine of milke, one cyath of mead or honied wine: while it doth ſeeth, keepe it from running over the veſſell, by plundging into it a ſilver gobblet or boll-full of cold water, and take heed that none thereof doe run out:
F after it is throughly ſodden take it from the fire; for when it is cooled, you ſhall ſee how the parts thereof will divide, and the whey depart from the milkie ſubſtance. Some there be, who take the verie whey againe, beeing now verie ſtrong of the mead or muſt above-ſaid, and boile the ſame untill a third part thereof be conſumed, and then ſet it a cooling abroad in the open aire: The uſe hereof is verie effectuall and commodious, if for five dayes ſpace togither, the pa-

tient take at times, with ſome reſt betweene, one hemine thereof in a day; but after the drinking G
of this whey, if ſome exerciſe by geſtation bee preſently uſed, it will have the better operation.
This drinke is uſually given to thoſe that be ſubject unto the falling ſickneſſe, the paſſions of me-
lancholie, and the palſie; alſo for the leproſie, elephanſie, and all gouts or diſeaſes of the joynts.
But to returne againe unto milke: a clyſtre made therewith, is excellent good againſt any inward
gnawings and frettings occaſioned by the taking of ſome ſtrong purgative medicines. Alſo in
caſe of the dyſenterie, or hote exulceration of the bowels, the decoction of milke ſodden togi-
ther with the gravell ſtones about the ſea ſide, or with barley ptiſane, is paſſing good to be clyſte-
rized: but for the corroſion of the guts, the milke of kine or ewes is better than any other. Alſo
for the dyſenterie or bloudie flix, the milke that is injected by way of clyſtre, would be freſh and
newly drawne from the udder: for the cholique, it ought to bee miniſtred raw without any boi- H
ling: in like manner is it to be uſed raw, for the diſeaſes of the matrice, the ſting of ſerpents, the
phthyſicke, the poiſons of the Cantharides, Salamander, Bupreſtis, and Pityocampe. But to
grow unto more particulars: cow milke is ſingular for them who bee poiſoned with drinking
Colchicon, Hemlocke, Dorycnium, or the venome of the Sea-hare. As for aſſe-milke, it is ſo-
veraigne good for thoſe who have taken inwardly, any plaſtre, ceruſe, * brimſtone, or quicke-
ſilver: alſo to looſen the belly that is coſtife in a fever: moreover, if the throat be exulcerat with-
in, it is an excellent thing to gargarize therewith. The ſame is a verie good reſtorative for them
to drinke, who after great weakneſſe are upon their recoverie and would gather ſtrength againe:
ſuch alſo as the Greeks call Atrophos, who have no feeling nor benefit of their meat: alſo it may
bee allowed in an ague, ſo that the Patient have no head-ach. It was held in old time for a nota- I
ble ſecret in Phyſicke, to give unto children before meat one hemine of aſſes milke; or at the
end of a meale, if they felt any fretting or gnawing occaſioned by their meat: but for default
hereof, they uſed goats milke in ſtead of the other. The whey of cow-milke is above all, ſove-
raigne for thoſe that be troubled with ſtreightneſſe of breath, ſo as they cannot fetch their wind
but ſitting upright, if there be put to it a little creſſes: alſo it is good therewith to annoint bleared
eyes, adding to everie hemine of milke foure drams of Seſame beaten to powder. Goats milke
cureth the hardneſſe and ſwelling of the ſpleene, eſpecially if the goats beeing kept from meat
two daies, were the third day fed with Ivie; of which milke the patient muſt drinke three dayes
togither, and forbeare all other food: and yet milke other-whiles is contrarie to thoſe who bee
given to head-ach, ſubject to the debilitie of the liver, and the oppilation of the ſpleene; to ſuch K
as have the ague, occaſioned by ſome infirmitie of the ſinews; or be troubled with dizzineſſe, with
the murre, poſe, and ſtuffing in the head; with the cough alſo, and bleared eies; unleſſe it be given
as a purgation. Sowes milke is of all other moſt excellent for the inordinat deſire to the ſtoole,
and ſtreining thereupon without doing any thing; for the bloudie flix alſo, and the phthyſick or
conſumption of the lungs. And ſome authors there be, who affirme, that it is moſt holeſome
for a woman to drinke in any of the afore-named infirmities.

Of Cheeſe, and the ſundrie kinds thereof, I have ſpoken ſufficiently in that diſcourſe where-
in I treated of Vdders, and the ſeverall parts or members of living creatures. And verely *Seſtius*
attributeth the ſame effects to the cheeſe made of mares milke, as hee doth to that which is ga-
thered of cow-milke: that kind of cheeſe hee calleth Hippace. Generally, all cheeſe unſalted, L
that is to ſay, freſh and greene, is good for the ſtomacke. Old cheeſe ſtoppeth a laske, abateth
flesh and maketh the bodie leane, yea and is * hurtfull to the ſtomack. In Summer, all ſalt meats
take downe thoſe that be corpulent, whereas ſoft and tender viands doe feed and nouriſh the bo-
die. Freſh cheeſe applied with honey, reduceth the skin which is blacke and blew by reaſon of
ſtripes, to the freſh and naturall colour againe. * Old cheeſe maketh the bodie coſtife, and aſ-
ſuageth the torments of the bellie, if it bee made into troſches, and thoſe ſodden in ſome ſtyp-
ticke or auſtere wine, and afterwards fried in a pan againe with honey, and ſo applied. There is a
kind of rotten and putrified cheeſe, which the Greeks call Sapron: the ſame being punned with
ſalt and drie Servoiſes, and ſo given in wine to drinke, cureth the flux of the belly cauſed by the
infirmitie of the ſtomacke. The cheeſe made of goats milke, ſtamped into a cataplaſme and ſo M
applied, healeth the carbuncles engendred about the privie parts: ſo doth the foure cheeſe alſo
with oxymell. The ſame reduced into a liniment with oile, taketh away all ſpots in the skin, if the
bodie be therewith annointed in a ſtouph or hot-houſe.

As touching Butyr, it is made likewiſe of milke, and among barbarous nations is held for the

daintieſt

* *Sulphur*: I marveile hereat, conſidering that brimſton may be taken inwardly with ſafetie. I ſuppoſe therfore, that for θεῖον, which is *Solani manicon, id eſt*, deadly dwale, (a peſtiferous and venomous hearb) he read θεῖον, *i.* brimſtone, in the author whom he followed.

* *Inutiliores*: ex Dioſc. κακοστόμαχοι.

* *Venus.*

A daintieſt meat, and which doth diſtinguiſh the * rich and better ſort from the poore commons. The milke of kine yeeldeth moſt Butyr, whereupon it tooke that name: but the fatteſt Butyr is made of Ewes milke. Alſo there is a kind of Butyr gathered of Ewes milke: but in Winter the milke ought to be heated: whereas in Summer time there needs no more to doe but to preſſe it forth from the milke after much ſhaking & often agitation in certain long veſſels (called cherns) having in the very mouth, a little narrow hole to receive aire and give vent to that within, or elſe otherwhiles ſtopped cloſe, and bound up with ſome cloth. Now in the cherning, they uſe to put thereto a little water, to the end that the milke may ſoure the ſooner. After this beating and working of the milke, the thickeſt part [which is Butyr] floteth aloft, and is naturally of an oilie ſubſtance. The reſt they uſe to boile in certaine pans, & that which ſwimmeth above, they take from
B the other, & putting ſalt to it, they call it Oxygala. *Butyr the ſtronger ſent or ſmack that it hath, the better it is eſteemed to be. And in very truth, ſtale Butyr that hath been long kept, is mingled in many compoſitions: for by nature it is *aſtringent, emollitive, incarnative, and mundificative. Moreover, there is another way to make Oxygala, namely, to put ſoure milke into the freſh and ſweet which you would have to be ſoure, and this kind of cherne-milke, ſoure-milke or ſulli-milk, call it what you will, is thought to be moſt holeſome for the ſtomacke. But the properties and effects thereof I will ſet downe in another place.

Among the medicinable parts which be common to all living creatures, their fat deſerveth greateſt commendation: but eſpecially ſwines greaſe, which in old time they uſed with great ceremonie and religion. Certes, even at this day there is a ſolemne ceremonie, that the bride new-
C ly wedded, as ſhe entreth into her husbands houſe, ſhould ſtrike the ſide poſts therwith for good lucke ſake. Hogs lard or greaſe may be kept two manner of waies, either with ſalt, or as it is of it ſelfe unſalted: and indeed, the older the better. The *Greekes in their bookes called it Axungia. But that there ſhould be ſuch ſtrength in ſwines greaſe, it is no marvell: for the reaſon is plaine, becauſe it is a beaſt that feedeth much of hearbe roots. Which is the cauſe alſo that their dung is much uſed for a number of purpoſes. And therefore take my words thus, that I mean no other ſwine but ſuch as * feed and root in the field: among which, the female, eſpecially a guelt that never farrowed, is more effectuall than a [tame] bore, barrow hog, or a breeding ſow. But the greaſe and dung both, of the wild bore, is preferred before all. Swines greaſe then is employed to mollifie, to heat, to diſcuſſe and mundifie. And ſome Phyſicians there bee who preſcribe for the
D gout an ointment made of it, with gooſe greaſe, buls tallow, and the greaſie ſweat of wooll called Oeſypus. But in caſe the paine continue ſtill, they give direction to uſe it with wax, myrtle, roſin, and pitch. Hogs greaſe alone unſalted and ſimple as it is, healeth burns & ſcaldings, yea, though one were ſcorched and ſendged with the ſnow. It cureth alſo kibed heeles, if it bee tempered with the aſhes of burnt Barley and gall nuts pulverized, of each a like quantitie, and ſo reduced into a ſalve. Alſo it is good to annoint merigals therewith, namely, when one part of the bodie is fretted and chafed againſt another: likewiſe it refreſheth thoſe that bee wearie and tired with much travell: for an old cough, ſeeth of freſh hogs greaſe, that is ſweet, the quantitie of three ounces in as many cyaths of wine, putting honey thereto, and let the patient drinke it. Old ſeame alſo that is tried and kept unſalted, made into pils and taken inwardly, cureth the phthiſicke and conſumption
E of the lungs. For ſurely if it have taken ſalt once, there is no uſe thereof, unleſſe it be to mundifie and cleanſe, or els before the part is exulcerat. Some there bee who ordaine to ſeeth hogs lard & honey, of each three ounces, in three cyaths of wine, for a medicine to cure the conſumption of the lungs: with this charge, that the fift day after the patient take a quantitie of tarre in a rere egge, having his ſide, breaſt, and ſhoulders well ſwaddled before and emplaſtered with the ſaid compoſition: for ſo forcible it is, that if a plaſtre thereof bee but bound to the knees, the very ſent thereof will come up to the mouth, and cauſe a kind of ſalivation, whereby the patient ſhall ſeeme to ſpit it up againe. The greaſe of a yong guelt which never had pigs, is a very proſper medicine for women, to make their skin ſupple & even without wrinckles. But any hogs ſeame tempered with the beſt tallow or ſuet, to the quantitie of a third part, and ſome pitch, all melted
F together, and made ſomewhat hote, is ſoveraigne for ſcabs. Swines greaſe that is pure and unſalted, if it be put up beneath in manner of a collyrie or peſſarie, giveth comfort to the infant within the mothers wombe, which otherwiſe would have beene readie to ſlip forth before time, and proove an abortive fruit. The ſame being tempered with ceruſſe or litharge of ſilver, into a ſalve, and ſo applied, reduceth any skars to the naturall colour of the other skin about them. But with brim-

* Either for that the rich onely are allowed to feed upon Butyr, or becauſe they have plentie thereof, and raiſe a yearely revenue for that commoditie, whereas the reſt can ſpare none from their owne bellies.

* *Quo magis virus reſipit.* Some would amend this place, and for [*magis*] put in [*minus*] in a contrary ſence: but I ſuppoſe he writeth in regard of barbarous people, who make more account of ſuch ranke Butyr: like as the uncivile Iriſh in theſe daies.

* *Naturam eius adſtringere,* ſome read *digerere, i.* it is digeſtive.

* And yet it is a Latine name of *axis* & *ungo*: becauſe they uſed to greaſe axeltrees therwith.

* Not thoſe that be franke-fed or kept in ſtie.

brimſtone it cureth the raggedneſſe of the nailes : it ſtaieth likewiſe the haire of the head which G
is given to ſhed : alſo if it be mixed with a fourth part of gall nuts, it healeth the ulcers in a womans head: but if it bee well ſmoaked, it helpeth to preſerve the haires of the eyelids. An ounce weight thereof boiled in one hemine of old wine, untill there bee three ounces and no more of the whole remaining, is given (an ounce at once) to thoſe who are in a phthyſick. Some appoint a little honey to be put thereto. The ſame together with Quicke lime reduced into a liniment, is ſingular for the biles and impoſtumes called Pani, as alſo for fellons and the hard tumors of womens paps: it ſerveth beſides to cure inward ruptures and convulſions, ſpaſmes, crampes, and diſlocations. Being applied with white Ellebore, it healeth cornes, agnels, fiſſures, chaps, and calloſities. But incorporat with the pouder of a ſalters pot-ſhard, it healeth the ſwelling impoſtumes
behind the eares, as alſo the wens called the kings evill, beeing ordered in like manner. If the bo- H
die be well rubbed and annointed therewith in the baine or hot houſe, it taketh away all itch, red pimples and wheales riſing in the skin. Moreover, prepared after another ſort, to wit, with old oile together with the ſtone called by the Greekes Sarcophagus, beaten to pouder, adding thereto the hearbe Cinquefoile ſtamped in wine either with Quicke lime or with aſhes, and ſo reduced into a liniment, it is very good for thoſe that bee troubled with the gout. Thereof alſo is made a ſingular plaſtre againſt inflammations, in this wiſe, Take of the ſaid greaſe the weight of fourſcore and five pound, of white litharge of ſilver one hundred pound weight, mix them both together. As for Bores greaſe, if there be a liniment made of it and roſin, it is thought to be excellent good for to annoint therewith ulcers that bee corroſive and given to ſpread farther. [In old time men
uſed it moſt about the axeltrees of their carts and waggons, annointing them therewith, that the I
wheeles might turne about more eaſily: whereupon it tooke the name Axungia.] And beeing employed in this manner, it ſerveth for a medicine to cure the ulcers of the ſeat and privie members ſerving to generation, by reaſon that it is mixed and coloured with the ruſt of the yron incorporat into it. The auncient Phyſicians made moſt account alwaies of the ſaid hogs greaſe, by it ſelfe, which was plucked from the kidneies; for after it was cleanſed from the ſtrings, veines, and skins, they waſhed it often and rubbed it well in raine water; which done, they ſod it in new earthen pots, ſhifting it out of one into another many times; and beeing thus tried and clarified, they kept it for their uſe. Howbeit, all are agreed, that when it hath taken ſalt, it is a greater emollitive, it heateth alſo, diſcuſſeth and reſolveth more: yea, and being waſhed in wine, it is much better than otherwiſe.

As touching the fat or greaſe of a Wolfe, *Maſſurius* writeth, that in old time it was eſteemed K
before any other, and had the price above all. And hee ſaith, that new wedded wives were woont upon their mariage day to annoint the ſide poſts of their husbands houſes therewith at their firſt entrance, to the end that no charmes, witchcrafts, and ſorceries might have power to enter in. Thus much of greaſe. Looke what vertue greaſe hath, the ſame, bee ſure, is the ſuet and tallow endued with which commeth from thoſe beaſts that chew cud: and although it may be handled and dreſſed otherwiſe, yet in force it is nothing inferior. But what tallow ſoever it be, the beſt way of preparing it, is after the skins or veines bee rid away, to waſh it firſt either in ſea water or ſalt brine, and then within a while to ſtampe it in a morter, eftſoones ſprinckling it with ſeawater: after which, it ought to be ſodden in many waters, untill it have loſt all the ſavour and rank taſt that L
it had: and then at laſt by ſetting it in the Sun continually, it will bee reduced to a perfect whiteneſſe. Moreover, this is to be noted, that the beſt ſuet is that which groweth about the kidneies. But ſay that old tallow is called for, and to be uſed in any cure, it ought firſt to be melted: and then anon to bee well and often waſhed in freſh cold waters; which done, it muſt bee liquified a ſecond time, caſting and pouring thereupon eftſoones the beſt odoriferous wine that may bee gotten: after which manner they uſe to ſeeth it againe and againe, and never give over, untill the ranke ſmell and ſent thereof be cleane gone: And verely many are of opinion, that particularly the fat of Buls, Lions, Panthers, and Cammels ought thus to bee ordered and prepared. As for the uſes and properties of theſe Pomonades, I will treat thereof in convenient place.

Concerning marrow, it is a thing common to all creatures, like as the fat aboveſaid. All the M
kinds thereof are emollitive and incarnative; they drie alſo and *heat the bodie. The beſt marrow ſimplie is that of Deere, as well red as fallow: next to it in goodneſſe is Calves marrow: and then in a third ranke follow Kids and Goats marrow. Prepared they ought to bee and dreſſed, before Autumne, when they be new and freſh waſhed, & dried in the ſhaddow. But afterwards they muſt

*If they come, from beaſts of hot nature: for otherwiſe they be temperat.

be

A be melted againe and run through a fine ſercer or preſſed through linnen ſtrainers, which done, they ſhould be put up in earthen pots, and ſet in a cold place.

But of all thoſe things which are generally to be found in every living creature, the gall is that which is of greateſt efficacie in operation: for power it hath naturally to heat, bite, cut, draw, diſcuſſe, and reſolve. The gall of ſmaller beaſts is taken to be more ſubtile and penetrative than that of the greater, & therefore ſuppoſed to be the better for to go into eyeſalves. Buls gall is thought to have a ſpeciall facultie above all others, principally in ſetting a golden colour upon skins, and braſſe. What gall ſoever it be, in the preparation thereof for any uſe, regard muſt bee had, that it be taken freſh and new; and then the orifice of the burſe or bag wherein it is contained, ought to be tied faſt with a good round packthred; thus being bound up cloſe, it muſt be caſt into boiling
B water, and there remaine halfe an hour; within a while after, ſo ſoon as it is dried (out of the Sun) it ought to be preſerved and kept in honey. The gall of horſes only is utterly condemned, and reputed as a very poyſon: which is the cauſe that the arch-Flamin or principall ſacrificer is forbidden by law expreſſely to touch an horſe, notwithſtanding that in Rome it is an ordinary thing to ſacrifice even horſes publickely: And not their gall alone but alſo their bloud, is corroſive by nature and putrifactive. The bloud of Mares likewiſe, unleſſe they bee ſuch as were never covered nor bare foles, doth corrode: in which reſpect it is good to eat away the ſcurfe about the brims of ſores and ulcers. And verely *Buls bloud freſh running out of the bodie, is reckoned no better than venome: and yet I muſt except Ægira, a cittie in Achaia, where the Prieſtreſſe of the god-
5 deſſe *Ops*, at what time as ſhe is to propheſie and foretell things to come, uſeth by drinking Buls
C bloud to prepare her ſelfe before that ſhee goeth downe into the vault or ſhrouds out of which ſhe delivereth her propheſies: ſo forcible is that Sympathie, whereof wee ſpeake ſo much, that otherwhiles it is occaſioned either by a religious opinion and devotion in mens minds, or els by the nature of ſome place. *Druſus* ſometimes a Tribune of the Commons in Rome, dranke (as it is reported) Goats bloud, to make himſelfe looke pale & *wan in the face, at what time as he ment to charge *Q. Capio* his enemie with giving him poyſon. And verely, the bloud of a Bucke goat is
, ſo ſtrong, that there is not any thing in the world will either ſharpen the edge of any yron tooles
2 ſooner, or harden the ſame when it is keene, than it. And as for the ruggedneſſe of any blade, it
3 will take it away more effectually and polliſh it better than the very file. Conſidering then this diverſitie which is ſeene in the bloud of beaſts, I cannot write thereof in ſuch generall tearmes as
D of a thing indifferently common to every one of them, but I muſt be forced to ſpeak particularly of their ſeverall effects. In which regard I will treat reſpectively of beaſts, according as they doe yeeld remedies againſt this or that maladie: and firſt as touching thoſe which are adverſe unto ſerpents.

To begin then with Stags and Hinds: no man there is ſo ignorant but hee knoweth, that they plague ſerpents to the very death, for they plucke them forth of their holes, and eat them when they have done. And not onely whiles they be alive doe they war againſt ſerpents with the breath of their noſthrils, but alſo when they be dead, every member and peece of their bodie is contrarie unto them. Burne a peece of an Harts horne, you ſhall ſee how the ſmoake and ſmell therof will chaſe away ſerpents, as I have obſerved heretofore: and yet they ſay that the perfume of the
E bones which are about the throat of a Stag, hath a contrary property, to gather them together. Let a man lay under him Stags skins in ſtead of a mattrace, he ſhall ſleepe ſecurely, without any feare that ſerpents will approch to do him harme. The rennet in their maw, or the rede it ſelfe, if it be drunke with vinegre, is a ſoveraigne antidot againſt their venomous ſting: and looke what day one doe but handle it, he ſhall bee ſure and ſafe from any daunger by them. The genetoirs of a Stag kept untill they be drie, like as the pizzle alſo made into pouder and taken in wine, is a ſingular countrepoyſon, reſiſting the venome of ſerpents. Even as the rim of the paunch, which is called in Latine Centipellio. Whoſoever have about them ſo much as the tooth of an Hart, or be annointed with the marrow or ſuet of a Stag, Bucke, or Hind-calfe, need not to feare any ſerpents, for they will flie from them. But above all remedies, there is none like to the
F rennet of a Fawne or Hindcalfe, ſuch a one eſpecially as was ripped out of the dams bellie, as I have ſhewed heretofore. If together with Deeres bloud there be burned the hearbe Dragon, baſtard Marjaram, and Orchanet, in a fire made with Lentiske wood, ſerpents (by report) will gather round together into an heape: Take away the ſame bloud and put into the fire the root of *Pyre-
thrum, they will ſcatter aſunder againe.

Themiſtocles therewith poyſoned himſelfe.

*i. *Tellus*, or *Terra* the earth

Invidia, for *Livor*.

*i. Pelitarie of Spaine.

I read

I read in Greeke writers of a certaine beaſt leſſe than a Stag, but like in haire, called Ophion: G
which folke ſay is wont to be found onely in the Iſle Sardinia. But I ſuppoſe that the race of them is utterly extinct and gone. Wherefore I will forbeare to write of the medicinable properties reported by that beaſt.

Chap. X.

The medicines (againſt Serpents) found in the wild Bore, in Goats, and wild horſes. Alſo of other remedies which diverſe beaſts doe yeeld againſt all diſeaſes.

THe braines of a wild Bore is highly commended againſt the wing and venome of ſerpents. H
So is the bloud likewiſe. Semblably is the liver kept and preſerved long with Rue, if the ſame be drunke in wine. In like manner the fat of the wild Bore incorporat with honey and roſin. Alſo the liver of a tame Bore being cleanſed from the filaments and ſtrings therein, taken to the weight of foure oboli, or the very braines drunke in wine.

If a man burne the horne or haire of Goats, the fume thereof driveth away ſerpents, as it is commonly ſaid: and the aſhes that come thereof either drunk inwardly or applied in a liniment without, are of great force againſt their ſtings. Moreover, a draught of Goats milke taken with the grape of the vine Taminia, or of their urine drunke with ſquilliticke vinegre. Furthermore, it is ſaid, that cheeſe made of Goats milke together with Origan uſed in a cataplaſme, or their tallow incorporat with wax, worketh the like effect. A thouſand medicines beſides are reported to I
bee drawne from this beaſt, as ſhall hereafter appeare: whereat for mine owne part I much marvell, conſidering, it is commonly ſaid that he is never out of a feaver. The wild of this kind doe affourd medicines more effectuall than the tame, and thoſe as I have ſaid multiplie exceedingly. As for the Bucks or male Goats, they have medicinable properties apart by themſelves. And *Democritus* ſaith, That the Bucke which the dam bare alone, is of greater efficacie than any other: who affirmeth moreover, that it is very good to annoint the place ſtung with ſerpents, with Goats dung ſodden in vinegre: alſo with the aſhes of the ſaid dung freſh made, and tempered with wine into a liniment. In ſumme, as many as hardly are cured of ſerpents ſtings, recover therof paſſing well, if they ordinarily haunt Goat-pens and ſtals where they be kept. But ſuch as would have a
more ſpeedie and aſſured cure, take the paunch cut out of a Goat newly killed, together with the K
dung found therein, and preſently bind the ſame faſt to the place affected, ſo ſoone as they bee ſtung. Others perfume the fleſh newly hurt, with Kids hair burnt: and with the ſame ſmoke chaſe away ſerpents: they uſe alſo to applie their skin newly flaied, to the wound: like as the fleſh and dung of a horſe that lieth out and feedeth abroad in the field: the rennet likewiſe of an Hare in vinegre againſt the pricke of a ſcorpion and the venomous tooth of an hardiſhrew. Moreover, it is ſaid, that as many as rub and annoint their bodies with Hares runnet, need not feare their ſtinging. If any be hurt by a ſcorpion, Goats dung helpeth them; but the better, if it bee boiled in vinegre: and in caſe one be poyſoned with ſwallowing downe thoſe venomous flies called Bupreſtes, he ſhall find great helpe by eating lard and drinking the broth or decoction thereof. Furthermore, if a man round an aſſe in the eare, and ſay cloſely, That hee is wounded by a ſcorpion, L
the paine and grievance thereof will immediatly paſſe away: yea and any venomous thing whatſoever, will flie from the fume of his lungs as it burneth: alſo it is good for thoſe who are ſtung by ſcorpions, to be perfumed with the ſmoake of calves dung. If a man bee wounded by the biting of a mad dog, ſome there be who cut round about the place to the very quick, laying therto the raw fleſh of a calfe, and then give the patient to drinke the broth of the ſaid fleſh boiled, or elſe hoggs greaſe ſtamped with quicke-lime. Others highly praiſe the liver of a bucke-goat, affirming that if it be once applied, hee ſhall not fall into that ſymptome of hydrophobie or fearing water, incident to thoſe that be bitten with a mad dog. They commend alſo a liniment made of goats dung and wine or honey tempered togither: like as the decoction of a grey or badger, of a cuckow and a ſwallow, taken in drinke. For the biting of other beaſts, it is an ordinarie practiſe M
to lay unto the ſore, drie cheeſe made of goats milk, togither with origan, but they give direction to drink the ſame in ſome convenient liquor. In caſe one be bitten by a mans tooth, they preſcribe boeufe ſodden and applied; howbeit the fleſh of a calfe is more effectuall; with this charge, That this cataplaſme bee not remooved before the fift day. It is a common ſaying, that the muffle or

ſnout

A ſnout of a Wolfe kept long dried, is a countercharme againſt all witchcraft and ſorcerie; which is the reaſon that they uſually ſet it upon gates of countrey fermes. The ſame force the very skin is thought to have which is flaied whole of it ſelfe, without any fleſh, from the nape of the necke. And in truth, over and above the properties which I have reported alreadie of this beaſt, of ſuch power and vertue it is; that if horſes chaunce to tread in the tracts of a Wolfe, their feet will bee immediately benummed and aſtonied. Alſo their lard is a remedie for thoſe who are empoyſoned by drinking quick-ſilver. Aſſes milke if it be drunke, doth dull and mortifie the force of any poyſon: but more particularly, if any have taken Henbane, the viſcous gum of the hearbe Chamæleon, Hemlocke, the ſea-Hare, the juice of Carpathum, the poyſon Pharicum, or Dorycnium: Alſo in caſe that cruddled milke have done harm to any: for ſurely it is no better than poy-
B ſon, eſpecially the firſt beeſtings, if it quaile and cruddle in the ſtomack. To conclude, Aſſes milke hath many other medicinable properties which wee will ſpeake of hereafter. But remember alwaies to uſe this milke while it is freſh and new drawne out of the udder, or els not long after, and then it muſt be warmed: for there is not any milke that ſooner looſeth the vertue. Moreover, the bones of an aſſe well broken, bruiſed, and ſodden, are given for a countrepoyſon againſt the venome of the ſea-Hare. And for all theſe purpoſes beforeſaid, the milke and bones of the wild Aſſes be thought more effectuall.

As touching wild horſes, the Greekes have written nothing, becauſe throughout all Greece there are none of them to be ſeene. Howbeit, whatſoever medicinable vertues bee attributed to horſes, the ſame we muſt think more forcible in the wild than in others. Neither had the Greeks
C any experience of thoſe Neat or Buffles called Vri and Biſontes: & yet the forreſt of India be full of wild buls & kine. Now by good reaſon and proportion, we are to thinke, that whatſoever commeth from them, is more availeable in Phyſicke, than from the tame of that kind. And verely, Cow milke is ſaid to bee a generall countrepoyſon, able to kill any of thoſe venomes abovenamed. Over and beſides, if the dangerous Lillie called Ephemerum Colchicum, be taken inwardly and ſetled in the ſtomacke, or if the greene flies Cantharides have been given in drink, the ſaid milke will ſend up all againe by vomit. And as for the Cantharides, the broth of Goats fleſh will doe the like. Againſt thoſe corroſive poyſons which kill by exulceration, the tallow of a Calfe or any Bœufe, is a ſoveraigne medicine. As for the daunger that commeth by drinking Horſe-lea-
ches, butyr made of Cows milke, is a ſingular remedie, if it be taken with vinegre, heat with a gad
D of ſteele. The ſame alone without any other thing is a good countrepoyſon, for if oile be wanting, butter may ſerve the turn as well. Being joined with honey, it healeth the ſores occaſioned by the biting of the Porcelets called Multipedæ. The broth made of their tripes, if it bee drunke, is thought to kill any poyſon abovenamed: and beſides, the Aconite and Hemlocke: ſo doth the ſuet of a Calfe. Greene cheeſe made of Goats milke, is good for them that have drunke the venomous viſcoſitie iſſuing out of the hearb Chamæleon, called Ixias: but their milke is a remedie againſt the flies Cantharides and the venomous hearbe Ephemerum, if it be drunke with the grape Taminia. Goats bloud ſodden together with the marrow, is taken againſt the poyſons called Toxica: and Kids bloud againſt the reſt. The rennet found in the maw of a Kid, hath a peculiar vertue to mortifie the venome of the foreſaid viſcous gum Ixia, as alſo of the hearb it ſelfe, Cha-
E mæleon the white, yea, and Buls bloud: for which the rennet of an Hare with vinegre, is a ſingular defenſative. Againſt the venomous Raie or Puffen called Paſtinaca Marina: the pricke or ſting alſo of any ſea-fiſh, the ſaid rendles of an Hare, Kid, or Lambe, is a ſingular antidot, taken to the weight of one dram in wine. As for the rennet of an Hare, it is one of the ordinary ingredients that goe to the compoſition of all preſervatives and countrepoyſons.

There is a kind of Butterflie that uſeth to flie about candles as they are burning, which is reckoned among poyſons. The adverſative remedie againſt it, is a Goats liver: like as their gall is ſoveraigne againſt any venomous drinkes made of the ruſticke weazill.

F

Chap. xi.

Receits and remedies for many kinds of maladies, taken from ſundrie beaſts.

BVt now will I return to the remedies appropriat to diſeaſes reſpective to the particular members of the bodie. And firſt to begin at the head: Beares greaſe mixed with Ladanum, and that kind of Maidenhaire which is called Adiantum, retaineth the haire of the head which

is

is given to fall off: alſo the places that be alreadie bare, it repleniſheth againwith new haire. The G
ſame beeing incorporat with the fungous excreſcence growing about the candle ſnuffe, as alſo with the ſoot found ſticking to the ſockets of lampes and candleſtickes, cauſeth the haire of the eyelids to come thicke. Mixed with wine, it is good againſt the skurfe and dandruffe among the haires: for which purpoſe ſerveth the aſhes of Harts-horn burnt and applied with wine: the ſame alſo preſerveth the haire from breeding lice and nits. Likewiſe, Goats gall mixed with Fullers
*Creta Cimolia. *earth and vinegre, if the head be waſhed withall, ſo as the haires may drie againe by little and little. Semblably, the gall of *Bucke-goats tempered with Buls ſtale, killeth lice. Now if the ſaid gall
* Hircinum. Some read Scrofinum, i. Swines gall. be old, adde thereto brimſtone, and it ſcoureth beſides the dandruffe. It is thought, that the aſhes of an Aſſe pizzle will make the haire to grow thicke, and preſerve them from being grey, if the place bee firſt ſhaven and well rubbed therewith, or annointed with the liniment made of it and H
oile, punned together in a leaden morter. Likewiſe, the urine of a young Aſſe ſole is ſuppoſed to thicken the haire: but there would be mixed ſome Spikenard with this waſhing lie, to rectifie the ſtrong ſent of the ſaid urine. Buls gall mixed with Ægyptian Allum, ſerveth for a liniment to make the haire come againe, if the bald place be annointed therwith warme. As for the running skals of the head, there is not a better thing to cure them than Buls urine: ſo doth ſtale chamber lie, if there bee put to it Sowbread and Brimſtone: howbeit, Calves gall is of greater efficacie in this caſe, which if it be mingled with vinegre, and the head rubbed therewith hot, riddeth nits alſo. Calves ſuet ſtamped with ſalt and reduced into a liniment, is ſingular good for the ſores in the head. In theſe caſes great account is made of Fox greaſe, but eſpecially of their gall and dung, tempered with an equall portion of Senvie and ſo brought into an ointment. Take the pouder I
or aſhes of a Goats horne, but principally of the Bucke, put thereto ſal-nitre and the ſeed of Tamariſk: incorporat all with butter and oile into an unguent. It is wonderfull effectuall in keeping haire from ſhedding, ſo that the head be firſt ſhaven. Semblably, the aſhes of a dog burnt, and made into a liniment with oile, cauſeth the haire of the eyebrows to looke blacke. Goats milk by report taketh away nits. An ointment made with their dung and hony together, cauſeth the hair to grow thick, in places deſpoiled therof by occaſion of ſome diſeaſes. Likewiſe the aſhes of their houfs incorporat with pitch, keepe the haire on which is about to ſhed.

As touching the paine of the head, the aſhes of an Hare burnt, mixed with oile of Myrtles, allay the ſame: ſo doth the blowne water which is left in the trough after that a Bœuſe or Aſſe hath done drinking, if the patient take a draught of it. And if we may beleeve it, the genetall member K
of a hee-Fox, worne about the head in manner of a wreath, cureth the headach. The aſhes of a Harts horne brought into a liniment with vinegre, oile roſat or oile of Ireos, hath the like effect. For watering eyes there is a ſingular ointment made of Bœuſe tallow boiled together with oile. And the aſhes of Harts horne ſerveth by way of inunction to cure their aſperitie and roughnes: for which purpoſe the very tips and points of the knags are thought more effectuall. The excrements or dung of a Wolfe are good to annoint the eyes for the catarract. The ſame reduced into aſhes and made into a liniment with the beſt Atticke honey, is ſingular for thoſe whoſe ſight is dim and troubled, ſo that the eyes be annointed therewith: in which caſe, Beares gall is excellent. The greaſe of a wild Bore incorporat with oile roſat, is ſingular good for the bloudie fals or chilblanes called Epinyctides. L

The aſhes of an Aſſes houſe mixed with Aſſes milke, taketh away the cicatrices of the eyes, together with the filmes and pearles that trouble the ſight, if they be annointed therewith. The marrow of a Beefe taken forth of the right leg before, punned with ſoot, and ſo incorporat together in manner of a liniment, rectifieth the diſordered haires and other accidents of the eyelids and corners of the eyes. But for to have an excellent ſoot, proper to make a ſalve for to beautifie the eyes, it ought to bee gathered from a wieke or ſnuffe made of Papyr reed, and burning with Seſame oile, in ſuch ſort as the ſame may bee wiped away with a wing into a new earthen pot that never was uſed. And verely, this is a ſoveraigne ſoot to hinder the growth againe of haires after they be once plucked up from the eyebrowes. Of an Oxe gall tempered with the white of an egge, are made eye-ſalves reduced into rolles, which beeing diſſolved in water, ſerve to annoint M
the eyes for foure daies together. Calves ſuet with Gooſe greaſe and the juice of Baſill, is ſingular for all the accidents whereto the eyelids bee ſubject. The marrow of a Calfe, incorporat with equall weight of wax and common oile or oile roſat, together with an egge, maketh a ſoveraigne liniment for the Stian or any other hard ſwellings in the eyelids. The violent rheumes

that

A that fall into the eyes, are repreſſed and allayed with a cataplaſme of tender cheeſe made of goats milke ſoked in hot water, and ſo laid too: and if there be any tumor or ſwelling riſen by occaſion of ſuch a flux, it would bee applied with honey: and both of them, as well with ſwelling as without, ought to be fomented with warme whey. But ſay the eyes bee enflamed and bleered onely, without any * extraordinarie moiſture appearing in them, the little muſcles lying within the loines of a ſwine, roſted and afterwards punned to a cataplaſme, and ſo applied, doe quite rid away the ſame bleerednesse. It is commonly ſaid, that goats be never troubled with bleered eies, nor yet roe-bucks or does, by reaſon of certaine hearbs which they feed upon: and for that their ſight is as good by night as day, therefore certaine pills bee ordained for the infirmities of the eyes, made of their dung, enwrapped within wax, for to bee ſwallowed at the chaunge of the
B moone. Many there be who are of opinion, that ſuch as be dim ſighted and ſee little or nothing toward night (whome the Greeks call * Nyctalopes) are cured with goats blond, eſpecially the male: alſo with the liver of a goat ſodden in ſome auſtere or hard wine. Some give direction, to annoint the eyes all over with the gravie or dripping of the ſaid liver roſted, or els with the gall of a goat, and to feed of the ſaid fleſh; with this regard, That whiles the ſame is a ſeething, the eyes may receive the vapour and ſteeme thereof. And of this opinion they be, that the ſaid medicine will doe the better, if the goat bee of a bright ruddie colour. Moreover, they would have the eyes of the patient to be fomented with the vapour and fume that riſeth from the decoction of the liver whiles it boileth: but others there be, that preſcribe to take the ſmoake thereof as it roſteth or frieth. As for goats gall, there bee that uſe it many waies prepared; ſome with honey,
C againſt the fumoſities that trouble and dim the eye-ſight: others, with a third part of white Ellebore, for the pin and web: others againe with wine, againſt cicatrices, pearls, obſcuritie of ſight, filmes, and ſpots. But for the eye-lids, after the haire which pricked and offended the eye is pulled out, they applie it with the juice of beets, ſuffering the ſaid liniment to drie upon the eye-lids. If any tunicles of the eye bee broken, they take womans milke to apply unto it. In ſum, for all infirmities of the eyes whatſoever, they hold a goats gall which is old and hath been long kept, to be more ſoveraigne and effectuall in operation than any other. Neither doe they reject the dung of this beaſt, but repute a liniment made of it and honey, to be as good for waterie eyes, as the marow for the paine thereof: likewiſe the lungs of an hare. And verely the gall of an hare (as it is commonly reported) incorporat with cuit or hony, and ſo applied, helpeth thoſe
D that bee dim ſighted. Furthermore they ordaine, to rub and annoint the eyes againſt their inflammation and bleerednesse, either with woolves greace, or elſe with ſwines marrow. And no marveile, for they ſay, That whoſoever uſe to carrie about them in a bracelet a foxes tongue, ſhall never be troubled with ſore eyes.

For the paine and infirmities incident to the eares, there is not a better nor more excellent thing than the urine of a wild bore ſaved and kept in a glaſſe: the gall likewiſe of a wild bore or ſow, as alſo of a bœufe, mixed with Cicinie oile and oile Roſat, in equall quantitie, is a ſingular remedie: but eſpecially bulls gall, dropped into the ears warme with the juice of Porret; or elſe with honey, in caſe they bee impoſtumat within and runne with water. The ſame alone by it ſelfe warmed in the rind of a pomegranat, is excellent to take away the ranke and ſtrong ſavour of
E the ears: and if any part within bee broken, the ſaid gall inſtilled with womans milke, healeth it effectually. Some there be, who ordaine the ears to be well waſhed with it ſo prepared, for to remedie the difficultie and hardneſſe of hearing: others uſe to put into the ears wooll, waſhed before in hote water, and encloſe therewith a peece of a ſerpents ſlough, with vinegre: but if the deafeneſſe bee the greater, they infuſe the ſaid gall into the ears, tempered with myrrhe and rue, and ſo made hot all together in the pill of a pomegranat. Fat lard alſo is good for this purpoſe: and the greene dung of an aſſe inſtilled with oile roſat; provided alwaies, that all theſe medicines be warme when they bee dropped into the ears. But the ſome that a horſe doth froth, is better than all theſe: or the aſhes of horſe dung freſh made and burned, mixed with oile of roſes. In this caſe likewiſe are commended bœufe ſewet, gooſe greace, and freſh butyr. The urine of a goat
F or bull, yea and ſtale chamber-lie which Fullers uſe, made hote, and the vapour thereof received into the eare, at the narrow mouth or necke of a bottle, cureth the deafeneſſe thereof. Some put thereto a third part of vinegre, and a quantitie of the piſſe of a calfe which is yet a ſuckling and never taſted graſſe: yea and others there be, which put thereto the dung mixed with the gall of the ſaid calfe. The skin or ſlough alſo which ſnakes caſt off, is very good to be applied unto the

* Ἐκτροφθαλμία.

* *Nyctalopes*, are they alſo called, who ſee better in the night than by day: according as the word importeth.

eats,but they ought to be well chaufed and ſet into an heat before. Now are theſe medicines to G
be encloſed within wooll, and ſo applied. Moreover, calves tallow, with gooſe greace and the
juice of baſill, is good for the hearing: alſo calves marow incorporat togither with the powder
of cumin, and ſo powred into the eats. The ſlimie ſperme of a bore which paſſeth from the ſhap
of a ſow after ſhe is brimmed, if it may be gotten before it touch the ground,is ſingular for the
paine of the eats. If the eats be crackt and hang flagging downe, there is nothing better than
glew made of calves pizzles, if the ſame bee diſſolved in water. For other impediments of the
eats, the fat of foxes is verie good. In like manner, goats gall, with oile of roſes warme, or the
juice of leeks: or if there be any rupture within the eats, the ſaid gall muſt be applied with breſt-
milke. For thoſe who be hard of hearing, or have their eares running and ſuppurat within, it is
not amiſſe to drop into them a beaſts gall, with the urine of a ſhe-goat or of the male,it makes H
no matter. But theſe medicines howſoever they are to be uſed,are thought to be more effectuall
by farre, in caſe they were put in a goats horne, and ſo hung in the ſmoke for the ſpace of twentie
daies togither. Alſo there is great commendation of the rennet of an hare, if there be one third
part of a Romane denarius thereof, and halfe a denare weight of gum Sagapene, concorporat
in Aminean wine. As for the ſwelling impoſtumes behind the eats, bears greace repreſſeth and
keepeth them downe, if there bee a cerot made thereof, togither with the equall weight of wax
and bulls tallow: ſome there be who put Hypoquiſtis thereto: and butter alone is good to an-
noint them with, ſo that they were fomented before with the decoction of Fenigreeke.Howbeit,
of much better operation it would be, in caſe Nightſhade were added thereto. The ſtones of a
fox, bulls bloud alſo dried and reduced to powder, bee commended in this caſe. Moreover,the I
urine of a ſhee goat made warme,and ſo dropped into the eats: the dung likewiſe brought into
a liniment with hogs greace,is verie good.

To come now to the infirmities of the teeth: if they bee looſe and ſhake in their ſockets, the
aſhes of harts horne will ſettle them firme and faſt againe: if they ake, the ſame aſhes are verie
good to eaſe the paine, whether the teeth be rubbed or waſhed therewith. But ſome are of opi-
nion, that the powder of the ſaid horne not burnt at all,is farre better than the aſhes in theſe ca-
ſes: howbeit, there be dentifrices made both of the powder and alſo of the aſhes. Moreover,the
aſhes of a wolves head is thought to be a ſoveraigne remedie for the pains incident to the teeth.
Now it is well knowne, that among the excrements of a woolfe, there bee many times bones
found, which if they be hanged about the necke,arme,or other parts of the bodie,have the ſame K
effect. Likewiſe the cruddled rendles of an hare infuſed into the eare,are ſingular for the tooth-
ach: the aſhes alſo which come of the head burnt,is a prettie dentifrice for to rub the teeth with-
all: but if you put nard thereto,it doth correct and palliat a ſtinking breath. But ſome there be,
who chuſe rather to mingle therewith, the aſhes of mice and rats heads. There is found in the
ſide of a hares head a certaine * ſharpe bone like unto a needle; herewith,Phyſicians give coun-
ſell to ſcarrifie the teeth and let the gumbs bloud, for the tooth-ach. Take the bone of a beaſt,
ſet it on fire, and when it is red hote, hold it cloſe to the teeth that bee looſe and ake withall, it
will ſet them faſt againe: the ſame being reduced into aſhes,and tempered with myrrhe, is a pro-
per dentifrice to blaunch the teeth. The bonie ſubſtance likewiſe of hoggs cleys burnt and cal-
cined, is of the ſame force and operation: alſo the hollow hetchell or whirlebones of their hips, L
about which their hucklebones turne, worke the like effect if they be brought into aſhes. Well
knowne it is, that if the ſame bee conveighed downe by a horne into the throat of horſes and
ſuch like beaſts, they will cure the wringing torments of the botts that fret and gnaw them in
the bellies: and beeing burnt, they are ſingular good to confirme and faſten the teeth that bee
looſe and doe ſhake. Alſo if the teeth bee pained by occaſion of ſome blow given unto them,
aſſes milke helpeth them: ſo doe the teeth of the ſaid beaſt,if they be calcined and reduced in-
to aſhes. This infirmitie is helped alſo with the rough wert or corne of an horſe if it be infuſed
into the ears with oile: this bunch is called by the Greeks Lichen: and it is not that which is na-
med Hippomanes, whereof I have no purpoſe to ſpeake (conſidering it is a hurtfull and veno-
mous thing) but a certaine excreſcenſe growing about horſe knees, and above their houſes. M
Moreover, in the heart of an horſe there is found a bone, like for all the world to the eye-teeth
of a dog: this they hold to bee a verie ſoveraigne thing for to ſcarrifie the teeth when they ake.
Alſo if one take a tooth out of one of the chawles of a dead horſe,it will eaſe his owne that aketh,
ſo it bee correſpondent in place and number to that which is in paine. The ſperme that paſſeth

* βιλονοειδὴς χειρουσα.

from

A from the mature of a mare after ſhee hathbeen covered by a ſtallion, if the wicke of a candle or lampe be therewith beſmeared and ſet a burning, doth repreſent a moſt ſtraunge and monſtrous ſight of horſe heads, as *Anaxilaus* hath reported: even ſo will that alſo of the ſhee aſſe, make a ſhew and apparition of aſſe-heads. As for Hippomanes before-named, it is ſo ſtrong and forcible a venome, eſpecially to incite and ſtirre unto luſt, that being upon a time poured into the braſen mettall that was caſt into the forme and ſimilitude of a mare at Olympia, the ſtone-horſes which came neare unto the ſaid image, were ſet into ſuch a heat and ſo farre enraged, that they could not by any means bee held backe but they would needs cover the ſaid braſen mare. Moreover, the glew that carpenters and joyners uſe, cureth the tooth-ach, if the ſame be boiled in water, and the teeth annointed therewith; but the ſame within a little while after muſt be remoo-
B ved, and the mouth preſently waſhed with wine, wherein were ſodden the pill of ſweet pomegranats. Furthermore, if the teeth be ill affected, a collution made with goats milke, or bulls gall, is thought to be a remedie of great efficacie. Finally, the aſhes of the ankle-bones of a female goat whiles they be freſh and new, are counted an excellent dentifrice to whiten the teeth: ſo are the ſaid bones of all other foure-footed beaſts, reared and nouriſhed about a ferme houſe, if they be in like manner calcined: which I note but once for all, becauſe I would not repeat one thing ſo often.

Chap. xii.

C *Remedies obſerved out of the bodies of beaſts, for the accidents that befall to the viſage, necke, and breaſt.*

IT is thought generally, that the skin of the face may be made ſmooth and without wrinckles; tender and delicat, yea and be kept faire and white, with aſſes milke: for well knowne it is, that ſome daintie dames (forſooth) there bee, that keepe and maintaine daily in ordinarie to the number juſt of five hundred ſhee aſſes for this purpoſe: according to the firſt example of the Empreſſe *Poppæa*, wife to *Nero* the Emperour; for ſhee uſed commonly to bath in aſſes milke, and deviſed whole baines to ſwim therewith: and ever as ſhee rode in progreſſe, or remooved from place to place, ſhee had her cuirie of ſhee-aſſes in her traine attending upon her for no other
D intent, but onely to waſh and bath her bodie in their milke. As for the pimples and wheales that breake out in the face, if they bee annointed with butter, they will weare away and be gone; and the ſooner, if Ceruſſe or Spaniſh white bee tempered therewith: but pure butter alone without any thing elſe mingled with it, killeth any fretting humours in the face that be corroſive, if ſo be that preſently after the inunction, barley meale be caſt upon the place. The gleane of a cow having newly calved, taken whiles it is moiſt and ſo applied, is good for any ulcers of the viſage. There is another receit making for this purpoſe, which may ſeeme but a fantaſticall and fooliſh thing; howbeit, for to ſatisfie and pleaſe in ſome ſort, our fine dames that are deſirous of ſuch deviſes, I am content to ſet it downe: They ſay (forſooth) that the paſterne bones of a young white bulkin or ſteere, ſodden for the ſpace of fortie daies and nights togither, untill ſuch time as
E they be reſolved into the liquor, if the face be wet with a fine linnen cloth dipped in the ſaid decoction, it cauſeth the skin to looke cleare and white, and without any rivels or wrinkles; but the ſaid liniment muſt be kept all night to the face in manner of a maske. Moreover, they ſay, that bulls ſherne is an excellent complexion forſooth, to ſet a freſh roſat or vermilion colour in the ball of the cheeke: and the liniment Crocodilea, made of crocodiles ordure, doth it no better: but then they give order, that the face be waſhed with cold warer both before and after this dreſſing. The dung of a calfe tempered and wrought in ones hand with oile and gumme, is ſingular good to take away ſun-burning, or any thing whatſoever whereby the colour is decaied and loſt. As touching the ulcers and chaps appearing in the lips or face, the ſewet of a calfe, or beaſts tallow, incorporat with gooſe greace and the juice of baſill, maketh a ſingular pomandre to a-
F mend and rectifie thoſe defects and imperfections. There is another compoſition alſo for this purpoſe; to wit, calves ſewet and deers marrow mixed togither, with the leaves of the white Saint *Mary* thiſtle, punned all together and reduced into a liniment. The ſame operation hath any marow, though it be of a cow, and the broth of cow bœufe. The tettars and wild-fires breaking foorth about the mouth and noſe, there is not the like medicine againe to bee found, to kill and

extinguiſh, than a glew made of a calves genetoirs, diſſolved in vinegre with quicke brimſtone and mingled togither with a figg-tree braunch; with this charge, that when it is freſh made, the place affected be annointed twice a day therewith. This glew boiled in honey and vinegre, is ſingular for the leproſie: which diſeaſe, the liver alſo of a calfe applied hot, doth cure: like as goats gall healeth the foule white leprie called Elephantiaſis: but an ox gall and ſal-nitre mixed therewith taketh away the leprie and the filthie dandruffe appearing in the skin. The urine of an aſſe taken about the riſing of the Dog-ſtar, cleanſeth the face from all ſpots: ſo doth the gall as well of an aſſe as a bull, uſed alone by it ſelfe, after it hath been well broken and tempered in water, and the old skin of the face taken off; but then the patient muſt forbeare to goe abroad either into the ſunne or wind. The like effect hath bulls tallow or calves gall, incorporat with the ſeed of Savorie and the aſhes of an harts horne, if the ſame be burnt at the beginning of the Dog-daies. Aſſes greace is a ſoveraigne thing to reduce unto a freſh and native colour, any skarrs or places of the skin blemiſhed with the ſtooles remaining of ringworme, tettar, and leproſie. The gall of a bucke-goat incorporat with cheeſe, ſulphur vif, and the aſhes of a ſpunge, and brought to the conſiſtence and thickeneſſe of honey, taketh away moles and pimples. Some make choiſe rather of old galls which hath been long kept to uſe in this caſe, mingling therewith hot brans to the weight of one obolus, and foure times as much of hony; but firſt the ſaid ſpots and ſpecks ought to bee plied well with chauſing and rubbing. The ſewet of the ſame goat, tempered with Gith or Nigella ſeed, Brimſtone, and Floure-de-lis root, is verie effectuall for this purpoſe. Semblably, it is good for the chaps in the lips, if it be incorporat with gooſe greaſe, deeres marow, roſin, and unquencht lime. I find it recorded in ſome authours, that they who are given to have red pimples appearing in their face, are diſabled for exerciſing any ſacrifices belonging to Art magicke.

If the tonſils, throat, and wind-pipe, bee either enflamed or exulcerat, they find much eaſe by cow milke, or goats milke, ſo the patient gargarize therewith warme as it commeth new from the beaſt, or otherwiſe made warme againe afterwards: but goats milke is the better of the twain, if mallowes be ſodden therein, and a little ſalt. For bliſters in the tongue and throat, the broath made of tripes is verie good to be gargariſed: and more particularly, for the inflammations and ſores incident to the tonſils or almonds of the throat, the kidnies of a fox dried are ſingular, if they be beaten into powder and reduced into a liniment with honey. The gall of a bull or goat mixed with honey, ſerveth right well for the ſquinancie. The liver of a grey or badger tempered with water and made in manner of a collution, rectifieth a ſtrong and ſtinking breath: the cankers alſo and ſores in the mouth, are healed with butyr. If a thorne, fiſh bone, or any other ſuch thing ſticke in the throat, take the dung of a cat, rub & annoint the place well without-forth, the ſame (by report) will thereupon come up againe, or paſſe downeward. As for the ſwelling wens called the Kinds evill, either the gall of a bore doth ſcatter and diſpatch; or elſe of a bœufe, if the place affected bee annointed therewith warme: for hares rendles tempered with wine and put into a linnen cloath, is good to bee applied unto the ſame onely when they be ſore and run. The aſhes alſo of the houſe both of horſe and aſſe, incorporat with oile, water, and hote urine, into a liniment and ſo applied, doth reſolve them before they bee broken. Of the ſame effect is the aſhes of an oxe or cows clee, applied unto the place with water: as alſo their dung laid too verie hot with vinegre. In like manner goats ſewet with quicke-lime, or their dung ſodden in vinegre and the genetoirs of a fox. For this purpoſe, there is much good done with ſope: an invention deviſed by the French for to colour the haire of the head yellow: made it is of tallow and aſhes: the beſt of all other is that which they make of beech-wood aſhes and goats ſewet; and the ſame after two manner of wayes; either thicke and hard, or elſe liquid and ſoft: but the one as well as the other is verie much uſed in Germanie, and a great deale more indeed by men than women.

The cricks and pains in the necke, are much aſſuaged by rubbing the nape of the necke with butter or beares greace: if the ſame bee ſtarke and ſtiffe, there is nothing in the world better than beaſts tallow; the which, togither with oile, is verie good for the Kings evill before-ſaid. The painfull * crampe that draweth a man backe, ſo as hee cannot bow his head forward (which convulſion the Greeks name Opiſthotonos) is much eaſed by infuſing into the ears the urine of a ſhee goat, or with a liniment made with their dung and bulbe roots.

If the nailes bee bruiſed, it is paſſing good to tie about them the gall of any beaſt whatſoever.

As

* *Supinus & poſterganeum raptus. Aurelian.*

A As for the riſings and ſore excreſcences about their roots, bulls gall diſſolved in hot water, and ſo applied, eaſeth that grievance: ſome there be who put thereto brimſtone and alume, of ech a like weight.

Moreover, it is ſaid, that a wolves liver taken in a draught of wine warme, cureth the cough: alſo a bears gall mingled with honey: or the aſhes made of the uppermoſt tips of a beaſts horne: likewiſe the froth or ſlaver of an horſe mouth: and ſome ſay, that be the cough never ſo bad, it will make an end thereof in three daies drinking. Semblably, the lights of a ſtag, togither with the throat died in the ſmoke, and afterwards pulverized and brought into a loch or liquid electuarie, is good for the cough, to bee taken ordinarily everie day: and for this purpoſe, the lungs of the ſpitter in this kind of red deere, is thought to be more effectuall. In caſe a man ſpit bloud,
B the aſhes of harts is much commended: and the rendles of an hares maw taken in drinke to the weight of a third part of a denier, with Terra Samia and Myrtle wine, cureth it perfitly. The aſhes likewiſe of hares dung drunke in wine late in an evening, ſtayeth the cough which is buſie in the night ſeaſon. Alſo a perfume made with the haire of an hare, diſchargeth the lungs of thoſe tough and viſcous humours which ſticke unto them, and are not otherwiſe eaſily remooved. The purulent ulcers in breſt and lungs, remaining after a pleuriſie or peripneumonie: the ſtrong and ſtinking breath alſo proceeding from the lights, are cured moſt effectually with an electuarie made of butter, boiled with a like quantitie of Atticke honey, untill it looke reddiſh; if the patient take thereof everie morning the meaſure of one ligula or ſpoonfull: ſome in ſtead of honey, chuſe rather to put thereto the * roſin of the Larch tree. If one do reach or caſt up bloud, it
C is ſaid, that cows bloud, taken moderatly and with vinegre, is of great force and efficacie to ſtay the ſame: but to thinke that this is meant of bulls bloud, were great follie and raſhneſſe. Howbeit, the ſtrong glew that is made of a bulls skin, taken to the weight of three oboli in warme water, is ſoveraigne for an old infirmitie of reaching and fetching bloud upward.

* Which is our Turpentine.

Chap. XIII.

Receits for the paine of ſtomacke and loines: alſo for the infirmities of the reins.

D IF there bee an ulcer growne in the ſtomacke, drinke the milke of an aſſe or cow, and it will heale it. Stew a peece of bœufe in wine and vinegre among, the broth thereof is ſingular for the gnawing and fretting in the ſtomacke: The aſhes of an harts horne is verie good to drie up rheumes and catarrhes, that have taken a courſe thither. As for thoſe that caſt up bloud, the freſh bloud of a kid taken to the quantitie of three cyaths, with the like proportion of ſharpe vinegre, and ſo drunke as hote as may be: the rendles alſo of the ſaid kid drunke with vinegre, ſo as there be two third parts of the vinegre to one of the rundles, is a ſingular remedie for the ſaid infirmities.

For the griefe of the liver, cauſed by obſtructions, the liver of a wolfe dried and taken in honeyed wine, is a proper receit. So is the liver of an aſſe beeing dried and brought into powder with two parts of ſtone perſley, and ſo incorporat with three nut kernels and hony; which com-
E poſition, the patient muſt uſe to eat. In which caſe, goats bloud is higly commended, if it be prepared ſo as it may be taken with meat.

Moreover, it is ſaid, that for them who be ſhort winded, there is nothing ſo good as to drinke the bloud of wild horſes. In the next place to it, great account is made of aſſes milke warme, or ſodden togither with bulbe roots, ſo that the patient drinke the whey that commeth thereof, putting to three hemins of the bloud one cyath of white garden creſſes, infuſed firſt in water, and then tempered with honey. The liver alſo or lungs of a fox, taken in ſome groſſe wine like alegant: or a bears gall in water, doth open the wind-pipes ſtuffed with fleame, and giveth free libertie for the wind to goe and come.

Furthermore, bears greace is exceeding good for the paines in the reins of the backe, yea and
F for any place els that hath need of emollitives, in caſe it be well rubbed therewith. Alſo in theſe caſes, it is thought meet, to take the aſhes either of a bores or ſows dung which hath been long made, and therewith to ſpice a cup of wine.

But before I proceed any farther, it is to be noted, that magicians alſo have meddled with this part of phyſicke, and have deviſed ſtraunge medicines, drawne from the parts and members of

beasts. And first of all they would make us beleeve, that be a buck-goat never so much enraged, doe but stroke him by the beard, he will come into good order and be quiet againe: cut and lop the same off with a paire of sheers, he will not stray away nor depart to another flocke. But to returne to the griefe of the reins: the magicians add to the foresaid medicine, goats dung, which being put into a linnen cloth, and the same well greased, they give direction to hold in the hollow ball of the hand, as hot as may be endured; with this regard, that if the paine bee in the left side, this medicine be made in the right hand, and so contrariwise. Moreover, the dung or treddles which must serve this turne, they give order, that it be gathered and taken up with the point of a brasen needle or bodkin. Now the foresaid medicine must be held in the hand so long, untill the patient perceive that the vapour thereof doe pearce as far as the loins: which done, they appoint afterwards to annoint the head with the juice of leeks stamped: to rub the loines also with the said dung tempered with honey: giving counsell, to eat the stones also of an Hare, for to appease the same pain. As for those that be troubled with the Sciatica, they ordaine a cataplasme of ox or cow dung, to be laid upon the grieved place; but it ought first to be lapped within some leaves, and so made hote in the embres. For the paine in the kidnies, they give order to swallow downe the kidnies of an Hare raw, or at leastwise sodden, yet so, as the patient touch them not with his teeth. Over and besides, they doe say, that whosoever have about them the ankle-bone of an Hare, shall not be grieved with the belly ach. As touching the paine of the splene, the gall of a swine, be it Bore or Sow taken in drinke, or the ashes of Harts horne in vinegre, assuageth the same. But the most effectuall and soveraigne remedie of all other, is the milt of an asse which hath been long kept; for within one three daies the benefit thereof will be felt, and the patient shall find ease. Also, for the disease of the splene, they use to give in oxymell, the ordure of an asses fole, which first came from it after it was foled (and this dung the Syrians call Polea.) Furthermore, for this infirmitie the tongue of an horse which hath been kept drie a long time, given in wine, is a present remedie: and this is a secret which *Cæcilius Bion* reporteth that he learned of the Barbarians, whiles hee conversed among them. In like manner, a beasts milt whether it bee cow or ox, hath the same operation, if it be used in that manner: but say it be fresh and new taken out of the beast, then it ought to be either rosted or sodden, and so taken as meat. Over and besides, take twentie heads of garlick, pun them all, and after they be bruised, put them into a beasts bladder with a sextar of vinegre; apply the same to the region of the splene, it assuageth the pain. And if all be true that these magicians say, the milt of a calfe is singular good for the maladie of the splene; but then it must bee bought at the same price that the butcher setteth first upon it, without hucking and beating it lower for to have any thing abated; because in their opinion (so ceremonious they be) therein lieth a great matter. Now when it is thus bought, it would be slit through the length in two parts, and both peeces attached to the shirt of the patient; with this charge, That when he is about to put on his other cloaths and make himselfe readie, he suffer the said peeces to drop downe to his feet, and then take them up againe, and so drie them in the shadow: for in thus doing, the diseased splene of the sicke partie will likewise fall and settle downe, so as the patient shall sensibly perceive himselfe to be delivered of that infirmitie. Finally, the lungs of a Fox dried in the ashes and so drunke in water, is good for the spleene: as also the milt of a kid, applied to the grieved part accordingly.

Chap. xiiii.

For to stop a laske and knit the bellie: for the flux proceeding from the imbecilitie of the stomacke: for the dysenterie or bloudie flix: for the ventosities and inflation of the bellie: for ruptures: the straining upon the seege without doing any thing: for the worms in the guts, and for the cholique.

TO stay the running out and extraordinarie loosenesse of the belly, these medicines following be convenient: *Imprimis*, the bloud of a stag: *Item*, the ashes of an harts horne: the liver of a bore fresh and without any salt at all, taken in wine: likewise the liver of a sow rosted, or of a male goat sodden in one hemine of water: the crudled rennet in a hares maw, drunke in wine to the quantitie of a cich-pease; or in water, in case the patient have an ague. Some there be, who put gall nuts thereto; others content themselves with hares bloud alone sodden with milke. Also the ashes comming of horse dung drunke in water: the ashes of that part of an old bulls

A bulls horne which groweth next to the head, ſtrewed into a draught of water. In like manner, Goats bloud ſodden upon coales. A Goats skin or fell, haire and all boiled together, yeeldeth a decoction which is good in this caſe to be drunke.

Contrariwiſe, to looſe the belly: the runnet found in a Colts maw: the bloud of a female Goat, or els her marrow or liver, are thought convenient laxatives. *Item*, A plaſtre made with a Wolves gall, together with the juice of the wild Cucumber, and applied to the navill. Alſo a draught either of Mares or Goats milke, taken with ſalt and honey. The gall of a ſhee-Goat is good for this purpoſe, if it be taken with the juice of Sowbread and a little Allum. But ſome there be who think it better to put thereto ſalnitre and water. Buls gall ſtamped and incorporat with Wormewood, made into a round ball, and ſo put up in ſtead of a ſuppoſitorie, will give a ſtoole, and make the
B bodie ſoluble.

Butter eaten in any great quantitie, is good for thoſe who have a flux occaſioned by the weakneſſe of the ſtomacke, and a dyſenterie or bloudie flix: ſo is a Cowes liver: the aſhes of an Harts horne, taken to the quantitie of as much as three fingers will comprehend, in a draught of water: likewiſe the rennet of an Hare wrought in dough for to make bread: or if the patient doe void bloud withall, the ſame ought to be incorporat in parched Barley meale. The aſhes of a Bores, Sowes, or Hares dung, is good to ſpice a warme potion of wine in theſe infirmities. Moreover an ordinarie Veale broth, as it is commonly given, is counted one of the remedies for theſe kind of fluxes abovenamed, whether they come of feeble ſtomacke or exulcerat guts. But if the patient drinke Aſſes milke for this purpoſe, it will be the better, if honey be put thereto. Furthermore, the
C aſhes of an Aſſe dung taken in wine, is as effectuall in operation as the reſt, for both diſeaſes. As alſo the firſt ordure of the Aſſe fole, which we tearmed Polea in the former chapter. The cruds or rennet of an horſe fole maw, called by ſome Hippace, is ſoveraigne for ſuch laskes, yea, though the patient did ſhere bloud upon the ſtoole. The aſhes alſo of Horſe dung, and the pouder of Horſe teeth is ſaid to be ſingular: yea, and Calves milke ſodden and ſo drunke. But if the flux doe prove to be a dyſenterie, Phyſicians give adviſe to put thereto a little hony: if gripes come thick, they preſcribe the aſhes of Harts horne, or Buls gall tempered with Cumin ſeed: and the fleſhie ſubſtance of a Gourd, to be laid in manner of a cataplaſme to the navill. The tender cheeſe curd of Cowes milke clyſterized, is paſſing good both for the ſtomacke flux, and alſo for the bloudie flix. In like ſort the butter made of Cowes milke, taken to the quantitie of foure hemins with two
D ounces of right Terpentine, either in the decoction of Mallowes or oile of Roſes. The ſuet of a Calfe, or beaſts tallow, is likewiſe an ordinarie remedie in theſe caſes. But diverſe there bee who ſeeth the marrow forth as well of the one as the other, with meale, wax, and a little oile, yet ſo, as the broth be clear, that it may be ſupped off. Their marrow alſo is uſually incorporat in the paſte whereof bread is made, and ſo taken with great ſucceſſe. Goats milke ſodden untill the halfe bee conſumed, is reputed alſo a proper medicine. And in caſe the guts beſides be wrung and griped, there would be put therto a little unpreſſed wine of the firſt running, called Mere-gourte. Howbeit, ſome there be who thinke it ſufficient for to appeaſe the torments of the wombe, to drink Hares rennet but once in a draught of wine warme. But the wiſer ſort and thoſe that deale more warily, thinke it good withall to make a liniment of Goats bloud, incorporat with Barley meale and ro-
E ſin, and therewith to annoint the bellie. And they alſo adviſe their patients for any violent flux of the bellie whatſoever, to applie thereto ſoft cheeſe: but if the flux bee from the ſtomacke, or dyſentericall, they preſcribe old cheeſe to be grated and given to the patient in wine, with this proportion, that in three cyaths of wine there be a third part of cheeſe. Goats bloud boiled with this marrow, is ſingular good for the dyſenterie or bloudie flix. The liver of a female Goat roſted, is a ſoveraign medicine for the fluxions of the ſtomack, but it were better if the male Goats liver were taken in drinke after it had been ſodden in ſome greene and auſtere wine, or with oile of Myrtles reduced into a cataplaſme, and ſo laid to the navill. Some ſeeth the ſame in water, from ſix ſextars to one hemine, and put Rue thereto. Others roſt the milt of a Goat, male or female (it skilleth not) and uſe it for the ſame purpoſe, or els they take the ſuet of a Bucke goat with bread that hath
F ben baked on the hearth under the embers. But above all they hold, that the ſuet taken from the kidneies of a ſhee Goat, and ſo drunk alone by it ſelfe, is a ſingular remedie for theſe infirmities: but they enjoine the patient preſently thereupon to drinke a little cold water. Yet there be others who ordaine the ſame ſuet to bee boiled in water with fried Barley groats, Cumin, Dill, and Vinegre mixed all together. And they give order to ſuch as have the ſtomacke flux to annoint their

bellies

bellies with Goats dung ſodden with honey. And for both theſe fluxions, as well from the ſtomacke as the ulcer of the guts, they preſcribe the rennet of a Kid to the quantitie of a Beane for to be drunke in Myrtle wine: alſo a pudding made of the bloud thereof, which kind of meat wee call in Latine *Sanguiculus. Moreover for the dyſenterie, they ordaine to inject into the guts by a clyſtre Buls glue reſolved in hot water.

*i. a bludding.

For any ventoſities, Calves dung is holden to bee ſingular good for to reſolve them, if it bee ſodden in wine and the decoction thereof uſed. But if the guts be diſeaſed any waies, the rennet of red Deere is very effectuall, ſodden with Lentils and Beets, and ſo eaten with meat. Likewiſe, the aſhes of the haire of an Hare boiled with honey. Alſo to drinke Goats milke ſodden with Mallows and a little ſalt put thereto, is good for the ſaid infirmities: but if the rendles be mixed therewith, the operation will bee the better. Of the ſame vertue is Goats ſuet, taken in any warme ſupping; with this charge, that the patient drinke preſently upon it cold water. Moreover, it is ſaid, that the aſhes of a Kids haunch hath a wonderfull vertue to ſouder the rupture, whereby the guts are fallen downe. Likewiſe, Hares dung ſodden with honey, and taken every day to the quantitie of a Beane, is a medicine for a rupture, ſo ſoveraigne, that it hath been knowne to cure them who were paſt all hope of remedie. Much commended alſo is the decoction of a Goats head ſodden, haire and all together.

The diſeaſe called Teneſmos, which is a deſire to goe often to the ſtoole without doing any thing, is cured by drinking of Aſſes and Cowes milke.

All the ſort of wormes bred in the guts, the pouder of Harts horne taken in drink, doth expell.

There bee, as I ſaid before, certaine bones found among the excrements of a Wolfe, which if they bee hanged about the arme, doe cure the Collicke; if this regard were had before, that they never touched the ground. As for Polea (whereof I made mention before) which is the firſt ordure of an Aſſes fole, it is ſingular good in that caſe. Likewiſe the pouder of a Sows dung taken in the decoction of Rue ſodden in water, with Cumin, is ſingular for the Collicke. Finally, the aſhes of a young Harts horne while it is new come up and tender, incorporat with the ſhell fiſhes of Barbarie, ſtamped ſhels and all together, and ſo taken in a draught of wine, is highly commended for the paſſion of the collicke.

Chap. xv.

For the dolourous torments of the bladder: for the ſtone and gravell. The remedies for the infirmities of the members of generation, of the fundament and the ſhare.

THe urine of a Bore helpeth thoſe who be tormented with the paine in the bladder, and the ſtone: yea, and the very bladder of the Bore eaten as meat, is ſingular good in that reſpect. Howbeit, if the one and the other were permitted to bee conſected before in ſmoake, you ſhould ſee a greater operation. Now the ſaid bladder ought to be firſt ſodden & then eaten. And if a woman be troubled with the ſaid greefes, ſhe is to chuſe the bladder of a wild Sow. There bee found alſo in the livers of ſwine certaine little ſtones, or els hard calloſities like unto ſtones, and white of colour, ſuch as wee may ſee daily in our tame ſwine: which beeing beaten into pouder and drunke in wine, doe expell the ſtone and gravell within our bodies. And verely the Bore feeleth himſelfe ſo farre forth charged with his owne urine, that unleſſe he be delivered thereof before, he is not able to flie before the chaſe, but ſuffereth himſelfe to bee taken as if he were encloſed and faſt bound within net and toile: and they ſay that his urine doth burne him within. The kidneies of an Hare kept untill they be drie, then made into pouder & drunke in wine, do thruſt forth the ſtone. In the peſtle and gammond both of a ſwine, there be certain joint whirlebones as I have ſaid before, which if they bee ſodden, doe yeeld a broth that is very good for the eaſie paſſage of urine. Likewiſe, the reins of an Aſſe dried, pulverized, and given in pure wine of the grape, doe cure the diſeaſes of the bladder. The ſurots or rugged werts in horſe legs & the corns about their houſe called Lichenes, drunke either in ſimple wine or meath for the ſpace of 40 daies together, doe expell the ſtone and gravell engendred in the body. The aſhes alſo of an horſe houſe, taken in wine or water, is good in that caſe. In like manner Goats dung drunke in honied wine, is ſingular for thoſe accidents; but eſpecially that of the wild Shamois is much more effectuall. Moreover, the aſhes of Goats haire is thought to availe much in theſe diſeaſes.

As

A As touching the botches and carbuncles which ariſe in the privie members; the brains and bloud of a Bore or Sow are thought to be proper remedies for them. And ſay there be ſome cankerous or corroding ulcers in thoſe parts, the liver of a Bore or Swine burned in a fire made principally of Iuniper wood, together with the Papyr reed and Arſenicke, dooth heale the ſame: ſo doth the aſhes of their dung. Or els take a Cow or Oxe gall and Ægyptian Allum, wrought and incorporat together with *Myrrhe, to the conſiſtence of honey. Beets alſo ſodden, yea, and their flesh boiled in wine and ſo applied as a cataplaſme. In caſe they bee running ſores: the ſuet and marrow of a Calfe boiled in wine, or Goats tallow tempered with honey and the juice of the brier, are reputed to be ſoveraigne. Now if the ſaid ſores ſpread farther ſtill, it is ſaid, that their dung incorporat with honey or vinegre, doth much good: as alſo butter and nothing els ſimply appli-
B ed to the greeved place. If the cods doe ſwell, the ſuet of a Calfe made into a liniment, with ſalnitre put thereto, keepeth downe the tumor. Of the ſame operation and effect is the dung alſo of a Calfe boyled in vinegre.

*Some read *Muria*, i. in pickle or brine.

Such as cannot hold their urine, but that it paſſeth from them againſt their wils, find great helpe by eating of a Bores bladder roſted or broiled. And verely the aſhes of a Bores or Sowes cleyes, is ſingular good againſt the involuntarie ſhedding of urine, if a cup or drinke bee ſpiced therewith for the patient to take. Likewiſe, the bladder of a Sow burnt and given to drinke, ſerveth well in this infirmitie: ſo dooth the bladder of a Kid, or the lungs in that manner uſed. Furthermore, it is ſaid, That the braines of an Hare taken in wine, is ſingular to helpe this infirmitie. Semblably, the ſtones of an Hare broiled and eaten, or the rennet in the Hares maw, incorporat
C with Gooſe greaſe in Barley groats. The kidneies beſides of an Aſſe, reduced into pouder and drunke in pure wine of the grape. The Magicians have a deviſe by themſelves, and they affirme, That for to hold ones urine, it is paſſing good to drinke the aſhes of a Bores pizzle in ſweet wine: but they inſtruct the patient withall, to make water in a dogs kenell; and in ſo doing, to ſay theſe words, *I do this, becauſe I would not piſſe my bed as the dog doth his couch.* Thus much for the incontinencie of urine. Now if one bee pent and would gladly void urine, let him take the bladder of a Swine, ſo that it never touched the ground, and applie the ſame to the ſhare, for it will provoke the water to paſſe.

But to come unto the diſeaſes of the *ſeat: there is nothing ſo good for them as Beares gall, incorporat together with their greaſe. Some put thereto litharge of ſilver and Frankincenſe. In
D which caſes butter is very good, if with Gooſe greaſe and oile of Roſes it be reduced into a liniment: the conſiſtence or thickneſſe of which compoſition, muſt bee ſuch as the greeved place will admit; namely, that it be gentle and ſmooth, ſo as there bee no paine in the annointing. Alſo Buls gall is a ſoveraign medicine applied thereto upon ſoft lint: for it will quickly skin the chaps and clefts in the fundament. If that part be ſwelled, the ſuet of a Calfe is very good to annoint it therewith: but if the tumors appeare about the ſhare, then there would be Rue joined therto. As for other infirmities incident to thoſe parts, nothing better than Goats bloud, tempered with parched Barly meale. In like manner, for the hard knobs in the ſeat called Condylomata, Goats gall by it ſelfe is a ſpeciall remedie: ſo is the gall of a Wolfe tempered in wine and ſo applied.

*That is to ſay *Piles*, blind hemorrhoids, chaps, fiſſures, and ſwelling biggs.

For the biles and impoſtumes riſing in any place thereabout, there is not a better medicine to
E ſcatter and diſſolve them, than Beares bloud or Buls bloud, dried firſt and ſo beaten to pouder. But the ſoveraigne remedie of all others, is the ſtone which a wild Aſſe is ſaid to void with his urine, at what time as he is killed in chaſe: which urine as it commeth firſt forth of his body, ſeemeth very liquid and thin, but being ſhed once upon the ground it groweth thicke and hard of it ſelfe. This ſtone tied to the twiſt or inner part of the thigh, is ſaid to diſpatch all collection of humors that might ingender biles and botches; or at leaſtwiſe ſo to reſolve them, that they ſhall never impoſtumat and come to ſuppuration. This ſtone is very rare and hard to be found, for it is not in every wild Aſſe: but ſurely famous it is and much ſpoken of by reaſon of this medicinable propertie that it hath. Moreover, the urine of an Aſſe together with Nigella, otherwiſe called Gith, is ſingular good in theſe caſes. Likewiſe a liniment made with the aſhes of an horſe houſe
F incorporat together with oile and water: ſo is the bloud of any horſe, but eſpecially of a ſtallion: the bloud alſo and gall of a Cow or Oxe. Their fleſh moreover, which wee call Bœufe, hath the ſame effect, if it be laid warme unto the place. The aſhes alſo of their cleyes tempered with water and honey. The urine of ſhee Goats: the fleſh of the male Goats boyled in water. In like maner their dung ſodden with honey. Beares gall or the gall of a Bore: laſt of all, the urine of a Sow

applied

applied unto the place with wooll. As touching the galls, which by overmuch riding on horſe- G
backe bee incident to the twiſt and the inner parts of the thigh, as every man knoweth full well; which doe burne and chauſe the skin in thoſe parts; the ſomie ſlime which a horſe yeeldeth, as well from his mouth as his cullions, is ſoveraigne therefore, if the place bee annointed therwith.

It falleth out many times that there ariſe ſwellings in the very ſhare and groine, by occaſion of ſome ſores or ulcers in other parts of the bodie; for the repreſſing of which, there is a preſent remedie, namely, to take three horſe haires, and to tie them in as many knots and ſo conveigh them into the ſaid ulcer which is the cauſe of ſuch tumors.

Chap. xvi.

Proper remedies for the gout: the falling ſickneſſe: for ſuch as be taken or ſtrucken with H
a Planet, or dead palſie: for the jaundiſe: and fractures of bones.

A Cerot made of Beares greaſe, Buls tallow, and wax, of each an equall quantitie, is ſingular good for the gout in the feet. And yet ſome there bee who adde unto them Hypoquiſtis and gall nuts. Others preferre a male Goats tallow, together with the dung of a female Goat, Saffron, and Muſtard ſeed; or the braunches of Yvie ſtamped with Parietarie alſo of the wall; or els the flowers of the wild Coucumber, reduced all into the forme of a cataplaſme and ſo applied. In like manner, others uſe a pulteſſe made of beaſts dung & the mother of vinegre tempered together. Some magnifie & highly commend in this caſe the dung of a Calfe, which hath not as yet taſted of graſſe; or Buls bloud alone without any other thing: likewiſe a Wolfe ſodden I
quicke untill all the fleſh bee gone & nothing but bones remaining; or els a live Wolfe ſodden in oile untill the ſaid oile be gellied to the height or conſiſtence of a cerot. Semblably, there is good account made of the tallow of a hee Goat, with as much Parietarie of the wall, and a third part of Senvie: as alſo of the aſhes of Goats dung incorporat with Hogs greaſe. Moreover, it is ſaid, that the beſt thing that the patient can do for to have eaſe of the Sciatica, is to endure the ſaid dung as hot as poſſibly hee can, under his great toes, untill it bee readie to burne them. For all other joint-gouts as well in feet as hands or els where, the gall of a Beare is a ſoveraigne medicine: as alſo a Hares foot bound faſt to the place affected. And ſome are of this opinion, that the gout of the feet will be aſſuaged, in caſe a man cut off the foot of a quicke Hare, & carie it about him continually. As touching kibes, bears greaſe cureth them: ſo it healeth alſo the chaps in the feet: but more ef- K
fectuall it is, in caſe there be allum put thereto: for which purpoſe Goats ſuet is commended: the pouder alſo of horſe teeth: the gall of a bore or ſow: the lights likewiſe of a ſwine, together with the fat laid to the place. Now if the feet be ſurbatted, galled, and bruiſed in the ſole by treading or ſtumbling againſt that which offendeth them, the ſame medicines be very good: but ſay they are benummed and frozen with cold, the aſhes of Hares haire bringeth them into order againe. The lungs alſo of an Hare ſlit and skiced & ſo laid too, is good for any bruiſe or contuſion in the feet; or the aſhes of the ſaid lungs applied therto. Contrariwiſe, if they be ſcorched and burnt with the heat of the ſun, they find a moſt ſoveraigne cure by the greaſe of an aſſe: likewiſe by bœufe tallow and oile of roſes mixed together. The corns, agnels, chaps, & calloſities of the feet, the freſh dung of a bore or ſow doth heale, if it be applied therto in form of a cataplaſme, & not removed before L
the third day. Of the like efficacie are the aſhes of a ſwines ankle bones, the lungs of a bore or ſow, or of a ſtag. If one have galled his feet by the fretting and ſtubborneſſe of hard ſhoes, the urine of an aſſe together with the mire that is made of the ſame urine upon the ground, doth heale if it be applied to the place. The corns or agnels find much eaſe by bœufe ſuet & the pouder of Frankincenſe reduced into a liniment. But kibed heeles are beſt healed with the aſhes of leather burnt, eſpecially if it were an old ſhoe. Again, if the feet have bin wronged by ſtreight ſhoes, take the aſhes of a goats skin tempered with oile. As for the painefull ſwelled veines, named in Latine Varices, there is a ſoveraign cataplaſm to aſſuage their greefe, made with the aſhes of Calves dung boiled with Lillie roots, and a little hony put therto. The ſame is ſingular for all impoſtumat inflammati-
ons that tend to ſuppuration. This medicine is good alſo for the gout in the feet, and for all diſea- M
ſes of the joints, & namely, if the ſaid dung came from an ox calfe. The joints if they have gotten a ſpreine by any ruſh, find remedie by the dung of bore or ſow, if it be laid too hot within a linnen cloth. The dung likewiſe of a calfe which yet ſucketh & never did eat graſſe, hath the ſame effect: even as goats dung boiled with hony in vinegre. The raggedneſſe of nailes have a proper remedy

of

A of calves dung, of goats treddles likewiſe, if there be red Arſenicke or Orpinent mixed therewith.

As touching werts, there is not a better thing to take them away than the aſhes of Calves dung tempered with vinegre, or the durt that is made by the urine of an Aſſe.

For thoſe that be ſubject to the falling evill, it is ſingular good to eat the genetoirs of a Beare, or to drinke the ſtones of a Bore either out of Mares milke or plaine water: alſo the urine of a Bore mingled with Oxymell. But more effectuall in operation is that urine which hath been ſuffered to drie as it lieth in the own bladder. The ſtones likewiſe of a Sow which are taken from her when ſhe is ſplaied, if they be kept untill they are dried, and ſo brought into pouder, are excellent in this caſe taken in the milk of a Sow, with this charge, that the patient abſtain from wine for certaine daies together, both before and after the receiving of this medicine. For this infirmitie alſo
B they uſe to give the lungs of an Hare poudred or kept in ſalt, with a third part of Frankincenſe in white wine for thirtie daies together. Alſo the rennet or cruds found in the maw. The braines of an Aſſe firſt dried in the ſmoake *within certaine leaves, drunke to the weight of halfe an ounce every day in honied water; or the aſhes of the ſaid beaſts houſe, taken to the quantitie of two ſpoonefuls daily for a month ſpace, are appropriat medicines for this maladie. In like manner, their ſtones preſerved drie and reduced into pouder, ſerve to ſpice their drinke, whether it bee the milk of Aſſes (which is the beſt) or ſhere water. The pellicle wherein the yong fole was lapped in the dams wombe, eſpecially if it were a male that was foled, is of great force to withſtand this diſeaſe, if the patient doe but ſmell thereto when the fit is comming. Some give counſell to eat the heart of a blacke he Aſſe, together with bread: but in any wiſe it muſt be done abroad in the open
C aire, and when the Moon is but one or two daies old at the moſt. Others preſcribe to eat the fleſh: and there be againe who adviſe to drinke their bloud dilaied with water for fortie daies together. Some take Horſe ſtale, mingling it with ſmiths water freſh out of the forge, for the ſaid purpoſe: and with the ſaid drinke cure thoſe that be lunaticke and mad at certaine ſeaſons. Mares milke is ordinarily given with good ſucceſſe to thoſe that be troubled with the falling evill: ſo are the rugged *werts growing upon horſe legs to bee drunke in Oxymell. And to this effect the Magicians would have a diſh of meat made with Goats fleſh roſted againſt a funerall fire, where ſome dead corps is burnt: who ordaine beſides their tallow and Buls gall, of each an equall weight, to bee ſodden, and then to be put up againe in the bladder or burſe of the ſaid gall, that it touch not the ground in any caſe; and beeing thus prepared, the patient forſooth muſt drinke it in water ſtan-
D ding upon the dore ſill, and under the very lintell thereof. Now, if you would know whether a man be ſubject to this ſickneſſe or no, doe but burne before him either a Goats or Stags horn, the very ſmoke or fume thereof will bring the fit upon him, if he be tainted therewith.

Concerning thoſe that be ſuddainely taken with a dead palſie of the one ſide of their bodie: it is ſaid that the urine of an Aſſe-fole incorporat with Spikenard into the forme of a liniment, is very good for them, if the inunction therewith be uſed.

For the jaundiſe, Harts horne burnt and reduced into aſhes, is a very proper medicine: ſo is the bloud of an Aſſe fole drunk in wine. Likewiſe the *dung of an Aſſes fole which came firſt from it after it was foled, given to the quantitie of a Beane in a draught of wine, cureth the jandiſe within three daies. The ſame operation and effect there is in the firſt ordure that a Colt maketh after
E it is come into the world.

If any bone be broken or bruiſed, there is not a more preſent remedy than the aſhes of a cheeke either of a wild Bore or tame ſwine. In like manner, their lard ſodden and tied round about the broken bone, doth conſolidat and ſouder it againe wonderous ſoone. And verely if there bee any ribs in the ſide broken, the ſoveraigne and onely remedie commended, is Goats dung tempered with old wine, for it openeth, draweth, and healeth the fracture throughly.

As touching feavers, the feeding upon the veniſon of red Deere driveth them all away, as I have before ſhewed: but more particularly, if it bee any of theſe Typicke and Periodicall agues, which be intermittent and returne by fits, there is not a better thing, if wee may beleeve Magicians, than to take the right eie of a Wolfe, ſalt it, and ſo tie it about the necke or hang it faſt to any
F part of the patient. Of theſe fevers, there is one called a Quotidian, which the Greeks name Amphemerinos; & from it (by their ſaying) a man ſhall be throughly rid, in caſe he let an Aſſe bloud in the eare veine, and drinke three drops thereof juſt in three hemines of water. But againſt the Quartane ague, the Magicians give order to weare about the necke or hanging to the arme cats dung, together with the claw or toe of a *ſcriche Owle, but ſo as they may not fall off nor bee removed

*In folijs. Some read *ſolijs*, i. in the baines or ſtouves.

*Lichenes: ſome take them for the Malandets.

*Called before Poſca.

*Bubonis.

moved before ſeven fits be paſt. Now tell me (I pray you) what was he that could find out this ſecret firſt? Gladly would I learne what reaſon there is in this mixture, and why an Owles claw or toe was choſen above all other for this purpoſe? Certes, there be ſome of them yet more modeſt than their fellowes: and they have given out, That the liver of a Cat killed in the wane of the Moone, laid up in pouder with ſalt, is to bee given in a draught of wine a little before the acceſſe or fit of a Quartane. And theſe Magicians have yet another pretie receit againſt ſuch agues: For they take the aſhes of a Cow or Oxe mucke, and ſprinckle it well with the urine of a young boy; wherewith they annoint the toes of the patient: but to his hands or armes they bind the heart of an Hare; which done, they ordain alſo to give him before the fit, the Hares rennet in a draught of drinke. To conclude, they ſay, that a freſh greene cheeſe made of Goats milke, out of which the whey hath been well preſſed, is ſingular to be given in honey. G H

Chap. xvii.

Proper remedies againſt the trouble of the braine by reaſon of melancholie, againſt the lethargie, dropſie, ſhingles, and S. Anthonies fire. Alſo for the paine of the ſinewes.

THe dung of a Calfe ſodden in wine, is an excellent remedie for thoſe who are given to melancholie. For to raiſe and awaken them that are in a lethargie, there is not a better thing than the rough werts growing upon an Aſſes leg, if the ſame be tempered with vinegre into a liniment, and the noſthrils annointed therewith: alſo the perfume of the horne or haires of a Goat; yea, and a Bores liver: which is the cauſe that it is given ordinarily to thoſe that have the drowſie diſeaſe, and be alwaies ſleepie. I

For the phthyſicke, the liver of a Wolfe ſodden in wine is very good: likewiſe the lard of a leane running Sow feeding only upon graſſe: as alſo Aſſe fleſh ſodden and eaten with the broth: And verely in Achaia this is the principall courſe they take for the cure of that diſeaſe. Moreover, it is ſaid, that to receive through a pipe or reed the ſmoake of the drie dung made by Cow or Oxe lying foorth and feeding onely upon greene graſſe, is very holeſome for thoſe that have the phthyſicke or conſumption of the lungs. Alſo there bee who calcine the tips of Bœufes hornes, and taking the meaſure of two ſpoonefuls of the aſhes, incorporat the ſame with honey, make it up into pils, and ſo ſwallow them downe for the ſaid maladie. Many there are who affirme, That the phthyſicke and cough be cured by eating a kind of pottage made with Frumentie corne and Goats ſewet: and they hold opinion, That the ſaid ſuet taken freſh and ſweet and ſo diſſolved in mead; with this proportion, that to every cyath of the mead there bee put an ounce of ſuet, and that order be taken to mingle them throughly well, with a braunch or ſprig of Rue among, is a ſoveraigne medicine for thoſe infirmities. There is one writer of good credit and authority, who upon his certaine knowledge doth avouch, That there was one ſo farre gone in a phthyſick, that he was given over by the Phyſicians, and yet he recovered by drinking the ſuet of a Shamois or wild Goat together with milke, of each one cyath at a time. Others ſay, that much good hath ben found by drinking in ſweet cuit, the aſhes of Swines dung: as alſo by the lungs of a red Deer, eſpecially the Spitter of that kind, dried in the ſmoke, reduced into pouder and ſo drunke in wine. K L

In caſe of the dropſie, the urine of a Bore found in his bladder given to the patient in drinke by little and little, helpeth very much: but of greater efficacie it is, if the ſame bee permitted to drie within the bladder. Furthermore, the aſhes of Harts dung, and namely of that deere which is called the Spitter: as alſo of Neats dung, ſuch I meane as goe abroad and feed with the heard, (and that they call by a peculiar name *Bolbiton) is a ſoveraigne remedie for the dropſie. Marie, if the patient be a woman, there muſt be choiſe made of Cow dung; but if a man, the dung of the other ſex is to be taken: and this I may tell you is ſuch a ſecret myſterie, that the Magicians would not have to be revealed & made known. Many other medicines there be for the dropſie, to wit, the dung of a Bull-calfe uſed in a liniment: the aſhes of a Calves dung drunk in wine, with an equall quantitie of the wild Parſenep ſeed: Goats bloud together with the marrow, eaten with meat: It is thought that this bloud will worke the better, if it bee taken from the male Goats; provided alwaies, that they feed upon the Lentiske tree, and then no doubt it will doe the deed ſurely. M

*i. Sherne.

As touching S. *Anthonies* fire, the ſhingles &c. the meanes to quench the ſame, is to annoint the place with Beares greaſe, and eſpecially the fat that is found about the kidneies: alſo with the

greene

A greene dung of a calfe, cow, or ox. Some uſe hard cheeſe made of goats milke and porret toge-
ther: alſo the fine ſcrapings of a ſtags skin fetched off with a pumiſh ſtone & brought into pow-
der, and ſo applied with vinegre. For the redneſſe of the skin with much itching, the ſome of an
horſe mouth, or the aſhes of his houſe, is a ſingular medicine. If there be any wheales or ſmall
pocks proceeding of fleame, doe annoy the skin, no better thing than a liniment made of aſſe-
dung aſhes incorporat in butyr: Say theſe wheals or pimples appeare blackiſh and ſwert by rea-
ſon of melancholly, drie cheeſe made of goats milke brought into an ointment with honey and
vinegre, is good to rub the bodie withall in a baine or hothouſe, without any uſe of oile at all. For
bliſters and angrie meazles, the aſhes of ſwines dung are thought to be verie meet: as alſo the a-
ſhes of harts horne, ſo that the place be rubbed with them and water togither. If there be any diſ-
B location or bone out of joynt, the green dung of a bore or ſow is good to be applied: ſo is that of
a calfe: the ſome frothing from a bore, laid to the place with vinegre: and goats dung with hony.

There is not a better thing to bring downe any ſwelling, than a cataplaſme of raw beefe: and as
for any hard tumors, ſwines dung made hote and dried in an earthen potſheard, or upon a tile, is
2 excellent to diſcuſſe and reſolve them: the greace of a woolfe is exceeding goood to breake any
impoſtumation that is grown to ripeneſſe: ſo is neats dung made hot under the embres: or goats
treddles ſodden in wine or vinegre. As touching fellons and ſuch like apoſtumations, bœufe tal-
low with ſalt is much commended for to reſolve them: and if the place be much pained, it were
good to dip the ſaid tallow in oile, and to melt the ſame without any ſalt: and in like manner is
goats ſewet to be uſed. For a burne or ſcald, there is a proper ſalve made of bears greace and lillie
C roots: for which purpoſe, the dung of bore or ſow that hath been long kept, is very good: ſo is
the aſhes of their briſtles (ſuch as pargettars whiting-bruſhes be made of) wrought & incorporat
with greace: alſo the aſhes of a beaſts ankle or paſterne bone tempered with wax and the marow
either of a deere or bull: like as the dung of an hare. And verely, goats treddles are ſo accom-
modat to this cure, that (by report) they will heale a burn without any skar at all. The moſt excel-
lent glew is made of the ears and pizzles of buls: and there is not a better thing in the world than
it, for to heale any place burnt or ſcalded: but nothing is ſo much ſophiſticat, what with other old
skins and hides, and what with old ſhoes and ſuch like lether, boiled againe and made into glew.
The moſt faſt and ſtrongeſt glew which a man may truſt unto, is made at Rhodes; and that is it
which painters and phyſicians moſt uſe: the whiter that the ſame is, the better is it eſteemed: that
D which looketh blacke, and is hard withall and brittle like wood, is rejected.

It is thought, that for the paine of the ſinews, goats dung boiled in wine with honey is ſove-
raigne, yea though a nerve began to putrifie: convulſions, cramps, and ſpreins of nerves upon
ſome violent ſtroke, are cured with bores dung gathered in the ſpring & ſo dried. After the ſame
manner, ſuch as be overſtreined and plucked with the draught of any charriot, or wounded with
the wheels going over them; and generally, howſoever the bloud be ſetled black under the skin
by contuſion or bruiſe, if the places be anointed with the ſaid dung, though it were green & freſh,
much eaſe and helpe enſueth thereupon: howbeit, ſome thinke that it were better to ſeeth the
dung firſt in vinegre: and others reduce the ſame being drie into powder, & promiſe them that
be either burſten, wounded and bruiſed inwardly, or have been overthrowne and falne from on
E high, if they drinke it in vinegre, that they ſhall have helpe thereby. But the better and thoſe that
love not to make the greateſt boaſt of their medicines, uſe the aſhes therof with water. And verely
it is ſaid, that the Emperor *Nero* was wont in this kind of drinke to take great pleaſure, and with it
to refreſh himſelfe, when his purpoſe was by that means to win a name and approove himſelfe a
doubtie wight, in running with coaches in the great cirque or ſhew-place. To conclude, next to
the dung of the bore, is commended that of a ſow or any other hog, and thought to be in a ſe-
cond place of operation.

Chap. XVIII.

*Medicines to ſtanch blood: to heale ulcers, cancerous ſores, and the wild ſcab: alſo what me-
dicines they be that draw thorns, pricks, or whatſoever ſticketh within the fleſh.*
F *Finally, proper receits to cicatrize and skin a wound or ſore.*

THe rennet of any deere or a hare, uſed in vinegre, ſtancheth bloud: The aſhes alſo of the
haire of an hare: likewiſe of aſſes dung: yea and the verie aſhes of their haire made into a
liniment with any convenient liquor, hath the ſame effect: but if you would have it to work

more effectually, chuſe theſe excrements of the male aſſe, mix the ſame with vinegre, and apply G
it with wooll; for it will ſtay any flux of blond whatſoever: likewiſe if it be of the hair which is curried from the horſe head or buttocke when he is dreſſed: or els the aſhes of calves dung tempered with vinegre, and ſo applied unto the place. In like manner the aſhes of the goats horne or dung, with vinegre. And yet the bloud that iſſueth out of a buck-goats liver when it is ſliced and cut in ſunder, is more effectuall: but the aſhes of them both, as well the male as female, the liver and the bloud drunke in wine, or applied unto the noſthrils with vinegre, is of vertue to ſtaunch bloud. Moreover, the aſhes onely of a leather wine-bottle made of a male goats skin, mixed with an equall quantitie of roſin, doth not onely ſtop an iſſue of bloud, but alſo conglutinat and heale a wound. Furthermore, the rennet of young kids, with vinegre; the aſhes alſo of their haunches burnt, is thought to have like operation in ſtaunching of bloud. If there be any ulcers upon the H
ſhins or any part of leg and thigh; bears greace & red oker incorporat togither into a ſalve, doth heale the ſame: but in caſe the ſaid ſores be corroſive and eat farther, the gall of a bore with roſin and ceruſe, cureth the ſame: ſo doth the aſhes of a bores or ſowes cheeke: likewiſe ſwines dung dried and applied to the grieved place: as alſo goats treddles warmed well over the fire with vinegre, and laid too accordingly. But for to mundifie and incarnat all other ſores, they uſe butter; the aſhes of a ſtags horne, or the marow of red deere; buls gall likewiſe, with the oile of the plant Cypros; or els the dung of a goat, male or female it skills not whether. If there be a wound made by ſword or edged weapon, there is good means to heale it with the freſh dung of ſwine, or elſe the powder thereof being long kept and dried, if the place be dreſſed therewith. In caſe there be an ulcer that eateth deepe to the verie bone, or an hollow fiſtula, it is good to inject into it with a I
ſyringe, a bulls gall, with the juice of leeks or breſt-milke: or elſe to dreſſe the ſame with the pouder of his bloud dried, incorporat with the hearbe called Vmbilicus Veneris. Is the ſame cancerous? the rennet of a leveret with the hearbe Capers, taken of each a like quantitie, and ſprinkled with wine, doth cure it. If it grow to mortification and proove a gangrene, it is good to annoint the place with bears gall, with a feather. As for corroding ulcers which ſpread ſtill farther, no better thing to repreſſe them, than to ſtrew upon them the aſhes of an aſſe-houſe. The bloud of an horſe is corroſive, by vertue whereof it doth eat away and conſume the excreſcenſe of prowd fleſh: ſo do the cinders of old horſe dung burnt. As for thoſe kind of fretting cankers which the Greeks call Phagedænæ, the aſhes of a bœufe hide mingled with honey, doth cure and heale perfitly. The application of raw veale unto a greene wound, keepeth it from ſwelling: and a cata- K
plaſme of beaſts dung and honey togither, doth the like. But ſay the ulcers be maligne and filthie morimals, ſuch as the Greeks call Cacoëthe, the aſhes of a leg of veale incorporat with womans milke, doe heale up cleane. Freſh wounds occaſioned by ſword or edged weapon, bulls glew diſſolved or melted, and ſo applied, doth cure verie well, ſo it be not remooved untill the third day. If a ſore need to be cleanſed, drie cheeſe made of goats milke, tempered with vinegre and hony, is a ſingular mundificative. An ulcer given to go farther, and to eat as it goeth, is repreſſed by applying tallow thereto and wax incorporat togither: put to it pitch and ſulphur, it will heale and skin the ſame throughly. In like manner, for the untoward morimals beforeſaid, which they call Cacoëthe, it is very good to lay a pultus made with the aſhes of a kids leg and breſt-milke. As
for carbuncles, take the brains of a tame ſow, roſt the ſame and apply it unto the ſores, it is a ſo- L
veraigne remedie. Touching the ſcabs that men be ſubject unto, there is not the like medicine for killing the ſame, to the marow of an aſſe: and a liniment made with the urine of the ſaid beaſt togither with the earth upon which he hath ſtaled. Butyr likewiſe is verie good in that caſe, as alſo for the farcins, ſullanders, and mallanders in horſes, if it bee applied thereto with roſin made hot: ſo is ſtrong bulls glew diſſolved in vinegre, with quick-lime put thereto: alſo goats gall tempered with the aſhes of alume calcined. For the red bliſters and meazils likewiſe, there is not a better medicine than the dung of a cow or ox; and therupon they tooke the name of Boæ. The mange in dogs, is healed with beaſts bloud, ſo they bee bathed therewith whiles it is freſh and warme; and after the ſame is dried upon the bodie, to follow it a ſecond time the ſame day: and the morrow after to waſh them throughly with lie made of ſtrong aſhes. M

If thorns, ſpills, bones, and ſuch like things have gotten into the fleſh and there ſticke, cats dung is verie good to draw the ſame forth: likewiſe the treddles of a goat with wine. Any rendles alſo, but eſpecially that which is found in an hares maw, ſerve in that caſe, reduced into a ſalve with the powder of frankincenſe and oile; or elſe with the like quantitie of birdlime, or the ce-

reous

A reous matter in the bee-hive called Propolis.

Furthermore, the greace of an aſſe is ſingular to reduce any ſwert ſploches and blacke skars to a freſh and native colour; which, if they overgrow the skin about them, are brought downe and made more even and ſubtile, by an inunction of calves gall: but the Phyſicians prepare the ſaid gall with an addition of myrrhe, honey, and ſaffron, and then put it up in a braſen box for their uſe: yet ſome there be, who mingle with the reſt verdegris or the ruſt of braſſe.

Chap. xix.

Receits appropriat to the maladies of women, and the diſeaſes of ſucking babes: alſo remedies for them that are unable to perfourme the act of generation.

B

TO begin with the naturall courſe of womens purgation: the gall of a bull or ox, applied unto their ſecret parts in unwaſhed greaſie wooll, is very effectuall to bring the ſame downe. The skilfull midwife of Thebes, *Olympias*, uſed to put thereto * hyſſope and ſal-nitre. For this purpoſe, harts horne burnt to aſhes is verie good to bee taken in drinke. But if the matrice be out of order and unſetled, it is not amiſſe to apply the ſame aſhes unto the naturall parts: yea and bulls gall togither with * Opium to the weight of two oboli; or els perfume their ſecret parts with a ſuffumigation of deers haire. Moreover, it is ſaid, that the hinds when they perceive themſelves to be in calfe, ſwallow downe a little ſtone; which is ſingular good for women with child to C carrie about them, that they may goe out their full time: and therefore much ſeeking there is after this ſtone, which is commonly found among their excrements at ſuch a time, or elſe in their wombe, if haply they be killed with calfe, for then is it to be had there alſo. Moreover, there are found certaine little bones in the heart and matrice of an hind, and thoſe bee paſſing good for great bellied women, and ſuch as be in travaile of childbirth. As for that ſtonie ſubſtance reſembling a pumiſh, which in like manner is found in the wombe of kine, I have ſpoken alreadie in my diſcourſe of Kine, and their nature. If the matrice of a woman bee growne hard, and have a ſcirrhe in it, the fat of a wolfe will mollifie it: if it be grieved with paine, the liver of a wolfe aſſuageth the ſame. When women bee neare their time, and readie to crie out, it is good for them to eat wolves fleſh: or if when they fall firſt to travaile, there bee but one by them who hath eaten D therof: and this is ſuch an effectuall thing, that if they were foreſpoken, or indirectly dealt withall by ſorcerie and witchcraft, this is thought to eaſe them of paine, and procure them ſpeedie deliverance. But in caſe ſuch a one as hath eaten wolves fleſh, chaunce to come into the chamber when a woman is in the mids of her travaile, ſhee ſhall ſurely have a hard bargaine, and die of it. Moreover, great uſe there is of the hare in all womens infirmities; for the lungs of an hare dried, made into powder, and taken in drinke, is comfortable to the matrice, and helpeth it in many accidents thereof: the liver drunke with Samian earth in water, ſtaieth the exceſſive flux of their fleurs: the rennet of their maw fetcheth away the after-birth when it ſtaieth behind; but then in any wiſe the woman muſt not bath or ſweat in baine the day before: the ſame rennet applied as a cataplaſme upon a quilt of wooll, with ſaffron & the juice of porret, forceth the dead infant within E the mothers womb to come forth. Many are of opinion, that if a woman eat with her meat the matrice of an hare, ſhe ſhall thereupon conceive a man-child if ſhe companie with her husband. And ſome ſay, that the genetoirs of the male hare, yea & the rendles, are good for that purpoſe. And it is thought, that if a woman who hath given over bearing children, do eat the young leveret taken forth of the dams belly when ſhe is newly bagd, ſhe will find the way againe to conceive and breed freſhly as before. But the magicians do preſcribe the husband alſo to drinke the bloud of an hare, for ſo (ſay they) hee ſhall ſooner get his wife with child. And they affirme moreover, that if a maiden be deſirous that her breſts or paps ſhould not grow any more, but ſtand alwaies at one ſtay knit up round and ſmall, ſhe is to drinke nine treddles or grains of hares dung: and for the ſame intent, they adviſe a virgin to rub her boſome with the hares rennet and honey togither: F alſo to annoint the place with hares bloud where the haire is plucked off, if they be deſirous that it ſhould not grow againe. As touching the ventoſities and inflation of the matrice, it is good to uſe thereto a liniment made of bores or ſwines dung, incorporat with oile: but in this diſeaſe, it were better for to repreſſe the ſaid windineſſe and flatuoſitie, to ſpice a cup with the powder of the ſame dung dried and give it to the woman to drink; for whether ſhe be vexed with wrings whiles

* *Hyſſopum*; ſome read *Oſypum*, which the Apothecaries call *Hyſſopus humida*: & is nothing els but the greaſie filth and ſweat tried out of the wooll growing in ſheeps flanks.

* *Opio*, ſome read *Apio*, *i.* perſley.

ſhe is with child,or pained with after-throws in childbed,ſhee ſhall find much eaſe by that potion. Furthermore it is ſaid, that ſows milke given with honyed wine to a woman that is in labour, helpeth her to ſpeedy deliverance. Let a woman newly brought to bed drink the ſame milk alone, ſhe will proove a good milch nource, and have her breſts ſtrut with milke: but let her breaſts be annointed all over with the bloud of a ſow, they will grow the leſſe by that means. If the paps doe ake and put the woman to paine, a draught of aſſes milke aſſuageth that griefe: put thereto a quantitie of honey, it will bring down the deſired purgation of a woman. The greace of the ſame beaſt, which hath been tried and long kept, healeth the exulceration of the matrice: and beeing applied to the naturall parts with a lock of wooll in forme of a peſſarie or otherwiſe, it mollifieth the hardneſſe of that place. The ſame freſh,or long kept(it makes no matter whether)is depilatorie; for looke what part is annointed with it & water togither, the haire will come no more there. The milt of an aſſe kept untill it be drie,and tempered with water into a liniment for the breaſts, cauſeth them to grow, and bringeth ſtore of milke into them: and if the matrice be unſetled and turned aſide any way out of order, it reduceth it into the place againe. If a woman ſit over a ſuffumigation of an aſſes houſe,and receive the fume up into her bodie,ſhe ſhall have quicke ſpeed of childbirth; for ſo ſtrong it is, that it will cauſe abortion and put her to a ſlip before the time: and therefore it is not to be uſed unleſſe a woman have gone her full time, or that the child bee dead in her wombe; for ſurely it is able to kill the child within her bodie, without great heed and carefull regard. Alſo it is ſaid, that the dung of this beaſt, if it be applied freſh and green, is of wonderfull operation to ſtop the extraordinarie flux of bloud in women: ſo is the aſhes of the ſame dung, which being laid unto their naturall parts, is a ſoveraigne remedie for the accidents therto belonging. Moreover, take the ſome or froth of an horſe mouth, and let the place be annointed therewith for * twentie daies togither, either before the haire doe come, or when it beginneth to ſpurt, it will keepe them for ever being undergrown: of the ſame operation is the decoction of a harts horne; but it will do the feat the better, in caſe the ſaid horne be new and greene. If the matrice be ſyringed and waſhed with mares milke, it will find much comfort and eaſe thereby. If a woman perceive the infant to bee dead in her bodie, let her take the powder of the rugged werts upon a horſe leg, called Lichenes, in freſh water, it will exclude the ſaid dead fruit of the wombe: the perfume alſo of the houſe will doe as much, or the dung dried. If the matrice be falne or ſlipt out of the bodie, an injection of butter by the metrenchyte, ſtaieth the ſame and keepeth it up. If there be any hardneſſe growne in that part, whereby it is ſtopped, a beaſts gall mingled with oyle of roſes and terpentine, and ſo applied outwardly in a lock of wooll, openeth the ſaid obſtruction. It is ſaid alſo, that a ſuffumigation made of ox dung, ſtaieth the matrice up when it is readie to fall, yea and helpeth a woman in labour to ſpeedie childbirth: but if ſhe uſe to drinke cows milke, ſhe ſhalbe the better diſpoſed and prepared to conceive with child. Moreover, this is a thing for certein knowne, that there is nothing bringeth a woman ſooner to barrenneſſe, than hard travaile in child-bearing. But to prevent this inconvenience, *Olympias* the expert midwife of Thebes, affirmeth, that there is nothing better than to annoint the naturall parts of a woman with ox gall, incorporat in the fat of ſerpents, verdegrece, and hony mixed therewith, before that ſhe medleth with a man in the act of generation. Likewiſe, if a woman which is given to have thoſe naturall parts over-moiſt and ſlipperie, by reaſon of humours purging immoderatly that way, doe apply unto the neck of the matrice a calves gall, a little before ſhe mind to admit the carnall companie of a man, ſhe will be the more apt to conceive: and in verie truth, the inunction therewith doth mollifie the hardneſſe of the belly; repreſſeth outrageous fluxions, if the navill bee annointed therwith: and in one word, is good everie way for the matrice. Howbeit in the uſe of this gall, they ordaine a proportion, to wit, that to everie denier weight of the ſame, there be put a third part of * perſley ſeed, with as much of the oile of almonds as is thought ſufficient to incorporat them into a liniment; and this they put up with wooll in manner of a peſſarie. The gall of an ox-calfe tempered with halfe as much honey, is a medicine ordinarily kept in readineſſe for the diſeaſes of the matrice. Some make great account of veale, and doe promiſe, that if women about the time that they conceive doe eat it with the root of Ariſtolochia, *i.* Birthwort, they ſhall bring foorth boies. As for the marow of a calfe, ſodden in wine and water togither with the ſuet, & ſo conveied up in a peſſarie, healeth the exulceration of the matrice. So doth fox greace, & the dung of cats; but this ought to bee applied with roſin and oile roſat. It is thought, that there is not ſo good a thing for the matrice, as to ſit over a ſuffumigation made of goats horne. The bloud of the wild

G H I K L M

* Some read, fortie.

* *Apÿ*, ſome read *Opÿ*. *i.* the juice of poppy.

goat

A goat or shamois tempered with the * sea-ball, serveth to take away haires: but the gall of other goats that bee tame, mollifieth the callositie in the matrice, if a pessarie be strewed withall, and causeth a woman to bee meet for conception, if shee use it presently upon the purgation of her monethly terms. Also the same hath a depilatorie vertue, if a liniment be made therewith, and used to the place where the haire is plucked forth alreadie, and kept thereto three daies togither. Furthermore, our midwives doe warrant, that if a woman drinke goats urine, it will stop all fluxes of bloud be they never so immoderat, so that she apply also outwardly the dung of the said beast. The pellicle or gleane wherein a kid was enfolded within the dams wombe, kept untill it bee drie and drunke in wine, putteth foorth the after-birth in women. And they are of this opinion, that a suffumigation of kids haire, is verie good for to cause the matrice to returne when it was falne
B downe: also, that to drinke their rennet, or to apply outwardly henbane seed, is singular for to stay any issue of bloud. *Osthanes* saith, that if the loins or small of a womans backe, be annointed with the bloud of a tike taken from a blacke bull or cow that is of a wild kind, it will put her out of all fansies of venereous sports. He affirmeth moreover, that if shee drinke the urine of a male goat, with some spikenard among to take away the lothsome tast therof, she will forget all love that she bare to any man before.

To come now unto little infants: there is not a more proper thing for them than butyr, either alone by it selfe, or with hony: and to speake more particularly, it helpeth them when they breed teeth, or have their gumbs sore, or mouth exulcerat. If there be hung about the necke of a little infant the tooth of a wolfe, it keepeth them from starting or skriching in their sleep for feare, and
C allaieth the paine which they feele in toothing: The same doth also a wolves skin. And verely the great master teeth and grinders of a wolfe, being hanged about an horse neck, cause him that he shall never tire and be wearie, be he put to never so much running in any race whatsoever. Let a nource annoint her breast with the rennet of an hare, the babe that she giveth sucke unto shall by that means be knit in the belly and not be troubled with the laske. The liver of an asse with a little of the hearb Panax mingled withall, dropped into the mouth of an infant, preserveth it from the falling sickenesse and other dangerous diseases; but this (they say) must be done for fortie dayes togither. If a child be lapped in a mantle or bearing-cloth made of an asse skin, it shall not be affrighted at any thing. The colts teeth that first fall from an horse-sole, if they be hung about yong childrens necks, ease them much of the paine that they have in breeding teeth: but more effec-
D tuall they be, in case they never touched the ground. The milt of a bœuse eaten with honey, and the same reduced to a liniment and applied accordingly, is good for the paine of the splene: put honey thereto, it healeth the running skalls that trouble children. The milt of a calfe sodden in wine, stamped and brought into a liniment, healeth the cankers or little sores in the mouth that young infants be subject unto. The magicians have a devise, to take the brains of a female goat, and let it passe through a golden ring, and to drop the same into the mouth of infants new born, before the teat be given unto them: which (they say) is singular good against the falling sickenesse, and other infirmities that to such babes are incident. Goats dung wrapped within a peece of cloth and so hanged about a young child, stilleth it, being never so froward or unquiet, and a girle especially. The gumbs of yong babes washed with goats milke, or annointed with hares brains, cause
E them to have great ease in toothing. *Cato* is of opinion, that whosoever use to eat hares flesh, shall sleepe well. And the common sort of people are perswaded, that the meat of this kind of venison, causeth them that feed upon it to looke faire, lovely, & gracious, for a weeke togither afterwards: For mine own part, I thinke verely it is but a toy and meere mockerie; howbeit there must needs be some cause and reason of this setled opinion which hath thus generally carried the world away to think so. The magicians affirme for certein, that if the eys be anointed with the gall of a female goat (such only as had been offred in sacrifice) or laid under the pillow in bed, it will procure them to take their repose who were far out of sleepe. The ashes of a goats horne incorporat into an unguent with oile of myrtles, keepeth those from diaphoreticall sweats who are anointed therwith.

A liniment made of bores gall, provoketh unto carnall lust: the same effect there is of that vi-
F rulent slime, which *Virgil* the Poët describeth to drop from *, a mares shap, against the time that shee is to be covered: also the stones of an horse so dried that they may be reduced into powder, for to be put in drinke: moreover, the right genetoir of an asse drunke in wine as need requireth, or tied in a bracelet fast to the arme, inciteth to venerie: furthermore, the frothie sperme that an asse sheddeth after he hath covered the female, gathered up in a peece of red cloth, and enclosed within

* *Pila marina*: θαλαττία σφαῖρα *Galen. lib.* 1. περὶ τύπ.

* *Ad coitū equæ* not according to the meaning of *Virg.* 3. *Geor.* in these words, *Scilicet ante omnes furor est insignis equarum, &c.* and a little after: *Hinc demum Hippomanes, &c. sentum destillat ab inguine virus.*

within ſilver and ſo carried about one, is of great power in this caſe, as *Oſthanes* mine authour G
ſaith. But *Salpe* (a famous courtizan) giveth direction to plunge the genitall member of this beaſt ſeven times togither in hot oile, and with the ſaid oile to annoint the ſhare and parts thereabout. *Bialcon* adviſeth to drinke the aſhes of the ſaid member, or the ſtale of a bull preſently after hee hath done his kind to a cow, and with the earth that is moiſtened & made mire with the ſaid ſtale, to anoint the privie parts. Contrariwiſe, there is not a thing that cooleth the luſt of a man more, than to annoint the ſaid parts with the dung of myce and rats. To conclude, for to avoid drunkenneſſe, take the lungs of an hog, be it bore or ſow it matters not; in like manner of a kid, and roſt it; whoſoever eateth thereof faſting, ſhall not be drunke that day, how liberally ſoever hee take his drinke.

H

Chap. xx.

Straunge and wonderfull things obſerved in beaſts.

THere be other admirable properties and vertues reported of the ſame beaſt, over and beſides thoſe before rehearſed; for it is ſaid, that whoſoever do find and take up an horſe ſhoe ſhaken from the houſe (an ordinarie thing that happeneth upon the way when a horſe caſteth his ſhooe) and lay the ſame up, they ſhall find a remedie for the yox, if they doe but call to mind and thinke upon the place where they beſtowed the ſame. Alſo, that the liver of an Hare is in this regard for curing of the hicket, like to an horſe ſhoe. Moreover, if an horſe doe follow in chaſe after a wolfe, and chaunce to tread upon the tracts where the wolfe hath run, hee will be I
broken winded and burſt, even under the man upon his backe. It is thought moreover, that the ankle bones of ſwine, have a propertie to make debate and quarrels. Alſo, when any ſheep pens or ox-ſtals be on a fire, if ſome of the dung be caſt forth, the ſheepe and oxen that be within will ſooner be gotten and drawn forth, and never come thither againe. Furthermore, that goats fleſh will have no ranke ſmell or taſt, if ſo bee the ſame day that they were killed, they did eat barley bread, or drinke water wherein Laſer was infuſed. Beſides, that no fleſh which is powdred well with ſalt in the wane of the moone, ſhall ever corrupt and be ſubject to worme or maggot. But ſee how diligent & curious our aunceſtors have been in ſearching out the ſecrets of every thing; inſomuch as wee find obſerved by them, That a deaſe Hare will ſooner feed and grow fat, than another that heareth. K

And to come unto leechcraft belonging to beaſts: it is ſaid, that if an horſe void bloud exceſſively, it is good to poure or inject into the bodie, hogs dung with wine. As for the maladies of kine and oxen, tallow, ſulphur-vif, crow garlicke, a ſodden [hens] egg, are ſingular good medicines to be given everie one of them beaten togither in wine: the fat alſo of a fox is good in that caſe. If ſwine be diſeaſed, the broth made of horſe-fleſh ſodden, is verie good to bee given them in their waſh to drinke. And in what diſeaſe ſoever it be of all foure-footed beaſts, there is not a better remedie than to ſeeth a goat all whole, in the very skin, and a land toad togither. Alſo it is ſaid, that a fox will not touch any cocks, hens, or ſuch like pullen, that have eaten (before) the dried liver of a Reinard; nor thoſe hens which a cock having a collar about his neck of a fox skin, hath troden. The like effects are reported of a weazils gall: As alſo that kine and oxen both in L
the Iſland Cyprus, when they are troubled with the belly-ach, cure themſelves with eating the excrements of a man: That the cleys of kine and oxens feet will not weare to the quicke nor bee ſurbated, if their hornes before were annointed with tarre: That wolves will not come into any lordſhip or territorie, if one of them be taken, and when the legs are broken, be let bloud with a knife by little and little, ſo as the ſame may be ſhed about the limits or bounds of the ſaid field, as he is drawne along, and then the bodie bee buried in the very place where they began firſt to drag him. Others take the plough-ſhare from the plough wherewith the firſt furrow was made that yeere in the field, and put it into the fire burning upon the common herth of the houſe, and there let it lye untill it be quite conſumed: and looke how long this is in doing, ſo long ſhall the wolfe doe no harme to any living creature within that territorie or lordſhip. Thus much by way M
of digreſſion: now is it time to return unto the diſcourſe of thoſe living creatures which be raunged in their ſeverall kinds, and ſuch as are neither tame nor ſavage.

THE

THE XXIX. BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

¶ The Proëme.

CHAP. I.

*The Originall of Phyſicke. When Phyſicians began to viſit the ſicke in their houſes. When came up firſt the maner of *curing diſeaſes by outward application of ointments and by fricatiõs. Of* Chryſippus *and* Eraſiſtratus. *Of the *Empiricke practiſe of Phyſicke. Of* Herophilus *and other famous Phyſicians. How many times the order of Phyſicke hath been chaunged. Who was the firſt profeſſed Phyſitian in Rome, and when hee began to practiſe. What opinion or conceit the auncient Romanes had of Phyſicians. Finally, the imperfections and defaults in this art of Phyſicke.*

THE admirable nature of a number of medicines, as well thoſe which I have alreadie ſhewed, as thoſe which remain as yet to be handled, forceth me to write yet more of Phyſicke, and to ſound to the very deapth and bottome: albeit I know full well, that there is not a Latine writer who hath travelled hetherto in this argument; and am not ignorant how tickliſh and daungerous a point it is at firſt to ſet abroach any new matters, eſpecially ſuch, whereby a man is ſure to reape but ſmall thankes, and in deliverie whereof, is to make account of a world of difficulties. But for as much as it is very like that thoſe who are well acquainted with this ſtudie, will muſe how it is come about, that the remedies drawne from ſimples, ſo eaſie to bee found and ſo accommodat to maladies, are caſt behind and growne out of uſe in the practiſe of Phyſicke; it cannot bee, but withall they muſt marvell much, and thinke it a great indignitie, that no ſcience and profeſſion in the world hath had leſſe ſoliditie in it and ben more unconſtant, yea, and how it daily changeth ſtill, notwithſtanding there is not any other more profitable and gainefull than it.

But to enter into the diſcourſe thereof, Firſt and formoſt, the invention of this act hath beene fathered upon the *gods, ſuch I mean as are canonized gods in heaven: yea, and even at this day we have recourſe ſtill unto divine Oracles for many medicines. Moreover, the fabulous tales deviſed by Poets have given a greater name and reputation thereto, in regard of the offence committed by *Æſculapius* in raiſing prince **Hippolytus* againe to life; for which bold part of his, *Iupiter* being highly diſpleaſed, ſmote him dead with lightening. And yet for all this, Antiquitie hath not ſtaied there, but made relation of others, who were revived by the meanes of the ſaid *Æſculapius* or his art: which during the *Trojane warre, whereof the fame and bruit is more certaine, grew into much requeſt and eſtimation: and yet in thoſe daies there was no other part of Phyſick profeſſed and practiſed, but Chirurgerie: and that in the cure of wounds onely. But in the age enſuing, and for many a yeare after, wonderfull it is, in what obſcuritie this noble ſcience lay dead, and as it were buried in darkeneſſe and oblivion, even untill the famous Peloponeſiacke war: for then aroſe *Hippocrates*, who revived and ſet on foot againe the auncient practiſe of *Æſculapius*, ſo long fore-let: and being borne in Coos, a renowmed and wealthie Iſland, altogether devote and conſecrated to *Æſculapius*, he made an extract of all the receits, which were found written in the temple of the ſaid god (for the manner was in that Iſland, that whoſoever were cured and delivered of any diſeaſe, regiſtred there upon record, the experiments of medicines whereby they had remedie;

This courſe in practiſe was called *Clinice*, ἀπὸ τῆς κλίνης, *i.* lecto, *i.* the bed or bed chãber.

* *Iatraleptice*, ἀπὸ τῦ ἰατρεύειν ἢ ἀλείφειν, *vel* ἀλειπτική, *quaſi medicina unguentaria.*

* *Empirice*, ἀπὸ τῆς ἐμπειρίας, *i. Experientia.* When Phyſicians cure by experimẽts only of medicines, withoutregard of the cauſe of the diſeaſe, or nature of the patient.

* To wit, *Apollo* & *Æſculapius.*

* *Tyndariden*: but out of *Plutarch*, & a manuſcript old copie, it ſhould bee read *Theſiden*, *i.* the ſon of *Theſeus*, which was *Hippolytus.*

* At what time and where, his two ſons, *Podalyrius* and *Machaon* practiſed Chirurgerie.

remedie, to the end, that afterward they might have helpe againe by the ſame in like caſes) and thereupon (as our countreyman *Varro* is perſuaded) after that the ſaid temple was burned, hee profeſſed that courſe of Phyſicke which is called *Clinice. Wherby Phyſicians found ſuch ſweetneſſe, that afterwards there was no meaſure nor end of fees: inſomuch, as *Prodicus*, a diſciple of *Hippocrates*, and borne in Silymbria, erecting that kind of practiſe in Phyſicke, which is called *Iatraliptice, opened by that meanes the way to enrich even thoſe, who under Phyſicians were emploied in rubbing and annointing mens bodies, yea, and brought gaine to other baſe and ſervile miniſters attending upon their cures. After them came *Chryſippus* in place: who through his much babble and pratling, wherewith hee was well furniſhed, altered the Theoricke and ſpeculative Phyſicke of *Hippocrates* and *Prodicus*, with all their principles: whome ſucceeded *Eraſiſtratus*, *Ariſtotles* ſiſters ſonne, and hee chaunged alſo many of *Chryſippus* his rules and receits, notwithſtanding hee was a ſcholler of his and brought up under him. This *Eraſiſtratus* for curing king *Antiochus*, received of his ſonne *Ptolomæus* (king after him) one hundred talents: which to begin withall, I note by the way, that you may ſee how (even in thoſe daies) Phyſicians were well rewarded for their pains and skill. But in proceſſe of time, one *Acro*, a cittizen of Agrigentum in Sicilie, much commended by the authoritie of *Empedocles* the famous naturall Philoſopher, began in that Iſland to inſtitute another faction and ſect of Phyſicians, who grounding altogether their worke and operation upon experience, called themſelves Empiriques. Thus there being diverſe ſchooles of Phyſicke, the profeſſours in every one of them entred into contention and variance, ſome ſiding this way and others taking the contrary; untill at length *Herophilus* entred the ſtage, who reproved and condemned as well the one as the other: and reduced the pulſes or beating of the arteries unto the times and meaſures in Muſicke, according to the degrees of every age. Long after it was not, but this Philoſophicall ſubtiltie of his ſect was given over and abandoned, becauſe the profeſſion therof required of neceſſitie ſo much learning and literature. And albeit that *Aſclepiades* when he began to profeſſe Phyſicke, brought with him an alteration of all that was before, yet (as I have already related) his Phyſick continued no longer than others: for *Themiſon* (a ſcholler and auditor of his) ſo ſoone as ever his maiſter was departed this life, altered quite all that hee wrote and noted at firſt from his mouth; and betooke himſelfe to a new practiſe, according to his owne head and fantaſie. But what became of it? Surely within a while after, *Antonius Muſa*, Phyſician to *Auguſtus* the Emperour, put downe that which *Themiſon* had ſet up: and that by the authoritie and warrant of the ſaid Emperor his patient, whom he delivered from a daungerous diſeaſe, *uſing directly a contrarie cure to that which had ben practiſed beforetime. Many other Phyſicians there were of great name, whome I overpaſſe: but the principall and moſt renowned of them all, were the *Caſij*, *Calpitani*, *Aruntij*, *Albutij*, and *Rubrij*, who in their time might diſpend in fees allowed them out of the princes and emperours exchequer, under whom they lived, 250000 Seſterces apeece, by the yeare. And as for *Q. Stertinius* the Phyſician, he complained of the Emperours whom he ſerved, and challenged them for that he had no greater revenues than 500000 Seſterces by the yeare from them: whereas he was able to make account, that by his practiſe in the citie he gained yearely 600000 Seſterces, being retained Phyſician to certain houſes, which he could readily name at his fingers ends. A brother of his received no leſſe in fees from *Claudius Cæſar* the Emperor. And albeit theſe brethren ſpent a great part of their wealth and ſubſtance in building ſumptuouſly at Naples, whereby they adorned and beautified that citie, yet they left behind them in goods unto their heires after them, to the worth of *thirtie millions; which was ſuch an eſtate, that unleſſe it were *Aruntius* onely, there was never any known before thoſe daies to have died ſo wealthie. After theſe men, there aroſe one *Vectius Valens*, who over and beſides his profeſſion of Phyſicke and Rhethoricke, which hee earneſtly followed, grew into a greater name, by reaſon of the familiar acquaintance hee had with *Meſſalina* the Empreſſe, wife to *Claudius Cæſar*. This minion of hers taking his time, and ſeeing how mightie he was, followed his fortunes, and erected a new ſect and practiſe of Phyſicke. But within the compaſſe of that age, and namely in the daies of the Emperour *Nero*, in commeth *Theſſalus*, who woon the name from all the Phyſicians of former times, and overthrew the precepts and doctrine of his predeceſſours; raging and faring as if he were mad, in open invectives againſt all the profeſſours of Phyſicke that ever were: and with what ſpirit, pollicie, wit, and dexteritie he performed this, it may be gathered ſufficiently by this one argument (if there were no more) that upon his ſepulchre or tombe, which remaineth at this day to be ſeen in the high way

or

G H I K L M

* *i.* Chamber-Phyſicke. So called, becauſe hee viſited his patients lying ſicke in bed.

* The manner of maintaining of health, and curing diſeaſes by frictions & outward application of oiles and ointmẽts.

* Who wroght by reaſons and rules, & thereupon were called *Rationales*, and *Dogmatici*.

* *Quia calida fomenta non proderant, frigidis curari coactus, auctore Antonio Muſa.* Sueton. *in vita Octav. Auguſt.*

* *Seſtertium trecẽties*, as *Budæus* readeth.

* He reduced Phyſicke into a Method: and from him deſcended the ſect called *Methodici*.

A or cauſey Appia, he triumphed over them all, and entituled himſelfe by the name of *Iatronices. And in very truth, never marched there plaier to the ſtage, or coach driver to the publick cirque for to run a race, better attended and with a greater traine of followers than hee when hee paſſed along the ſtreets: and yet *Crinas* of Marſiles put him downe and outwent him farre in credit and authoritie: and that by the meanes of a twofold skill and knowledge wherein hee was ſeene: For beſides his ordnarie profeſſion of Phyſicke, he ſhewed himſelfe more warie and ceremonious in all his practiſe than any other before him by reaſon of the deepe inſight that he had in the Mathematickes; obſerving the courſe of the ſtarres, chuſing good daies and houres, and going ever by his Almanakes and Ephemerides, whenſoever hee miniſtered unto his patients, inſomuch, as in their very diet he was ſo preciſe, that hee would not allow them to eat or drinke but with great
B regard of times and ſeaſons. Whereby he grew to ſuch wealth, that of late he bequeathed by his laſt will and teſtament *ten millions of Seſterces unto his native citie Marſils toward the fortifications thereof, beſides the walls that he cauſed to be built and emmanteled about other towns, which coſt him little under the foreſaid ſumme. Whiles this *Crinas*, with ſuch others as himſelfe, ſeemed with their Aſtrologie to commaund the courſe of the deſtinies, and to have mens lives at their own diſpoſition, all on a ſuddain one *M. Charmis*, a Marſilian likewiſe, put himſelf forward and entred the citie of Rome, who not onely condemned the former proceedings of the auncient Phyſicians, but alſo put downe the baines and hot houſes: he brought in the bathing in cold water, and perſuaded folke to uſe the ſame even in the middeſt of Winter: nay, hee feared not to give direction unto his ſicke patients for to ſit in tubs of cold water. And I aſſure you, my ſelfe
C have ſeene auncient Senatours, ſuch as had been Conſuls of Rome, all chilling and quaking, yea and ſtarke againe for cold, in theſe kind of baths: and yet they would ſeeme to endure the ſame, to ſhew how hardie they were. And verely, there is a Treatiſe extant of *Annæus* *Seneca*, wherein he approveth highly of this courſe. Neither is it to be doubted, but ſuch Phyſicians as theſe, who having woon credit and eſtimation once by ſuch novelties and ſtrange deviſes, ſhoot at no other marke but to make merchandiſe and enrich themſelves even with the hazard of our lives. And
3 hereupon come theſe lamentable and wofull conſultations of theirs about their patients, wherin you ſhall ſee them ordinarily to argue and diſagree in opinion, whiles one cannot abide that another mans judgement ſhould take place, and ſeeme to carie away the credit of the cure. From hence alſo aroſe that Epitaph of his (whoſoever he was) that cauſed theſe words to bee engraven
D upon his unhappie tombe, *Turba medicorum perij*, *i.* The variance of a ſort of Phyſicians about me, were the cauſe of my death. Thus you ſee how often this art from time to time hath been altered, and how daily ſtill it is turned like a garment new dreſſed and tranſlated; inſomuch, as wee are caried away with the vaine humor of the Greekes, and make ſaile as it were with the puffes of
3 their proud ſpirit: For ever as any of theſe new commers can venditat and vaunt his owne cunning with brave words, ſtraightwaies we put our ſelves into his hands, and give him power to diſpoſe of our life and death at his pleaſure; and without further regard, are as obedient to him as a ſouldiour to his captaine and generall of the field. A ſtraunge matter that we ſhould ſo do, conſidering how many thouſands of nations there be that live in health well ynough without theſe Phyſicians, and yet I cannot ſay altogether without Phyſicke. Like as the people of Rome alſo
E (notwithſtanding the Romanes were ever knowne to be forward ynough to entertaine all good arts and diſciplines) continued for the ſpace of ſix hundred yeares and above after the foundation of their citie, and knew not what a Phyſician meant, but afterwards they did caſt a great fanſie to Phyſicke alſo: howbeit, upon ſome little experience thereof, they were as readie to loath and condemne it, as they were deſirous before to have a taſt and triall of it. And here I think it not amiſſe in this corrupt age of ours wherein we live, to diſcover and relate certain principall examples of our auncеſtours, worthie to be noted in this behalfe.

And to begin withall, *Caſſius Hæmina*, an auncient Hiſtoriographer dooth report, That the firſt Phyſician that ever came to Rome, was one *Archagathus*, the ſonne of *Lyſanias*, from out of Peloponneſus, which was when *L. Æmylius* and *M. Livius* were Conſuls, and in the year after the
F foundation of the citie of Rome 535. And this mine Author ſaith, That hee was enfraunchiſed free denizen of Rome, and had a ſhop provided for him, ſtanding in the carrefour of *Acilius*, bought at the charges of the citie for to entertaine his patients, and therein to exerciſe his cunning. Called he was (by report) The vulnerarie Phyſician or Chirurgian: woonderfull much ſeeking and running there was after him, and none more wealthie than he at his firſt comming. But

ſoone

*i. The maiſter and conqueror of all Phyſians.

*Conties H-Ss

*Such as bath in cold water be called by *Seneca*, *Pſychroloutæ*.

ſoone after, when he was knowne once to carie a cruell hand over his poore patients, in cutting, launcing, diſmembering, and cauterizing their bodies, they quickly began to alter his name, and to tearme him the bloudie Butcher or Slaughterman: whereupon not onely all Phyſicians, but Phyſicke alſo grew into a bad name and became odious; as may appeare evidently by the monuments and bookes of *M. Cato*, a worthie perſonage, and in regard of whoſe vertues and commendable parts, his triumph and Cenſureſhip, as famous and honourable as they were, deſerve the leaſt part of his authoritie and reputation, ſo much was there in himſelfe, above the gifts and graces of Fortune. I will therefore inſert in this place, word for word, an Epiſtle of his unto his ſon *Marcus*, touching this matter, wherein hee thus writeth: *Concerning theſe Greekes (ſonne* Marcus) *I will write in place and time convenient, what I have found out and knowne by them in Athens: and namely, that it were good to looke into their bookes and read them (as it were) by the way, but in no wiſe to ſtudie upon them much and learne them throughly. I have alreadie given the attempt, and intend to convince and put downe the wickedeſt race and moſt perverſe and obſtinat kind of them. And learne this of me, as from the mouth of a true Prophet, That whenſoever this Greekiſh nation ſhall bring into Rome their Philoſophie, they will corrupt and marre all: but let them ſend once their Phyſicians hither, you ſhall ſee a greater wrecke and confuſion thereby. For I aſſure thee, they have complotted and ſworne one to another for to murder all *Barbarians by meanes of their Phyſicke. And even to effect and bring this about, they will bee fed alſo and take money; to the end, that both wee ſhould truſt them the rather, and they alſo have the better meanes to worke the feat and diſpatch folke with more facilitie. As for us, it pleaſeth them uſually to name us Barbarians, yea, and they give unto us more filthie tearms than any others, and miſcall us *Opiques. Well, remember thou once for all, that I have given thee warning of their Phyſicians, and forbidden thee to be acquainted with them.* Now *Cato*, who wrote this letter, died in the ſix hundred and fift yeare after the foundation of our citie, when himſelfe was foureſcore yeares old and five: wherby a man may ſee that he wanted not grounded knowledge when he delivered this ſpeech unto his ſonne; for he had both the practiſe of former times in publicke affaires, and age ſufficient of his owne to furniſh him with experience of privat examples. What ſay we then to this reſolution of his? Are we to judge and beleeve that he hath condemned therby a thing ſo neceſſarie and profitable as Phyſicke is? God forbid: For himſelfe ſetteth downe a little after, what Phyſicke and what medicines both hee and his wife were acquainted with, and by meanes whereof they came to bee ſo aged as they were: and thoſe were no other (verely) but the uſe of Simples, whereof we now are in hand to treat. He ſaith moreover and profeſſeth, that hee hath made one Treatiſe expreſſely, containing certaine receits for the cure of his ſonne and ſervants, and for the preſervation of their health: the which I have not omitted, but diſperſed here and there, according to the occurrences of accidents and diſeaſes of ſundrie ſorts, whereof I have had ſome occaſion to ſpeake of, & ſtill ſhall have more. Wherby it is plain, that our ancient forefathers blamed not the thing it ſelfe, I meane Phyſicke, and medicines; but the art and cunning of Phyſicians, who had the handling thereof. And moſt of all, they held off and were afraid to entertaine thoſe amongſt them, who ſought ſuch exceeding gaines for their handie worke, eſpecially where they endaungered their lives withall. And that they made ſome account of Phyſicke, may appeare by this, that when they received *Æſculapius* as a cannonized god into their Kalender, they built one temple for him without the cittie of Rome, yea, and the ſecond, which in his honor they erected, was ſituat within the Iſland apart from other buildings. Alſo at what time as by vertue of an edict all other Greekes were baniſhed Italie, Phyſicians were excepted; and that was many a yeare after *Cato* his time. And here by the way, one word will I ſpeake to the honour of our Romanes for their ſingular wiſdome and providence, namely, That howſoever they are growne to good proofe and be accompliſhed in all other arts and profeſſions of the Greeks, yet their gravitie hitherto hath beene ſuch, as they would not give themſelves to the practiſe of this onely Science. And notwithſtanding the exceeding wealth that accrueth by Phyſicke, yet very few or none of our naturall Romane citizens have medled therewith. And thoſe alſo that have betaken themſelves unto it, preſently have forſaken their native language and gone to the Greek tongue. For this opinion verely there is of this art, That if the profeſſors therof handle it in their vulgar and mother tongue, or otherwiſe in any other than Greeke, all the authoritie, grace, and credit thereof is loſt, even with thoſe that be altogether unlearned and know not ſo much as the Greeke Alphaber. See the nature and fooliſh propertie of our countreymen, to have leſſe confidence and truſt in thoſe things which concerne their life and health, if they bee intellegible and

delive-

*That is to ſay all nations but themſelves.

* *Opici*, were a certain people of Italie, infamous for their unhoneſt life and filthie language, *quaſi* αἰσχροποιοὶ καὶ αἰσχρολογοι.

* Why the tẽple of *Æſculapius* ſtood without the citie of Rome? See *Plutark* 94 *Quæſtionum Romanorum.*

A delivered to their capacitie; than in others, which they underſtand never a whit! And hereupon verely it is come to paſſe, that the art of Phyſick hath this peculiar gift and priviledge alone, That whoſoever profeſſeth himſelfe a Phyſician, is ſtraightwaies beleeved, ſay what he will: and yet to ſpeake a truth, there are no lies dearer ſold, or more daungerous than thoſe which proceed out of
3 a Phyſicians mouth. Howbeit, we never once regard and look to that, ſo blind we are in our deepe perſuaſion of them, and feed our ſelves each one in a ſweet hope and plauſible conceit of our health by them. Moreover, this miſcheef there is beſides, That there is no law or ſtatute to puniſh
1 the ignorance of blind Phyſicians, though a man loſt his life by them: neither was there ever any man knowne, who had revenge or recompence for the evill intreating or miſuſage under their hands. They learne their skill by endaungering our lives: and to make proofe and experiments
B 2 of their medicines, they care not to kill us. In a word, the Phyſician onely is diſpenſed withall, if he murder a man: ſo cleare he goeth away with impunitie, that none ſo hardie as once to twit or challenge him for it. But ſay that one bee ſo bold as to charge them with any untoward dealing; out they crie preſently upon the poore patients, at them they raile with open mouth, they are
3 found fault with for their unrulineſſe, diſtemperature, wilfulneſſe, and I know not what: and thus the ſillie ſoules that be dead and gone, are ſhent and bear away the blame. The decuries or bands at Rome of thoſe knights which are deputed and called Iudges, are not choſen but by an ordinarie triall and examination of their eſtate, qualitie, and perſon; and the ſame by the principall of that order and degree, both taken and approoved: ſtreight inquiſition there is made of their demeanure from houſe to houſe; of their parentage alſo, yea and true information given to the ele-
C ctors before they can be choſen. Mint maiſters, ſuch as are to give their judgement of money, and the touch of coine, be not taken hand over head: but if any be more skilfull than others therin, they are ſent for (rather than to faile) as far as from Calis and the ſtreights of Gilbretar. And for to pronounce ſentence as touching the baniſhment of a Romane citizen, the five deputed or elected delegats (named Quinqueviri) had no warrant or decreed paſſe before 40 daies were expired. But for theſe Phyſicians, who are the judges themſelves to determine of our lives, & who many times are not long about it, but give us a quick diſpatch and ſend us to heaven or hell; what regard is there had, what enquirie and examination is made of their qualitie and worthineſſe? But ſurely, well ynough are we ſerved, and we may thanke none but our ſelves, if we come by a ſhrewd turne, ſo long as there is not one of us hath any care or deſire to know that which is good for his
D life and health. We love to *walke (forſooth) with other mens feet. *Wee read, wee looke by the eyes of others: we truſt the remembrance of another when we ſalute any man: and to conclude, in the very maine point of all we commit our bodies and lives to the care and induſtrie of others: No reckoning is there now made of the riches and treaſure of Nature: but the moſt precious things indeed which ſerve for the maintenance and preſervation of health and life, are utterly rejected and caſt away: No account make we of any thing and thinke our owne, but to live in pleaſures and daintie delights. I will not leave my hold of *M. Cato*, whom I have oppoſed as a ſhield and buckler againſt the envie and ſpight of this ambitious and vaine-glorious art: neither will I give over the protection of that honourable Senat which hath judged no leſſe: and that without catching advantage at the ſinfull pranks & leud parts which are committed and practiſed under
E the pretence of this art, as ſome man haply would look that I ſhould ſet them abroad. For to ſay
1 2 a truth, is there any trade or occupation goeth beyond it for poyſoning? that is the cauſe of more gaping and laying wait after wils and teſtaments, than this? What adulteries have beene
2 committed under the colour hereof, even in princes and emperours pallaces? As for example, *Eudemus* with *Livia* the princeſſe, and wife to *Druſus Cæſar*: *Valens* likewiſe with the queene or empreſſe abovenamed, *Meſſalina*. But ſay that theſe crimes and odious offences are not to be imputed unto the art it ſelfe, but rather to bee charged upon the perſons, I meane the corrupt and leaud profeſſours thereof: yet ſurely I am of this beleefe, that in regard of theſe enormities, *Cato* was as much afraid of the entrance of Phyſicke, as of ſome Queene into the cittie of Rome.
F For mine owne part, I meane not to ſay ought of their extreame avarice; of the merchaundiſe, ſpoile, and havocke that they make when they ſee their patients in daunger of death, and drawing to their end; nor how high they hold (as it were in open market) the eaſement and releaſe of the ſicke mans pains, whiles he is under their hands; ne yet what pawnes and pledges they take as earneſt of the bargaine, to diſpatch the poore patient out of the way at once; and laſtly, of their hidden ſecrets and paradoxes, which forſooth they will not divulge abroad, but for ſome round ſumme

*In this place he caſteth in the Romanes teeth, their *Leſticarij*, *Anagnoſtæ*, and *Nomenclatores*.
*Agnoſcimus, ἀναγνῶσται, μνήμονες.

ſumme of money. As for example, that a cataract or pearle in the eye is to bee couched rather G
and driven downe by the needle, than quite to be plucked forth. Wherby it is come to paſſe, that
it is a very good turn & the beſt for us (as the caſe ſtandeth) that we have ſo great a number of ſuch
murderers & theeves in the Commonwealth: for I aſſure you it is not long of any ſhame and ho-
neſtie (whereof there is none in them) but their malicious æmulation, being ſo many as they are,
that the market is well fallen, and the prices come downe of their workmanſhip. Notorious it is,
that *Charmis* the abovenamed Phyſician that came from Marſiles, bargained with one patient
that he had, to have two hundred thouſand Seſterces for his cure, and yet hee was but a ſtraunger
and a provinciall inhabitant. Alſo as well knowne it is, that *Claudius Cæſar* upon a condemnation
and judgement, tooke at one time by way of confiſcation, one hundred thouſand Seſterces from
one *Alcontes*, who was no better than a Chirurgian or wound-healer: who beeing confined into H
France, and afterwards reſtored, gathered up his crums again and got as much within few yeares.
I am content alſo, that theſe faults ſhould bee laid not upon the art but the men that profeſſe it:
Neither verely doe I meane to ſhew and reprove the baſe, abject, and ignorant ſort of that crew:
nor how little order and regiment they obſerve in the cure of diſeaſes, or in the uſe of baines and
hot waters: how imperiouſly they preſcribe otherwhiles to their patients moſt ſtreight diet: and
again, when they are readie many times to faint & die under their hands for want of ſuſtenance,
how they be forced to cram them as it were, and give them meat upon meat, oſtentimes in one
day, before they have digeſted the former viands. Moreover, how they doe and undoe, altering
the manner and courſe of their proceedings a thouſand waies, miſliking and bethinking them-
ſelves after they have done a thing: making a miſh maſh and mingle mangle in the kitchin of I
thoſe victuals which they ordaine for their poor patients: beſides a deale of mixtures and ſophi-
ſticat compoſitions of drugs and ointments. For there is no ſuperfluitie tending unto vain plea-
ſures and wanton delights that hath overpaſſed their hands. And ſince I light upon the mention
of theſe drougs and ſpices, for mine own part I am verely perſuaded, that our auncеſtours & fore-
fathers were nothing well pleaſed with the bringing in of ſuch forraine wares, which bear ſo high
prices and are extreame deare: and that *Cato* never thought of theſe drougs and mixtures, nor
foreſaw theſe corruptions by them occaſioned, when hee blamed ſo much and condemned this
* *i.* Treacle. art of Phyſicke. Yet ſee what account there is made of a compoſition called *Theriall, deviſed
onely for exceſſe and ſuperfluitie: Compoſed it is of diverſe ingredients farre fetched and deare
bought: whereas Nature hath beſtowed upon us and preſented to our eyes ſo many wholeſome K
ſimples, and every one of them by it ſelfe medicinable and ſufficient. Moreover, another antidot
and confection there is, conſiſting of no fewer than four and fiftie ſundrie ſorts of drougs and in-
gredients, all of diverſe weights, and ſome of them are preſcribed to carie the poiſe preciſely of
the ſixtieth part of one denarius or dram. Now would I gladly know what god he was (for ſurely it
paſſeth the wit of man thus to diſpenſe the ingredients, & calculat their vertues, to a ſingle ſcru-
ple) that taught firſt this ſubtile and intricat compoſition? By which it appeareth manifeſtly,
that this geere bewraieth onely a vaine oſtentation, and all to give a glorious and wonderfull lu-
ſtre to the art, for to make it better accepted and more vendible. And yet the very Artiſts them-
ſelves are not ywis ſo skilfull, as to know that whereof they make profeſſion. For I my ſelfe have
ſeene theſe that goe for Phyſicians, put commonly into their medicines and receits *quid pro quo*, L
* *Sanguis Draconis.* Sang-dragon, *Lachrymæ ſpecies*, a kind of gum. * *Metallicum*, a minerall Vermillion. and namely, in ſtead of the Lidian *Cinnabaris, *Minium; which is no better than a very poy-
ſon, as I will prove and ſhew hereafter in my Treatiſe of Painters colours: which errour proceе-
deth onely from this, that they are not well ſeene in Grammar, nor in the proper ſignification of
words. But theſe and ſuch like errours touch and concerne the health of every one in particular.
As for thoſe abuſes in the art of Phyſick, which *Cato* feared, foreſaw, and would have prevented,
they be ſuch as are nothing ſo hurtfull and daungerous as the reſt, and indeed ſmall matters in
the opinion of man: and ſuch as the principall profeſſours and maiſters of this art doe avow and
confeſſe among themſelves. Howbeit, even thoſe deviſes, as harmeleſſe as they ſeeme to be, have
been the overthrow of all vertue and good manners in our Romane State, I meane thoſe things
which wee doe and ſuffer in our health: our exerciſe of wreſtling, our greaſing and annointing M
with oile for that purpoſe, brought in forſooth and ordained by theſe Phyſicians for to preſerve
our health. And what ſhould I ſpeake of their drie ſtouves, hot houſes, and ardent baines, which
they would beare men in hand to be ſo good for digeſtion of meat in their ſtomackes? Yet could
I never ſee any, when he came forth of them upon his own feet, but he was more heavie & found
himſelfe

himselfe feebler than before he went in: and as for those who have been more observant of their rules than the rest, and wholly governed by them, I have known many such carried out for dead, or els extreame sicke. To say nothing moreover of the potions and drinks ordained by them, to be taken in a morning fasting, for to vomit and scoure the stomack thereby; and all to make way for to quaffe and carouse againe upon it more lustily. I forbeare also to write of their rosins and pitch-plastres devised by them for to plucke away and fetch off the haire where Nature hath ordained it to grow, wherby they would seeme to effeminat our men. I bash also to speak how even our women have prostituted their nakednesse and privities unto them, by occasion of these their wanton devises. In summe, conclude we may, that considering these enormities and corruptions which have crept into our life, by nothing more than by the means of physicke, *Cato* was a true prophet indeed, and his oracle is verefied and fulfilled every day, when he said, That it was sufficient to looke cursorily into the writings and wittie devises of the Greeks, without farther studying thereupon and learning them throughly. Thus much I thought good to speake, in justification of that Senat and people of Rome, who not without great reason continued 600 yeeres without the entertainment of Physicians; and against that Art, which of all others is most daungerous and fullest of deceit: in regard whereof, it hath bleered the eies of good men, and they be those who have given credit and authoritie therunto. And withall, thus much may suffice to meet with the fond opinion and foolish persuasion of those, who are ravished and caried away with a conceit, esteeming nothing good for the health of man, but that which is costly and pretious. For certes I doubt not, but some there be who will loath these receits taken from divers beasts, wherof I shall have occasion to speake hereafter. But I comfort my selfe againe herein, That *Virgil* disdained not to name the verie pismires and the weevils; * blind beetles also delighting in darkenesse, and their nests wherein they keepe; of which he wrote, notwithstanding hee was not urged thereto upon necessitie. Neither did *Homer* thinke it improper, to * mingle the description of a shrewd and unhappie flie, even with the heroicke battails of the gods: ne yet dame Nature, who hath brought forth and made man, thought it any disparagement to her majestie for to engender also these fillie and small creatures. And therefore let every man consider their vertues, properties, and effects, and not regard so much themselves. To come then unto those things that are most common and knowne, begin I will at sheeps wooll, and birds egs, to the end that by that means due honour may be yeelded to the chiefe and principall of all others, as it doth appertain. Howbeit, I must of necessitie speake of some other things by the way as occasion shall be offered, notwithstanding the place be not so proper and fit for them. Neither wanted I means sufficient to furnish this worke of mine with many gallant matters and pleasant discourses, if my delight and mind had been to looke after any thing els but a plaine and true narration, according to my first desseine and intention: For well I wot, that I might have inserted here and there, the rare receits which are reported to be made of the ashes of the bird Phœnix, and her nest; but that I know all to be meere fabulous, howsoever they carrie a pretence of truth. Besides, I count it a verie mockerie and no better, to deliver unto the world those medicines which are not to be made but once in the revolution of a thousand yeers.

* *Iliados 4.*

Chap. 11. *The vertues and properties of Wooll.*

THe auncient Romans attributed unto Wooll great authoritie, & had therein a certain religious and reverent opinion of holinesse: in so much as new wedded wives by an old custom and ordinance at Rome, were wont with great ceremonie to adorne and bedeck with wooll the side-posts of the dore or entrie into their husbands house, upon the mariage day. Now besides the use of wooll for decent apparell, & defence against cold weather; that which is unwashed and full of the sheeps swet serveth in physick, and is a soveraigne remedie for sundrie accidents, being applied with oile, wine, or vinegre, according as need requireth, either in mitigation of pain, or mordication and corrosion; and according as our purpose is, to bind, or to enlarge and open any part: and namely, it is emploied in dislocations of members, and griefe of sinews, if it be laid unto the affected place, well sprinkled and wet eftsoons with the said liquors, that it might be alwayes moist. But more particularly, for disjointed members, some put thereto a little salt: others take rue, and when they have stamped it, incorporat the same with some convenient grease, & so apply it in maner of a cataplasme upon sweatie wooll: after which manner, it is good for contusions or bruses and swellings. Also it is said, that if the teeth & gumbs be well rubbed with such wooll and

honey mingled togither, it will cauſe the breath to bee the ſweeter: a ſuffumigation or perfume therof, is ſingular for the frenſie: applied with the oile of roſes, it ſtancheth bleeding at the noſe: or otherwiſe if the ears be well ſtopped therewith, and a little garlick conveied withall thereinto. Moreover, it is laid unto inveterat ſores with good ſucceſſe, ſo that honey be put thereto. Soake wooll in wine, vinegre, or cold water and oile, and then wring and preſſe the ſame forth, it healeth any wound. The wooll of a ram well waſhed in cold water, and afterwards ſteeped in oile, is ſingular for womens infirmities, and particularly allaieth the inflammation of the matrice: but in caſe it be falne downward and readie to ſlip out of the bodie, a perfume therof received beneath, ſtaieth the ſame and keepeth it up. The fattie wooll of a ſheep being either applied, or put up in maner of a peſſarie, draweth down the dead infant out of the mothers belly: and yet the ſame otherwiſe repreſſeth the immoderat flux of womens fleurs. If it be couched hard and cloſe within the wound occaſioned by the biting of a mad dog, it ſerveth to great purpoſe; but with this charge, That it be kept bound thereto & not removed untill the ſeventh day be paſt: applied unto whitflaws and impoſtumations about the naile-roots, with cold water, it cureth them: the ſame, if it be dipped and ſoked, in a medly made of ſalnitre, brimſtone, oile, vinegre, and tar, all diſſolved togither and readie to boile, and ſo laid as a cataplaſme to the loins as hot as the patient can abide it, changing it twice a day, appeaſeth the pain of thoſe parts. Take the greaſie wooll of a ram, bind therewith very hard the joints of the extreame parts, as namely the fingers and toes, you ſhall ſee how it will ſtaunch bleeding. [Howbeit, note this, that the wooll growing upon the ſheeps neck, is ever beſt and moſt medicinable: and if we regard the countrey from whence it commeth, that of Galatia, Tarentum, Attica, and Miletum, is alwaies reputed better than any other.] Furthermore, the greaſie or ſweatie wooll of a ſheepe, is proper to be applied unto any raw places where the skin is fretted off, to contuſions, bruiſes looking black and blew, ſtrokes, cruſhes, ruſhes, rubs, and gals; as alſo for them who are tumbled downe from ſome high place; for the head-ach and other pains; and laſtly, for the inflammation or heat of the ſtomack, being decently applied with vinegre and oile roſat. Reduced into aſhes and uſed as a liniment, it is ſingular for them that be cruſhed or ſquezed, wounded, burnt, or ſcalded. This aſhes entreth alſo into colyries & eyeſalves: it ſerveth for hollow ulcers & fiſtuloes: like as for the ears when they run filthie matter. For theſe purpoſes above ſpecified, ſome ſheare it from the ſheeps backe; others chuſe rather to plucke it: and when they have clipped off the upmoſt parts or forced, lay it forth to drie: they toze and card it alſo, and then beſtow it in an earthen pot not fully baked, which they beſmeare all over with honey, and ſo burne and calcine it to aſhes: others put under, ſmall chips or ſlices of torchwood, and lay certain beds or courſes therof between the locks of wooll; and after they have beſprinkled the ſame with oile, ſet all on fire: which done, the aſhes that come thereof they put into little pans or veſſels, & poure water thereupon: and after they have well ſtirred the ſaid aſhes with their hands, they ſuffer it to reſt and ſettle downe to the bottom; which they do oftentimes, & alwaies chaunging the water untill ſuch time as a man may perceive the aſhes at the tongues end to be ſomewhat aſtringent, but not biting: and then they lay up this aſhes for their uſe. A great* ſcourer and cleanſer this is, and therefore moſt effectuall to mundifie the eye-lids.

Moreover, the very filthie excrements of ſheep, & the ſweat ſticking to the wooll of their flanks, between their legs and the concavities thereabout (which they call Oeſypum) is thought to have infinit number of medicinable properties: but the beſt Oeſypum ſimply is that which commeth from the ſheep bred about Athens. This ſwet or filthie excrement, call it what you will, is prepared and ordered many waies; but the principall is that which is gathered from the wooll newly taken from between the legs and ſhoulders of the ſheepe, and preſently tozed ready for to be carded: others are content to take the ſweatie filth of any wooll, ſo it bee freſh plucked or clipped from the ſheep; and whether it be the one ſort or the other, they let it diſſolve over a ſoft fire in a pan of braſſe: which done, they ſet it a cooling, and take off the fat that ſwimmeth aloft, & gather it into an earthen veſſell. As for the reſt which remained behind of the firſt ſtuffe, they ſet it upon the fire again, that the fatneſſe may boile forth of it: after this, the fat that floted above, as well the former as the latter, they waſh in cold water, and let* it drie in a linnen cloth, expoſe it to the heat of the Sun, that it may frie therein untill it be blanched white and looke pure and cleare: then is it put up in tin boxes or pewter pots, and reſerved for uſe. The true marke to know which is good Oeſypum, after it is thus tried and putrified, is thus: If it have a ranke ſmell ſtill of the firſt filthines which it had from the ſheepe: alſo, if when you rub it with your hand in water, it melt not, but in

* *Vis ejus ſmectica eſt*, out of *Dioſc.* not *ſeptica*, as is commonly read: for how can it be corroſive, if it bite not at all.

* *Siccatur*, or rather *Saccatur*, ſ. ſtreine it through a linnen bag.

the

A the working look whitiſh like unto ceruſe or white lead: a ſoveraigne thing it is for the inflammation of the eies: for the hard callofities alſo that grow upon the eyelids. Some there be who torrifie the foreſaid greaſie wooll into an earthen pot or pan, ſo long untill it have forgone and yeeldeth forth all the ſweat & fattineſſe; the which they ſuppoſe to be the beſt Oeſypum that is for any eroſion, fretting, or hardnes of the eyelids: or to cure the ſcabs and ſores, yea, and the watering of the angles of the eies. Well, this fattie excrement thus clarified, incorporat with gooſe greaſe, cureth not only the ulcers of the eyes, but of the mouth alſo and members of generation: the ſame tempered with Melilot and Butyr, maketh an excellent liniment for all inflammations of the matrice: the chaps alſo and ſwelling piles or biggs in the fundament. Many other vertues it hath, which I will digeſt into their ſeverall places, and ſpeak of them accordingly. As touching the filthy excre-
B ments hanging to ſheeps tailes, and baltered together into round pils or bals, if they be dried and ſo beaten to pouder, are ſingular for the teeth, yea, though they ſhooke in the head, if they be rubbed therwith; alſo for the gums, though there were gotten into them a cankerous ſore. Now concerning fleece wooll that is pure and waſhed, either by it ſelfe alone, or elſe with ſulphur vif, it is paſſing good to be applied unto any place in paine, whereof the cauſe is not evident and known: which alſo being reduced into aſhes, is ſoveraign for the accidents which happen unto the privie parts. In ſum, of ſuch vertue is wooll, that there is no cataplaſme, pulteſſe, or plaſtre, in maner applied to a grieved place, but the ſame hath wooll laid over it. The ſame alſo hath a ſingular vertue above all things, to recover the appetite of meat in the very ſheepe that bare it, in caſe they have loſt their ſtomacks & feed not: for plucke the wooll that groweth to their tailes, and therewith tie
C the ſame as hard as is poſſible, you ſhall ſee them preſently fall to their meat: But it is ſaid withall, that the reſt of the tail which is underneath the ſaid knot where it was bound, wil quickly become mortified, and die.

* *Doloribus cæcis.*

Chap. XIII.

The nature and properties medicinable of Eggs.

GReat ſocietie and affinitie there is between wooll and egs; in this regard, That if they be applied both togither in a frontall to the forehead, they repreſſe all violent fluxes & rheums falling into the eies: but you need not take for this purpoſe any wooll that hath ben dreſſed or cleanſed with the *Fullers ſcouring weed: neither is it required, that in this caſe there ſhould be
D uſed any more but the white of an egg, and the ſame ought to be infuſed or ſpread upon the foreſaid wooll, with the powder of frankincenſe: and in very truth, the white of an egg alone, if it be inſtilled or dropped into the eies, is ſufficient to reſtreine the flux of humors thither, yea and to coole any hot rheume or inflammation incident to them. Howbeit, ſome thinke it better to put ſaffron thereto, and uſe this gleere or white of the egg beaten, in ſtead of water, for all collyries or medecins appropriat to the eies. The white of an egg incorporat with freſh butyr, is ſo ſoveraign for the red and bloudſhotten eies which put little children to paine, as none in the world better; nay there is not in a maner any other uſed in that caſe. The ſame beaten and tempered with oile, aſſuageth the heat of S. *Anthonies* fire, if there be leves of beets laid upon the place and kept bound thereto. The white of an egg incorporat with ſalhormoniacke finely pulverized, doth ex-
E tend and turne backward the haires of the eie-lids which grow inward into the eies: the ſame with pine nut-kernels and a little hony mingled withall, and ſo reduced into a liniment, taketh away the pimples that ariſe in the face: annoint the viſage therewith, it will keepe it from being ſun-burnt. If one be ſcalded with hot water, lay quickly an egg to the place, yelke, white, and all togither, it will take out the fire and preſerve it from bliſtering: ſome put thereto barley meale and a little ſalt: but ſay the place be bliſtered and exulcerat with any burne or ſcald, parched barley with the white of an egg and ſwines greace, is an excellent medecine to heale the ſore: and the ſame cataplaſme is much uſed in the cure of the hæmorrhoids, piles, and chaps of the fundement; and eſpecially in children, for to reduce the tiwill into the right place, if it hang forth: for the rifts and chaps which appeare in the feet, take the white of an egg ſodden or roſted, the weight of two de-
F niers of ceruſe, as much of letharge of ſilver, and myrrhe, with a little quantitie of wine; incorporat all togither into a cataplaſme, there is not a better medecine for them: and for the inflammation called S. *Anthonies* fire, the white of an egg beaten togither with Amydum or ſtarch-floure, is right ſoveraigne. It is ſaid moreover, that the white of an egg is very good to congluti-nat or ſowder any wound, yea and to expell the ſtone and gravell out of the bodie.

* *Radicula*, called before *Struthium*.

The yelke of an egg ſodden untill it be hard, and tempered with a little ſaffron, with hony alſo and breſt-milke, and ſo reduced into a liniment, allaieth the pain of the eies, if they be annointed or fomented therewith: or if the ſame be incorporat with oile roſat and honyed wine, & ſo ſpred upon a quilt of wooll and applied, it worketh the ſame effect. Others there be who take the yelke of an hard egg, mix therewith the powder of perſley ſeed, adding thereto fried barly meale dried, and honied wine; with which compoſition they annoint the ſore eies. Alſo the yelke of a ſoft egg alone, ſupped off and ſwallowed downe cleare that it touch not the teeth by the way, is ſingular good for thoſe that bee troubled with the cough, with the rheume or catarrhe that hath taken a way to the breſt or pectorall parts; yea and the roughneſſe of the throat and pipes which cauſeth hoarſeneſſe: but principally if one be bitten with the worme or ſerpent called * Hæmorrhois, let him both ſup off the yelke of an egg raw or ſoft, and apply it alſo to the wounded place. It helpeth the infirmities of the reins; it healeth the fretting, excoriation, and ulcers of the bladder; yea and cureth thoſe that reach and caſt up bloud. Five yelks of egs ſupped off raw in one hemin of wine, are ſingular good for the dyſenterie or bloudie flix, and namely, with the powder of the ſhels from whence they came, the juice of poppie, and a little wine withall. For the flux of the belly proceeding from a feeble ſtomacke, they uſe to give the ſaid yelks of eggs raw, with as much in weight of good and full raiſins, and the rind of a pomegranat; with direction to the patient, for to take this medicine three daies togither by even portions, and no more one day than another: for which purpoſe alſo, there is another way to uſe them; namely, to take three yelks of an egg, to incorporat the ſame in as many ounces of honey and old lard, putting thereto three cyaths alſo of good old wine; and ſtamping all togither into one compoſition untill ſuch time as it be reduced to the conſiſtence or thickneſſe of honey; of which the patient muſt drinke as need requireth, with water, the quantitie of an hazle nut at a time. Alſo it is good to lay three egs in vinegre for three daies togither, and upon the fourth day to eat them, for the foreſaid flux of the ſtomacke: after which manner it availeth much to take them againſt the oppilations & hardneſſe of the ſplene: but to ſuch as are ſubject to caſting and reaching bloud upward, Phyſicians preſcribe to take them in three cyaths of new wine. Some uſe the yelks of egs that have been old kept, for to reduce the skin that is blacke and blew to the freſh and lively colour againe; but they incorporat the ſame in honey with bulbe roots: the ſame ſodden and drunke in wine, doe repreſſe the immoderat flux of womens months: but applied raw with oile and wine, they diſcuſſe & reſolve the ventoſities within the matrice. Incorporat with oile roſat & gooſe greace, they are good to be applied unto the nape of the necke for the cricke and paine thereof: beeing roſted againſt the fire hard, and ſo preſently applied hot unto the ſeat, they are good for the griefs and accidents of the fundement: but more particularly for the ſwelling piles and bigs riſing in thoſe parts, they would be laid too with oile of roſes. Beeing ſodden in water untill they bee hard, they ſerve verie well for any burne or ſcald; with this charge, That preſently the aſhes of the ſame eg-ſhells calcined upon burning coles, be applied to the place, and then to annoint the ſame with the foreſaid yelks and oile roſat mixed togither. Now it falleth out ſometime, that egs be all yelke within, and have no white at all; namely, when the hen hath couved and ſitten over them three daies togither, and then be taken away from under her; and ſuch kind of egs the Greeks call Schiſta.

Take the egs from under the hen when they be full of chicken, a little before they ſpring and the chicke be hatched, togither with halfe as much of gall-nuts, and give the ſame for to ſtrengthen a feeble and weake ſtomacke; with this caution, That the patient have eat nothing in two hours before. And ſome do adviſe for the dyſenterie or bloudie flix, to give the ſaid chickens ſodden egg and all togither, putting thereto one hemine of auſtere or ſharpe wine, and an equall quantitie of oile and parched barley groats drie. The fine pellicle or skin that is within the egg-ſhell, beeing taken from it (whether the egg be raw or ſodden it skilleth not) healeth the chaps that are in the lips, if it be appplied thereto. The aſhes of an egg-ſhell drunke in wine, ſtoppeth the iſſue of bloud guſhing out at any part: but the ſame ought to be burnt or calcined without the pellicle or skin aforeſaid; and ſo it makes an excellent dentifrice alſo to cleanſe and ſcoure the teeth white: a liniment made with the ſaid aſhes and myrrhe togither, ſtaieth the ſuperfluous flux of womens terms. And here I cannot chuſe but note unto you by the way, the ſtraunge propertie and wonderfull nature that egg-ſhels have: for ſo hard compact and ſtrong they be, that if you hold or ſet an egg endlong, no force nor weight whatſoever is able to breake and cruſh it, ſo long as it ſtanderh ſtreight and plumbe upright, untill ſuch time as the head incline to a ſide

and

*Which name it hath for that it cauſeth flux of bloud at ſundrie parts.

Dalechampius would have the ſame egs to be dried and reduced into pouder, &c.

A and bend one way more than another. Egs entier and all whole as they be, [i. white, yelke, ſhell, and skin] taken in wine with rue, dill, and cumin, helpe women in hard travaile to ſpeedie and eaſie deliverance. Egs incorporat with oile & roſin of the cedar mixed togither, are ſingular good for to heale ſcabs and to kill the itch: put thereto the root of Cyclamin, [i. Sow-bread] it healeth the running skalls of the head: for thoſe that reach up purulent matter out of their cheſt, or ſpit bloud, it is good to ſup of a raw egg togither with the juice of unſet leeks, and an equall quantitie of Greekiſh wine; but firſt all muſt be warmed, before that it bee given to the patient. Againſt a cough, they ordeine egs ſodden and ſtamped togither with honey, and ſo to eat them; or elſe to ſup them off raw, with wine cuit and oile, of each a like quantitie. If a man have any ſore or ulcer in his ſecret parts ſerving for generation, it were verie good to inject one egg tempered
B with three cyaths of wine cuit, and halfe an ounce of Amylum or ſtarch-floure, preſently upon his comming forth of the bains or hothouſe. An excellent liniment there is made of ſodden egs ſtamped togither with creſſes, for the ſting or biting of ſerpents. How many means there bee whereby egs doe good as meat, there is not one but knoweth: for even in their going downe, they paſſe through any tumor and ſwelling of the throat, and with their kind heat foment thoſe parts by the way. There is not any kind of viand in the world beſides it, that nouriſheth a ſicke man without any offence or burden at all to the ſtomacke; and it may go well enough for meat and drinke both. As touching egs ſoked in vinegre, and how their ſhells may bee made ſoft and tender thereby, I have alreadie ſhewed: ſuch egs if they be wrought and knead with meale into a dough or paſt, doe make a kind of bread which is ſoveraigne for all fluxes of the ſtomack. Some
C there be who thinke it better to take theſe egs thus mollified & reſolved in vinegre, and to torrifie the ſame betweene two platters of earth; ſuppoſing that being thus prepared, they ſerved not only to ſtop a laske, but alſo to repreſſe the immoderat flux of womens monthly terms: but in caſe the ſaid fluxions be exceſſive and beyond all meaſure vehement, they are to bee ſupped off raw, with water and meale in manner of a grewell or pottage: or els the yelks may be boiled by themſelves in vinegre, untill they be hard; and then a ſecond time be fried & torrified afterwards with groſſe pepper, and in this ſort they will ſtay any looſeneſſe of the belly. And yet there is another ſingular remedie for the bloudie flix, namely, to put the meat of a raw egg in a little earthen pot that never was occupied, and to add therto as much hony as may amount to the quantitie of the egg; to the end that all be of equall proportion; then, within a while after, to temper therewith
D the like meaſure of vinegre and oile both, and to beat them all togither oftentimes that they may be well concorporat and united in one. In which compoſition, this is to bee obſerved, That the better that every one of theſe ingredients is that enter into this confection, the more excellent operation and ſpeedier remedie will enſue theupon. Others there are, who in ſtead of oile and vinegre, put in red roſin and wine, according to the former rate and proportion: howbeit they temper the ſaid medicine after another ſort; for they put in of oile, onely as much as the egg comes too, adding thereto of the pine-tree barke * two ſixtie parts of a Romane denier, and one ſixtie part of Sumach, which I called Rhus, and five oboli weight of hony; with this charge, That they be all boiled togither; and that the patient eat no other meat whatſoever for the ſpace of foure hours after. Many there be, who to cure and eaſe the wringing gripes and torments of the belly,
E take two egs and foure cloves of garlicke, which they pun and ſtampe togither; then they heat them over the fire in one hemine of wine, and give this maſh unto the patient for to drinke. To conclude, becauſe I would not willingly omit any thing that may commend egs and give grace unto them, know thus much moreover, That the gleere or liquid white of an egg with quicke-lime, maketh an excellent cement to ſowder or unite any broken peeces of a glaſſe togither: beſides, of ſuch ſtrength and efficacie they are, that neither a peece of wood no nor ſo much as any parcell of cloth wet or dipped in the white of an egg will burn, but check the violence of the fire. Howbeit, note that all which I have ſpoken of egs, is to be meant of thoſe that hens only do lay: for as touching other birds eggs, I will write in their due places; for as much as they are not deſtitute
F of many peculiar vertues and ſingular properties of their owne. Over & beſides, I will not overpaſſe one kind of eggs beſides which is in great name and requeſt in Fraunce, and whereof the Greeke authors have not written a word: and this is the ſerpents egg, which the Latins call Anguinum. For in Summer time verely, you ſhall ſee an infinit number of ſnakes gather round togither into an heape, entangled and enwrapped one within another ſo artificially, as I am not able to expreſſe the manner thereof: by the means therfore of the froth or ſalivation which they

* i. about two grains.

yeeld from their mouths, and the humour that commeth from their bodies, there is engendred G
the egg aforesaid. The priests of Fraunce called Druidæ, are of opinion, and so they deliver it, That these serpents when they have thus engendred this egg, doe cast it up on high into the aire, by the force of their hissing; which being observed, there must be one readie to latch and receive it in the fall againe (before it touch the ground) within the lappet of a coat of arms or soldiours cassocke. They affirme also, that the partie who carrieth this egg away, had need to be well mounted upon a good horse and to ride away upon the spur, for that the foresaid serpents will pursue him still, and never give over untill they meet with some great river between him and them, that may cut off and intercept their chase. They add moreover and say, that the onely marke to know this egg whether it be right or no, is this, That it will swim aloft above the water even against the streame, yea though it were bound and enchased with a plate of gold. Over and besides, these H
Druidæ (as all the sort of these magicians bee passing cautelous and cunning to hide and cover their deceitfull fallacies) doe affirme, That there must be a certaine speciall time of the moones age espied, when this businesse is to be gone about, as if (forsooth) it were in the power and disposition of man to cause the moone and the serpents to accord togither in this operation of engendring the egg aforesaid by their froth and salivation. I my selfe verely have seene one of these egs, and to my remembrance, as big it was as an ordinarie round apple: the shell thereof was of a certain gristly and cartilagineous substance, and the same clasped all about (as it were) with many acetables or concavities representing those of the fish called a Pourcuttle, which shee hath about her legs. And it is the ensigne or badge that the Druidæ doe carrie for their arms. And they hold it a soveraigne thing, for to procure readie accesse unto any princes, and to win their grace I
and favour; as also to obtaine the upper hand over an adversarie in any sute and processe of law, if one doe but carrie it about him. But see how this vanitie and foolish persuasion hath possessed the minds of men! for I am able upon mine owne knowledge to avouch, that the Emperor *Claudius Cæsar* commaunded a man of arms and gentleman of Rome, descended from the Vocantians, to be killed for no other reason in the whole world, but because he carried one of these egs in his bosome, at what time as he pleaded his cause before him in the court. This winding and mutuall enfolding of these serpents one within another, putteth me in mind of one thing worth the observation, That it was not for nought that forrein nations have ordained, that their Embassadors who had commission to treat of peace, should carrie with them a certain rod or mace wherin were pourtraied serpents winding and clasping round about it; to signifie and shew, that these K
creatures, as savage, fell, and venomous as they be otherwise, and as it were made altogither of poison, yet otherwhiles they accord and agree well enough togither: where it is furthermore to be noted, that the manner was not to represent in these maces and ensigns of peace, any furious serpents with crests upon their heads.

As touching geese and their egs, how good and profitable they are, before I enter into any discourse (for my purpose is to treat of them also in this verie booke) I cannot chuse but for the honour due unto the Comagenes, in regard of an excellent composition by them made, write first of it, being of them called Comagenum: for that also the principall and best of that kind was most used and in greatest request in Comagene, which is a region belonging unto Syria. It consisteth of goose greace, cinamon, casia or canelle, white pepper, and an hearbe called likewise L
Comagene. Now for the better mixture and fermentation of these ingredients and the whole composition, the vessell which containeth the same ought to be buried in snow: a pleasant smell it hath, and is held to be a soveraigne ointment for any through-cold and quivering fit; for convulsions, for sodaine pains whereof no evident cause is knowne; and in one word, for all lassitudes and what infirmities soever be cured by the medicines called in Greeke * Acopa: in such sort, as that it serveth not onely for an outward ointment, but also for an inward medicine. This Comagenum is made in Syria after another manner, namely of the fat or grease of birds which is clensed, tried, and purified, according as I have before said, with an addition of Erysisceptron, Xylobalsamum, the barke or young shoots of the Date tree, and sweet Calamus, of each as much as amounteth to the weight of the greace aforesaid; and all these togither must be put into wine and M
set over the fire for to siver and take two or three waulms. Now this is to be noted, that the convenient time of making it is in winter, because it will neuer jellie and grow to any thicke consistence in summer, unlesse there be * wax put into it.

* ἄκανα, so called, because they be good against lassitude or wearinesse.

* And that delaieth much the odoriferous smell.

Many other good medicines and ointments there be made of Geese, whereat I marveile as much

A much as at *Goats: for it is said, that all Summer long even unto the fall of the leafe, Geese and Ravens bee continually sicke. Finally, as touching the honour which Geese deserved and woon by discovering the skallade that the Frenchmen made into the Capitoll hill of Rome, I have written heretofore.

*For Goats are said never to be cleare of the ague.

Chap. iiii.

Medicinable receits taken from dogs and other beasts which are not tame, but wild: also from foules. Remedies against the pricke or sting of the venomous spiders Phalangia.

B VPon the foresaid occasion, for that the dogs which had the custodie of the Capitoll, barked not when the Gaules skaled the Capitoll, there is a custome yearely observed at Rome to trusse certaine *dogs to forkes, and thus as it were crucified, to hang them alive upon an Elder tree for exemplarie justice: which execution was performed between the temple of *Iuventus* and *Summanus*. But seeing I am thus light upon the mention of dogs, I must needs discourse of them more at large, and the rather, for that our aunceStours in old time observed many ceremonies about this beast. First and formost, the ancient Romans thought the flesh of sucking whelps to be so pure and fine a meat, that they used to sacrifice and offer them as an expiatorie oblation to their gods for to appease their indignation. And verely at this day they make no scruple to sacrifice a young whelpe before it be full a day old, and especially such an one as the bitch puppied the same morning: yea, and at the solemne feastivall suppers ordained for the honour of the C gods, they forget not at this day to serve up at the table certaine dishes of young whelpes flesh that sucke their dams. Moreover, that young dogs flesh was an ordinarie service at those sumptuous feasts called *Aditiales, it appeareth plainly by the testimonie of *Plautus* in his *Comædies. Certes, it is generally thought, that for the venome called Toxicum, there is not a better countrepoyson than dogs bloud. It seemeth also that this domesticall creature taught men first the manner of discharging and purging the stomacke by vomit. In summe, there are a number of other medicinable vertues in a dog highly commended, whereof I will write as occasion shall be offered in convenient place. But for this present I will proceed orderly according to my first intention and purpose.

*ἀνολδεντες, saith *Cæl. Rhodig. cap. 29, lib. 17.* such as will not barke and give warning of strangers comming

* or *Adjciales.*

* *Festus* quoteth the place in the Comædie, called *Saturio*, which is not now extãt.

D To returne againe unto the stinging of serpents, these remedies following are taken to bee effectuall, to wit, sheepes treddles and goats dung fresh gathered and boiled in wine to the consistence of a liniment, and so applied unto the place: also mice and rats splitted and so laid hot unto the wound. And verely, how basely soever men thinke of this kind of cattaile, and hold them no better than vermine, yet they are not without certaine naturall properties, and those not to be despised: but principally in regard of the sympathie betweene them and the planets in their ascent, as I have noted heretofore: and namely, considering how the lobes and filaments of their livers and bowels doe encrease or decrease in number, according to the daies of the Moons age. And these Magicians do report, That if one doe give unto hogs the liver of a mouse or rat within a fig, they will follow the partie that gave them the morcell. They say moreover, that the same E is able to doe as much in a man: but in case a cyath of oile be drunke upon it, it looseth all the vertue.

As touching Weasels, there be two kinds of them: for there bee a wild sort different from the rest in bignes, for they be smaller: and those the Greeks call *Ictides: Their gall is said to be very effectuall against the sting of the Aspis, whereas otherwise it is a very poyson it selfe. As for that kind which keepeth about our housen, wandering here & there in every corner, &*useth to carie her kitlings in her mouth too and fro every day from place to place and never resteth (as mine author *Cicero* doth write) she is an enemie to serpents, and naturally persecuteth them. Their flesh being salted, is given to the weight of one denier in three cyaths of wine, with great successe, unto those that be stung by serpents: also their maw farced with coriander seed, and kept in salt or F brine, is good for the same purpose, if it be drunke in wine. But the young kitling of the Weasell is best and most effectuall.

*Which be our Ferrets.

*Some take these for our Cats.

Other vile creatures there are besides, which for their baseness I bash to name and relate in this place; howbeit, because so many authors with one consent have so constantly commended their medicinable properties, I make it a matter of conscience to passe them over in silence: conside-

conſidering that all our medicines proceed from that conveniencie and repugnancie which is in G
the nature of all things, whereof we have ſo much ſpoken. As wee may ſee for example in theſe punies or wall lice (the moſt illfavored and filthie vermine of all other, and which we loth and abhorre at the very naming of them) for naturally they are ſaid to bee adverſative to the ſting of all ſerpents, and principally of the Aſpis: nay they are thought to be a counterpoyſon againſt any venomous thing whatſoever: and ſolke ground their reaſon hereupon, becauſe looke what day that Hens doe eat a wall-louce, the ſame day there ſhall no Aſpis have power to kill them. And it is ſaid moreover, That the very fleſh of ſuch hens as have eaten ſuch punies, is ſingular good for thoſe that be ſtung alreadie by the ſaid ſerpents. Other receits there be ſet down by our great maſters in Phyſicke, as touching this ſoule vermine: but thoſe which carie moſt modeſtie with them and have greateſt reſpect unto manhood and humanitie, are theſe; namely, to rub or annoint the H
place which is ſtung, with the ſaid wall-lice and the bloud of a Tortoiſe together: alſo to chaſe away ſerpents, with the ſmoake or perfume of them: likewiſe, if any beaſt which hath ſwallowed down horſe-leeches, doe take them in drinke, they will either kill them or drive them out, yea, and in what part ſoever they are ſettled and ſticke faſt, they will remoove them and make them to fall off. And yet ſome there be who uſe this naſtie and ſtinking creature in eye-ſalves, for they incorporat them in ſalt and womans milke, and therewith annoint their eyes: yea, and drop them into the eares with honey and oile roſat mingled together. Others there be who uſe to burne theſe punaiſes or wall-lice, ſuch eſpecially as be of a wild kind, and breed upon Mallowes, and incorporat their aſhes in oile of roſes, and inſtill them into the eares. Touching other medicinable properties which they attribute unto them, namely, for impoſtumes & botches that are broken and I
run, for the Quartane ague and many more maladies; although they give direction to ſwallow them downe in an egge, or elſe encloſed within wax or a beane, I hold them for lies, and therefore not worthie to be related in ſadneſſe. Marie I will not ſay but there is ſome probabilitie and apparence of reaſon why they ſhould put them in thoſe medicines which are ordained for the lethargie: for ſurely they are knowne to bee very proper againſt that drowſineſſe, which is occaſioned by the venome of the Aſpis: to which effect ſeven of them bee ordinarily given in a cyath of water, or but foure, if the patient be a child. In caſe of ſtrangurie alſo, when a man piſſeth dropmeale, they uſe to put wall-lice into a ſyringe, and ſo conveigh them into the paſſage of the yard. See the goodneſſe and induſtrie of dame Nature, the mother of all, how ſhe hath produced no
thing in the world but to good purpoſe and with great reaſon. And yet here is not all that they K
report of theſe lice called punaiſes: For they ſay, that whoſoever carie two of them in a bracelet about his left arme, within a lock of wooll (but the ſame forſooth muſt be ſtollen from ſome ſhepheard) he ſhall bee ſecured againſt thoſe agues that come ordinarily in the night ſeaſon: but ſay their fits uſe to returne by day time, then the ſaid punices ought to bee lapped in a reddiſh clout of a carnation colour. Contrariwiſe, the worme called Scolopendra is an enemie unto theſe wall lice, and killeth them.

As for the Aſpides, looke whomſoever they have ſtung, they die upon it with a kind of deadly ſleepineſſe and benummednes in all their lims: and to ſay a truth, of all ſerpents that creep upon the ground, they are moſt mortall, and their wounds leaſt curable. Their venome, if it enter
once ſo farre, that it come to bloud, or doe but touch a greene wound, there is no remedie but L
preſent death: marie if it light upon an old ſore, the daunger is not ſo ſpeedie, nor the force ſo quicke. Otherwiſe let the ſame bee taken in drinke to what quantitie ſoever, it is harmeleſſe and doth no hurt at all: for ſetting aſide that ſenceleſſe drowſineſſe which it inflicteth, putrifaction and infection it cauſeth none: which is the reaſon, that the fleſh of thoſe beaſts which die of their ſting, is meat good ynough. I would pauſe and make ſome ſtay in reporting a remedie that theſe Aſpides doe yeeld, but that I have my warrant from *M. Varro*, whom I know to have delivered the ſame, even when he was *foureſcore yeares old and eight: namely, That there is not in the world ſo good a thing to cure the biting of the Aſpides, as to give the partie who is wounded thereby, ſome of their urine to drinke.

* At which years he would have beene aſhamed to tell a lie.

To come now unto the Baſiliske, whom all other ſerpents doe flie from and are afraid of: al- M
beit he killeth them with his very breath and ſinell that paſſeth from him; yea, and (by report) if he do but ſet his eye on a man, it is enough to take away his life: yet the Magicians ſet great ſtore by his bloud, and tell wonders thereof: and namely, that being of it ſelfe as blacke and as thicke congealed as pitch, yet when it is waſhed and diſſolved, it looketh more cleare and pure than-

*Cinna-

A *Cinnabaris. Vnto it they attribute ſtrange and admirable effects: For whoſoever (ſay they) carie it about them, ſhall be gracious with princes and great potentats, yea, and at their hands obtaine a graunt of all their petitions: they ſhall find favour with the gods above, and ſpeed in all their praiers: remedie they ſhall have of all diſeaſes: and no ſorcerie or witchcraft ſhall take hold of them. And ſome of them there be who call it the bloud of *Saturne*.

*A kind of gum, called *Sanguis Draconis*.

As for Dragons, they have no venome in them. And if it be true that our Magicians ſay, if a Dragons head bee laid under the threſhold of a dore, after due worſhip and adoration of the gods, with praiers and ſupplications unto them for their favourable grace, that houſe ſhall ſurely be fortunat. The eyes of a Dragon preſerved drie, pulverized and incorporat with honey into a liniment, cauſe (by their ſaying) thoſe who bee annointed all over therewith, to ſleepe ſecurely,
B without any dread of night-ſpirits, though otherwiſe they were fearefull and timorous by nature. Moreover, if we may beleeve them, the fat growing about the heart of a Dragon, lapped within a peece of a Buckes or Does skin, and ſo tied faſt to the arme with the nerves or ſinewes of a red Deere, is very availeable, and aſſureth a man good ſucceſſe in all ſuits of law. The firſt ſpondyle or turning joint in the chine of a Dragon, doth promiſe an eaſie and favourable acceſſe unto the preſence of princes and great ſtates. The teeth of a Dragon lapped within the skin of a Roe buck or wild Goat, and ſo bound faſt with the ſinewes of a Stag or Hind, doe mitigat the rigor of great lords and potentats, cauſing them to encline unto their petitions & requeſts, who preſent themſelves before them. But above all other receits, one compoſition there is which bewraieth the impudent and lying humor of theſe Magicians, who promiſe undoubted and infallible victorie,
C unto thoſe that have it about them, and this it is: Take (ſay they) the taile and head both of a Dragon, the haire growing upon the forehead of a Lion, with a little alſo of his marrow, the froth moreover that an Horſe foameth at the mouth, who hath woon the victorie and priſe in running a race, and the nailes beſides of a dogs feet: bind all theſe together with a peece of leather made of a red Deere skin, with the ſinewes partly of a Stag and partly of a fallow Deere, one with another in alternative courſe: carrie this about you, and it will worke wonders. Impoſtures all, and loud lies. And verely, it is as gracious a deed to diſcover and lay abroad theſe impudencies of theirs, as to ſhew the remedies for the ſting of ſerpents, conſidering how theſe deviſes be no better than meere miſcheefes and ſorceries, which hurt and bewitch poor patients, and ſuch as truſt in them. True it is, that all venomous beaſts flie from thoſe that bee annointed with Dragons
D greaſe. Likewiſe they cannot abide the ſtrong and virulent ſavour of the rat of India called Ichneumon: inſomuch as they ſtand in dread of them who are annointed with a liniment made of the aſhes of their skin incorporat in vinegre. Moreover, lay the head of a Viper unto the place where ſhe hath wounded one, it is a ſoveraign remedie; yea, though it were the head of any other Viper than it which inflicted the wound, it is infinitly good. Likewiſe, if a man doe hold up the ſame Viper that inflicted the ſting, at a ſtaves end over the ſmoake of wood burning, or the vapor of ſeething water (and yet, ſay they, warie ynough they bee thereof, and will avoid it) or annoint the place with a liniment made of her aſhes burnt, it is ſufficient to heale the ſore. *Nigidius* mine Author affirmeth, That ſerpents after they have ſtung one, are forced by a certaine neceſſitie and inſtinct of Nature to returne unto the partie whom they have hurt. The Scythians verely uſe to
E ſlit a Vipers head betweene the eares for to take forth a little ſtone, which ſhe is wont to ſwallow when ſhe is affrighted. Others make uſe of the whole head as it is. Certaine trochiſks there bee, made of a Viper, called by the Greekes Theriaci: for which purpoſe they cut away at both ends as well toward the head as the taile the breadth of foure fingers, they rip her bellie alſo, and take out the garbage within: but eſpecially they rid away the blew ſtring or veine that ſticketh cloſe to the ridge bone. Which done, the reſt of the bodie they ſeeth in a pan, with water and dill ſeed, untill ſuch time as all the fleſh is gone from the chine: which being taken away, and all the prickie bones thereto belonging, the fleſh remaining they incorporat with fine flower, & reduce into troſches, which being dried in the ſhade, are reſerved for diverſe uſes, and enter into manie ſoveraigne antidots and confections. But here is to bee noted, that although theſe troſches bee
F called * Theriaci, yet are they made of Vipers fleſh onely. Some there be, who after a Viper is cleanſed as is aboveſaid, take out the fat, and ſeeth it with a ſextar of oile untill the one halfe bee conſumed: which ſerveth to drive away all venomous beaſts, if three drops of this ointment be put into oile, and therewith the bodie be annointed all over. Moreover, this is held for certaine, that there is no ſting or bitt of ſerpents ſo mortall and incurable otherwiſe, but the entrailes of

* θηριακὰ. For *Theriaci* in the primitive and naturall ſignification is more generall: of θὴρ or θηρίον, which is any wild or venomous beaſt.

the

the ſame which gave the wound, applied thereto, will heale it: as alſo, that as many as have at any time ſupped the broth wherein a Vipers liver was boiled, ſhall never afterwards bee ſmitten or ſtung by ſerpents. G

As for Snakes, venomous they are not but at ſome times of the month, when they feel themſelves moved by the inſtigation of the Moone: but contrariwiſe they bee good for thoſe which chaunce to be ſtung by them, if they be taken alive, ſtamped, or braied with water, and therewith the affected place fomented. Certes, they are thought to be medicinable in many reſpects, as I will hereafter declare: which is the cauſe that a Snake is dedicated unto the god of Phyſicke, *Æſculapius*. And *Democritus* verely talketh of many ſtraunge and wonderfull compoſitions made of ſnakes, by meanes whereof a man may underſtand the language of birds, and know what they prattle one to another. But to ſay no more, was not *Æſculapius* brought from Epidaurus to Rome in the forme of a Snake? And keepe we not ſtill many of that race commonly in our houſes tame and gentle, feeding them by the hand? Surely if their egges and young frie were not eftſoones deſtroied with firing them in their holes, the world would bee peſtered with them, they multiplie ſo faſt. The goodlieſt and faireſt ſnakes to ſee too, are thoſe which live in the water, and are called Hydra, *i.* water-ſnakes: but a more fell and venomous ſerpent, there lives not upon the face of the earth. Howbeit, the liver of theſe water-ſnakes, if it be kept in ſalt or otherwiſe preſerved, is a ſoveraigne remedie for thoſe that be ſtung by the ſame kind. H

Now for the ſpotted Lizards, called Stellions, a ſcorpion ſtamped is ſingular good againſt their poyſon. For this you muſt thinke, that of them there is made a venomous drinke: for let him be ſtrangled or drowned in wine, whoſoever drinke thereof ſhall find themſelves empoyſoned, inſomuch as their faces will breake forth into certaine ſpots & pimples and foule morphew. And this is the reaſon that our jealous dames when they would avert the affection & love of their husbands from thoſe concubines, upon whom they ſuſpect them to be enamoured, will if they can poſſible, ſtiffle a ſtellion in the complexion or ointment wherewith ſuch harlots uſe to paint their viſage; by meanes whereof they become disfigured, and grow both foule and ill-favoured. But what is the remedie to cleanſe the skin from ſuch deformities? The yolke of an egg incorporat with honey and ſalnitre, doth the feat. The gall of theſe Lizards or Stellions punned and diſſolved in water, is ſaid to have an attractive facultie to draw all the Weaſels about the place to reſort thither in companies. I

Of all venomous beaſts, there are not any ſo hurtfull and daungerous as is the Salamanders. As for other ſerpents, they can hurt but one at once, neither kill they many together: to ſay nothing, how when they have ſtung or bitten a man, they die for very greefe and ſorrow that they have done ſuch a miſcheefe, as if they had ſome pricke and remorſe of conſcience afterwards; and never enter they againe into earth, as unworthie to be received there: but the Salamander is able to deſtroy whole nations at one time, if they take not heed and provide to prevent them: For if he get once to a tree, and either claſpe about it or creepe upon it, all the fruit that it bears is infected with his venome; and ſure they are to die, whoſoever eat of that fruit, and that by the meanes of an extreame cold qualitie that his poyſon hath, which dooth mortifie no leſſe than if they had taken the Libard-baine called Aconitum. Moreover, ſay that ſhee doe but touch any peece of wood, billet, or hedge ſtake, wherewith either a loafe is baked, or a ſhive of bread toſted, as many as eat thereof, ſhall catch their bane by it: or if one of them chaunce to fall into a well or pit of water, looke whoſoever drinke thereof, ſhall bee ſure to die upon it: and that which is more, if there happen never ſo little of the ſpittle or moiſture which ſhee yeeldeth, to light upon any part of the bodie, though it touched no more but the ſole of the foot, it is ynough to cauſe all the haire of the bodie to fall off. And yet as great and daungerous as the poyſon of theſe beaſts is, there bee ſome creatures, and namely Swine, that eat them ſafely; ſo effectuall is their contrarietie and repugnancie in Nature, that it conquereth and ſubdueth the ſaid poyſon: And to mortifie this venome, it ſoundeth to good reaſon, that thoſe beaſts ſhould have power, which feed upon them and find no harme thereby. But writers there bee who ſay, that the flies called Cantharides, taken in drinke, or the Lizard in meat, are good for that purpoſe: beſides other things which are adverſe and contrarie thereto, wherof I have alreadie ſpoken & will ſpeake more in time and place convenient. As for that which the Magicians do report of the Salamander, againſt skarefires (for that there is no other beaſt but it that ſcorneth the violence of the fire and quencheth it) ſurely it had beene put in practiſe long ſince at Rome, in caſe their words K L M

had

A had proved true. *Sextius* affirmeth, That the bodie of a Salamander cleanſed from the guts and garbage within, and parted from the head and feet, if it bee condite in honey, inciteth greatly to fleſhly luſt thoſe that eat thereof: but he denieth flatly that it dooth extinguiſh and put out the fire.

Now concerning thoſe birds which yeeld any helpe againſt ſerpents, the Vulture or Geir deſerveth to be ſet in the firſt ranke: but this hath been obſerved and found by experience, that the blacke of this kind are not ſo powerfull as others in this behalfe. It is commonly ſaid, that a perfume made with burning their feathers, chaſeth ſerpents away. Likewiſe, it is an opinion generally received, that whoſoever carie about them the heart of this foule, are ſecured from the violent aſſault, not of ſerpents onely, but alſo of other wild beaſts, yea, and of theeves and robbers by the
B high way ſide. The ſame alſo aſſureth them to eſcape the daunger of princes wrath and indignation, howſoever they be ſet and incenſed againſt them. The fleſh of Cocks and Capons diſmembred, if it bee applied warme (as it was plucked from the bones) to the place which is bitten or ſtung by any ſerpent, draweth out the venome, and mortifieth the ſtrength thereof, ſo doth their braines, if it bee drunke in wine. But the Parthians thinke it better to lay unto the ſaid ſores the braines of an Hen. Alſo a broth made of ſuch Pullein, hath a ſingular vertue in this caſe, if it be ſupped off: like as in many others it worketh wonderfull effects, as it is uſed. For firſt and formoſt neither Lions nor Panthers will ſet upon thoſe perſons who are bathed with their decoction, eſpecially if there were any Garlicke ſodden therein. Secondly, it is paſſing good to keepe the body looſe: but ſtranger is the operation, if it were of an old Cocke. *Item*, It ſerveth very well to cure
C long feavers, the trembling alſo and nummedneſſe of the lims, it aſſuageth the paine of all kinds of gout, eaſeth the headach, ſtaieth the violence of rheumes eſpecially falling into the eyes, reſolveth ventoſities, quickeneth the dull appetite to meat, preventeth the daunger of the inordinat deſire to the ſtoole without doing any thing, if it bee taken betimes and in the beginning of that diſeaſe; ſtrengtheneth a feeble liver, comforteth the reines and the bladder, concocteth crudities in the ſtomacke, and finally, helpeth thoſe who are ſhort winded. In regard of theſe manifold commodities, the manner of making this broth as it ought to be, is ſet down in writing, and direction given therefore. For more effectuall it is found to be, in caſe there be ſodden with the Cocke or Capon the ſea wort Soldanella, or the hearbe Cybium, Capres, or Perſely, Mercurie the hearbe, Polypodium, or Dill. Now the beſt way of making this broth, is to ſet the ſaid Cocke
D or Capon a ſeething with the abovenamed hearbes in three gallons of water; and to ſuffer the ſame to boile untill there remain but three pints of liquor: when it is thus ſodden to this height, it ought to coole without dores in the open air: and then is it ſingular good to be given in thoſe caſes above rehearſed, provided alwaies, that the patient have taken a vomit before, for that is the onely ſeaſon. And for as much as I am thus far entred into a diſcourſe of Pullain, I cannot forget one miraculous experiment, although it be nothing pertinent to Phyſick, & this it is, That if one put the fleſh of an Hen into gold as it is in melting, it will draw all the mettall into it, and * conſume it ſo, as thereupon the ſaid fleſh is held to bee the poyſon (as it were) of gold. Moreover, if you would not have a Cocke to crow and chaunt, put a wreath or collar of Vine twigs about his
E necke. But to returne againe to our receits and medicines againſt ſerpents: the fleſh of yong Pigeons newly hatched, as alſo of Swallows, is very good: ſo are the feet of a ſcriche Owle burnt together with the hearbe *Plumbago. But before I write farther of this bird, I cannot overpaſſe the vanitie of Magicians which herein appeareth moſt evidently: For over and beſides many other monſtrous lies which they have deviſed, they give it out, That if one doe lay the heart of a ſcrich-Owle upon the left pap of a woman as ſhe lieth aſleepe, ſhe will diſcloſe and utter all the ſecrets of her heart: alſo whoſoever carie about them the ſame heart when they goe to fight, ſhall be more hardie, and performe their devoire the better againſt their enemies. They tell us moreover, I wot not what tales of their egges, and namely, that they cure the accidents and defects befalling to the haire of the head. But I would faine know of them what man ever found a ſcrich Owles neſt and met with any of their egges, conſidering that it is holden for an uncouth and ſtraunge prodigie to have ſeene the bird it ſelfe? And what might he be that tried ſuch concluſions and experiments, eſpecially in the haire of his head? Furthermore, they affirme aſſuredly, That the bloud of their young birds will curle and frizzle the ſame haire? Much like to theſe toies are their reports alſo of the Bat: for (ſay they) if a man goe round about an houſe three times, carrying a live Bat with him, and then naile it upon the window with the head downeward, it is a ſoveraigne

coun-

*Hereupō peradventure it is, that in collices & Cock broths we uſe to ſeeth peeces of gold, with an opiniō to make them thereby more reſtorative.

* Which ſome take for the leſſe wild Tazell.

countercharme againſt all ſorceries and witchcrafts: and more particularly, if a Bat bee borne G
thrice round about a ſheepe-coat, and then hanged upon the lintell of the dore, with the heeles upward, it will ſerve for a ſingular preſervative to defend the ſheepe from all ſuch harmes. As for the bloud of a Bat, they commend it highly for healing the ſting of ſerpents: if together with the leaves or ſeeds of a thiſtle it be applied to the place.

* Yet *Matthiolus* upon *Dioſcorides* reckoneth *Tarantula* to be a kind of Phalangium, whereof there is great ſtore in Apulia.

Touching the venomous ſpider called * Phalangia, they know not in Italie what it is, for all there be many kinds thereof: For ſome are like unto Piſmires, but that they bee far bigger; their heads be reddiſh, the reſt of their bodie blacke, howbeit here & there marked with white ſpots. The ſting of this ſpider is more keene and ſharpe than that of the weſpe. It liveth ordinarily about ovens and mils. The beſt remedie againſt the pricke of their ſting, is to preſent before the eyes of the patient, another ſpider of the ſame kind: for which purpoſe folke uſe to keepe them H
in ſtore, when they find any of them dead. Their caſes or skins brought into pouder and taken in drinke, have the like effect to young weazils or kitlings, as I have declared before. A ſecond ſort there is of theſe venomous ſpiders Phalangia, which the Greekes diſtinguiſh from others by the name of Lupus. Thoſe that be of a third kind, and yet named Phalangia, are the ſpiders which be covered all over with a certain down, and of all the reſt have the biggeſt heads. Cut one of them and rip the bellie, you ſhall find within two little wormes or grubs, which (if it bee true that *Cæcilius* hath left in writing) hinder women for conception, in caſe they be knit within a peece of leather of a red deere skin, and tied to their armes or other parts of their bodie before the ſunne-riſing: but this vertue continueth not above one yeare. Thus have I ſhewed one receit only, of all
*called *Atocia* thoſe that *keep women from conceiving; which I may be allowed to do in regard of ſome wives, I
who being too fruitfull and overcharged with child bearing, have ſome reaſon to play them a while and reſt from teeming: and therefore may bee pardoned, if they uſe ſome ſuch meanes therefore.

There is another kind of ſpiders, which the Greekes call Rhagion, for that it reſembleth a black grape kernill: theſe have a very little mouth under their bellie, and as ſhort legges, as if they were unperfect and not fully made. Looke where they bite, the paine that enſueth is much like to that which is occaſioned by the ſting of a ſcorpion: and their urine who are hurt by them, ſeemeth to ſhew unto the eye, cobwebs floting aloft. I would ſay, that this ſpider were the ſame that Aſterion, another kind of them, but that theſe have certaine raies or ſtreakes of white. Their ſting or pricke cauſeth looſeneſſe and feebleneſſe in the knees. As for the blew ſpider, which carrieth a K
blacke downe or cotton, it is worſe than both the former, cauſing trouble and dimneſſe of the eyes by their pricking, yea, and vomiting of matter reſembling cobwebs. And yet there is another Phalangium worſe than it, which commeth neare in ſhape unto the Hornet, but that it hath no wings at all, and looke whomſoever it biteth, they are ſure to become leane and pine away. The venomous ſpider, called by the Greekes Myrmecion, is headed like unto an Emmet: the bellie is blacke, howbeit marked with certaine white ſpots: their ſting is as painefull as that of
*i. Having four clawes. Weſpes. But as touching that kind of Phalangium which is called *Tetragnathium, there bee two ſorts thereof: The one, which is the worſt of the twaine, hath the head devided directly in the middeſt with a white line; whereas in the other, the ſaid line or ſeame runneth croſſe overthwart. Theſe make their mouths to ſwell whom they have bitten. But thoſe that be of a dead aſh L
colour, and yet whitiſh behind, are not ſo quicke with their pricke as the reſt: Of which colour there is another ſort that be altogether harmeleſſe, and theſe be our common ſpiders or ſpinners which againſt wals uſe to ſtretch out their large webs as nets to catch poore flies. Now concerning the remedies appropriat to any prick or biting of the foreſaid Phalangia, there is not a better thing than to drinke in oxycrat, *i.* wine and vinegre mingled together, the braines of a Cock or Hen with a little pepper. Alſo to take in drinke five Piſmires, is thought to bee a ſingular medicine: and withall to make a liniment of ſheeps mucke aſhes, tempered in vinegre, and therwith to annoint the grieved place. Moreover, the ſaid ſpiders themſelves (of any kind whatſoever) reſolved and putrified in oile, ſerve for the ſaid purpoſe.

As for the miſcheevous mouſe called the Hardiſhrew, the rennet found in a lambes maw taM
ken in wine, healeth the hurt that commeth by her biting: alſo the application of a ſalve made with the aſhes of a Rams cley incorporat with honey, worketh the ſame effect: ſo doth a young weazill or kitling, prepared and uſed in manner aforeſaid in the Treatiſe of ſerpents. If one of theſe ſhrewes have bitten a horſe or other beaſt, it is good to lay unto the place a mouſe or rat

new

A new killed, with ſome ſalt; or elſe the gall of a bat with vinegre. The ſhrew it ſelfe being burſt and ſo laid freſh and warme to the ſore, cureth the ſame: for this is obſerved, That if one of them be with young when ſhee doth bite, preſently ſhee cleaveth in ſunder. And in truth, the beſt and ſureſt means to cure the hurt, is to apply unto the wound the verie ſhrew it ſelfe that did the deed, if poſſibly ſhe may be had: and yet the reſt are very good: for which purpoſe, they uſe to be kept either in oile, or elſe to be dawbed over with clay, to ſerve in time of need: alſo the earth taken from a cart-rut where the wheele hath gone, is thought to bee a proper remedie for the ſaid biting of a ſhrew, if it bee applied thereto: for it is ſaid, that this creature is by nature ſo benummed or dull of mooving, that it will never goe over a cart-tract.

As touching Scorpions, the lizard named Stellio (by way of a reciprocall countrechange) is
B the greateſt enemie they have: inſomuch, as at the verie ſight onely of the ſaid lizard, they will be affrighted and aſtonied and fall into cold ſweats: and therefore people uſe to putrifie and reſolve Stellions in oile, and therewith annoint the wounds that ſcorpions have made. Some there be who make a kind of plaſtre of the ſaid oile and litharge of ſilver boiled both togither, wherewith they rub and annoint the grieved place. This lizard which we name Stellio, the Greekes call Colotes, Aſcalabotes, and Galeotes: * it breedeth not within Italie: but call it what you will, and whereſoever it is to be found, full it is of little red ſpots like lentils; a ſhrill noiſe it maketh that pearceth the ears and goeth through ones head; it doth eat and graze like other beaſts; which be marks all contrarie to our Stellions or Star-lizards here in Italie. But to come againe unto the prick of ſcorpions: it is thought good to rub the ſame with the aſhes of hens dung, mixed with
C the liver of a dragon: or to take a lizard that is burſten, and the ſame to apply unto the affected place; or a mouſe likewiſe which is cloven in ſunder: alſo to lay unto the ſore the very ſame ſcorpion that did the harme; or to eat him roſted: and laſt of all, to drinke it in two cyaths of pure wine of the grape. Moreover, this proper qualitie have ſcorpions alone by themſelves, That they never pricke the ball of ones hand; nor ſting at all, unleſſe they may touch ſome haire. Furthermore, take any little ſtone whatſoever, and apply that ſide which lay next the ground unto the wound, it will eaſe the paine: likewiſe any ſhell or potſheard that lieth with ſome part of it covered with earth, if it be taken up and laid unto the ſore, with earth and all upon it as it was found lying, is ſaid to heale the ſame perfectly: but in no wiſe they that have the applying of it, muſt looke behind them: they ought alſo to take heed and be verie carefull, that the Sun ſhine not
D upon them when they are about this buſineſſe. Earth-worms or mads ſtamped and laid too, are verie good to cure the biting of ſcorpions: and yet they ſerve beſides for many other remedies; in which regard, they be ordinarily preſerved in honey.

For the ſting of Bees, Weſps, and Hornets; for the biting alſo of theſe Horſeleeches called Bloudſuckers, the Howlat is counted a ſoveraigne thing, by a certaine antipathie in nature: alſo whoſoever carrie about them the bill of a Woodpecker or Hickway, ſhall never be annoied with
F any of the foreſaid vermine. The ſmalleſt kind of Locuſts likewiſe, which are without wings and be called Attelabi, be adverſe and contrarie unto them all.

Over and beſides the Inſects above-named, there be in ſome places certaine Piſmires alſo venomous, which *Cicero* calleth Solpugæ; but they of Grenade in Spaine, Salpugæ: howbeit, few
E or none of them are to be found throughoughout all Italy. But what helpe is there for them and their poiſon? Surely the heart of a Reremouſe, otherwiſe called a Bat, hath an operation which is adverſe not onely to them, but to all Ants beſides.

As for the flies named Cantharides, I have ſhewed before, how contrarie they be to the venome of the Salamander: and yet conſidering how hurtfull they be themſelves and a verie poiſon to the bladder, cauſing intollerable paine if they be drunke downe, much diſpute and queſtion there is among Phyſicians, * how they ſhould be taken and uſed? For how venomous they be, it may appeare by the practiſe of a certaine Ægyptian Phyſician, whome by occaſion that one *Coſſinus* a knight of Rome, a great favourit of the Emperour *Nero*, was infected with the foule tettar called Lichen, the ſaid prince ſent for out of Ægypt, to cure that diſeaſe: But hee
F prepared ſuch a drinke of Cantharides for his patient *Coſſinus*, that it quickely coſt him his life and brought him to his grave. Howbeit, there is no doubt, but being applied outwardly, they are not onely harmleſſe but alſo verie good, eſpeciallly if they be incorporat in the juice of the black wild vine called Vva Taminia, and ſheeps ſewet or goats tallow. Moreover, albeit well knowne it is, that theſe Cantharides be venomous, yet thoſe authours that write of them be not agreed

* And yet *Matthiolus* upon *Dioſc.* ſaith it is the *Terrancola*, which is common in Tuſcan.

* Namely, whether they are to be uſed inwardly at all? whether with their wings, head, & feet, or without them?

and reſolved, in what part that venome lyeth: for ſome there be who are of opinion, that their feet are poiſon; others thinke, that their miſchiefe is all in their head: and there be againe, who denie both: but whereſoever the ſaid poiſon lieth, all conclude joyntly upon this point, that their wings be medicinable therefore, and doe cure the ſame. As for the generation of theſe daungerous flies, they be engendred of certaine little grubs or wormes, and moſt commonly upon the ſpungeous balls which wee ſee to grow upon the ſtalke or ſtem of the Eglantine: but ſurely the greateſt plentie of them breed in an aſh tree. As for others which come of a white roſe buſh, they are not ſo vehement in operation as the reſt: and of them all, thoſe worke moſt violently which are ſpotted and of divers colours, ſtreaked with yellow lines overthwart their wings, and beſides are verie plumpe and fat. The ſmaller ſort, which alſo are broad and hairie, are nothing ſo powerfull and ſpeedie in their operation: But the woorſt of all, and leaſt effectuall in Phyſicke, bee thoſe which are of one entire colour, and leane withall. Now for the manner of preparing and ordering of them for phyſicall uſes: they would bee gotten when roſes be fully out: heaped up togither into one maſſe, and ſo beſtowed in an earthen pot not pitched, verniſhed or nealed, the mouth whereof is cloſe ſtopped with a linnen cloth: then are they to be hanged up with the mouth of the ſaid pot downeward over ſome vinegre boiling with ſalt, untill ſuch time as by the fume or vapour thereof ſteeming through the ſaid linnen clout, they be choked and killed: and afterwards they be laid up and reſerved for uſe. Of a cauſticke and burning nature they are, in ſo much as they will raiſe bliſters, yea and leave an eſcharre upon the exulcerat place.

Of the like force bee the wormes Pityocampæ, breeding in pitch trees: ſo is the venomous flie or beetle called Bupreſtis: and after the ſame manner be they prepared as the Cantharides: all the ſort of them in generall be moſt effectuall to kill the leproſie, and ill-favoured tettars called Lichenes. Beſides, they have the name to provoke womens monethly terms, and urine: which is the cauſe, that *Hippocrates* preſcribed them to bee uſed in a dropſie. To conclude with theſe Cantharides, I thinke it not amiſſe to note, that *Cato*, ſurnamed **Vticenſis*, was accuſed and endited for ſelling of poiſon; becauſe in the generall portſale of the kings goods, among other mooveables, hee held Cantharides at threeſcore Seſterces the pound, and made ſo much money of them.

* For that hee killed himſelfe at Vtica.

Chap. v.

Of the Oſtrich greace, and of a mad dog: of Lizards, Geeſe, Doves, and Weaſils, with the medicines that they doe yeeld.

I Cannot chuſe but relate alſo by the way, upon this occaſion miniſtred, that at the ſame time Oſtrich greaſe was ſold for *foureſcore ſeſterces the pound: and in truth it is much better for any uſe that it ſhall be put unto than gooſe greaſe.

* Some read, thirtie.

As touching divers ſorts of venomous honey, I have written alreadie: but for to repreſſe the poiſon thereof, it is good to uſe other honey wherein a number of bees have been forced to die: and ſuch hony ſo prepared and taken in wine, is a ſoveraign remedie for all thoſe accidents which may come by eating or ſurfetting upon fiſh.

For the biting of a mad dog, Take the aſhes of a dogs head burnt, and apply it to the ſore, it will ſave the patient from that ſymptome of beeing afraid of water; which is incident unto ſuch as be ſo bitten. [And now by occaſion of ſpeech, know thus much once for all, That all things which are to be calcined, require one and the ſame name of burning; to wit, within a new earthen pot never occupied before, well luted all over with ſtrong cley, and ſo ſet into an oven or furnace untill ſuch time as the contents be calcined.] The ſaid aſhes made of a dogs head, is ſingular good likewiſe to be drunke in the ſame caſe: and therefore ſome there bee who have given counſell, to eat alſo a dogs head. Others ſeeke after the wormes that breed in the carkaſſe of a dead dog, and hang the ſame faſt about the necke or arme of the partie that is bitten: or elſe they lap within a cloth ſome of the menſtruall bloud of a woman, and put it under the cup or pots bottome, out of which the patient drinketh. And there bee ſome againe, who burne the haires of the ſame mad doggs taile, and conveigh their aſhes handſomely in ſome tent of lint into the wound. Moreover, it is commonly ſaid, that as many as have a dogs head about them, no other dogs will come neare to doe them any harme. In like manner, if a man carrie a dogs tongue in his ſhoe under his great toe, there will no doggs bay or barke at him: or if hee have

about

A about him a weazils taile, which hath been let goe againe after it was cut away. There is to bee found under the tongue of a mad dog, a certaine ſlimie and groſſe ſpittle, which beeing given in drinke to thoſe that are bitten, keepeth them from the feare of water; which ſymptome the Greekes call Hydrophobia: but the beſt and moſt ſoveraigne remedie of all other, is the liver of the ſame dog that in his madneſſe bit any bodie, eaten raw, if poſſibly it may be; if nor, yet ſodden or boiled any way; or elſe to cauſe the patient for to ſup the broth that is made of the ſame doggs fleſh. There is a certaine little worme in doggs tongues, called by a Greeke name Lytta, which if it be taken out when they be young whelps, they will never after proove mad, nor looſe their appetit to meat. The ſame worme given to ſuch as are bitten with a mad dogg, preſerveth them from beeing mad; but with this charge, that before they take the ſame, it muſt bee carried
B three times about the fire. Alſo the braines of a cocke, capon, or hen, is ſingular good againſt the biting of a mad dogg: but if one have eaten the ſame, the vertue thereof endureth but for that yeere onely, and no longer. It is commonly ſaid, that the creſt or combe of a cocke well bruſed and ſtamped, and ſo laid in manner of a cataplaſme to the place bitten, is verie effectuall to cure it: as alſo the greaſe of a gooſe incorporat with honey. Furthermore, ſome there be who uſe to ſalt the fleſh of dogs which have been mad, and ſo keepe it to give in meat unto thoſe who chaunce to be bitten by others. There be, who take ſome young whelps, male or female according to the ſex of dogg or bitch that hath bitten any one, and preſently drowne them in water, cauſing the patient to eat their livers raw. The yellow or reddiſh dung of a cocke or hen, diſſolved in vinegre and applied to the ſore, is ſingular good. The aſhes alſo of an hardyſhrews taile;
C provided alwaies, that the ſhrew were let goe alive, ſo ſoone as ſhee was curt-tailed. Moreover, a peece of clay taken from a ſwallows neſt, made into a liniment with vinegre: or the aſhes of young ſwallows newly hatched and burnt: the old skin alſo or ſlough which a ſnake uſeth to caſt off in the ſpring time, ſtamped with a male crab-fiſh, and with wine brought into a cataplaſme, be all eſpeciall remedies for the biting of a mad dog. As for this skin or ſpoile of a ſnake, if it be put alone in a chiſt, preſſe, or wardrobe, among cloaths, it will kill the moth. But to come again unto a mad dog: his poiſon is ſo ſtrong, that whoſoever doe but tread upon his urine, eſpecially if they have any ſore or ulcer about them, they ſhall ſenſibly feele hurt thereby. Now what remedie is there for ſuch? None better than the dung of a caple, well wet and tempered with vine-
D gre, and the ſame laid very hote within a fig to the foreſaid ſore. Theſe may ſeeme to ſome men ſtraunge things and monſtrous; but leſſe will they woonder hereat, when they ſhall heare and conſider, that a ſtone which a *dog hath taken up with his mouth and bitten, will cauſe debate and diſſention in the companie where it is: and yet this is held for a certaine truth, inſomuch as it is growne into a common proverbe and by-word, when wee perceive thoſe that dwell in one houſe togither to be evermore jarring and at variance one with another, to ſay, You have a dog-bitten ſtone here among you. Againe, whoſoever maketh water in the ſame place where a dog hath newly piſſed, ſo as both urines be mingled togither, ſhall immediatly find a coldneſſe and aſtoniſhment in his loins, as folke ſay.

That kind of lizard, which of ſome Greekes is called Seps, of others Chalidice, hath a venomous tooth: howbeit, the ſame worme or ſerpent taken in drinke, cureth the bit which it
E ſelfe inflicted.

If wild weazils have empoiſoned any bodie, let the patient take a large draught of the broth of an old cocke, hee ſhall find it to bee a verie ſoveraigne remedie therefore: but above all, it is moſt effectuall againſt the poiſon of the hearbe Aconitum; but then it muſt be given with a little ſalt among.

Againſt the poiſon of venomous Tadſtoles and hurtfull muſhroms, hens dung (I meane that part alone which is white) ſodden with *hyſſope or honeyed wine, is ſingular good, for it repreſſeth and killeth the malice thereof. And the ſame otherwiſe keepeth downe ventoſities and ſtuffing of the ſtomacke, readie to choke one. Whereat I cannot chuſe but marveile much, conſidering that if any other living creatures doe taſt never ſo little of the ſaid dung (but man
F or woman onely) they ſhall bee exceedingly vexed with wind in the belly, and other grievous wrings and torments.

The Sea-hare is knowne to be venomous; but gooſe bloud taken with an equall quantitie of oile is a ſoveraigne countrepoiſon for it. Of this bloud, incorporat with the beſt Terra Sigillata of the Iſland Lemnos, and the juice of the S. *Mary* thiſtle called Bedegnar, there be excellent

* For the manner of a dog is to bee angrie with the ſtone that is thrown at him, without regard of the partie that flung it: whereupon grew the proverbe in Greeke, κύων εἰς λίθον δηγκᾶται.

* *In hyſſopo decocta, aut muſſo*: ſome read, *cum œſypo decoctum in muſſo*: *i.* Boiled with tried greaſe of ſheeps woolle, in honeyed wine.

trochiſchs made weighing five drams apeece, which are uſually kept in a readineſſe for to bee drunke in three cyaths of water as a countrepoiſon and countrecharme, againſt all venomous confections and deviliſh ſorceries: for which purpoſe ſerveth alſo a young ſucking weazill prepared in manner aforeſaid. The rennet in a lambs maw likewiſe, is paſſing good for any ſuch indirect means wrought by poiſon or witchcraft: like as the bloud of ducks and mallards bred in the realme of Pontus: and therefore their bloud is ordinarily kept drie in a thicke maſſe, and as need requireth is diſſolved and given in wine. But ſome thinke, that the bloud of the female duck is better than that of the mallard or drake. Semblably, the geſtier of a ſtorke, and the rennet or read of a ſheepe, is thought to be ſingular good for any poiſons whatſoever. The broth or decoction of Coleworts boiled with rams mutton, hath a peculiar vertue againſt the Cantharides. Ewes milke alſo drunke warme, availeth much againſt all poiſons, unleſſe it be the venomous flie Bupreſtis, or the deadly hearbe Aconitum. The dung of wild quoiſts or ſtockdoves taken in drinke, hath a ſpeciall vertue to helpe thoſe that have drunke quicke-ſilver. Finally, the fleſh of the ordinarie or common houſe-weazill kept in ſalt, is a preſent countrepoiſon againſt all venome that goeth under the name of Toxicum, if one drinke of it the weight of two drams.

Chap VI.

Medecines to bring haire againe in places that by ſome diſeaſe are bald: alſo to rid away nits: for to rectifie and keepe in order the eye-lids, and the haire growing thereupon: for to cure the pearle in the eye: and generally for all the accidents befalling to the eyes: laſtly, for the impoſtumat kernels behind the ears.

THe naked places in head or beard, are repleniſhed againe with haire by a liniment made of the aſhes of ſheeps dung incorporat in Cyprin oile & hony: alſo with the aſhes of mules or mullets houfes, applied with oile of myrtles. Our countreyman and Latine writer *Varro* affirmeth moreover, That the dung of mice (which he by a proper name calleth * Muſcerda) is a convenient medicine for the ſaid infirmitie and defect: he attributeth alſo the ſame operation to the heads of flies applied freſh to the bald place, if ſo bee the ſame were before rubbed hard, and in ſome ſort fretted with a figtree leafe. Some uſe in this caſe the bloud of flies: others mingle their aſhes with the aſhes of paper uſed in old time, or els of nuts; with this proportion, that there be a third part onely of the aſhes of flies to the reſt, and herewith for ten daies togither rub the bare places where the haire is gone. Some there be againe, who temper and incorporat togither the ſaid aſhes of flies with the juice of the colewort and breſt-milke: others take nothing thereto but honey. Certes, a ſtraunge thing it is of theſe flies, which are taken to be as ſenſleſſe and witleſſe creatures, yea and of as little capacitie and underſtanding as any other whatſoever: and yet at the ſolemne games and plaies holden everie fifth yeere at Olympia, no ſooner is the bull ſacrificed there to the Idoll or god of Flies called * Myiodes, but a man ſhall ſee (a wonderfull thing to tell) infinit thouſands of flies depart out of that territorie by flights, as it were thick clouds. But to come againe to the foreſaid infirmitie of haire-ſhedding: the aſhes of the heads, tails, yea and the whole bodies of mice burnt, are very good to make it come againe; eſpecially if the haire went off by occaſion of ſome venomous matter or poiſon: ſo are the aſhes of an urchin or hedgehog medled with honey: or the skin thereof burnt and applied with tar. As for the head alone of an urchin conſumed into aſhes, it is thought ſo effectuall for this purpoſe, that it will cauſe haire to grow againe upon a skar: but for the cure of the foreſaid defect of haire, called Alopecia, the places ought before the application of thoſe topicke medicines, to be well prepared with the razour, and a ſinapiſme or rubificative made of muſtard ſeed, untill the place look red: howbeit, ſome chuſe rather to take vinegre unto it. Here note by the way, that whatſoever vertue we attribute unto hedgehogs, the ſame is more effectuall in the porkeſpine. Moreover, Lizards torrified yea and calcined as I have ſhewed before, with the root of reeds or canes that bee greene and new drawne (which that it may burne the better with the Lizards, ought to bee ſliced ſmall) yeeld aſhes, which beeing incorporat well in oile of myrtles, doe retaine the haire and keepe it from ſhedding, if the place be annointed therewith: and the greene lizards in this cure and operation be ſimply the beſt: But if you would have this medicine to worke more effectually, put thereto ſalt, bears greace, and onions ſtamped. Some there be, who in ten ſextars of old oile ſeeth ten greene lizards, and therewith make a liniment, thinking it ſufficient therewith

to

* The Latines in old time after the ſame analogie called the dung of ſwine, *Sucerda*; of kine and oxen, *Bucerda*; like as the ordure of men, *Homerda*.

*This Idoll of the Painims, I take to be called in the holy Scripture, *Beel-zebub*.

A to annoint the place once a moneth, and no oftener. The aſhes of vipers skins doth raiſe haire quickely againe and make it grow apace, where it was ſhed: ſo doth hens dung that is freſh and new, if the place be plied with annointing. Taken a ravens egg, and mix it with the dung aforeſaid in a veſſell of braſſe, and therewith rub and annoint the head (ſo that it were ſhaven before) it will cauſe the new haire to come up blacke: but untill this unguent be dried upon the head, the patient muſt hold oile in his mouth, for feare leaſt the teeth alſo by this means turne blacke: and withall, this ought to be done in the ſhade or within-houſe: and the foreſaid ointment not to be waſhed off in foure daies ſpace. Others in this cure, uſe the bloud and brains of a raven, togither with ſome thicke and deepe coloured wine. Some boile a raven throughly, untill the fleſh be parted from the bones, and in the dead time of the night when every bodie is found aſleepe, put him
B up into ſome pot or veſſell of lead. There be againe, who having prepared and rubified the skin with ſalnitre, do annoint the place where the haire is gone or groweth thin, with a liniment made of Cantharides and tar punned and incorporat togither. Now foraſmuch as Cantharides be of a cauſticke qualitie and corroſive, great heed would be taken that they doe not fret and eat into the skin over deepe. Now when the place is thus prepared, and lightly exulcerat, they ordaine to apply thereto a liniment made of mice heads and their galls, incorporat and wrought togither with their dung, putting thereto ellebore and pepper.

The head many times is peſtered with nits; but for to rid them away, there is not a better thing than dogs greaſe. Some for this purpoſe, make a diſh of meat with ſnakes, dreſſing and ordering them as eels, and ſo eat them; or els they take their ſlough which they ſlip off in the ſpring
C time, and drinke the ſame.

Otherwhiles there be certaine brannie ſcales called dandruffe, which over-ſpread the head: to cleanſe it from this ſcurfe and deformitie, it were not amiſſe to annoint the head with ſheeps gall tempered with fullers * ſcouring clay, and let it remaine on the head untill it be drie.

* *Creta cimolia*, Tuckers earth.

For the painefull head-ach, it is commonly thought, that the heads of naked ſnails (I meane thoſe that bee found without ſhells, and are unperfit yet and not fully made) plucked from their bodies, are a ſingular remedie to be hung about the necke or tied to the head; with this charge, that there be taken forth of their heads firſt, a certaine ſtonie hard ſubſtance, which is made flat and broad like a thin gravell ſtone: and if the ſaid ſnails be but young and ſmall, they uſe to ſtamp them, and in manner of a frontall apply them to the forehead. In like manner, the bones of a
D Vulturs head, whether it be the common Geire, or that which the Greeks call Ægypios, hanged about the necke or faſtened to the arms: alſo the brains of the ſaid foule tempered with the oile of Cedar-roſin, driveth away the head-ach, if either the head bee throughly annointed, or the noſthrils within-forth, therewith. The brains of a crow or of an owle, beeing ſodden and eaten, will doe as much. Some thinke it good in this caſe, to lap the head and forehead with the fethers or plume plucked from about the necke of a cocke, or with his creſted combe, but it muſt be of ſuch a cocke as hath been cloſe ſhut up as a priſoner and kept from meat and drinke a whole day and a night; but take this withall, the patient who is troubled with the headach, muſt faſt as long from all meat and drinke. The aſhes of a rat or weazill applied to the forehead, eaſeth the paine; ſo doth a twig or ſticke taken from a puttocks neſt, laid under the pillow of the ſicke perſon: yea
E 3 and a liniment made of a mouſe skin burnt to aſhes, mixed with vinegre, and ſo applied. Many doe ſay, that the little hard bone in the head of ſnailes (ſuch eſpecially as are found between two cart-tracts) if it bee put through the eare, and hanged thereto within a little box of Ivorie, or otherwiſe tied faſt and carried about one within a peece of a dogs skin, is a remedie for the head-ach that never faileth, and may ſerve to doe many good. If the head be hurt, or the crown crackt, lay to the wound a copweb with oile and vinegre, and ſo let it lie, it will not lightly goe off untill ſuch time as it bee perfectly healed: this copweb is very good alſo to ſtaunch the bloud * of wounds in a barbars ſhop. But ſay that the bloud guſh out of the head, and from the braine, what is to bee done in that caſe? Surely there is not a better thing to ſtay the flux thereof, than to inſtill and drop thereupon the bloud of a gooſe or ducke, with the greace of the ſaid foules, ſod-
F den togither with oile of roſes. And to returne once againe to the cure of the head-ach: Take a ſwallow feeding in a morning betimes, cut off his head (but let this be done if poſſibly you can in the full of the moone) wrap it within a linnen cloth, and bind it to the head of the patient with the yarne that goeth to the ſelfe-edge or liſt of a peece of cloth: and yet ſome there be, who incorporat the ſaid head within white wax, and therewith annoint the forehead; and withall, baſt

* *Vulneribus tonſtrinarum ſanguine fiſtis*: Either whē the barbar would ſtop the orifice of a vein after bloud-letting: or when one that is newly wounded; cōmeth freſh bleeding to be dreſſed: or if his owne raſor chaunce to go awrie & ſhave to the quicke; whiles he hath a man under his hand to trim.

dogs haire downe to a bend or peece of cloth, and faſten the ſame cloſe to the ſaid forehead. G

Let us come lower to the eye-lids: It is ſaid, that if one doe eat the brains of a crow with meat, it will make the haire there to grow: ſo doth the tried greace of ſweatie wooll called Oeſypum, if the edges or brims of the eyelids be annointed with it and myrrhe hote, with a fine penſill. Many promiſe the ſame effect, if there be taken the aſhes of flies and mice dung, of each an equall portion; ſo as they both togither amount to the weight of halfe a dram or denier Romane; adding thereto of Stibi or Antimonium * two ſix parts of a denier; ſo as they bee all incorporat with Oeſypum aforeſaid, and therewith the eye-lids be annointed. Likewiſe young mice are emploied to the ſame purpoſe, beeing braied in a mortar with old wine to the conſiſtence of thoſe medecines which be called Acopa, and prepared for to diſſolve laſſitudes. If any hairs grow in the eielids untowardly and bee offenſive to the eyes, or otherwiſe, plucke them foorth, and annoint the H place with the gall of an urchin, they will never grow againe to trouble you: of the ſame operation and effect, is the humor or liquor that the eggs of the Star-lizard called Stellio, doe yeeld from them: the aſhes of a Salamander: the gall of a greene Lizard, tempered with white wine and permitted in the Sun to thicken and drie untill it have gotten the conſiſtence of honey, lying all the while in ſome baſon or veſſell of braſſe: the aſhes of young ſwallows with the milkie juice of the Tithymall: and laſt of all, the ſlime or froth that iſſueth from ſhell-ſnails.

* ſ. one whole ſcriptule or ſcruple.

To come nearer to the very eyes: the fierie red ſpots or pearls appearing in the chryſtalline humor, which the Greeks call Glaucomata, may be cured (as our magicians ſay) with the brains of a young whelpe or puppie that is but ſeven daies old; ſo as the chirurgian with his probe or inſtrument, doe conveigh the ſame gainly on the right ſide, if the right eye be amiſſe; and contrariwiſe on the left ſide, if the other eye be affected. And ſome of them affirme, that the freſh gall of a foule called Aſio will doe as much: this Aſio, is of the biggeſt kind of owles, who have certein feathers pricking up like ears. *Apollonius Pitanæus* was of opinion, that for to cure the cataract in the eye, the gall of a dog was better than that of the Hyæna, ſo that it were applied thereto with honey: and he was perſuaded, that the ſame would take away the white ſpots or pearls of the eye, called Albugines. It is a generall ſpeech, that to clarifie and quicken the eye-ſight that is dim and overcaſt with a miſt or clowd, a collyrie or eye-ſalve made with the aſhes of mice heads and their tails, mixed with honey, is a ſingular medicine: but the ſame would be much better in caſe the ſaid ſalve were made up with the aſhes of heads and tailes both, of dormice, or the wild field-mice: or at leaſtwiſe with the brains or gall of an ægle. The greace and aſhes of a rat burnt and K well incorporat in a mortar with the beſt Atticke honey, is a ſoveraigne remedie for weeping and waterie eyes: ſo is Antimonium, otherwiſe called Stibi; but what this is, I meane to declare in my treatiſe of Minerals. The aſhes of a weazill is good for the cataract: ſo are the brains of a lizard or ſwallow: and if the ſame lizards and ſwallows be either braied in a mortar or ſodden, and ſo applied to the forehead in manner of a liniment, they do repreſſe the violent rheume that taketh to the eyes: which effect they worke either alone by themſelves, or elſe with fine floure of meale, or with frankincenſe: and in this wiſe they helpe the eyes and face * blaſted and bliſtered with ſun-burning. Moreover, there is not of all others a better medicine to cleare the eye and to rid away all thicke filmes and miſts that trouble the ſight, than to burne the ſaid lizards and ſwallows alive, and with an eye-ſalve made of their aſhes and honey of Candie, to annoint them. The L ſlough or skin of an Aſpis, which ſhe likewiſe ſometime caſteth, tempered with the owne greace, mundifieth the eyes of horſes and ſuch labouring beaſts, if they bee annointed therewith. Alſo, there is not a more ſoveraigne thing in the world for to remoove the cataract, and diſpatch the miſts and cloudie films that dim the eies, than to burne and calcine a viper alive in a new earthen pot never occupied before; putting thereto of the juice of fenell the meaſure of one cyath, and ſome corns or crums of Olibanum or frankincenſe: and this medicine is commonly called * Echion. Moreover, there is a collyrie or ſpeciall eye-ſalve made of a viper ſuffered to putrifie in a pot of earth, ſo as the grubs or worms that come of the ſaid carrion be ſtamped and incorporat in ſaffron. Some burne a viper with falt in an earthen pot; and they are of opinion, that whoſoever doe licke the ſame falt, or let it melt at the tongues end, it clarifieth the eyes: and that they M ſhall *keepe the ſtomacke and all the bodie beſides in good temper, yea, and live long by that meanes. They uſe to give alſo of this falt unto ſheepe when they are not well at eaſe, and it is thought to be very holeſome for their health: yea, and it entreth into many antidotes and countrepoyſons deviſed againſt the venome of ſerpents. Some there bee who uſe to eat vipers ordinarily

* *Sicet ſolatiis proſunt.* This ſcorching and roughneſſe of the skin or face, is called by Phyſicians *Ephelis.*

*As one would ſay, made of a viper.

* *Stomachi totiuſq; corporis temperiem, ſeruſq; ætates, Ex Dioſc.* μακροβίους γίνας.

A rily at their table, for to preſerve their eyeſight. But for meat they prepare and order them in this wiſe: Firſt, ſo ſoone as they have killed a viper, they give order to put ſalt into the mouth, untill ſuch time as it hath ſucked out the venomous humor that lieth at the root of the teeth, and diſſolved or conſumed it: afterwards, when they have cut away to the breadth of foure fingers from under the top of the head, and withall taken forth the entrailes and garbage out of the belly, they ſeeth the reſt of the bodie in water, or oile, together with ſalt and dill ſeed: and this fleſh either they eat out of hand thus dreſſed, or els working it with ſome paſte, they reduce the ſame into troſches, that they may be preſerved for their uſe at ſundrie times. As touching the broth that is made of this decoction, over and beſides that it is good in thoſe caſes beforeſpecified, this qualitie it hath, namely, to rid and cleanſe both the head and all the bodie beſides of lice; yea, and to
B kill the itch that runneth aloft in the skin. The aſhes of a vipers head calcined, are by themſelves very effectuall without any thing els; but principally in clearing the ſight, if the eyes be annointed therewith in ſome convenient liquor: ſo is the greaſe alſo of the viper. As for their gall, I dare not be ſo bold as to approve that which others confidently have adviſed and preſcribed: becauſe (as I have alreadie ſhewed) the venome of ſerpents is nothing els but their gall. The greaſe of a ſnake mixed with verdegreece, healeth any part of the eye that is broken: but the ſlough or old skin which they caſt off in the Spring, doth clarifie the eyeſight if the eyes be gently rubbed therwith. The gall of an Hulat likewiſe is highly commended for the white pearles, the cataracts and thicke filmes which trouble the ſight: the fat alſo of the ſaid bird is as much praiſed for the clearing of the ſame. Moreover, it is ſaid, that the gall of that *Ægle (which I ſaid heretofore, to prove
C and trie her young birds, uſeth to force them for to looke directly upon the Sunne) mingled with the beſt honey of Athens, ſerveth to annoint the eyes, for the webs, filmes, and cataracts which trouble the eyeſight. Of the ſame operation is the gall of a Vulture or Geire, incorporat with the juice of Porret and a little honey. The like vertue alſo there is in the gall of a Cocke or Capon, for the pin and web, and for the pearle in the eye, if the ſame bee diſſolved in water; yea and for the cataract, eſpecially if the ſaid Cocke or Capon be all white. The dung likewiſe of Cocks and Capons, I meane that part onely thereof which is ruddie and browne, they ſay, is ſingular good for thoſe that be poreblind or ſhort ſighted, ſuch alſo as ſee not well but about noone tide. They commend moreover the gall of an Hen (but the fat eſpecially) for the little bliſters or ſpots that otherwhiles ariſe in the apple of the eie: In regard of which vertue, many there be that cram
D them fat, and for no cauſe elſe. But if there bee put thereto the pouder of the red bloud-ſtone Hæmatites, and the yellow ſaffron-coloured Schiſtos, it is wonderfull how much better it will bee for that purpoſe; yea, and to heale the tunicles of the eyes that bee broken. Moreover, Hens dung, as much onely of it I meane as is white, many uſe to keepe in old oile within certaine boxes of horne, for to cure the white pearles that grow in the apple of the eye. And ſince I am entered thus farre into the dung of Pullaine, I muſt advertiſe you what is reported of Peacocks, That they doe eat and ſwallow downe againe the ſame dung which themſelves have meuted, for very envie that they have unto mankind, knowing by a ſecret inſtinct of Nature how good it is for many uſes. Furthermore, it is an opinion commonly received, that all the race of Faulcons, if they be boiled in oile roſat, are ſoveraigne for any accidents of the eyes whatſoever,
E if they be bathed with that decoction. Semblably, it is ſaid, that their dung reduced into aſhes and incorporat in the beſt honey of Athens, is very good therefore: as alſo the liver of a Glede or Kite is much commended in thoſe caſes. Pigeons dung tempered in vinegre, cureth the fiſtulaes which are betweene the lachrymall corners of the eyes and the noſe: and otherwiſe is ſingular for the white pearles and the cicatrices or filmes growing in the eyes. Gooſe dung and Duckes bloud, be both of them very ſoveraigne for to ſoake out the blacke bloud in the eyes, occaſioned by ſome contuſion or bruiſe, with this regard, that they bee afterwards annointed with *Hyſſope
F and Honey. The gall of a Partridge mixed with honey, of each a like weight, mightily cleareth the eyeſight: ſo doth the gall of a fallow Deere applied ſimply alone, without any mixture or addition at all. But theſe gals ought to be kept in a ſilver box, ſay they who ground upon the authoritie of *Hippocrates* for their warrant. Partridge egges ſodden with honey in a braſen pan or poſnet, doe cure the ulcers in the eyes, and take away the red pearles ariſing in the black therof. The bloud of Pigeons, Turtledoves, Stockdoves, or Coiſts, and Partridges, is paſſing good for bloudſhotten eyes. But they ſay that the bloud of the Cocke Pigeons is better for this purpoſe than that of the female. Now for to fit this cure, they muſt be let bloud in the veine under the wing or

pinion,

Haliætoi, i. the ſea-Ægle or Orfray.

Hyſſope, unleſſe we read *Oeſypo*, which is the tried greaſe of unwaſhed wooll.

pinion, becauſe that bloud is whoter, and therefore by ſo much the better. But when the eyes be G
dreſſed with this bloud, it would not be forgotten, that there bee a thin bolſter boiled in honey,
laid aloft, yea, and a locke of greaſie wooll upon it, which had been ſoaked either in oile or wine.
The bloud of the foules abovenamed helpeth thoſe that cannot ſee toward a night: the liver al-
ſo of a ſheepe doth the ſame: but if the ſaid ſheepe be of a ruſſet or browne colour, the medicine
will doe the better: for as I obſerved before in Goats, thoſe that carie ſuch a coat, bee alwaies
eſteemed beſt. Many give counſell to foment and waſh the eyes with the decoction of the ſaid
liver: and if they be in paine and ſwoollen withall, they adviſe to annoint them with the marrow
of a Mutton. They promiſe alſo, That the aſhes of ſcrich-Owles eyes put into a collyrie, will
clarifie the ſight. Indeed the dung of Turtles conſumeth the white pearles in the eyes: ſo doth
the aſhes of ſhell-ſnailes or hoddidods: as alſo the meuting of the keſtrell Cenchris, which the H
Greeke writers will have to bee a kind of Hawke. As for the ſpot or pearle in the eye called Ar-
gema, it may be cured by all thoſe medicines above rehearſed, ſo that they bee applied thereto
with honey. But the beſt honey ſimply for the eyes, is that wherein a number of Bees were for-
ced to die. Whoſoever hath eaten a young Storke out of the neaſt, he ſhall (they ſay) continue
many yeares together, and never be troubled with inflamed or bleared eyes: like as they that ca-
rie about them a Dragons head. It is ſaid moreover, That the Dragons greaſe incorporat in ho-
ney and old oile, diſpatcheth and ſcattereth the filmes and webs that trouble the ſight, if they be
taken betimes before they be growne too thicke. Some there bee who at the full of a Moone put
out the eyes of young Swallowes, marking the time when they have recovered their ſight again:
for then they plucke off their heads and burne them to aſhes, which beeing tempered with ho- I
ney, they uſe for to cleare their owne ſight, to eaſe the paines, and diſcuſſe the blearednes of eyes,
yea, & to heale them, if they have caught a blow or ruſh. As for Lizards, they uſe to prepare them
many and ſundrie waies for the infirmities incident to the eyes: Some take the greene Lizard and
put her cloſe within a new earthen pot that never was occupied; and therewith nine of thoſe lit-
tle ſtones which the Greekes call *Cinædia, (and theſe are uſually applied unto the ſhare for the
ſwelling glandules & tumors that many times riſe there) marking every one of them reſpective-
ly by themſelves: which being done, they take forth of the pot every day one; & when the ninth
day is come, they let out the Lizard, and then they keepe the ſaid ſtones thus ordered and pre-
pared, as ſoveraigne remedies to allay the paine and greefe of the eyes. Others get a greene
Lizard and put out her eyes, and beſtow her in a glaſſe with a bed of earth under her in the bot- K
tome thereof, and withall, encloſe within the ſaid glaſſe certaine rings, either of ſolide yron or
maſſie gold: and ſo ſoone as they perceive through the glaſſe, that the Lizard hath recovered
her ſight againe, they let her forth: but the ſaid rings they keepe with great care and regard, as a
ſpeciall meanes for to helpe any bleared eyes. There bee moreover who uſe the aſhes of a Li-
zards head inſtead of Stibium or Antimonium, for to make ſmooth the roughneſſe of the eye-
lids. Some hunt after greene Lizards with long neckes, which breed in ſandie and gravellie
grounds, and when they be gotten, burne them to aſhes, with which they uſe to repreſſe the flux
of wateriſh humors which begin to fall into the eyes, yea, and therewith conſume the red pearls
growing therein. It is ſaid moreover, That if a Weaſels eyes bee pecked or plucked out of the
head, they will come againe, and ſhee will recover her ſight: and therefore they practiſe the like L
with rings and them together, as I obſerved before in Lizards. Furthermore, it is ſaid, That as
many as carrie about them the right eye of a ſerpent tied unto any part, it is very good for to ſtay
the violent rheumes that have taken to the eyes; but then in any wiſe the ſerpent muſt bee let
goe alive after that ſhee hath loſt her eye. As touching thoſe eyes which be evermore weeping,
and doe ſtand full of water continually, the aſhes of the ſtarre-Lizards head called Stellio, to-
gether with Antimonium, helpeth them exceeding much. The copweb which the common
ſpider maketh, that uſeth to catch flies; but eſpecially that which ſhe hath woven for her neaſt
or hole wherein ſhee lieth her ſelfe, is ſoveraigne good for the flux of humours into the eyes,
if the ſame bee applied all over the forehead, ſo as it meet with the temples on both ſides: But
wot you what, none muſt have the doing hereof, either to get the ſaid copwebs, or to lay it M
unto the place, but a young lad not as yet undergrowne, nor foureteene yeares of age: neither
muſt he beſeene of the partie whom hee cureth, in three daies after: ne yet during the ſpace of
thoſe three daies muſt either he or his patient touch the ground with their bare feet: Which
circumſtances and ceremonies beeing duly obſerved, it is wonderfull to ſee what a cure will

follow

*Becauſe they be found in the fiſh called Cinædi.

A follow thereupon. Furthermore, it is ſaid, That theſe white ſpiders with the long and ſlender legs, being punned and incorporat in old oile, bee ſingular for to conſume the white pearle in the eye, if the ſame bee dreſſed with that compoſition. Alſo thoſe ſpiders that worke ordinarily under rouſes, rafters, and bourded floores of houſes, and weave the thickeſt webs, if any of them bee enwrapped within a peece of cloth and kept bound to the eyes or forehead, doe reſtraine for ever the ſaid rheumes and catarrhes that have found a way to the eyes. The greene Beetle hath a propertie naturally to quicken their ſight who doe but behold them: and therefore theſe lapidaries and cutters or gravers in precious ſtones, if they may have an eye of them once and look upon them, take no more care for their eye-ſight, how it ſhould ſerve their turnes when they are at their worke. Thus much of eyes.

B As concerning the eares and the infirmities incident unto them, there is not a better thing to mundifie and cleanſe them than a ſheepes gall with honey: and a bitches milke if it bee dropped into them, eaſeth their paine. Dogs greaſe tempered with Wormwood and old oile, helpeth thoſe that be hard of hearing, ſo doth Gooſe greaſe: Howbeit, ſome put thereto the juice of an Onion and Garlicke, of each a like quantitie. In this caſe alſo there is much uſe of Ants egs alone without any thing els: for as little and ſillie a creature as it is, yet ſhe is not without ſome medicinable vertues: inſomuch, as Beares, when they feele themſelves ſickiſh or not well at eaſe, cure themſelves with eating Piſmires. As for the manner of preparing as well the greaſe of a Gooſe as of all other foules, this it is: Firſt the fat ought to be cleanſed and rid from all the skins, veins, and ſtrings that are among it, and then to bee laid abroad to the Sun in an earthen pan, covered over
C with a new lid of earth likewiſe which had never been uſed: this done, the foreſaid pan muſt bee ſet over ſeething water, that the ſaid greaſe may melt: and then it is to paſſe through linnen bags that it may be tried from all the groſſe cratchens: and ſo they put it up in a new earthen pot, and ſet it in ſome cold place againſt the time that it is to be uſed. Howbeit, this is well knowne, That if ſome honey be put thereto, it is leſſe ſubject to corruption or putrifaction. Moreover, the aſhes of burnt mice incorporat in honey, or els ſodden with oile of Roſes, allaieth the paine in the ears if it be inſtilled into them. But in caſe ſome earewig or ſuch like vermine be crept within the ears, there is not the like meanes to cauſe it to come forth againe, as is the gall of mice diſſolved in vi-
5 negre and dropped into them. Alſo when water is gotten into the head by the ears, Gooſe greaſe together with the juice of an Onion, is ſingular good to draw it out. Moreover, there is a notable
D medicine made of dormice for all infirmities of the eares, which otherwiſe could not bee cured, but were given over by all Phyſicians: for the making whereof, they take a dormouſe and flea it, and after the guts and entrailes be taken foorth, they ſeeth the ſame with honey in a new earthen veſſell. Howbeit, ſome Phyſicians there be who thinke it better to boile the ſame with Spikenard, untill a third part be conſumed, and ſo reſerve it for their uſe: and whenſoever after there is need of it, the manner is to infuſe the ſaid liquor warme into the eare by a pipe or inſtrument called an Otenchyte. This is knowne by experience to heale all the accidents of the eares, though otherwiſe incurable. Alſo the decoction of earth wormes boiled with Gooſe greaſe, is ſingular good likewiſe to be poured into the eares. But if the eares be exulcerat, broken out, and do run matter, the red wormes engendred about trees ſtamped in a morter with oile, are very proper to heale the
E ſame, if they bee applied thereto. Lizards that have hanged up a long time a drying with their mouths downeward, if they bee punned with ſalt, ſerve to heale the eares that have caught ſome hurt either by bruſe, cruſh, or ſtripe. But above all other, the Lizards that have brown ſpots upon them like ruſtie yron, and are ſtraked along the taile with lines, are moſt effectuall for theſe infirmities. As touching the Wooll beads or Caterpillers, which ſome call Millepedæ, others Multipedæ or Centipedæ, which are a kind of earthwormes keeping upon the ground, all hairie, having many feet, and courbing archwiſe as they creepe; and if you touch them, they will gather round together: the Greekes, ſome call them *Oniſcos, others Tylos: theſe *wormes (I ſay) are very effectuall to aſſuage the paine of the eares, if they be ſodden with the juice of Porret in the rind of a pomgranat: Some put thereto oile of Roſes, and give adviſe to poure this medicine in-
F to the contrarie eare that is not pained. As for that worme or vermine which riſeth not arch-wiſe with ſome part of the body in creeping, the Greeks ſome call it Seps, others Scolopendra; which though it be leſſe than the former deſcribed, yet miſcheevous ynough and venomous. The ſnails that carie ſhels upon their backe, and are uſually dreſſed for good meat, if they bee applied with Myrrhe or the pouder of Frankincenſe, are very good for the eares that be crackt: ſo are the little

*Plinie confoundeth *Oniſcos* (which we call a Sow or Wood-louſe) with the Caterpiller or Woolbead Millepeda.

*Indeed our Sows or woodlice, called otherwiſe Porcelliones, and Multipedæ, but not Millepedæ, and which if one touch thē, draw thēſelves roūd, are good for the pain of the eares: but not the foreſaid Woollbeads or Caterpillers, Millepedæ, which in their creeping riſe and fall, &c.

tle and broad ſnailes brought into the forme of a liniment with honey, and laid too accordingly. The ſloughs or skins that ſerpents caſt, calcined upon a tile or potſhard red hot, and ſo reduced into aſhes and incorporat with honey, are very medicinable for all the accidents of the eares, if the ſame be dropped into them; but principally when they ſtinke or yeeld from them a ſtrong ſavour: But if they bee full of purulent matter, and run withall, it were better to mingle the ſame with vinegre in ſtead of hony: but beſt of all with the gall of a Goat, a Bœufe, or a ſea Tortoiſe. The foreſaid ſloughs or skins if they bee above one yeare old, or have caught much wet by raine and water, have loſt their vertue and doe no good, as ſome are of opinion. Moreover, the bloudie humor that commeth from a ſpider, either tempered with oile of Roſes, or els alone by it ſelfe upon a locke of wooll, or with a little Saffron, is very good for the eares: ſo is the Cricket digged up and applied to the place earth and all where it lay. *Nigidius* attributeth many properties to this poore creature, and eſteemeth it not a little: but the Magicians much more a fair deale: and why ſo? Forſooth becauſe it goeth as it were reculing backward, it pierceth and boreth an hole into the ground, and never ceaſeth all night long to creake very ſhrill. The manner of hunting and catching them is this, They take a flie and tie it about the middeſt at the end of a long haire of ones head, and ſo put the ſaid flie into the mouth of the Crickets hole: but firſt they blow the duſt away with their mouth, for feare leaſt the flie ſhould hide her ſelfe therein: the Cricket ſpies the fillie flie, ſeaſeth upon her preſently and claſpeth her round, and ſo they are both drawne foorth together by the ſaid haire. The inner skin of a Hens giſier, which the cooke uſeth to caſt away, if it be kept and dried, and ſo beaten to pouder and mingled with wine, is good to bee dropped or poured hote into the eares that run with matter: ſo is the fat alſo of an Hen. There is a certaine kind of fattineſſe to bee found in the Flie or Inſect called * Blatta, when the head is plucked off, which if it be punned and mixed with oile of Roſes, is (as they ſay) wonderfull good for the eares: but the wooll wherein this medicine is enwrapped, and which is put into the eares, muſt not long tarie there, but within a little while be drawne forth againe; for the ſaid fat will very ſoone get life and prove a grub or little worme. Some writers there be who affirme, That two or three of theſe flies called Blattæ ſodden in oile, make a ſoveraigne medicine to cure the eares: and that if they bee ſtamped and ſpread upon a linnen rag and ſo applied, they will heale the eares, if they bee hurt by any bruiſe or contuſion: Certes this is but a naſtie and illfavoured vermine, howbeit in regard of the manifold and admirable properties which naturally it hath, as alſo of the induſtrie of our aunceſtours in ſearching out the nature of it, I am mooved to write thereof at large and to the full in this place. For they have deſcribed many kinds of them. In the firſt place, ſome of them be ſoft and tender, which being ſodden in oile, they have proved by experience to be of great efficacie in fetching off werts, if they be annointed therewith. A ſecond ſort there is, which they call Mylœcon, becauſe ordinarily it haunteth about mils and bake-houſes, and there breedeth: theſe, by the report of *Muſa* and *Pyction* two famous Phyſicians, beeing bruiſed (after their heads were gone) and applied to a bodie infected with the leproſie, cured the ſame perfitely. They of a third kind, beſides that they be otherwiſe illfavored ynough, carie a lothſome and odious ſmell with them: they are ſharpe rumped and pin buttockt alſo: howbeit, beeing incorporat with the oile of pitch called Piſſelæon, they have healed thoſe ulcers which were thought, *Nunquam ſana*, and incurable. Alſo within one and twentie daies after this plaſtre laid too, it hath been knowne to cure the ſwelling wens called the Kings evill: the botches or biles named Pani, wounds, contuſions, bruiſes, morimals, ſcabs, and fellons: but then their feet and wings were plucked off and caſt away. I make no doubt or queſtion, but that ſome of us are ſo daintie and fine eared, that our ſtomacke riſeth at the hearing onely of ſuch medicines: and yet I aſſure you, *Diodorus* a renowmed Phyſician, reporteth, That hee hath given theſe foure flies inwardly with roſin and honey, for the jaundiſe, and to thoſe that were ſo ſtreight winded that they could not draw their breath but ſitting upright. See what libertie and power over us theſe Phyſicians have, who to practiſe and trie concluſions upon our bodies, may exhibit unto their patients, what they liſt, bee it never ſo homely, ſo it goe under the name of a medicine. Howbeit, ſome of the more civile ſort, and who carried with them a better regard of manhood and humanitie, thought it better and a more cleanely kind of Phyſicke, to reſerve in boxes of horne the aſhes of them burnt, for the uſes abovenamed. Others alſo would beat them (after they were dried) into pouder, and miniſter them in manner of a clyſtre unto thoſe that were * Orthopnoicke and Rheumaticke.

G H I L M

*Which *Pliny* taketh for a kind of *Scarabæus* or Beetle.

**Orthopnoici*: Such as cannot take their wind but ſitting upright.

Certes,

A Certes, it is well knowne and confeſſed, that a liniment made of them, will draw foorth prickes, thorns, ſpils, and whatſoever ſticketh faſt within the fleſh. Moreover, the honey wherein Bees were extinct and killed, is ſoveraigne for the diſeaſes of the eares. As for the impoſtumes and ſwellings ariſing behind the eares, called Pacotides, Pigeons dung applied thereunto, either alone by it ſelfe, or with Barley meale or Oatmeale, driveth them backe or keepeth them downe. Alſo the liver or braines of an Owle, beeing reſolved in ſome convenient liquor, and applied accordingly, cureth the accidents of the lap of the eare, and the foreſaid impoſtumations, ſo dooth a liniment made of the wormes called Sowes, together with a third part of roſin: and laſtly, the cricquets above rehearſed, either reduced into a liniment, or elſe bound too, whole as they be, are good in theſe caſes. Thus much concerning thoſe maladies above ſpecified. It remaineth now to proceed
B unto other diſeaſes, and the medicinable receits reſpective unto them, drawne either from the ſame creatures, or elſe from others of that kind: whereof I purpoſe to treat and diſcourſe in the next booke enſuing.

C

THE XXX. BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

D

¶ The Proëme.

Chap. I.

The originall and beginning of Art Magicke. When it firſt began, and who were the inventors of it. By whom it was practiſed and advaunced. Alſo other receits or medicines drawne from beaſts.

E THe follie and vanitie of Art Magicke I have oftentimes alreadie taxed and confuted ſufficiently in my former books, when and whereſoever juſt occaſion and fit opportunitie was offered: and ſtill my purpoſe and intention is to diſcover and lay open the abuſe therof in ſome few points behind. And yet I muſt needs ſay, the argument is ſuch as deſerveth a large and ample diſcourſe, if ther were no more but this only to induce me, That notwithſtanding it be of all arts fulleſt of fraud, deceit, and couſenage, yet never was there any throughout the whole world either with like credit profeſſed, or ſo long time upheld and maintained. Now, if a man conſider the thing well, no marvaile it is that it hath continued thus in ſo great requeſt and authoritie; for it is the onely Science which ſeemeth to compriſe in it ſelfe three profeſſions beſides, which have the command and rule of mans mind above any other whatſoever. For to begin withall, no man doubteth but that Magicke tooke root firſt, and proceeded from Phyſicke, under the pretence of
F maintaining health, curing, and preventing diſeaſes: things plauſible to the world, crept and inſinuated farther into the heart of man, with a deepe conceit of ſome high and divine matter therein more than ordinarie, and in compariſon whereof, all other Phyſicke was but baſely accounted. And having thus made way and entrance, the better, to fortifie it ſelfe, and to give a goodly colour and luſtre to thoſe fair and flattering promiſes of things, which our nature is moſt given

given to hearken after, on goeth the habite also and cloake of religion: a point, I may tell you, G
that even in these daies holdeth captivate the spirit of man, and draweth away with it a greater part of the world, and nothing so much. But not content with this successe and good proceeding, to gather more strength and win a greater name, shee entermingled with medicinable receits and religious ceremonies, the skill of Astrologie and arts Mathematicall; presuming upon this, That all men by nature are very curious and desirous to know their future fortunes, and what shall betide them hereafter, perswading themselves, that all such fore-knowledge dependeth upon the course and influence of the starres, which give the truest and most certaine light of things to come. Being thus wholly possessed of men, and having their sences and understanding by this meanes fast ynough bound with three sure chains, no marvell if this art grew in processe of time to such an head, that it was and is at this day reputed by most nations of the earth for the para- H
gon and cheese of all sciences: insomuch as the mightie kings and monarchs of the Levant, are altogether ruled and governed thereby. And verely there is no question at all, but that in those East parts, and namely in the realme of Persia, it found first footing, and was invented and practised there, by * *Zoroastres*, as all writers in one accord agree. But whether there was but that one *Zoroastres*, or more afterwards of that name, it is not yet so certainely resolved upon by all Authors: for *Eudoxus* (who held art Magicke to be of all professions Philosophicall and learned disciplines, the most excellent and profitable science) hath recorded, That this *Zoroastres*, to whom is ascribed the invention thereof, lived and flourished * 6000 yeares before the death of *Plato*. And of his mind is *Aristotle* also. Howbeit *Hermippus*, who wrote of that art most exquisitely, and commented upon the Poëme of *Zoroastres*, containing * a hundred thousand verses twentie I
times told, of his making; and made besides a Repertorie or Index to every book of the said Poësie: this *Hermippus* (I say) reporteth, That one *Azonaces* taught *Zoroastres* Art-Magicke; which maister of his lived 5000 years before the war of Troy. Certes, I cannot chuse but marvell much, first, that this science and the memoriall therof should so long continue, and the Commentaries treating of it not miscarie and be lost all the while, during such a world of years: considering besides, that neither it was ordinarily practised and continued by tradition from age to age, nor the successors in that facultie were professours of the greatest name, and renowned by any writings. For what one is there thinke you among so many thousands, that hath any knowledge, so much as by bare hearesay, of those who are named for the onely Magicians in their time, to wit, *Apuscorus* and *Zaratus*, Medians; *Marmaridius* of Babylon; *Hippotus* the Arabian; and *Zarmocenidas* of Assyria? For bookes have we none extant of their writing, nor any monuments which K
beare record and give testimonie of such clearks. But the greatest wonder of all is this, that *Homer* the Poet, in his Ilias (a Poëme composed purposedly of the Trojane warre) hath not so much as one word of Magicke: and yet in his Odyssæa, where he discourseth of the adventures, travails, and fortunes of prince *Vlysses*, such adoe and stir there is with it, as though the whole worke consisted of nothing els but Magicke. For what is meant by the variable transformations of * *Proteus*, or by the songs of the * Meremaids, whereof hee writeth so much; but that the one was a great sorcerer, the other famous witches or enchauntresses? As for that which he relateth of lady *Circe* how she wrought her feats by conjuration only and raising up infernall spirits; surely it favoureth of art Magicke and nothing els. I muse much also, that after *Homers* time there is no writer ma- L
keth mention how this art arrived at Telmessus, a citie [in the marches of Lycia] wholly addicted to religion, and so famous for the colledge of priests & soothsayers there: or at what time it made a voiage & passed over into Thessalie; where it reigned so rife and was so usually practised in every towne and citie, that with us here in these parts of the world, it tooke the denomination of * that countrey, and retained the same for a long time, notwithstanding that the word Magicke indeed was appropriat unto a strange and far remote nation. And verely, considering how about the time of the war and destruction of Troy, there was no other Physicke in use but that which *Chiron* the Chirurgian practised, and that during the heat and bloudy wars only; it seemeth very strange and wonderfull unto me, that the nation of Thessalie, and the native country of *Achilles* [and *Chiron*] should become so famous for Magick: insomuch as *Menander* also (a Poet by all mens judgment M
so framed by nature for deep learning and exquisit literature, as that he had no concurrent in his time that came neare unto him) entituled one of his comœdies, Thessalica; wherein he deciphered and depainted lively unto us, the whole order and manner of witches with all their charms and incantations, by the vertue wherof they would seem to pull the Moon down from heaven. I would

have

* King of the Bactrians, which some take to be *Abraham*.

* It seemeth that in this calculation of yeares, *Plinie* mistaketh the number: For *Plutarch* saith he lived 600 yeares before the Troiane war: or els that he meaneth *Lunares annos*.

* *Vicies centum millia versum*, i. two millions of verses.

* *Diodorus Siculus* saith, That this was a meer fiction, arising hereupon, That *Proteus* being a king of Ægypt, according to the custome of the Ægiptiã kings, for greater maiestie and state, shewed himself abroad adorned with the ensigns, representing a Bull, Dragon, Liõ, Tree, Fire, and such like: altering eftsoons these ornamẽts, which cõtained some hieroglyphicall mysteries appropriat to the person of a king.

* Three daughters of *Achelous* & *Calliope*: whose names were *Parthenope*, *Ligia*, and *Leucosia*, reputed witches, & able to doe great matters by charmes.

* For properly the *Magi* were the wise men of Persia, and yet at Rome they usually tearmed Magicians by the name of Thessalians.

A have thought that *Orpheus* soone after and in the age next ensuing, had brought in first these superstitious ceremonies, by reason of the propinquitie and neighbourhood of that region, and that he proceeded therewith to the advancement of physicke, but for one thing which plucketh me backe; namely, That Thrace his naturall countrey and the place of his birth, was altogither ignorant of Magicke, and knew not what it meant. But as far as ever I could find, the first that is recorded to have commented and written of this Art, was *Osthanes*, who accompanied *Xerxes* K. of the Persians, in that voiage and expedition which (in warlike maner) he made into Greece: and to say a truth, he it was that sowed the seeds of this monstrous Art, and infected therewith by the way, all parts of the world whersoever he went and came. Howbeit, those authors and historiographers who have searched more nearely into the matter, set down another *Zoroastres*, borne
B in the Isle Proconnesus, who wrote somewhat before *Osthanes*, of that argument: nevertheless, this is held for certaine, That *Osthanes* was the man, who most of all other set the Greeke nations not only in a hot desire, but also in a madding fit and enraged as it were, after Magicke. And yet I must needs say that I have observed, that not onely at first, but also from time to time, the greatest name that went of learned men and great philosophers, for their singular skill and profound knowledge, arose from the opinion that was of their insight in this Science. Certaine it is, that
4 *Pythagoras*, *Empedocles*, *Democritus*, and *Plato*, were so far in love therewith, that for to attaine the knowledge thereof, they undertooke many voiages and journies over sea and land, as exiled and banished persons, wandering from place to place, more like travailers than students; and
C being returned home againe into their owne countries, this Art they blazed abroad and highly praised; this they held as a secret and divine mysterie. As for *Democritus*, he raised a great name of *Apollonices Captidenes*, and *Dardanus* of Phœnicia, as well by the books of *Dardanus* his master (which he fetched from out of his sepulchre where they were bestowed) as also by publishing commentaries of his owne, which were extracts and draughts out of those authors and their writings; which afterwards, received and learned by others, so passed from hand to hand, and were
2 so deeply engraven and imprinted in the minds and memories of men, that I assure you I woonder at nothing in the world so much; for so full they are of lyes, & so little or no truth, godlinesse, and honestie is conteined in them, that men of judgement and understanding who approove and esteeme his other books of Philosophie, will not beleeve that these works were of *Democri-*
D *tus* his making: howbeit, this is but a vaine conceit and persuasion of theirs; for well it is known and confessed, that *Democritus* led away an infinit number of people by this means, and no man so much; filling their heads with many faire promises, and the sweet impression thereof ravished their spirits after this Art. Moreover, there is yet one point more, whereat I woonder as much as at any other; to wit, that these two professions (Physicke I meane, and Magicke) flourished both togither in one age, and shewed themselves in their greatest glorie: which was about the Peloponnesiacke warre in Greece, three hundred yeers after the foundation of our citie of Rome; at what time as *Hippocrates* professed the one, & *Democritus* for his part published the other. Now there is another faction (as it were) of Magicians, which tooke the first foundation from *Moses*;
E * *Iamnes*, and *Iotapes*, Iewes; but many thousands of yeers after *Zoroastres*: and yet the *Cyprian Magicke is later than so by as many yeers. But to come again unto our Magick abovesaid: there was a second *Osthanes* in the daies of K. *Alexander* the Great, who (by reason that he attended upon him in his traine, during his journies and voiages that he made) was himselfe in great reputation abroad, and by meanes thereof gave no small credit and authoritie to this profession; for that he had opportunitie thereby (as no man need to doubt) to travaile and compasse the globe of the Earth, & so to spread and divulge this learning in all parts. And verely, that this doctrine hath been heretofore received in some nations of Italy, it appeareth as well by good evidences and records extant at this day in the bodie of our Law written in the twelve tables, as by other arguments and testimonies which I have alledged in the former booke. Certes, in the 657 yeere after the foundation of Rome citie, and not before (which fell out to be when *Cn. Cornelius Le-*
F *pidus* and *P. Licinius Crassus* were Consuls) there passed a decree and act of the Senat, forbidding expressely the killing of mankind for sacrifice: wherby we may evidently see, that untill this inhibition or restraint came forth, our progenitors and ancestors were given to these inhumane and monstrous sacrifices. No question there is verely, but that this Art of Magicke was professed in Fraunce, and continued untill our daies: for no longer is it agoe than since the time of *Tiberius Cæsar*, that their Druidæ (the Priests and Wise men of France) were by his authoritie put downe,

togither

* It should seeme that these were the Magicians of *Pharao*, of who S. *Paul* 2. *Tim.* 3. *chap.* maketh mention, who would have counterfeited the miracles wrought by *Moses*: where note, that *Plinie*, ignorant in the holie Scriptures & void of true religion, rangeth *Moses* the prophet & faithful servant of almightie God, with such sorcerers and enchanters. For the Painims, wanting the light of the gospell, attributed all effects and operatiõs above nature, to Magick; & were not able to distinguish between miracles done by the finger of God or his ministers, and the illusions practised by the devill and his limbs.

* Some interpret this to bee meant of Christianitie, which was received with the first in Cypros by the preaching of the Gospell, and as it is thought, by S. *Barnabas*: for that during the infancie of the primitive Church, manie miracles were wrought by the Apostles and Disciples of our Saviour Iesus Christ, the heathen hold that Religion of Christians to be a kind of Magicke. Others understãd this place, of the priests of *Cyprian Venus* called *Cynareans*.

togither with all the pack of ſuch phyſicians, prophets, and wizards. But what ſhould I diſcourſe any longer in this wiſe, of that Art which hath paſſed over the wide ocean alſo, and gone as far as any land is to be ſeene, even to the utmoſt bounds of the earth; and beyond which, there is nothing to be diſcovered but a vaſt proſpect of Aire and Water. And verely in Britaine at this day it is highly honoured, where the people are ſo wholly devoted unto it, with all reverence and religious obſervation of ceremonies, that a man would thinke, the Perſians firſt learned all their Magicke from * them. See how this Art and the practiſe thereof is ſpread over the face of the whole earth! and how * thoſe nations were conformable enough to the reſt of the world in giving entertainment thereto, who in all other reſpects are far different and divided from them, yea and in manner altogither unknowne unto them. In which regard, the benefit is ineſtimable that the world hath received by the great providence of our Romans, who have aboliſhed theſe monſtrous and abominable Arts, which under the ſhew of religion, murdred men for ſacrifices to pleaſe the gods; and under the colour of Phyſicke, preſcribed the fleſh to be eaten as moſt holeſome meat.

* As it appeareth by our old Engliſh Chronicles, which write of K. *Arthur*, the knights of the round table, and *Merlin* the prophet or magician.

* No doubt hee meaneth Englād, Scotland, and Irelād, which ſeemed to be ſeparat from the reſt of the world; where, in old time Magicke bare a great ſway, and witches ſtill ſwarm too much.

Chap. II.

The ſundrie kinds of Magicke. The execrable acts of Nero: and the deteſtation of Magicians.

MAgicke may be practiſed after divers ſorts, according as *Oſthanes* hath ſet downe in writing: for it worketh by the means of [1] Water, [2] Globes or Balls, [3] Aire, [4] Stars, [5] Fire-lights, [6] Baſons, and [7] Axes: yea and many other means there be, that promiſe the fore-knowledge of things to come: beſides the raiſing up & conjuring of ghoſts departed, the conference alſo with Familiars and ſpirits infernall. And all theſe were found out in our daies, to be no better than vanities and falſe illuſions, and that by the Emperour *Nero*. And yet was he never more addicted to play upon the cythern, nor tooke greater pleaſure to hear and ſing tragicall ſongs, than to ſtudie art Magicke: and no marveile if he were given to ſuch ſtraunge courſes, having wealth and world at will; and his fortunes beſides attended upon and accompanied with many deepe corruptions of the mind. But amid thoſe manifold vices whereunto hee had betaken and ſold himſelfe, a principall deſire hee had, to have the gods (forſooth) and familiar ſpirits at his commaund; thinking that if he could have attained once to that, he had then climbed up to the higheſt point and pitch of magnanimitie. Never was there man that ſtudied harder, and followed any Art more earneſtly, than he did Magicke. Riches he had enough under his hands, and power he wanted not to execute what he would; his wit was quicke and pregnant, to apprehend and learne any thing, over and beſides other means that he practiſed for to bring about this deſſeine of his, which were ſo intollerable, that the world could not endure them: and yet hee gave it over in the end without effect: an undoubted & peremptorie argument to convince the vanitie of this Art, when ſuch an one as *Nero* rejected it. But would to God he had conferred with familiars and ſpirits, yea and taken counſell of all the devils in hell, for to bee reſolved of thoſe ſuſpicions which were gotten into his head, rather than given commiſſion as hee did to the profeſſed bawds and common harlots in ſtinking ſtewes and brothell-houſes, for to make inquiſition from houſe to houſe after thoſe whome he had in jealouſie. Certes, no bloudie and deteſtable ſacrifices (how inhumane and barbarous ſoever) he could have performed, but they had been far more eaſie and tollerable, than thoſe cruell imaginations which he conceived, and whereupon he murdred moſt piteouſly ſo many good citizens, and filled Rome with their reſtleſſe ghoſts. But to returne again to Art-magick, which *Nero* would ſo faine have learned: what might be the reaſon that he could not reach unto it? Surely theſe Magicians are not without their ſhifts and means of evaſion to ſave the credit of their Art, if haply they miſſe and come ſhort at any time of their purpoſe: For otherwhiles they beare us in hand, that ghoſts and ſpirits will not appeare, nor yeeld any ſervice to thoſe perſons who are * freckled and full of pimples: and haply * *Nero* the Emperor was ſuch an one. As for his lims otherwiſe, he had them all, and ſound they were: beſides, the ſet daies and times fit for this practiſe, and preſcribed by Magicians, he might chuſe at his good will and pleaſure. Moreover, an eaſie matter it was for him to meet with ſheepe, cole-black, and ſuch as had not a ſpeck of white or any other colour; for him (I ſay) who when he liſt could ſacrifice men, & tooke greateſt delight in thoſe ſacrifices. Furthermore, he had about him *Tyridates* the K. of Armenia, a great Magician, for to give him inſtructions. This prince *Tyridates* being vanquiſhed and ſubdued

1 *Hydromantia.*
2 *Sphæromantia.*
3 *Aëromantia.*
4 *Aſtrologia.*
5 *Pyromantia.*
6 *Lecanomantia.*
7 *Axinomantia.*

* *Lentiginoſis.*
* *Suetonius in Nérone: Corpore fuit maculoſo & fœdo:* i. His skin was full of foule ſpots.

A dued by the Romane captains under *Nero*, and forced by their capitulations to present himselfe personally at Rome for to doe homage unto the emperour, travailed thither all the way by land (which was a sore charge to the countries and provinces through which he passed, bringing with him as he did the whole pompe and traine for the triumph over Armenia and himselfe) & came unto *Cæsar*. And why would not this *Tyridates* passe the seas and saile over into Italy the neareſt and most expedit way? Forsooth, so precise he was, that he made a scruple, and thought it unlawfull (as all magicians doe) either to spit into the sea, or otherwise to discharge into it the necessarie excrements that passe from mans bodie, thereby to pollute and defile that Element. Many other magicians he brought with him in his traine. Hee instructed *Nero* in the principles of Magicke, yea and admitted him to their sacred feasts and solemne suppers, & all to enter him into that pro-
B fession: but it would not be: for albeit *Nero* enthronized & enstalled *Tyridates* in his kingdome, and gave him his roialties againe, all would not serve; for never could he receive at his hands by way of remuneration and recompence, the skill of this Science. And therefore we may be fully assured and boldly conclude, That it is a detestable & abhominable Art, grounded upon no certaine rules; full of lies and vanities, howsoever it carrie some shew or shadow rather of veritie: and to say a truth, that certitude which it hath in effecting any thing, proceedeth rather from the devilish cast of poisoning practised therewith, than from the Art it selfe of Magicke. But what needs any man to seeke and hearken after the lies which the Magicians in old time have let flie and sent abroad? When I my selfe in my youth have seene and heard *Apion* (that great and famous Grammarian) tell straunge tales of the hearbe Cynocephalia, which the Ægyptians call
C Osyrites, and namely, that it hath a divine and heavenly vertue, and was a singular preservative against all poisons, charms, & enchantments; but whosoever plucked or drew it out of the ground (saith he) could not escape present death. The same *Appion* reported in my hearing, that he hath conjured and raised up spirits, to * enquire and learne of *Homer*, what countryman born he was? and from what parents descended? mary he durst not report what answer was made againe, either unto him or them.

* *Adsciscitandi Homerum.*

Chap. iii.

Of Mould-warps: and of many other medicines taken from sundrie beasts, which are in their kind either tame or wild: and the same medicines digested according to diseases as they orderly follow.

D

ONe speciall argument this may be, to proove the follie and vanitie of Magicians, because of all other living creatures, they do admire and set greatest store by these wants or mouls, which Nature seemeth to have condemned to perpetuall blindnesse and prison, shutting them up as it were evermore in a darke dungeon, or keeping them rather under the earth, like as they were buried and enterred. And yet for all this, these Wise men give more beleefe to those signes which they spie in their bowels and entrailes when they be opened, than to the inwards of any beast whatsoever. This opinion moreover they have of a mould-warpe, that there is not a creature more capable of religion, and fitter to be emploied in sacrifice and divine service, than
E it: nay they bash not to avouch & warrant, That whosoever swalloweth down all whole the heart of a moule fresh killed, whiles it is yet warme and panting with life in it, shall have the gift of divination, and foretell the event and issue of any businesse in hand. Moreover, they affirme, that the tooth of a mould-warpe taken out of her head whiles shee is alive, is singular to allay the toothach, if it be hanged about the necke or tied to any part of the bodie. They talke of many other wonders wrought by this poore creature, which I purpose to deliver as occasion shall be offered, in place convenient. And yet when they have all said that they can of them, that which carrieth the greatest likelihood and probabilitie, is this, That they should bee good against the biting of these musets or hardishrews, for, as you have heard me say before, the very earth that is pressed down with the wheels in a cart-tract, is proper for that purpose. But to leave these mouls & to follow on still with this maladie of toothach, the said Magicians tell us a medicine made of the ashes
F of a dogs head (dying of madnesse) that it should be passing good therfore, if it be mixed with the oile Cyprinum, and so dropped into the ear on the pained side: howbeit this care would be had, That the said doggs head have no flesh at all sticking to the scalpe or scull, when it is burned and calcined. They say moreover, that the greatest eye-tooth of a dog growing on the left side of his

head ſerveth well for this grievance, if the tooth that is in paine be ſcarrified round about there- G
with. Alſo a bone growing out uf the ridge or chine of a dragon, will do as much; or that of the ſerpent called Enhydris. Now are theſe ſerpents white of colour, and held all to be the male. The greateſt tooth of this Enhydris is thought to be ſingular for to ſcarrifie or to let the painful tooth bloud therwith: but in caſe the teeth in the upper chaw doe ake, they take two of the upper teeth of this ſerpent, and apply them faſt thereto; but contrariwiſe of the neather jaw. They that hunt after crocodiles, uſe to greaſe themſelves with the fat of this ſerpent. Moreover, it is good by their ſaying, to ſcarrifie the gumbs about the teeth with the bones taken out of a lizards fore-head at the full of the moone; with this regard, that the ſame in any wiſe touch not the ground. Some of them there be who make a collution with dogs teeth ſodden in wine untill the one halfe be conſumed, and therewith waſh the teeth that ake: but the aſhes of the ſaid teeth incorporat H
in hony, are ſingular good for little children which have much a doe in breeding their teeth. The ſame medecine is holden to be an excellent dentifrice for to make teeth looke white. If the teeth that ake be hollow, they uſe to put into the concavitie thereof, the ſaid aſhes incorporat in mice dung, or elſe the liver of a lizard dried. Alſo if one that is troubled with tooth-ach, ſet his teeth in a ſnakes heart and bite it, or hang the ſame about the necke or otherwiſe, it is thought to be an effectuall remedie for the ſaid diſeaſe Others there be of theſe magicians, who preſcribe to chew and eat the fleſh of a mouſe twice in a month, and they aſſure us by this means that we ſhall pre-
vent and avoid the tooth-ach. Moreover, it is ſaid, that a decoction of earthworms boiled in oile and poured into the eare on that ſide where the toothach is, doth give great eaſement of paine. The aſhes of the ſame mads burnt, put into the hole of a tooth that is rotten or worme-eaten, I
cauſeth it to fall out of the head with eaſe: and if the teeth that doe ake be ſound, rub them with the ſaid aſhes and the paine will ceaſe. Now the ſaid worms ought to bee burnt or calcined upon a tyle or potſheard. Alſo a decoction of this kind of worms ſodden in ſquilliticke vinegre with the root of a mulberrie tree, is a ſoveraigne medecine to waſh the teeth withall when they be in
*Veneris Labrũ. paine. Furthermore, the little grub or worme which is found in the hearbe Tazill, called * *Venus* Laver, hath a woonderfull operation to cure the tooth-ach, if it bee put into the hole of a faultie tooth: and no marveile, for the caterpillers that breed in coleworts, will preſently fall off if they be but touched with this worme. The punaiſes alſo or wall-lice that come from mallowes, infuſed into the ears with oile roſat, aſſuage the toothach. The ſmall ſandie grit that is found in the horns of ſhell-ſnails, conveighed into an hollow tooth, preſently allaieth the paine. The bare ſhells of K
the ſaid ſnails, hollow as they be and void, calcined and reduced into aſhes, and incorporat with myrrhe, are paſſing good for the gumbs: but the aſhes of a ſerpent burnt and calcined in an earthen pot, with ſalt among, helpeth the tooth-ach, if it be inſtilled into the eare on the contrarie ſide, with oile of roſes. The skin of a ſnake which ſhe hath caſt in the Spring, made hote in oile and the roſin of torchwood, is ſingular in this caſe to be inſtilled into either of the ears, it makes no matter which: ſome put therto frankincenſe and oile roſat. The ſaid ſlough or skin of a ſnake thus prepared and put into an hollow tooth, cauſeth the ſame to fall out of the head without any paine or griefe at all. As touching white ſnakes, how they caſt their ſlough at the riſing or apparition of the Dog-ſtarre, I hold it to be a meere fable; for it was never ſeene or knowne, that they did ſo in Italie: much leſſe therefore is it credible, that in hot countries they ſhould be L
ſo late ere they caſt their ſlough. Moreover, it is commonly beleeved, that the ſaid ſlough kept long and incorporat with wax, draweth out a tooth moſt ſpeedily, if it be applied thereto. Alſo, ſnakes teeth, either worne about the necke or laid to teeth in paine, aſſuage their griefe. Some are of opinion, that a verie ſpider all whole as it is, caught with the left hand, bruiſed and incorporat in oile of roſes, and ſo dropped into the eare of the ſame ſide that the teeth ake, is very good to mitigat the paine. It is ſaid alſo, that if a man take all the little bones of an hen (and ſave thoſe onely of the legs whole that be hollow) and keepe them in the hole or cranie of a wall, and with one of the ſaid bones either hitt the tooth that aketh, or ſcarrifie the gumbe about it, and then preſently caſt it away when he hath done with it, the paine will immediatly be gone. The like ef-
fect hath the dung of a raven, applied hard unto the place within a locke of wooll: likewiſe of M
ſparrows, tempered in oile hot and poured into the eare that is next unto the pained tooth; but ſurely it will cauſe an intollerable itch: and therefore many thinke it a more ſafe and eaſie remedie, to burne young ſparrowes in a fire made of vine-twiggs, and the aſhes that commeth from them to temper with vinegre, and therewith to rub the ſaid teeth.

CHAP.

Chap. iiii.

How to procure a sweet breath. Means to take away the spots that blemish the face: and to amend the infirmities incident to the throat.

A IT is said, that for to rectifie the offence of a strong and stinking breath, and to make it sweet and pleasant, it is good to rub the teeth with the ashes of mice burnt, and incorporat with honey. Some there bee, who mingle therewith the root of fennell. If the teeth be pricked or scraped with a vulturs quill, it will cause the breath to be sowre: but to do the same with the quill or prick of a porkepine, is a singular thing to strengthen the teeth and keepe them fast in the head. As touching the sores in the tongue, or the scabs and little ulcers breaking out about the lips, a de-
B coction of swallows sodden in honyed wine, healeth them: but if the lips bee chapped, there is not a better thing than to annoint them with the grease of a goose or hen. For the same purpose serveth the tried or rindled greace of sweatie wooll, beeing incorporat with the powder of gall-nuts: also the white copwebs that spiders doe weave, or els the little fine ones which they worke under the planks and floors of high lofts, or roufs of housen. * If one chance to burn his mouth inwardly with some scalding broth or otherwise, the milke that a bitch giveth is a present remedie therefore.

* *Si ferventia os intus exusserint:* peradventure hee meaneth the hote sores within the mouth, called *Aphthæ*.

As touching the spots that infect the skin of the face, the foresaid tried grease of wooll unwashed, called œsypum, incorporat with the hony of the Iland Corfica (which of all other is counted most unpleasant and untoothsome) is proper to subtiliat and scoure them: the same also laid
C to the face upon a locke of wooll, causeth the scurfe or scales whereby the skin seemeth to pill, for to fall away: howbeit, some thinke it better to put honey thereto. But say there appeare upon the face any foule and thick morphew that hath pierced deepe into the skin, it is good to rub the same with dogs gall; but first the place ought to be pricked thick with a needle, that the medicine may enter in. If the skin looke wan, or black and blew, take the lights of rams or other sheepe, cut them into thin slices like unto skins, and lay them hot to the place; or els apply thereto pigeons dung. The fat of a goose or hen, is a singular thing to preserve or keepe soft, smooth, and delicat, the skin of the face. As for the ringworms or illfavoured tettars called Lichenes, there is a proper liniment made either of the dung of mice incorporat with vinegre, or the ashes of an urchin tempered with oile. But in this cure, the face ought to be bathed and fomented before with vine-
D gre and salnitre. For to take away any spots or pimples arising in the face, there is not a better thing to apply unto them than the ashes of the little broad snails which are commonly found in every place, incorporat with hony. And in truth, the ashes of any snails whatsoever, are astringent and hot, by reason of a certaine absterfive qualitie that they have; which is the reason that they enter into potentiall cauteries, or caustick and corrosive medicines: and therefore they serve in liniments for to kill scabs, scurfs, mange, and leprosie; yea and to scoure away the foule spots called Lentils. Moreover, I read in authors of certain pismires greater than the rest, called Herculaneæ, the which being stamped with a little salt put unto them, are good for all the infections of the skin mentioned in the former receit. There is a kind of insect or flie called Bupreſtis, passing like unto a long-legged beetle; but seldome or never bee any such found in Italy: kine and oxen
E catch much harme by this flie; for many times as they grase, they licke it up with the grasse and swallow it downe: and hereupon it tooke that name Bupreſtis: for no sooner commeth it to the gall, but it inflameth and setteth the beast into a great heat, whereupon it swelleth untill it burst againe. So corrosive it is (as I have said before) that beeing incorporat with goat sewer, and so reduced into a liniment, it taketh away the tettars called Lichenes that be in the face. The bloud of a vultur [*i.* a geire] tempered with the root of white Chamæleon (I mean the hearb so called) and the rosin of cedar, healeth the leprosie, so that this liniment be covered with colewort leaves. Of the same effect are the feet of locusts braied in a mortar and incorporat with goats tallow. The greace of a cock, capon, or hen, well stamped and wrought with an onion, is singular to scoure the spots and specks of the visage: also the hony wherein a number of bees were stifled and killed, is
F proper for the said purpose: But above all, the greace of a swan is commended both for to cleanse the skin of the face from all flecks and freckles, and also to take away wrinkles. As for the markes remaining after the cauterie or hot yron, there is no better means to take them out, than a plastre of pigeons dung and vinegre. If the rheume cause the mur, the pose, or heavinesse in head, I find a pretie medecine to rid it away, by kissing onely the little hairie muzzle of a mouse.

As touching the uvula and paine of the throat, they may bee both of them eaſed and cured with lambs ordure, which paſſeth from them before they have bitten graſſe dried in the ſhade. The juice or ſlimie humor that ſhel-ſnails yeeld when they be pricked through with a pin or needle, is ſingular good in a liniment for to be applied unto the uvula; provided alwaies, that thoſe ſhailes doe hang after, in the ſmoke. The aſhes that come of ſwallows calcined and burnt, is likewiſe verie ſoveraigne, beeing laid to the grieved place with honey: and in that ſort prepared, it ſerveth alſo for the inflammation and ſwelling of the tonſils or amygdals of the throat. For the ſaid tonſils and other accidents of the throat, a gargariſme of ewes milke is right ſoveraigne. There is a certaine creeper called a * Cheeſlip, which if it be bruiſed or ſtamped, is good for the ſaid infirmities: ſo is pigeons dung gargarized with wine cuit, or applyed outwardly with ſalnitre and dried figs. If the throat be troubled with hoarſneſſe, occaſioned by rheume or catarrhe, theforeſaid ſhell ſnails doe greatly mitigat the ſame infirmitie, beeing firſt ſodden in milke (all ſave the earthie or muddie ſubſtance which they muſt bee cleanſed from) and then given in wine cuit to the patient for to drinke. Some hold opinion, that the ſnails found in the Iſle Aſtypalæa, are the beſt of all others for this purpoſe, but principally the abſterſive ſubſtance that is found in them. The cricquet called Gryllus, doth mitigat catarrhs and all aſperities offending the throat, if the ſame bee rubbed therewith: alſo if a man doe but touch the amygdals or almonds of the throat, with the hand wherewith he hath bruiſed or cruſhed the ſaid cricquet, it will appeaſe the inflammations thereof. To come now unto the Squinancie: a gooſe gall incorporat with the juice of the wild cucumber and honey togither, is a moſt ſpeedie and preſent remedie for it: alſo the brains of an owle, and the aſhes of a ſwallow drunke in water well and hot, is good for the ſaid diſeaſe: But for this medicine we are beholden to the Poët *Ovid*. Note that when I ſpeake of any medicine (for what maladie ſoever) made of ſwallows, the young wild ones are alwaies the better and more effectuall in operatiou: * and thoſe you may know eaſily by the faſhion of their neſts where they doe build: But if you would have the beſt indeed, the young ones of that kind which are called Ripariæ, paſſe all the reſt for medicinable uſes, for ſo are they commonly named which build in the holes of banke ſides. Howbeit, ſome there be who aſſure us, that we ſhall not need to feare that diſeaſe for a yeare togither, if wee doe but eat any young ſwallow, it skills not of what kind ſoever it be. Now the order of calcining them for their aſhes, is to ſtrangle them firſt, and ſo to burne them in their bloud within an earthen veſſell: and the aſhes thus made, is uſually given either wrought in paſt for bread, or els to be drunke: and ſome there be who mingle withall, the like quantitie of the aſhes which come of weazils. And this kind of medicine thus prepared, they give in drinke everie day againſt the kings evill, and falling ſickneſſe. Moreover, ſwallowes kept and condite in ſalt, are paſſing good for the ſquinancie, taken in drinke to the weight of a dram at a time: and it is ſaid, that their very neſt given in drinke, cureth the ſaid maladie. It is a common opinion, that a liniment made with the creepers called Sowes or Multipedes, is moſt effectuall to cure the ſaid ſquinancie. And ſome there be who adviſe to take one and twentie of theſe worms ſtamped, and to give them in one hemine of mead or honyed water for the ſaid diſeaſe; but they muſt be conceived downe the throat by a pipe or tunnell, for if this medicine touch the teeth once, it will doe no good. It is ſaid moreover, that if one drinke the decoction of mice ſodden with vervaine, it is a ſoveraigne remedie for that diſeaſe: as alſo that a leather thong made of a dogs skin put thrice about the necke, will doe the deed. And ſome there be, who in this caſe uſe pigeons dung mixed wrth oile and wine.

As touching the cricks of the nerves or ſinews that ſerve the nape of the necke; as alſo for the cramps that draw the head backward, they ſay, that a twig or braunch of a vine taken out of a puttocks neſt, and carried about one hanging to the necke or arme, is a ſpeciall remedie for the abovenamed accidents.

* *Multipeda.*

* For the martinets or ſwallows called *Apodes*, build not, but lay and breed in chinks and cranies of old walls.

Chap. V.

Medecines for the Kings evill that is broken and doth run: for the pains lying in the ſhoulders: as alſo for the griefe of the bowels about the midriffe and precordiall parts.

THe bloud of a weazill is good for the wens called the Kings evill, when they be exulcerat and doe run: ſo is the weazill it ſelfe ſodden in wine and applied; provided alwaies, that they run

A not by occasion of any launcing or incision made by the Chirurgians hand. And it is commonly said, that to eat the flesh of a Weazill, is as effectuall for the cure. So are the ashes of a Weazil calcined upon a fire made of Vine-twigs, if they bee incorporat with Hogs grease. *Item*, Take a greene Lizard and bind it to the sore; but after thirtie daies you must doe so with another, & this will heale them. Some make no more ado but in a little box of silver keepe the heart of a Weazill and wear it about them. If women or maids be troubled with the kings evill, it were good to make choise of old shell-snailes, and to stampe them shels and all into a plaster or liniment: but especially such as be found sticking to the roots of shrubs and bushes. The ashes of the serpent Aspis calcined, are likewise very good for this disease, if they be incorporat with Buls tallow and so applied. Some use snakes grease and oile together: also a liniment made with the ashes of snakes
B burnt, tempered either with oile or wax. Moreover, it is thought that the middle part of a snake, after the head and taile both be cut away, is very holsome meat for those who have the kings evill: or to drinke their ashes, beeing in the same manner prepared and burnt in a new earthen pot never occupied, marie if the said snakes chaunced to bee killed betweene two cart-tracts, where the wheeles went, the medicine will worke much more effectually. Some give counsell to applie unto the affected place Crickets digged out of the earth, with the mould and all that commeth up: Also to applie Pigeons dung onely without any thing else, or at the most to temper it with Barley meale or Oatmeale in vinegre. Likewise to make a liniment of a Moldwarpes ashes incorporat with honey. Some there be who take the liver of a Moule, crush and bruise it betweene their hands, working it into a liniment, and lay the same to the sore, and there let it drie upon the place
C and wash it not off in three daies. And they affirme, That the right foot of a Moule is a singular remedie for this disease. Others catch some of them, cut off their heads, stampe them with the mould that they have wrought and cast up above ground, & reduce them into cerrain trochisks, which they keepe in a box or pot of tinne, and use them by way of application to all tumors and impostumes which the Greekes call Apostemata, and especially those that rise in the necke: but then they forbid the patient to eat porke or any swines flesh during the cure. Moreover, there is a kind of earth-beetles called Tauri, *i.* Buls: which name they tooke of the little hornes that they carie; for otherwise (in colour) they resemble tickes; some tearme them Pedunculos terræum, earth-lice: These also worke under the ground like wants, and cast up mould, which serveth in a liniment for the Kings evill, and such like swelling, as also for the gout in the feet, but it must not
D be washed off in three daies space. Howbeit, this is to be noted, that this medicine must be renued every yeare, for the said mould will continue no longer in vertue than one yeare. In sum, there be attributed unto these Beetles, all those medicinable properties which I have assigned unto the crickets called Grylli. Moreover, some there be who use in manner & cases aforesaid, the *mould which Ants doe cast up. Others for the Kings evill take just as many mads or earthworms in number as there bee wens gathered and knotted together, and bind the same fast unto them, letting them to drie upon the place: and they are perswaded that the said wens will drie away & consume together with them. There be againe who get a Viper about the rising of the dog star, cut off the head and taile, as I said before of snakes, and the middle part betweene they burne: the ashes that come thereof, they give afterwards to be drunke for three weekes together, every day as much as
E may be comprehended and taken up at three fingers ends: and thus they cure and heale the kings evill. Moreover, there bee some that hang a Viper by a linnen thread fast tied somewhat under the head, so long untill she be strangled and dead, and with that thread bind the foresaid wens or Kings evill, promising unto their patients assured remedie by this meanes. They use also the Sowes called Multipedæ, and incorporat the same with a fourth part in proportion to them, of true Terpentine: and they be of opinion, That this ointment or salve is sufficient to cure any impostumes whatsoever.

*Of which being raised more & more, come Maure-hils, corruptly calleed Moule-hils: for Ants were in old English called Maures: and Moules never cast up such.

As touching the paines that lie in the shoulders, there is a proper medicine made in forme of a liniment, with the ashes of a Weazill tempered with wax, which easeth the same.

To keepe young boies from having any haire growing on their face, that they may seeme al-
F waies young, it is good to annoint their cheekes and chin with Ants egges. Also the marchants or hucksters that buy young slaves to sell them againe for gaine, use to hinder the grouth of hair as well of the visage, as in the armeholes and upon the share, that they may bee taken for young youths still, by annointing those parts with the bloud that commeth from lambes when they be libbed: which ointment doth good also to the armepits, for to take away the ranke and rammish smell

ſmell thereof: but firſt the haire there growing ought to be pulled up by the roots. G

Now that I am come to ſpeake of the precordiall region of the bodie, know this, That by this one word *Præcordia*, I meane the inwards or entrailes in man or woman, called in Latine **Exta*, whenſoever then there ſhall be paine felt in theſe parts or any of them, applie thereto a yong ſucking whelpe, and keepe it hard huggled to the place, doubtleſſe the ſaid greeſe will paſſe away from the part to the puppie it ſelfe, as men ſay: and this hath beene found true by experience in one of thoſe whelpes*ripped and opened alive, and the ſaid bowels taken foorth: for looke what part in man or woman was greeved, the very ſame was ſeene infected thereupon, in the puppie. And ſuch whelpes thus uſed for the curing and taking upon them our maladies, were wont to be enterred with great reverence and ceremoniall devotion. As touching the pretie little dogs that our daintie dames make ſo much of, *called Melitæi in Latin, if they be ever and anon kept cloſe H unto the ſtomacke, they eaſe the paine thereof. And in very truth a man ſhall perceive ſuch little ones to be ſicke, yea, and many times to die thereupon: whereby it is evident, that our maladies paſſe from us to them.

* The bowels, as heart, liver, lights, &c.

**Proſciſſoque vivo*, not *profuſoque vino*.

*Becauſe they were brought from the Iſle Melita, lying within the Sclavonian ſea

Chap. VI.

Of the diſeaſes incident to the lights and liver. Of thoſe that uſe to caſt and reach up bloud at the mouth.

MIce are very good for the infirmities of the lungs, eſpecially thoſe of Barbarie, if they be I firſt flaied, then ſodden in oile and ſalt, and ſo given to the patient for to eat: Thus prepared and uſed, they cure them that either ſpit purulent and filthie matter, or els reach up ſhere bloud. But a diſh of meat made of ſnailes with ſhels, is moſt excellent for the ſtomack. But for the better ordering and dreſſing of them: firſt they ought to ſiver over the fire and take a few waulmes untill they be parboiled, without touching or medling one jot with their bodie: afterwards they muſt bee broiled upon the coales, without putting any thing in the world unto them, and then to bee ſerved up in wine and fiſh pickle or brine called Garum, and ſo eaten. But the beſt for this purpoſe are thoſe of Barbarie. It is not long agoe, that this experiment was found: but ſince it was once knowne, many have done themſelves much good thereby. But (that which I had well neare forgotten) many obſerve to take them in ſome odde number. Howbeit, as holeſome as they are ſuppoſed to be otherwiſe, this diſcommoditie is found by them, That they cauſe K thoſe to have a ſtrong and ſtinking breath that uſe to eat them. Beeing ſtamped without their ſhels, and ſo drunke in water, they helpe them that reach bloud upward. But that you may know that there be degrees of them in goodneſſe. The beſt ſnailes ſimply are they of Barbarie, & namely, thoſe about the quarter neare Soli: Next to them are much eſteemed ſuch as are gathered in the Iſlands Aſtypelæa, and Sicilia, for they are of a meane bigneſſe; for ſuch as bee growne very great, have their fleſh hard, and be void of humiditie. Then are raunged in a third place, thoſe that come from the Baleare Iſlands, called Cavaticæ, becauſe they breed in caves and holes. There be good alſo brought from the Iſlands Capreæ. Holeſome theſe ſhell-ſnailes may be well ynough: but toothſome ſurely they are not, whether they be old kept or new taken. Thoſe that be found in rivers, and which have white ſhels, carie a ranke and ſtrong ſavour with them: ſo do the wild ſort L that are not kept up and fed in ſtewes and pits, and be hurtfull to the ſtomacke, but good to looſen the bellie: even ſo are all the ſort of the little ones. But contrariwiſe, thoſe that breed in the ſea are better for the ſtomacke than others: and moſt effectuall to allay the paines thereof. Moreover, it is ſaid, that they doe moſt good, of what kind ſoever, if they bee ſwallowed downe alive and all whole with vinegre. Moreover, there be of theſe ſnailes called *Ceratæ, of a broad making, and growing in many and ſundrie formes; of whoſe properties and how they are to be uſed, I will write elſewhere in place convenient. The inner skin of a Hen or Capons geſier, preſerved untill it be drie, and reduced into pouder, and ſo put into a cup of drinke like ſpice; the ſame alſo eaten freſh, and newly roſted or broiled, is ſingular for the catarrhes that fall into the breaſt, and for a moiſt cough. Shell-ſnailes punned raw and given in a ſupping with three cyaths of warme M water, ſerve well to appeaſe & ſtay the cough. Take a peece of a dogs skin, and tie the ſame about any one of your fingers, which you will, it ſtaieth all rheumes and diſtillations. The broth made of Partridges, is ſoveraigne to comfort and refreſh the ſtomacke. As touching the greeſe or pain of the liver, it is ſaid, That the fleſh of a wild Weazill, or her liver eaten, is a ſingular meat therefore,

*Haply ſo named, becauſe they have little or no hornes, *quaſi* ἀνδύτων κεράτων.

A fore: ſo be Ferrets roſted in manner of little pigs. The wormes with many feet called ſowes or cheſelips, are very proper for them that draw their wind ſhort; but there muſt be one and twentie of them, neither more nor leſſe, diſſolved in the beſt Atticke honey, and ſo given in drink and ſwallowed downe by a pipe or tunill: the reaſon why they muſt be thus conveighed through ſuch a cane or tunill is this, becauſe looke what cup or boule they ſo touch, they ſtaine the ſame black. Some take of them to the quantitie of one ſextar, and torrifie them upon a pan or platter, untill they looke white and be calcined, and then incorporat them in honey: [there be Latine writers who call this worme Centipeda, as if it had a hundred feet] and then give direction, that they ſhould be taken in hot water. Furthermore, it is ſaid, That if the patient doe either eat or drink for the ſpace of nine daies together one ſnaile hot, ſtamped ſhell and all in three cyaths of wine cuit
B he ſhall find helpe, if he were given either to faint and ſwoune, or to bee lunaticke and to goe beſide himſelfe, or elſe be ſubject to the dizzineſſe of the head. Others give order to take them after another manner, namely, one the firſt day, the morrow twaine, the third day three, the fourth two, and the fift one againe: and in this wiſe they cure thoſe who are ſhortwinded, or have an impoſtume broken within their bodie. There is a kind of Inſect reſembling a Locuſt, but that it hath no wings, which in Greeke is called *Tryxalis; a Latine name it hath not found yet, as ſome doe thinke: and writers there bee not a few, who are of opinion, That it is the ſame that our Gryllus or criquet. Call it what you will: let there be twentie of them torrefied and drunke in honnied wine, it is reported for to be a ſingular medicine for thoſe that cannot take their breath but ſitting upright, and for ſuch as ſpit bloud. There is one writer who ordaineth to take ſnailes unwaſhed,
C and to poure upon them either the Mere-gout of the grape that runneth out firſt without preſſing, or elſe ſea-water, and ſo to boile them therein, and afterwards to eat them for a cough. And the ſame Authour giveth counſell, to pnn them ſhels and all, and to take them with the foreſaid Mere-gout to the ſame effect.

*or Troxalis, according to Ælianus.

Touching inward impoſtumes broken, the hony wherin a number of Bees have ben drowned to death, hath a peculiar vertue to heale them. The lungs of a Vulture burned to pouder in a fire made of Vine-cuttings, given in wine morning and evening, if the patient be free from the ague: ſo there bee put thereto one moietie of Pomegranat flowers, and the flowers of Quinces and Lillies as much of each, is a very ſoveraigne remedie for thoſe that caſt up bloud out of their bodie: but if he be in a feaver, the ſame medicine would be taken in the decoction of Quinces.

D As for the paine of the ſpleene, if we may beleeve the receits and preſcriptions of the Magicians, the patient ought to have the milt or ſpleene of a ſheepe ſpread and laid over the place: but the partie that hath the application thereof, muſt ſay theſe words withall, *This I doe to cure the ſpleene*: Which done and ſaid, the ſame milt of the ſheepe muſt be laid up cloſe and hidden within the wall or behind the ſeeling of the bed-chamber where the ſicke bodie lieth, and ſealed up with a ſignet, for feare it ſhould be taken away: with this charge, that he or ſhee that hath the beſtowing of it, repeat the foreſaid charme nine times thrice over. If a dogs bellie be ripped alive, and the ſpleene taken forth, whoſoever eateth thereof, ſhall find it very good to eaſe them of the
2 ſaid maladie. But ſome content themſelves with laying it freſh and warme to the region of the ſpleene. Others give the ſpleene of a young whelpe but two daies old, in ſquillitick vinegre, to the
E patient, but they make not the patient acquainted with the medicine what it is; or els they miniſter the ſpleene of an Hedgehog in the ſame manner. Likewiſe they give the aſhes of ſhell-ſnails with Lineſeed and Nettle ſeed, putting thereto ſome honey: and this cure they continue untill the patient be throughly whole. It is ſaid moreover, That a green Lizard taken alive, and hanged ſo in a pot juſt before the dore of the patients bedchamber: with this charge, that ever as he goes in and out he touch the ſame with his hand, will worke the ſame effect. The aſhes of a ſcrich-owls head reduced into an unguent with oile, is good for this purpoſe, ſo is the honey wherein Bees were ſtifled: and laſtly a ſpider, but eſpecially that which they call Lycos.

The heart of the bird called a *Houpe, is highly commended for the paine of the ſides. Alſo *Vpupa.
F the aſhes of ſhell-ſnailes boiled in Ptiſane or husked Barley water: and ſome in this caſe applie the ſame otherwhiles in a liniment only without any thing elſe. The aſhes of a dogs head (I mean the bare skalpe or skull only) dying enraged and mad, is good to ſpice a cup of drinke withall for
3 this diſeaſe.

If the loines be pained, it is ſaid, That the ſtarre-Lizards called Stelliones, comming from beyond ſea ſodden in wine together with the ſeed of blacke Poppie to the weight of halfe a denier,

is

is very good, ſo the decoction be drunke: howbeit, this care muſt be had, that the head be cut off G
firſt, and the garbage taken forth. The green Lizards are good meat in this caſe, if they be dreſſed accordingly, and their feet and head cut away: ſo are ſhell-ſnailes, braied ſhels and all together, and ſodden in wine with fifteene graines of pepper. Some uſe the feet and legs of an Ægle in this diſeaſe, pulling them away backward from the knees: and the right foot they applie faſt unto the paine of the right ſide: but the other, if the contrary ſide bee greeved. The many-foot Sowes or Cheeſlips, which I called before Oniſcos, helpe the ſame paines, if they be taken to the weight of halfe a denarius in two cyaths of wine.

To conclude with the Sciatica, the Magicians give order to put an earthworme in a treene or wooden diſh, which having been cleft, was ſtitched up again with yron wier, or bound with a plate or hoope of yron: then to lade up ſome water therwith, & in it to waſh and rince the ſaid worme H
very well, and then to enterre or burie the ſame again in the very place from whence it was digged forth: which done, to give the ſaid water anon to the patient for to drinke out of the ſaid wooden diſh: and this they hold to be a wonderfull medicine.

Chap. VII.

Remedies for the dyſenterie or bloudie flix. And generally for all diſeaſes of the bellie.

THe decoction of a leg of Mutton ſodden in water with Line ſeed, is ſingular good for to be I
ſupped off to ſtay a bloudie flix. So is old Cheeſe made of Ewes milke: and ſheeps ſuet ſodden together in ſome auſtere wine. The ſame is ſingular for the Sciatica paſſio, and an old cough. The ſtarre-Lizard Stellio, which breedeth beyond ſea, being flaied, garbaged, and dreſſed for meat, ſo that the head and feet be taken away, and ſo ſodden and eaten, is commended alſo in this caſe. Moreover, it is ſaid, That two ſnailes and one Hens egg, ſtamped the one as well as the other with their ſhels, and afterwards gently ſodden in a new earthen pot with ſome ſalt and two cyaths of wine cuit, or els with the juice of Dates & 3 cyaths of water given to the patient to drink who is tormented with the dyſenterie or bloudie flix wil bring great alleviation of the ſaid diſeaſe. It is thought alſo, That the aſhes of the ſaid ſhell-ſnailes calcined, if they bee taken in wine with a little roſin, are ſoveraigne therefore. As touching naked ſnailes without any ſhels, they be found plentifully in Affricke. Paſſing good they be for the bloudie flix, if five of them be burnt and cal- K
cined together, with halfe a denier weight of Acacia, and two ſpoonefuls of their aſhes taken in Myrtle wine or ſome other auſtere and aſtringent wine, and a like quantitie of hot water. Some
*Or Affricke. there be who in this ſort uſe all the ſnailes of *Barbarie. Others thinke it better to take five of the ſaid ſnailes of Affricke, or rather as many of the broad and flat ſort, and to clyſterize them for the dyſenterie. But if the flux be exceeding vehement, then they put thereto of Acacia the quantitie of a Beane. It is ſaid moreover, That the ſpoile or ſlough of a ſerpent boiled with oile
*Vlcer of the guts or bloudie flix, roſat in a veſſell of tinne, is ſingular for the *Dyſenterie and *Tineſme, to bee injected by a clyſter: Or if it be ſodden in any other veſſell, yet with an inſtrument or pipe of tinne it is to be con-
*A continuall deſire to the ſtoole, without doing ought. veighed into the fundament, that the tiwill thereby may bee annointed. The broth of a Cocke
*Dolores cœliacorum. Some read Colicorum, i. of the Colicke. cureth theſe infirmities: but if it bee of an old Cocke, it is the more effectuall. And yet if the L
ſaid broth be any thing ſaltiſh, it ſtirreth the bellie and provoketh to the ſeege. The inward skin of an Hens giſier broiled and given with ſalt and oile, doth mittigat and appeaſe the * wrings cauſed by the flux of the ſtomacke. But then this regard muſt bee had before, That neither the Hen have any corne given her, nor the patient feed upon any graine ſome time before. Pigeons dung being burnt, and the aſhes taken in drinke, is of great effect and vertue in theſe caſes. The fleſh of a Quoiſt or Stock-dove ſodden in vinegre, is good both for the bloudie flix, and alſo for the looſeneſſe, proceeding from the imbecillitie of the ſtomacke. The Thruſh or Mavis roſted with Myrtle berries, is ſoveraigne for the dyſenterie: ſo is the Merle or Blacke-bird. In which reſpect, great account alſo is made of the honey boiled, wherein Bees were killed. [Of
*Which is the torture or inflammation of the upper fmal guts. all the paines that be, the *Iliacke paſſion is moſt ſharpe and greevous to be endured. But it M
is ſaid, That the bloud of a Bat, torne and plucked in peeces alive, is verie good againſt it; yea, and if the bellie be annointed therewith, it eaſeth the torment thereof.] But to come againe unto the flux of the bellie, ſhell-ſnalles prepared and made in manner aforeſaid for thoſe that be ſhort-winded, are ſingular good for to ſtop the ſame, and to knit the bodie. So are their

aſhes

A aſhes(if they were burnt and calcined alive)taken in ſome auſtere or aſtringent wine. The liver of a Cocke roſted, together with the skin of the giſier, which ordinarily the cooke caſteth away, dried and kept, and ſo taken with a little of the juice of Poppie mixed with it,is of great power to remedie theſe accidents. Others take the ſame skin whiles it is new and freſh,which they broile and torrifie, for to bee given in wine to drinke. A Partridge broth, yea,and the giſier of the bird alone beaten to pouder and taken in ſome groſſe and aſtringent wine,is ſingular to ſtay a flux of the bellie. The wild Ringdove or Quoiſt,boiled in vinegre and water,is of the ſame effect. The milt of a ſheepe firſt torrified,then pulverized and taken in wine,helpeth much this infirmitie. A liniment likewiſe made of Pigeons dung and honey, is of great vertue,if the patients bellie bee annointed therewith.

B Touching thoſe that have feeble ſtomackes, and cannot concoct and digeſt their meat. It is ſaid, That the maw or giſier of that kind of Geire or Vulture, which is called in Latine Oſſifragus,dried,pulverized and drunke,is right ſoveraign. Nay if the patient doe but hold the ſame giſier in his hand whiles hee is at his repaſt,it will helpe digeſtion. And in truth there be divers that for this cauſe weare theſe giſiers ordinarily about their neckes: but I thinke it not holeſome to do ſo,long,for it maketh them leane as many as uſe it,and ſpendeth their bodie.

To ſtay a flux of the bellie, the bloud of Mallards or Drakes is thought alſo to bee ſingular good. The meat made of ſhell-ſnailes,diſcuſſeth and ſcattereth ventoſities. The milt of a Mutton broiled to aſhes and given in wine,is ſingular good to allay the wrings and torments of the bellie. Of the ſame operation is the wild Quoiſt or Ringdove,ſodden in vinegre and water. The
C greater kind of Swallowes or Martins called Apodes,are no leſſe powerfull,if they be ſodden and taken in wine. The aſhes of the bird Ibis plucked and burnt without his feathers,and ſo given to drinke,worke the ſame effect. But ſtraunge it is and wonderfull,if that be true which is reported as touching this maladie,namely,that if a Ducke be applied alive unto the bellie which is tormented with ſuch wrings,ſhe ſhall draw away the diſeaſe into her own bodie,and die of the torment, but the patient ſhall be eaſed by that meanes. Theſe painefull gripes likewiſe are cured with ſodden honey,wherein Bees ſometimes were drowned to death.

As for the Collicke,there is nothing ſo good to aſſuage the paine thereof,as to eat Larkes, which the Latines name Galeritæ. Howbeit, ſome give adviſe and thinke it better to burne and calcine them in their feathers within a new earthen veſſell,& ſo to ſtampe them to aſhes or pou-
D der,and to drinke therof foure daies together in water by three ſpoonfuls at a time. Others make no more adoe,but take the heart of a Larke,and bind it to the inward part of the thigh: and ther bee againe who would have the ſame to bee ſwallowed downe whole newly taken out of the bird while it is warme. There is a familie of the Aſprenates,men of good qualitie and reputation, for that they had been ſometimes Conſuls of Rome: in which houſe,of two brethren, the one was fully cured of the collicke by eating theſe birds, and by wearing ordinarily the heart of one of them about his arme,encloſed within a bracelet of gold: the other being likewiſe troubled with the ſaid diſeaſe, found remedie by a kind of ſacrifice which hee offered in a little chappell made with unbaked brickes,piled up archwiſe in manner of a furnace: and ſo ſoone as the ſacrifice was finiſhed,he ſtopped up the ſame againe. That Vulture which is called Offifragus,hath one gut of
E a wonderfull nature,for it is able to concoct and digeſt whatſoever the ſaid foule devoureth. And for certaine this is knowne and generally received,that the nethermoſt end therof cureth the collicke,if the patient do but carie it about him. There are other ſecret and hidden diſeaſes incident to the guts,whereof there be wonders told: and namely,that in theſe caſes,if young whelpes before they can ſee be applied for three daies together unto the ſtomacke eſpecially,and the breaſt: ſo that they ſucke milke from out of the patients mouth the while: the ſaid diſeaſe ſhall paſſe into the bodie of the poore whelpes,whereof in the end they ſhall die. Let the ſame be ripped & opened,then will it appeare evidently what the cauſe was of the foreſaid ſecret maladie of the patient: But ſuch whelps ought when they are dead to be enterred and buried. As for the Magicians,they avouch, That if the bellie bee annointed lightly with the bloud of a Bat, the partie thus dreſſed,
F ſhall not need to feare any paine of that part for one whole yeare after: or if it chaunce that one be pained in the bellie,let him(ſay they)endure to drinke the water that runneth downe from his feet when his legs be waſhed,and he ſhall find helpe anone.

CHAP.

G

Chap. viii.

Medicines against the ſtone and gravell: the paines of the bladder. The ſwellings in the cods and the ſhare. Alſo for the biles or botches called Pani.

FOr them that are troubled with the ſtone, it is good to annoint the region of the bellie with Mouſe dung. It is ſaid, that the fleſh of an Vrchin or Hedgehog is very good meat and pleaſant in taſt, if ſo be he were killed outright in the head at one blow, before that hee had time to ſhed his owne urine upon himſelfe: and looke whoſoever eat this fleſh, ſhall never be ſubject to the diſeaſe of the ſtrangurie. The fleſh of an Vrchin killed in this ſort, helpeth the bladder, in H
caſe the urine paſſe by dropmeale from it. But contrariwiſe, if the Vrchin chaunce to wet and drench himſelfe with his owne urine, as many as eat of the fleſh ſhall fall into the infirmity of the ſtrangurie or piſſing dropmeale. Moreover it is ſaid, That earthwormes drunke either in wine or cuit, is of great efficacie to breake or diſſolve the ſtone: as alſo that ſnailes, prepared in that ſort as they are ordained to be dreſſed for ſhortneſſe of wind, worke the like effect. Take ſnailes naked out of their ſhels, and ſtampe them; give three of them unto the patient to be drunke in a cyath of wine the firſt day, two the morrow after, and the third day one againe, you ſhall ſee how it will helpe the ſtrangurie or piſſing dropmeale. But let the emptie ſhels be burnt, the aſhes thereof will ſcoure away and expell the ſtone. Semblably, it is ſaid, that the ſame effect followeth upon
drinking the liver of a water-ſnake: the eating of the aſhes of ſcorpions calcined, either in bread, I
or with locuſts. Likewiſe, to take the little ſtones or grit that be found in the craw of a Cocke, or in the giſier or maw of a Stocke-dove: to beat the ſame to pouder, and therewith to ſpice the drinke, is ſingular good for the infirmitie aforeſaid. To doe the like with the skin of a Cockes or Hens giſier, dried: or if it be new and freſh, to roſt and eat it. Alſo for the ſtone and other difficulties or impediments of the bladder, it is good to take the dung of Quoiſts or Stocke-doves, with Beane meale. In like manner there is much helpe found by the aſhes of Quoiſts feathers, ſuch as be of a wilder kind than the reſt, taken with Oxymell. Moreover, the aſhes of the guts of this bird given to the quantitie of three ſpoonefuls: as alſo the neaſt of Swallowes: and Cricquets infuſed and diſſolved in hot water, are commended for this purpoſe. Some helpe themſelves with the giſier of Oſſifragus dried: others uſe the decoction of Turtles dung boiled in honied wine; or elſe K
the broth of the Turtle it ſelfe. Furthermore, for the difficultie of urine, it is holſome to eat blacke birds, or Merles, boiled with Myrtle berries: or Graſhopers fried in a pan: and to drinke the Sows or Cheeſlips called Oniſcoi, folke make it not ſtraunge to doe themſelves good. But if there bee paine in the bladder, it is ſaid, That the broth made of Lambes feet, is ſoveraigne. If the bodie be bound or coſtive, a Cocke broth cauſeth it to be ſoluble: and the ſame dooth withall lenifie the acrimonie of humors that cauſe the foreſaid greeſe of the bladder. The dung of Swallows likewiſe procureth looſeneſſe of bellie, in caſe it bee tempered with honey to the forme of a ſuppoſitarie, and ſo put up.

Touching the infirmities incident to the ſeat, the tried greaſe of unwaſhed wooll, (whereunto ſome adde Tutie and oile of Roſes) the aſhes alſo of a dogs head are ſoveraign medicines. The L
ſlough likewiſe which a ſerpent hath caſt, applied with vinegre, is good, in caſe there bee chaps and fiſſures in that part. Likewiſe, the aſhes of dogs dung, which looketh white, incorporat with oile of Roſes: and this receit (they ſay) was the invention of *Æſculapius*, and is beſides moſt effectuall to take away werts. The aſhes of Mice dung, Swans greaſe, & the tallow of Ox or Cow, are helpefull for this infirmitie. If the tuill or gut Longaon bee relaxed and hang forth, it is good to annoint the ſame with the moiſture iſſuing forth of ſhell-ſnails that is pricked through with a pin
*Repellit. or needle, for it *driveth it backe againe to the right place. If the ſeat be galled, it is thought that the aſhes of the wood-Mouſe tempered with honey, cureth the ſame: or els the aſhes of an Vrchin, together with the braines of a Bat, Allum, and the greaſe tried out of unwaſhed wooll, will skin it againe. In like manner, Pigeons dung with honey. For the ſwelling blind hæmorrhoids or M
piles called Condylomata, there is a proper remedie, namely, to rub the place with a ſpiders bodie, after the head and legs be caſt away. Againſt the acrimonie and ſharpeneſſe of humors, that they ſhould not fret and burne thoſe parts, there is a faire liniment made with Gooſe greaſe, incorporat with Barbarie wax, white lead, and oile roſat. So is the fat of a Swan. Theſe medicines

alſo

A alſo are ſaid to heale the hæmorrhoids that run.

For the paine of the Sciatica, it is thought that raw ſhell-ſnailes bruiſed are good, if they be taken in Amminean wine and pepper: alſo a greene lizard eaten as meat, without the feet, garbage, and head: ſo is the ſtar-lizard Stellio, but thereto ought to be put the weight of three oboli of blacke poppie ſeed.

For ruptures, inward ſpaſmes and convulſions, it availeth much to take ſheeps gall with breaſt-milke. In caſe the privities have an itch and a fretting humour upon them, or if ſome offenſive werts ariſe in thoſe parts, the dripping or gravie that commeth from a rams lights roſted, doth much good, if the place be therewith annointed. As touching other accidents which happen to thoſe parts, the wooll of a ram calcined and reduced into aſhes, even with all the filthineſſe that
B is therein, is thought to be verie good, ſo that the aſhes be applied unto the affected place with water. The ſewet of the kell of a mutton, but eſpecially that which groweth to the kidnies, incorporat with the powder of a pumiſh ſtone and ſalt, is much commended in this caſe: alſo greaſie and unwaſhed wooll ſoked in cold water, is good to be applied unto the place: the fleſh moreover of a mutton calcined, ſo as the aſhes be incorporat with water. *Item*, the aſhes of a mules houſe: and the powder of caples teeth braied and pulverized, if the grieved place be ſtrewed therewith.

To come lower to the infirmities of the cods: the powder of the bones of a dogs head without any fleſh upon it, pulverized, is ſingular therefore. If it fall out that one of the genetoirs be relaxed and hang down lower than his fellow, it is good to annoint the ſame with the waterish ſlime and ſome that commeth from ſhell-ſnails; for they ſay it is an excellent remedie. If there be any
C foule and maligne ulcers in thoſe parts running with filthie matter, the aſhes of a dogs head freſh killed are ſingular to heale the ſame: ſo are the little broad and flat ſhell-ſnails bruiſed and incorporat with vinegre, if either the ſame or the aſhes be applied thereto: alſo the honey wherein bees have been killed mixed with roſin: the naked ſnails likewiſe which breed (as I ſaid) in Barbarie, in caſe they be ſtamped and incorporat with the powder of frankincenſe and the white of an egg; with this charge, that the ſaid cataplaſme be not taken off in thirtie daies, by which time it will be ready to fall away of it ſelfe. Some in ſtead of frankincenſe, put the bulbous roots of ſmall onions or ſcallions. For thoſe who be troubled with the *waterish rupture, it is thought that the * *Hydrocelicis.*
ſtar-lizards Stelliones be woonderfull good, in caſe their head, feet, and guts, be taken forth, and and the reſt of the bodie roſted: but the patient had need to eat of this meat often, and ſo it helpeth thoſe who cannot hold their water. The like opinion there is of dogs greaſe incorporat with
D *Alume de plume, if the patient take thereof to the quantitie of a bean: as alſo the ſnails of Barbarie burnt, fleſh, ſhell and all, ſo as the patient drinke their aſhes. Furthermore, it is ſaid, that * *Alumine ſchiſto.*
the tongues of three geeſe roſted and eaten, is a ſpeciall remedie for this infirmitie: and *Anaxilaus* is he that deviſed this receit.

Touching the biles called Pani, ſheeps tallow incorporat with ſalt torrefacted, is ſingular good to breake them: but mice dung, with the fine powder of frankincenſe and orpiment or red arſenicke, is as proper to reſolve them: likewiſe the aſhes of a lizard, and the lizard it ſelfe ſplit alive and applied hot thereto. In like manner cheeſlips or ſows ſtamped and incorporat with the right terpentine, to the quantitie of a third part, and ſo brought into a cataplaſme. Some there be
E who unto ſhell-ſnailes punned, add the common bole-armoniacke. Alſo the aſhes of the void ſhels only alone without the ſnails mixed with wax, are of a reſolutive and diſcutient facultie. In like manner, a liniment made either of pigeons dung onely, or els incorporat with barley meale or otemeale. The flies called Cantharides mixed with quicklime, are a good potentiall caurerie, and open ſuch biles as well as the Chirurgians launcet. The botches or ſwellings in the ſhare, a liniment made with the ſmall ſhell-ſnails and honey, doth aſſuage and mitigat. Finally, to keepe downe the veins from ſwelling which be called Varices, it is good to annoint the legs of children with the bloud of a lizard, but this muſt bee done, whiles both the children and the partie who hath the doing thereof, be faſting.

F

Chap. IX.

Receits for the gouts of feet and hands: and generally for the pains or diſeaſes of joynts whatſoever.

THe tried greace of unwaſhed wooll incorporat with womans milke and white lead, is a very proper liniment to mitigat the paine of the gout: ſo is the liquid dung of ſheep when they

run out behind. Their lights likewiſe, or a Rams gall incorporat with their ſuet. Some ſplit Mice, G
and lay them hot to the place. Alſo the bloud of a weazill reduced into a liniment with Plantain:
and the aſhes of a weazill burnt alive, tempered with vinegre and roſewater, and brought into a
thin liniment, ſo that the place affected may be dreſſed with a feather. Others temper wax & oile
of roſes together. And there be again who uſe dogs gall for this purpoſe, but in any wiſe the hand
muſt not touch it, but the place ought to be annointed with a feather: likewiſe hens dung, and the
aſhes of earthwormes mixed with hony, with this charge, that this cataplaſme be not undone or
removed before the third day. Howbeit it is thought better by ſome, to apply the ſame aſhes with
water: but by others to uſe vinegre in meaſure and with moderation, together with three cyaths of
honey, having beforehand annointed with oile roſat the goutie feet. It is ſaid moreover, That to
drinke broad ſnailes, is a ſingular medicine to take away the gout of the feet or the paine of any H
other joint: the manner whereof is to ſtampe two at a time, and drinke them in wine: Some applie
the ſame in a liniment with the juice of the hearb Parietarie: Others content themſelves to bruiſe
them and ſo to incorporat them into a cataplaſme with vinegre. Many are of opinion, That the
gout may bee cured, if the patient uſe oftentimes to take the ſalt, which together with a Viper
was calcined in a new earthen pot: as alſo that it is very good to annoint the feet with Vipers
greaſe. And they affirme conſtantly of a Kite that hath been kept long dried, if the patient reduce
it into powder, and drinke thereof in water as much as three fingers will well take up, it cureth
the gout throughly. But if the feet be full of bloud and ſwollen withall, they uſe Nettles thereto.
Some there be that take the young feathers of a Kite ſo ſoone as they put foorth, and ſtampe the
ſame with Nettles to a liniment. The very dung likewiſe that theſe foules doe meut, ſerveth in I
ſtead of a good liniment to annoint the painefull gout in any joint whatſoever: ſo doe the aſhes
of a weazill or of ſhell-ſnailes burnt or calcined and incorporat either with Amydum or gum
Tragacanth.

If a man have gotten a rap or ruſh upon any joint, there is not a better thing for to cure it than
copwebs: ſome chuſe for this intention, thoſe which be woven by the ſpiders of aſh colour: like as
to uſe the aſhes of Pigeons dung with parched Barly groats and white wine. In any diſlocation of
joints, the moſt preſent remedie that is known, is ſheeps ſuet tempered with the aſhes of womens
haire burnt. This ſuet likewiſe ſerveth well to bee applied with allum to the kibes of the heeles: ſo
*Pura ulcera. doe the aſhes of a dogs head, or of mice dung. But in caſe there be any *ulcer there not yet putri-
fied adde wax thereto, and it will skin up and heale the ſame: and the like effect is wrought by the K
light aſhes of criquets burnt and tempered with oile, or els with the aſhes of the wild wood-mice
mixed with honey: of earth-wormes alſo incorporat with old oile: and laſtly, many applie therto
the ſnailes that be found naked and without their ſhels. And verely, the aſhes of ſuch ſnails burnt
alive, heale all ſores of the feet: howbeit, if the feet be galled and but lightly excoriated, there is
not a better thing for them than the aſhes of hens dung, or pigeons dung incorporat with oile. If
the ſhoe hath rubbed off the skin, or fretted any part of the foot, the aſhes of an old ſhoe-ſole are
ſingular good to heale the ſame: ſo are the lights of a lambe or ram. The pouder of a caples teeth
is a ſoveraigne and ſpeciall remedie for the feet, if there ouſe out any matter from under the nails.
The bloud of a greene lizard healeth the gals under the foot, yea, and cureth throughly the ſore
feet both of man and beaſt, if they be dreſſed therewith. L

As for the cornes and agnels which ariſe about the feet, it is good to beſmeare them with the
*Muli mulæve: Some take *mulus* to be the mule ingendred by a male aſſe & a mare: but *mula*, to be that mule that commeth of an horſe and female aſſe. urine of * mule or mulet, together with the mire in the very place where they ſtaled: alſo with
ſheepes dung. The liver or bloud of a greene lizard applied upon ſome flocke to the place, or up-
on a locke of wooll. Some uſe in that order, earth-wormes ſtamped with oile, or the head of the
ſtar-lizard Stellio, incorporat in oile with a like quantitie of Agnus Caſtus. Laſt of all, others take
Pigeons dung ſodden in vinegre, and lay the ſame to the place.

Touching werts, of what ſort ſoever they bee, there is not a more proper thing to make
them fall off, than to bath them well with the urine, durt and all, of a dog where he lately piſſed:
or to applie thereto a ſalve of dogs dung aſhes and wax: it is not amiſſe alſo to lay to them ſheeps
dung, or to rub them well with Mice-bloud new killed: or to applie a Mouſe ſplit along the mids M
alive: the gall likewiſe of an Vrchin: the head of a lizard, or the bloud: or laſtly, the aſhes of a lizard
calcined: the old ſlough of a ſnake alſo. Laſtly, hens dung incorporat with oile and ſalnitre. If all
theſe medicines faile, begin the cure new again with Cantharides incorporat with wild grapes cal-
led Vvæ taminæ: This is a corroſive, and will eat them out: but when they be thus fretted and ex-

ulcerat,

A ulcerat, the cure muſt be followed with thoſe appropriat means which I have ſet downe before in the healing of ulcers.

Chap. X.

Medicines appropriat for divers and ſundrie diſeaſes which poſſeſſe the whole bodie.

RE turne wee now to the cure of thoſe maladies which are incident not to this or that member, but to the whole bodie. Firſt and foremoſt, the magicians ſay, that the gall of a blacke dogg (a dog I ſay and not a bitch) is a ſingular countrecharme and preſervative againſt all
B ſorceries, enchantments, and poiſons, which may endaunger a whole houſe, in caſe there be a perfume made therewith to purifie the aire therof; yea and to hallow and bleſſe it againſt all ſuch daungers. The like effect (ſay they) wee are to looke for, if the walls of the ſaid houſe be ſprinkled or ſtriked with the bloud of the ſaid blacke dog; with this charge, To burne under the threſhold or dore-ſell at the entrie of the ſaid houſe the genitall member of the ſame dog. Men may marveile well enough at theſe fooleries and abſurdities of theirs: but ſurely wonder leſſe will they thereat, who know what ſtore they ſet by illfavoured ticks, the fouleſt and naſtieſt creatures that be: and why doe they thus magnifie ſo filthie a vermin? becauſe (forſooth) this creature onely of all others hath no paſſage at all for the voidance of excrements, ſucke it never ſo much: and no
C way there is but death with them when they are thus full, but ſo long only as they continue hungrie and faſting: and yet they ſay, that they will endure ſo a long time, even a whole ſeven-night togither with abſtinence and ſparie feeding: mary let them feed ſtill to the full, they will not hold out ſo long, but burſt againe in fewer daies ſpace. Well, this ticke, ſo filthie as it is, and of ſo admirable and ſtraunge a nature in their conceit, they hold to be of exceeding vertue to appeaſe all paines and torments of the bodie whatſoever, in caſe a man take one of them, with the left eare of a dogg, and carrie them hanging to ſome part about him. And more than that; theſe magicians take marks by it, and preſage of the life or death of their patients; for they hold it for a certaine and aſſured ſigne of life, if one having a ticke about him, ſtand at the beds feet where the ſicke man lyeth, and when hee asketh him how hee doth, and where hee is amiſſe &c. if the patient make anſwere readily unto him; but in caſe hee make no anſwer at all, then ſurely hee
D ſhall die, there is no remedie. But take this withall: this ticke muſt be plucked likewiſe from the left eare of a dog, and the ſame dogg ought to bee cole-blacke without any ſpecke of other colour. And *Nigidius* hath left in writing, that doggs will not all day long come neare unto a man nor abide to ſee him, who hath plucked a ticke from an hogg. But to returne unto our magicians: they affirme, that ſuch as be lunatick and beſide themſelves, ſhall come againe to their right wits and ſences, in caſe they be ſprinckled with the bloud of a moule. They avouch moreover and ſay, that if one ſeeth the tongue, eyes, gall, and guts of a dragon in wine and oile, and permit this decoction to coole all night abroad in the open aire, it is a ſoveraigne medicine to chaſe away ſuch bugs, ſpirits, and goblins, wherewith folke be haunted and affrighted in the night ſeaſon, if they bee annointed therewith all over their bodie, morning and evening. *Nicander* wri-
E teth, that whoſoever carrie about them the ſerpent Amphisbæna dead, or no more but the verie skin thereof hanging faſt to any part of their bodies, they ſhall find it to be a moſt ſoveraigne remedie for any through-cold or chilling fitt that hath ſurpriſed them. Nay he ſtaieth not there, but addeth moreover and ſaith, that if the ſaid ſerpent bee bound unto any part of a tree that is to be felled and laid along, the workemen that hew at the bat thereof, ſhall feele no cold all the while; and the tree by that meanes ſhall the ſooner and more eaſily bee cut downe and overthrowne. No marvaile therefore, if this ſerpent aforeſaid dare leave his neſt, and commit himſelfe to the cold weather; for hee ventureth firſt to come abroad, and is to be ſeen above ground before the cuckow begins to ſing. But ſince I have made mention of the cuckow, there comes into my mind a ſtraunge and miraculous matter that the ſaid magicians report of this bird;
F namely, that if a man the firſt time that he heareth her to ſing, preſently ſtay his right foot in the very place where it was when he heard her, and withall marke out the print and juſt proportion of the ſaid foot upon the ground as it ſtood, and then digg up the earth under it within the ſaid compaſſe, looke what chamber or roume of the houſe is ſtrewed with the ſaid mould, there will no fleas breed there.

They ſay moreover, that the fat which is fleeted or skimmed from the broth wherein dormice G
and rats be ſodden, is excellent good for thoſe that be afraid of the palſie, and ſubject thereto:
alſo that Sowes or Cheeſlips called Millipedæ, prepared and taken in drinke, in manner as I ap-
pointed for the ſquinancie, are ſingular for thoſe that find themſelves to be falne into a phthyſick
or conſumption of the lungs: ſo is a green lizard (by their ſaying) ſodden in three ſextars of wine,
untill there be but one remaining, if the patient take thereof a ſpoonfull at a time everie day, un-
till he feele himſelfe wariſhed and fully cured. Others aſſure us of as great effect, by drinking the
aſhes of ſhell-ſnails in wine.

As for the falling ſickneſſe, the tried greace of ſweatie and unwaſhed wooll tempered with a
little myrrhe, ſo that the quantitie of them both ariſe to the bigneſſe of an hazell nut, cureth the
ſame, if it be taken infuſed and diſſolved in two cyaths of wine, preſently after the patient have H
ſwet and be come out of the baine. For the ſame diſeaſe, they ordaine the cullions or ſtones of a
ram which have been kept long and dried, to be reduced into powder to the weight of halfe a de-
nier Romane, and ſo to be taken in water, or els in one hemine of aſſes milke; howbeit with this
charge, That the patient forbeare drinking of wine five daies after, and as many before. Further-
more, they doe highly commend the drinking of ſheeps bloud: likewiſe their gall in milke, but
principally if it be the gall of a lambe: a ſucking whelpe is verie good in this caſe, if it bee taken
with wine and myrrhe; but firſt the head and feet muſt be cut away. Some for this purpoſe drinke
the ſurots or rough werts growing to the leggs of a mule, in three cyaths of oxymell: others give
order to drinke in vinegre the aſhes of the ſtar-lizard Stellion, which breedeth beyond-ſea: and
the tender skin or ſlough of the ſaid lizard (which ſhe caſteth in the ſame maner as a ſnake doth) I
taken in drinke, helpeth much. Some phyſicians are ſo venterous and bold, that they have given
unto thoſe who be ſubject to the falling ſickneſſe, the verie Stellion it ſelfe, after it is rid and clen-
ſed from the garbage or guts, and ſo kept dried; appointing their patients to drinke the powder
therof in ſome convenient liquor, through a pipe of a cane: others appoint it to be roſted upon
a wooden broch or ſpit, and ſo to bee eaten for meat. And ſeeing I have occaſion thus to write
of this Stellio, and the skin thereof, it were very convenient and neceſſarie in this place to ſhew
the manner how the ſaid ſlough (which is growne over him in winter) may be gotten from him
when he hath turned himſelfe out of it, conſidering that he uſeth commonly to devoure and eat
it himſelfe, becauſe it ſhould not doe any man good; for there is not a beaſt again more ſpight-
full to mankind, and envious of our commoditie: inſomuch as this word * Stellio is growne to K
be a reprochfull tearme among us. Well, to meet with this skin of his (as craftie as hee is to be-
guile men of it) they uſe to obſerve in hot ſummer daies, his neſtling hole into which he is wont
to retire himſelfe; and ordinarily they find it to be in ſome hollow crannies about doores & win-
dows, or elſe under vaults and ſepulchres: when they have eſpied where it is, they wait for the
prime of the Spring, they ſet juſt againſt his hole certaine little cages or leaps made of cloven
and ſlived reeds, and the ſame wrought and woven good and thicke: and in very truth, he delight-
teth to get betweene the ſtreights and narrow paſſages of the ſtaves and windings, whereof the
ſaid cages are made, for by means thereof he may the better ſlip himſelfe out of that coat which
cloggeth his bodie and maketh him unweldie: and thus in getting through the ſaid lattices, he
leaveth the ſame behind him: but after he hath thus done, hard beſted he is, for backe he cannot L
the ſame way againe for to eat the ſaid ſlough. Certes, there is not a medicine preferred before
it, for the falling ſickneſſe: and yet good reckoning there is made of the brains of weazils which
have been kept and dried; yea and of the liver ſo prepared, if they be reduced into powder and
ſo taken in drinke: yea their very genetoirs, and bagg or matrice wherein they beare and breed
their young; or their maw likewiſe ſaved, dried, and condite with coriander ſeed, are ſingular
good for this maladie, as I have heretofore noted: and ſo are their aſhes. Some are of opinion,
that it is good eating of them whole as they be, eſpecially the wild kind, without any ſuch prepa-
ring and dreſſing: but others eſteeme ferrets to be as effectuall as they, for the falling evill. More-
over, it is ſaid, that the greene lizard eaten with ſome ſharpe ſauce that quickneth appetit, is ſin-
gular good in this caſe, but the heads and feet muſt be firſt taken away. Moreover, the aſhes of M
ſhell-ſnails togither with line-ſeed and nettle-ſeed, brought into the forme of a liniment with ho-
ney, cure thoſe throughly of this diſeaſe who are all over annointed therewith. But I like better
yet, that for this maladie one ſhould carrie about him the taile of a dragon bound within a bucke
or does skin to ſome part of his bodie, with the ſinews of a ſtag or hind: or els to tie unto the left

arme

* *Stellionatus crimé*, as much as couſenage, or conycatching.

A arme the little ſtones that bee taken out of the craw or giſier of young ſwallows: for it is ſaid, that ſo ſoon as the old ſwallow hath hatched her birds, ſhe giveth them ſuch little ſtones to ſwallow downe: but in caſe this doſe be taken in the verie beginning, and that the firſt time that one is falne of this diſeaſe, there be given unto him for to eat, the young ſwallow that the dam hatched firſt, he ſhall be delivered from it clearely and never have more fits. But at any time after, ſwallows bloud and frankincenſe, or elſe the heart of a ſwallow freſh killed, cureth them that bee ſurprized with this maladie, if they ſwallow the ſame downe. Moreover, it is ſaid, that the little ſtone found in a ſwallows neſt, if it bee but applied unto man or woman that is falne of this ſickneſſe, it will raiſe them out of the fitt, and bring them againe to themſelves immediatly; but if they carrie it tied to any part about them, they ſhall never have fitt againe. Much talke there is
B alſo of a kites liver, that it ſhould be of ſingular operation to this effect, if it be eaten: as alſo of a ſerpents old skin which ſhe hath caſt off, that it will doe no leſſe. The heart of a vultur ſtamped togither with the owne bloud, and given in drinke three weeks togither, worketh wonders in this diſeaſe. So doth the heart of the young bird of a vultur, if the patient weare it about his arme, or hang it at his necke: but then they give counſell, to eat the fleſh of the vultur it ſelfe, and eſpecially when he hath eaten his full of mans fleſh. Some of them ordaine the breaſt of a vultur to be drunke, but it muſt be out of a cup or maſer made of the wood of Certus: & others there be who to this purpoſe cauſe the ſtones of a cocke to be kept and dried, and the ſame to be given unto the patient in water and milke, after hee hath abſtained five daies from drinking wine. To conclude, there have been of them, that preſcribed unto their patients in this caſe, one and twentie of theſe
C ſandie or reddiſh flies (but they muſt be dead ones) for to be taken in drinke: howbeit, if they were but of a feeble complexion, they gave fewer of them.

Chap. XI.

Againſt the Iaundiſe and Phrenſie. Againſt Fevers and the Dropſie.

THe excrement engendred in the eares, called commonly Earewax, mightily withſtandeth the jaundiſe: ſo doth that ordure alſo which gathereth about the udders and teats of ſheep and goats, if the patient drinke thereof to the weight of one denier in two cyaths of wine, with ſome myrrhe though it be never ſo little. The aſhes of a dogs head calcined, taken in honied
D wine: one of theſe Sows or Cheeſlips with many feet, in one hemine of wine: earthworms in honyed vinegre with myrrhe, be all excellent for the ſaid diſeaſe. Moreover, it is ſaid, that a hen with yellow feet is very good therefore; in caſe the ſaid feet be cleanſed and waſhed firſt in faire water, afterwards bathed and rinſed in the wine that the patient is to drinke. The brains of a Partridge, Ægle, or other birds of prey, taken in three cyaths of wine, is very proper alſo therefore. The aſhes of dates; thoſe alſo of the entrails of ſtockdoves, given in honyed wine to the quantitie of three ſpoonfuls, are ſoveraign in this maladie: likewiſe the aſhes of ſparrows burnt in a fire made of vine-wood, worke the ſame effect, if they be taken in mead to the quantitie of three ſpoonefuls. A bird there is called in Greeke Icterus, of the yellow colour which the fethers carrie, which if one that hath the jaundiſe doe but looke upon, he or ſhe ſhall preſently be cured thereof; but
E the poore bird is ſure to die for it: I ſuppoſe that this is the ſame bird which in Latine is called Galgulus.

As for the Phrenſie, it ſeemeth that the lights of a mutton, applied hot round about the head and ſo kept faſt, is ſoveraigne to bring their heads againe into temper, who are beſides themſelves. Say that true it were, that not only the brains of mice given in water to drinke, or the aſhes of a weazill, but alſo the fleſh of an urchin kept in ſalt or dried, are verie good for ſuch as are bereft of their right wits; who will venture to give them theſe medicines, be they never ſo certaine and aſſured? For as touching the aſhes verely of Scritch-owls eyes calcined, (which theſe magicians ſo highly commend for the phrenſie) I take it to bee one amongſt many other of their illuſions, whereby they mocke and abuſe the world. But above all, the courſe that they take in the
F cure of fevers, ſavoureth nothing at all of phyſicke, which indeed is oppoſit to all their rules and proceedings: for they have divided and digeſted the ſame into all the twelve ſignes in the Zodiacke, according as the Sun or Moone paſſeth through any of them: All which, is nothing elſe but a meere mockerie to be rejected and utterly condemned, as I will plainly proove and ſhew to the view of the eye by ſome few examples and inſtances gathered out of many. For in the firſt

place they ordaine, that when the Sun is in Gemini, the combs, the ears, the nailes, and clawes of cocks should be burned, and the ashes thereof tempered with oile, wherewith the sicke persons are to be annointed all over: but if the moone do passe through the said signe, the same cure (say they) is to be done with the ashes that come of their barbs and spurs: whiles either Sun or Moon be in Virgo, the cure doth alter, and is to be wrought with barly corns in the same manner used. But how if either of these two planets be in Sagittarius? then the wings of a Batt must serve the turne. In case the moone be entred into Leo, they employ the leaves and braunches of the Tamariske; mary it must be the tame and garden Tamariske in any case. Lastly, if she be in Aquarius, they prescribe the coles made of box-wood, punned and pulverized. Certes, I purpose not to run through all their Receits: such onely as are found and approoved good, or at leastwaies carrie some shew and probabilitie therof, I am content to set downe: as namely, when they give order for strong odours and perfumes to be applied unto patients lying of a lethargie, for to awaken and raise them out of their dead sleepe: among which peradventure, the stones of a weazill dried and long kept, or their liver burnt, may do some good. And whereas they thinke it convenient to apply hot unto their heads all about, the lungs of a mutton, they speake not altogither besides sense and reason. G H

As for quartane agues, forasmuch as it is often seene, that all the physicke that is used about them doth little good or none at all, be a physician never so Methodicall, Rationall, & Diligent, yea though he visit such patients ordinarily, and bee present with them by their bed sides: in that regard I will not sticke to relate many of their medecines and receits for this disease; beginning first with those that are locall, and outwardly to bee applied, hanged, or worne about any part of the bodie. *Imprimis*, they say, that the dust or sand wherein any hawke or bird of prey hath basked or bathed her selfe, is singular good for the quartane ague, if the patient weare it in a linnen cloth tied with a red thread. *Item*, the longest tooth in the head of a cole-blacke dog, is very proper for this purpose. There is a kind of bastard wesps, which the Greeks thereupon call Pseudospheces, and ordinarily they doe flie alone, and not in troups as others doe; which, if they bee caught with the left hand, and hanged about the necke under the chin, do cure quartans, as some magicians say: howbeit, others attribute this effect to one of these wesps, which a man saw first the same yeare. Cut the head of a viper off, or take out the heart alive, and wrap the one or the other within a little linnen rag, and carrie it about you, the quartan ague will bee gone anon, by their saying. Some of them take onely the little prettie snouts end of a mouse, or the very tips of the ears, and enjoyne the patient to lap the same in a red carnation coloured cloth, and so to carie it about him; but then the mouse must in any case bee let goe againe and not killed. Others plucke out the right eye of a green lizard alive; which done, within a while after they chop off the head: then they enfold them both in a peece of goats skin, & give the patient in charge to have the same about him. And many there be, who by the direction of magicians carrie about them in like manner for the same purpose, one of these flies or beetles that use to roll up little balls of earth: and in very truth, in regard of this kind of beetle, the greater part of Ægypt honour all beetles, and adore them as gods, or at leastwise having some divine power in them: which ceremoniall devotion of theirs, *Appion* giveth a subtill and curious reason of; for he doth collect, that there is some resemblance between the * operations and works of the Sun, and this flie: and this he setteth abroad, for to colour and excuse the superstitious rites of his countreymen. Howbeit the magicians employ in the cure of a quartan ague, another kind of them * which hath little horns turning backward, but they must be gotten likewise with the left hand, or els they will doe no good. As for the third sort, spotted with white, and called in Latin by the name of Fullo, they appoint one of them to be slit through in twaine, and the two peeces to be tied to both armes of the patient; whereas those of other kinds, they bind to the left arme onely. Semblably they say, that the heart of a snake taken out of her bodie alive with the left hand, cureth the quartan, if the patient carrie it about him: as also, that whosoever taketh foure of the knots or joynts of a scorpions taile, togither with the sting, and carrieth the same about him enwrapped within a peece of black cloth, with this charge, That for three daies space he do not see either the scorpion which was let goe, nor the partie who tied the said cloth and that which is within it about him, he shalbe delivered from the quartan ague: but after the returne of the third fit, the patient must hide this clout and the joynts aforesaid, and burie them in the ground. Some there be who lap a caterpiller in a little peece of linnen cloth, and bind the same thrice about with linnen thread, making I K L M

three

*Haply, because all these beetils be coũted of the male sex, & none of them female: for in those little roundles of earth there breed grubs, which turne to be in the end beetles.

*This beetle he called before *Taurus*, i. Bull.

A three knots thereof, ſaying at the knitting of every knot, that this they doe to cure him or her of a Quartane feaver. Others carie about them a naked ſnaile in a little peece of fine leather: or elſe foure heads of ſnailes cut off and encloſed within a ſmall reed. Many think it better to enfold one of theſe ſowes or cheeſlips within a locke of wooll, and ſo to carie it about them against the quartane, or els the little grubs or wormes whereof come the Oxe flies, before their wings bee growne. And there be that for this purpoſe fit themſelves with thoſe ſmall wormes covered all over with a kind of downe or cotton, which are found in thickets, & among buſhes or ſhrubs. Some of theſe Magicians give direction otherwhiles to take foure of the ſaid wormes encloſed within a Walnut ſhell, and to bind them to ſome part of the patient, or elſe the ſnailes which be found naked without their ſhels. Others put a live Stellion or ſtarre-Lizard in ſome little caſket or box, and lay
B the ſame under the pillow or boulſter where the patient laieth his head: but when the ague beginneth to decline and is like to goe away, they let the ſaid Stellion goe againe at libertie. They preſcribe likewiſe to ſwallow downe the heart of a ſea gull or cormorant, taken forth of the bodie without any knife or inſtrument of yron: If not ſo, to keepe the ſame dried, to beat it to pouder, and then to drinke it in hote water. The hearts of Swallowes condite in hony, and ſo eaten, be excellent good for the Quartane ague, as our Magicians ſay. And yet ſome of them make no more adoe, but give of their dung to the weight of one dram, in three cyaths of Goats milke and Ews milke, or elſe of wine cuit, before the acceſſe come. Howbeit, others would have the Swallowes themſelves to bee eaten whole without any dreſſing at all. The people of Parthia drinke for the Quartane ague the ſixt part of a denier weight of an Aſpis skin, with the like poiſe of Pepper, and
C they hold it to be a ſoveraigne remedie. *Chryſippus* the Philoſopher was of opinion, and ſo hee hath put downe in writing, That to carie one Phryganium tied to ſome part of the bodie, is excellent for the Quartane. But what living creature hee ſhould meane by that ſame Phryganium, neither hath he himſelfe deſcribed, nor ever could I meet with any man that knew it: howbeit, I thought it good to ſet downe this remedie, being thus delivered by ſo grave an Authour as *Chryſippus* was, to ſtir up the diligence of others, if haply there be any ſo induſtrious as will take pains to ſearch further into the thing, and learne what it might be.

In any of theſe long diſeaſes which be called Chronique, it is commonly thought, That to eat the fleſh of a Crow, and to applie unto the bodie their *neaſt, is moſt excellent to bring them to an end. *Nidum.* Some read *Nitrum.*

D As for Tertian agues, it were an eaſie matter to trie the experiments of ſuch receits as are given out for them: conſidering how the poore patients in hope of eaſe are willing ynough & delighted to be doing and working concluſions: and namely to ſee whether the copweb, neaſt and all, of that ſpider which they call *Lycos, incorporat with roſin and wax, and ſo applied as a frontale to the forehead and temples on both ſides of the head, will doe any good to rid them away? Certes ſome uſe to wear about them the ſpider it ſelfe, encloſed within a quill or peece of a reed: in which ſort it is reported to availe much in the cure of other feavers. Alſo it is thought, That a greene Lizard hung about the neck alive in ſome box ſufficient to receive it, is as effectuall. And theſe kind of medicines they affirme to bee of great efficacie for to drive away thoſe agues which by way of relaſpe uſe often to returne againe when they were thought to be cleane gone. *i. Wolfe. Supposed to be our common ſpider that hunteth flies.

E Touching the dropſie, the tried greaſe of ſweatie wooll taken in wine with a little Myrrhe, ſo that the whole ariſe to the quantitie of an Hazell nut, is ſuppoſed to be a ſingular receit. But ſome put thereto Gooſe greaſe alſo and oile of Myrtles. The filthie ordure that gathereth about Ewes udders, hath the ſame effect. Likewiſe, the fleſh of an Vrchin long kept in pouder or otherwiſe, and eaten, doth much good. To conclude, it is thought, That if the bellie be rubbed well and annointed with that which a dog dooth uſe to caſt by way of vomit, it helpeth thoſe that bee in a dropſie, for it is reported to have a ſpeciall vertue to draw a water, and to drie up the ſuperfluous humiditie engendring that diſeaſe.

Chap. xii.

F *Medicines for S. Anthonies fire, carbuncles, fellons, burnes, crampes, or contractions of ſinewes.*

THe ſuet or greaſe of unwaſhed wooll incorporat with oile of Roſes and Tutie, is a proper liniment for S. *Anthonies* fire: ſo is the bloud of a tike, and earth-wormes reduced into an unguent with vinegre: but eſpecially theſe cricquets, cruſhed and wrought within ones hand

hand to the conſiſtence of an unguent and ſo applied. And this medicine laſt mentioned, is paſſing effectuall for the partie himſelfe that hath the handling of it: for it aſſureth him aforehand, that he ſhall not fall into the ſaid diſeaſe in a whole yeare following: But this Cricquet muſt bee digged out of the ground with ſome inſtrument of yron, and the earth & all to be taken up with it, for to ſerve in this cure. Moreover, it is ſaid, That Gooſe greaſe is very good in this caſe: ſo are the aſhes of a Vipers head kept dried and then calcined, if the ſame be afterwards applied in form of a liniment with vinegre. The old ſloughs that ſnakes caſt off, reduced into an unguent with Bitumen and Lambes ſuet, quencheth this burning humor of S. *Anthonies* fire, if the bodie be annointed therewith tempered in water, preſently after the baine. G

As for Carbuncles, the means to rid them away, is to annoint them either with Pigeons dung alone, or els mixed with Line ſeed and honied vinegre. Likewiſe, it is good to make a caraplaſme of thoſe Bees which have beene drowned or killed in their owne honey, and lay the ſame upon the ſore. Others applie unto them either a pulteſſe of fried Barley groats, or elſe a pouder made with their meale. If there be a carbuncle riſen in the privities, the fattineſſe of greaſie and unwaſhed wooll, incorporat in honey and the skales refuſe or cindres of lead, into a ſalve, cureth it: and the ſame healeth generally all other botches or ulcers in thoſe parts. Sheepes dung that is freſh and greene, they hold to be ſingular for carbuncles, taken in the very beginning. H

All tumours and hard ſwellings, which had need to be mollified, are made ſoft and brought downe moſt effectually with Gooſe greaſe, or the fat of a Swan.

Moreover it is ſaid, That a ſpider laid to any fellon, before it bee once named what thing it is, cureth the ſame; but it muſt not bee remooved from the place before the third day. The Mouſe called an Hardiſhrew hanged up alive untill it be dead, is very good for theſe fellons, in caſe it touch not the ground afterward, and that there bee three circles or turnes made with it round about the ſore; ſo that withall both the patient and the partie that hath this cure in hand, ſpit upon the floore three times in the doing thereof. Alſo the dung of Cocke or Hen (that which looketh reddiſh eſpecially) tempered with vinegre and laid to a fellon, healeth it; but the ſaid dung ought to be freſh and newly meuted. Of the ſame operation and effect is the giſier of a Storke boiled in wine. Some there be that take certaine flies of ſome odde and uneven number, bruſe and worke them into the conſiſtence of a ſalve, with their *ring-finger, and therewith applie them to the fellon. Others uſe for the ſaid purpoſe the filth engendred in ſheeps eares. Old ſheeps tallow mixed with the aſhes that come of womens hair, reduced into a liniment, ſerveth to cure the ſaid accident: ſo doth Rams ſuet mixed with the aſhes of a pumiſh ſtone calcined, and a like quantity in weight of ſalt. I K

*Medico, i. the fourth or next to the little finger.

As for burnes and ſcaldings, the aſhes of a dogs head burnt, are ſingular good to cure the ſame: ſo be the aſhes of Dormice tempered with oile: ſheepes treddles alſo mixed with wax: the aſhes of mice and ſhell-ſnailes; and this medicine will skin them ſo cleane, that there ſhall no ſcar remaine afterwards to be ſeene. In like manner, the greaſe of Vipers: or the aſhes of Pigeons dung calcined and reduced into a liniment with oile.

Touching the nodoſities of the ſinewes, the aſhes of a Vipers head burnt and brought into an unguent with the oile Cyprinum, is thought to bee a ſoveraigne medicine for to reſolve them. Likewiſe, earth-wormes made into a cataplaſme with honey, and ſo applied unto the affected place. But if the ſaid ſinewes doe ake and be pained: bind unto them the ſerpent called Amphisbæna dead, and it will eaſe the greefe. The like effect you may looke for of Vultures greaſe, together with the giſier of the ſaid foule, dried and ſtamped with old ſwines greaſe or lard, and ſo reduced into a liniment. And if wee may give any credit to the Magicians, a drinke made of honied wine, ſpiced with the aſhes of a Scrich-owles head, together with a Lillie root, will worke the ſame effect. L

In contractions of the ſinewes, it is good to eat the fleſh of Stock-doves, eſpecially if the ſame hath been poudered and kept in ſalt. The fleſh likewiſe of an Hedgehog is as good for crampes and ſpaſmes: as alſo the aſhes of a Weazill. The old ſlough that ſnakes leave off, enfolded within a peece of a Buls skin or leather made thereof, is good to be worne tied about one for to prevent this diſeaſe: and more particularly for thoſe ſpaſmes or convulſions that draw the ſinewes of the necke ſo, as the head is plucked backward, there is not a better medicine than to drink the poiſe of three oboli of a Kites liver dried, in as many cyaths of mead or honied water. M

When the skin turneth up about the roots of the nails, or the excreſcence of the fleſh putteth

the

A the fingers to paine, which accidents be called in Latine Reduviæ, and in Greek Pterygia: it were good to uſe to them the aſhes of a dogs head calcined, or the matrice of a bitch ſodden in oile; with this charge, to annoint them aloft with a liniment of butter, made of ewes milke and honey incorporat together. The burſe likewiſe or little bladder, which containeth in it the gall of any beaſt, is good for this purpoſe.

If the nailes bee ragged and rugged, it is not amiſſe to applie unto them Cantharides incorporat with pitch, without removing this plaſtre before the third day: or els to lay unto them Locuſts fried in Goats ſuet: ſheeps tallow alſo is good therfore. Some mix therwith Birdlime made with Miſſelto and Purcellane tempered together: others take Verde gris or ruſt of braſſe and the foreſaid birdlime, but they remove not the plaſter off in three daies.

B

Chap. xiii.

Receits for ſtaunching bloud: repreſsing or ſmiting backe the ſwelling incident to wounds: healing of ulcers and greene wounds: and generally for curing of many other maladies. Remedies all taken from dumbe creatures.

THe ſuet that commeth from the kell of a Mutton, ſtaieth any flux of bloud, if it be conveied into the place from whence it iſſueth: ſo is their rede, eſpecially if it be the rennet of a yong Lambe tempered with water, either drawne up into the noſthrils or poured into them: this C is thought to bee ſuch a ſoveraigne remedie, that when all others have failed, it hath done the deed. The earthie ſubſtance ſticking to ſhell-ſnailes, hath the ſame effect: yea, and their verie fleſh when they are pulled out of their houſes. In caſe the noſe do bleed exceſſively, take the ſaid ſhell-ſnailes, bruiſe them and lay them to the forehead, they will ſtaunch the bleeding: the cop-webs alſo put up into the noſthrils. As for the braines of a Cocke or Capon, they ſtop a flux of bloud iſſuing from the braine. But ſay that bloud doe guſh immoderatly out of a wound: it is wonderfull how the aſhes of horſe dung, together with eggeſhels, will ſtop the ſame, if it be laid thereto.

As for *wounds, the greaſe of unwaſhed wooll, incorporat with the aſhes of torrified and calcined Barley and Verdegris, of each a like quantitie, and ſo made into a plaſtre, healeth them. D The ſame is a ſoveraigne ſalve for any corroſive ulcers, be they never ſo maligne and cankerous. It eateth and conſumeth the dead fleſh about the brims and edges of ulcers, yea, & bringeth down the excreſcence of proud fleſh, reducing the ſame to bee even with the reſt about it. The ſame doth incarnat likewiſe and skin the place after it is filled up with young fleſh. If the ulcers proove to be illfavoured cankers, it is thought, That the aſhes of ſheepes dung mixed with ſalnitre, is an effectuall pouder for the ſame: and as great operation is attributed to the aſhes of a Lambs leg bones, but principally if the ſaid ſores bee of the nature of *Nunquam ſana*, and will not skin up, but ſcorne all healing plaſtres whatſoever. Much vertue alſo is attributed unto Rams lights in theſe caſes; for it eateth away all the excreſcences of ranke fleſh in ulcers, and there is not the like againe unto it, for reducing all unto an equalitie. The very dung alſo of ſheepe heat under an E earthen pan and afterwards wrought into a maſſe or paſte, aſſuageth the tumour of any ulcers: And it ſerveth likewiſe to mundifie and heale fiſtulaes, as alſo to rid away the chil-blanes or bloudie fals, which are our night-foes. But of all other, the aſhes of an horſe head is moſt forcible in this caſe, for it conſumeth all ſuperfluous fleſh growing in ſores, and healeth up the ſame afterwards, no Spodium better. And yet it is ſaid, that Mice dung is very good therefore: like as the aſhes of Weazils dung. The hard calloſities in the bottome of ulcers, the Cheeſlips or Sowes if they be ſtamped freſh and reduced drie into pouder, doe ſearch throughly: like as all cankers alſo they cure, if they be incorporat with the right Terpentine and common *Bole-Armoniacke. And theſe medicines aboveſaid are ſingular for thoſe ulcers that be given to breed wormes, and thereby are daungerous. And ſeeing I am light upon the mention of wormes, it would be noted, F that there bee diverſe ſorts of wormes which have wonderfull properties in theſe caſes: For firſt and formoſt, the groſſe and fat wormes breeding in wood & timber, which the Latins call Coſſi, are ſoveraigne healers of any ulcers whatſoever. But if the ſame bee burnt with an equall weight of Anniſe ſeed, and reduced into a liniment by the meanes of oile, they have a ſpeciall vertue to cure thoſe ſores that be corroſive, which the Greekes call Nomæ. Earthwormes are great heaters, and

**Vulneribus.* Some read *Viceribus*, i. Vlcers.

**Sinopide*: ſome take it for *Terra Sigillata*: but it skilleth not much, ſeeing that *Rubrica Sinopica*, *Terra Sigillata*, & *Bolus Armena*, yea, and *Terra Lemnia*, little differ in operation, *niſi ſum magis & minus*, as the learned thinke, *Vide Encelium de re Metallia.*

and ſoone do ſouder greene wounds: in which operation they are ſo effectuall and ſpeedie withall, That if the ſinewes bee cut quite aſunder, it is a common opinion, that they will conſolidat and unite them againe in leſſe ſpace than a weeke: and therefore, becauſe they ſhould bee readie and ever at hand, many preſerve them for this purpoſe condite in hony. Indeed, when they be reduced into aſhes, they are effectuall to eat down the hard callofities growing in the ſides and edges of ulcers, if they be incorporat with Tarre, or the Sicilian honey called Hyblæum. Some uſe them dried in the Sun and tempered with vinegre, for wounds: but this cataplaſme they doe not remove untill two daies be paſt. After the ſame manner, the terrene or earthly ſubſtance of ſhell-ſnailes doe much good: yea, and taken forth whole as they bee out of their ſhels, ſtamped and ſo applied, they conglutinat greene wounds, and ſtay the running farther of corroſive ulcers. Alſo there is a certaine living creature, which is called Herpes by the Greekes; the ſame hath a peculiar propertie to heale any ſore that *runneth on ſtill and corrode as it goeth. For which kind of ulcers, ſnailes, bruiſed ſhels and all, bee paſſing good: and the ſame incorporat with Myrrhe and Frankincenſe, have the name to heale ſinewes that be cut in twaine. Moreover, the fat of a Dragon dried in the Sun, is very effectuall: like as the braines alſo of a Cocke, to heale green wounds, if the patient withall eat ſalt to his meat, which was calcined together with Vipers fleſh: And by this meanes (they ſay) that any ulcers will ſooner yeeld unto the cure, and bee healed with more ſpeed. The renowned Phyſician *Antonius Muſa*, having certaine patients in cure under his hand, who had ulcers that were thought incurable, preſcribed them to eat Vipers fleſh; and wonderfull it is how ſoone he healed them cleane by that meanes.

G

H

*Which alſo is called Herpes: as the ſhingles, wild fire and wolfe.

The aſhes of certain Locuſts without wings, called by the Greeks Tryxalides, cauſe the thick roufes and eſcarres that grow about the brims of ulcers to fall off, and they conſume the hard callofities thereof applied with hony. The aſhes likewiſe of Pigeons dung tempered with Orpiment or Arſenicke and Honey, ſerve as a corroſive to eat away any excreſcence that ought to bee conſumed. The braines of Scrich-owles incorporat with greaſe, dooth wonderfully conglutinat anie wounds. As for thoſe morimals, named by the Greekes Cacoëthe, the aſhes of a Rams ſhanke-bones and legs mixed with breaſt milke, is ſingular to heale them, ſo that the ſaid ſores were firſt well and throughly waſhed and bathed with fine linnen cloaths ſoked in ſome convenient liquor. There is a bird called an Hulat, which if it be ſodden in oile and ſo reſolved, is good therefore, in caſe the ſame bee incorporat in butyr made of Ewes milke and honey. If the ſides or brims of any ulcer be growne callous and hard, the Bees that are ſtifled and killed in honey, doe mollifie very well. The bloud and aſhes of a Weazill calcined, doe cure the white filthie leproſie called Elephantiaſis. The wounds occaſioned by whipping and ſcourging, the markes alſo and wales remaining to be ſeene blacke and blew after ſuch laſhes and ſtripes, are done away and goe preſently out, with applying thereto a ſheepes skin freſh and newly flaied. If there be any joint bruiſed or cracked, the aſhes of a ſheepes leg bone, burnt, have a ſpeciall vertue to helpe the ſame: but much better, if they be incorporat into a cerot with wax. Of the ſame operation there is another plaſtre made, namely, If there be calcined with the former the jawes of the ſaid ſheepe, and a Harts horne: and if the wax be ſoftened and reſolved with oile roſat. When bones be broken, it is good to applie unto the fracture the braines of a dog ſpread upon a linnen cloth or enwrapped therein, covering the ſaid cataplaſme with wooll laid aloft, and the ſame eftſoones moiſtened and wet throughly [*in ſome aſtringent liquor:] This manner of cure doth ſouder them lightly in foureteene daies at the fartheſt. The aſhes alſo of field-Mice worke the like effect as ſpeedily, if the ſame be tempered with honey, or mingled with the aſhes of earthwormes: which alſo is able to draw forth ſpils of bones, and make them to worke out. The lights of a Mutton and of a Ram eſpecially, reduce skars to their lively colour againe, ſutable unto the skin about: their tallow alſo mixed with ſal nitre: ſo doe the aſhes of a greene Lizard: the ſlough that ſnakes caſt off in the Spring boiled in wine: and Pigeons dung tempered with honey, and ſo applied. The ſame medicines doe take away the filthie white Morphew, called in Latine Vitiligo, if they bee uſed with wine: for which Morphew or infection of the skin, it is good to applie Canthárides, with twice as much of Rue leaves, which the patient muſt endure and abide, lying ſtill upon the place in the Sunne, untill ſuch time as the skin begin to riſe in pimples and little bliſters. Afterwards it is needfull to foment and bath the ſaid place thus offended, yea, and to annoint it well with oile: which done, to return again to the former emplaſtration, & ſo hold on this courſe by turnes for many daies together, but in any wiſe to take heed that the exulceration by this cure

I

K

L

*As oile of roſes, or red wine.

M

goe

A goe not over deepe. For the ſame Morphew, many give order to make a liniment with flies & the root of dockes, and herewith to annoint the places infected with this Morphew: alſo, to applie thereto hens dung, I meane as much thereof as is white: for which purpoſe they keepe the ſame in oile within horne boxes, for to ſerve the turne as need requireth. Likewiſe, to annoint them with the bloud of bats, or the gall of an urchin tempered with water. As for the running skals, the braines of a ſcritch-owle is very good, incorporat with ſalt petre: but dogs bloud hath no fellow to repreſſe the ſame: like as to kill the itch, the little broad ſnailes ſtamped and brought into a liniment, are ſoveraigne. If there bee any ſpill or ſhiver of arrowes, if any peece of a dart or whatſoever elſe ſticke within the fleſh, which would bee gotten forth, ſplit a live mouſe in the middeſt, and lay the ſame hot to the place, you ſhall ſee how it will draw the ſame out. But a Li-
B zard paſſeth all the reſt, being in this wiſe ſlit along and divided: or if the head onely be ſtamped with ſalt, and applied accordingly. There be certaine ſhell-ſnailes that creepe in troupes together for to devour the young ſpring and greene leaves of plants, which ſerve to this effect, if they bee punned with their ſhels and laid to the place. Thoſe alſo that we uſe to dreſſe and eat, if they be taken forth of their ſhels: but if you put thereto the rennet of a young hare or leveret, it is woonderfull to ſee how effectually they will worke. Snakes bones incorporat with the rennet of any fout footed beaſt whatſoever, within leſſe than three daies ſhew the ſame effect, and draw foorth any thing that ſticketh within the bodie. Finally, the flies called Cantharides are much commended for this operation, if they be ſtamped and incorporat with barley meale.

C

Chap. xiiii.

Proper remedies for the cure of womens maladies: and to helpe them for to goe out their full time, and bring forth the fruit of their wombe fully ripe and accompliſhed.

THe skin or ſecundine which an Ewe gleaneth after ſhee hath yeaned, and which enlapped the lambe within her bellie, prepared, ordered, and uſed (as I ſaid before) as touching goats, is very good for the infirmities that properly be incident unto women and occaſioned by their naturall parts. The dung likewiſe of ſheepe, bee they rams, ewes, or weathers, hath the ſame operation. But to come unto particulars, the infirmity which otherwhiles putteth them
D to paſſe their urine with difficultie and by dropmeale, is cured principally by ſitting over a perfume or ſuffumigation of Locuſts. If a woman after that ſhe is conceived with child, uſe eftſoons to eat a diſh of meat made of cock ſtones, the infant that ſhe goeth with ſhall prove a manchild, as it is commonly thought and ſpoken. When a woman is with child, the meanes to preſerve her from any ſhift and ſlip that ſhe may tarie out her full tearme, is to drinke the aſhes of Porkepines calcined: alſo the drinking of a bitches milke maketh the infant within the wombe to come on forward and to grow to perfection, before it ſeeke to come forth untimely. Alſo, if the child ſticke in the birth, or otherwiſe make no haſt to come foorth of the mothers bodie when the time is come: the skin wherein the bitch bare her whelpes within her bodie, and which commeth away from her after ſhe hath puppied, haſteneth the birth, if ſo be it were taken away from her before it
E touchee the ground.

If women in labour drinke milke, it will comfort their loines or ſmall of the back. Mice dung delaied and diſſolved in raine water, is very good to annoint the breaſts of a woman, newlaid, for to breake their kernell, and to allay their overmuch ſtrutting preſently after childbirth. The aſhes of hedgehogs preſerveth women from abortion or untimely births, if they be annointed with a liniment made of them and oile incorporat together. The better ſpeed and more eaſe ſhall thoſe women have of deliverance, which in the time of their travaile drinke a draught of Gooſe dung in two cyaths of water: or elſe the water that iſſueth out of their owne bodie by the naturall parts a little before the child ſhould bee borne, and that out of a weazils bladder. A liniment made of earth-wormes, if the nouch or chine of the necke and the ſhoulder blades bee annointed there-
F with, preſerveth a woman from the paine of the ſinewes, which commonly followeth upon child bearing: And the ſame ſend away the after-birth, if when they bee *newly brought to bed, they drinke the ſame in wine cuit. A cataplaſme made of them ſimply alone without any other thing, and applied unto womens ſore breaſts which are impoſtumate, bring the ſame to maturation, breake them when they are ripe, draw them after that they run, & in the end heale them up clean

*Gravidis, κ) χρησικοις, for Puerperis.

and

and skin all againe. The ſaid earthwormes alſo if they be drunke in honied wine, bring down milk G
into their breaſts. There be certaine little wormes found breeding in the common coich-graſſe, called Gramen, which if a woman weare about her necke, ſerve very effectually, to cauſe her for to keepe her infant within the wombe the ordinarie tearme: but ſhee muſt leave them off when ſhe drawes neare unto the time when ſhe ſhould crie out: for otherwiſe, if they be not taken from her, they would hinder her deliverance. Great heed alſo there muſt be taken, that theſe worms be not laid upon the ground in any hand. Moreover, there be Phyſicians who give women to drink five or ſeven of them at a time, for to helpe them to conceive. If women uſe to eat ſnailes dreſſed as meat, they ſhall be delivered with more ſpeed, if they were in hard labour: let them be applied unto the region of the matrice or naturall parts with Saffron, they haſten conception. If the ſame be reduced into a liniment with Amylum and gum Tragacanth, and laid too accordingly, H
they doe ſtay the immoderat flux of reds or whites. Being eaten in meat, they are ſoveraigne for their monthly purgations. And with the marrow of a red Deere they reduce the matrice againe into the right place, if it were turned a to ſide: but this regard muſt bee had, that to every ſnaile there be put a dram weight of Cyperus alſo. If the matrice be given to ventoſities, let the ſame ſnailes be taken forth of their ſhels, ſtamped and laid too with oile of roſes, they diſcuſſe the windineſſe thereof. And for theſe purpoſes beforenamed, the ſnailes of Aſtypalæa bee choſen for the beſt. Alſo for to reſolve the inflation of this part, there is another medicine made with ſnails, eſpecially thoſe of Barbarie, namely, to take two of them and to ſtampe them with as much Fenigreeke ſeed as may be comprehended with three fingers, adding thereto the quantitie of foure ſpoonefuls of honey, and when they bee reduced all into a liniment, to applie the ſame unto the I
region of the wombe, after the ſame hath beene well and throughly annointed all over with the juice of Ireos, or Floure de lis. There bee moreover certaine white ſnailes that bee ſmall and long withall, and theſe be commonly found wandering here and there in every place. Theſe being dried in the Sunne upon tiles and reduced into pouder, they uſe to blend with Beane floure, of each a like quantitie. And this is thought to bee an excellent mixture for to beautifie their bodie, and make the ſkin white and ſmooth. Alſo, if the itch be offenſive, ſo as a woman bee found ever and anon to ſcratch and rub thoſe parts, there is not a better thing therfore than the little flat ſnails, if they bee brought into a liniment with fried Barley groats. If a woman with child chaunce to ſtep over a Viper, ſhe ſhall be delivered before her time of an unperfect birth. The like accident will befall unto her, in caſe ſhe goe over the ſerpent Amphisbæna, if the ſame were dead before. K
And yet if a woman have about her in a box one of them alive, thee ſhall not need to feare the going over them, though they were dead. And one of theſe Amphisbænes dead as it is and preſerved or condite in ſalt, procureth ſafe and eaſie deliverance to a woman that hath it about her. A wonderfull thing, that it ſhould be ſo daungerous for a woman with child to paſſe over one of them which hath not been kept in ſalt; and that the ſame ſhould be harmeleſſe and doe no hurt at all, if immediatly after it hath been ſo kept, ſhe ſtep over it. A perfume made with a ſnake long kept and dried, procureth the deſired ſickneſſe of women. The old ſlough of a ſnake which ſhee hath caſt, applied unto the loines of a woman that is in labour, helpeth her to better ſpeed: but it muſt be removed preſently after that ſhe is delivered. Many uſe to give it unto women with child for to bee drunke in wine with Frankincenſe: for beeing taken otherwiſe, it cauſeth abortion. The L
rod or wand whereby one hath parted or taken off a frog or toad from a ſnake, helpeth women that be in travell of childbirth. And a liniment made with the aſhes of the unwinged Locuſts called Tryxalides and honey tempered together, helpeth forward their monthly purgations. The ſpider like wiſe that commeth downe ſpinning from aloft, hanging by her fine thread which ſhee draweth in a length, if ſhe be caught with the hollow of the hand, bruſed and applied accordingly, worketh the ſame effect: but take the ſame ſpider winding up her yearne, and returning backe to her neaſt upward, it will worke contrariwiſe, and ſtay the fleurs of women. The Ægle ſtone called Aëtites, becauſe it is found in an Ægles neſt, preſerveth and holdeth the infant ſtill in the mothers wombe to the full time, againſt any indirect practiſe of ſorcerie or otherwiſe, to the contrarie. If a woman be in hard labour of childbirth, put a Vultures quill under her feet, it will helpe her to a M
more ſpeedie deliverance. Great bellied women, as it is well knowne and found by proof, ought to bee very charie and to beware of Ravens egges, for if they chaunce to goe over one of them, they ſhall fall to labour preſently, and ſlip an untimely birth with great daunger of their life. It ſeemeth to many, that the mewing of an Hawke drunke in honied wine, maketh women which

were

A were barraine before, to be fruitfull. Certes, the greace of a goose or swan, doth mollifie any hard tumors, schirrhs, and impostumations of the matrice and secret parts. Goose greace mixed with the oile of roses and * Ireos, *preserveth womens breasts after they be newly brought to bed. In Phrygia and Lycaonia, it is found by experience, that the fat of the Bistard or Horne-owle, is verie good for greene women lately delivered, if they bee troubled with the pricking or shooting pains of their breasts: but for women that are in daunger to bee suffocated with the rising of the mother, they have a liniment also made with the beetils or worms called Blattæ. The ashes of Partridge eg-shells calcined, mixed with brasse-ore called Cadmia, and wax, and so reduced into a cerot, preserveth womens breasts plumpe and round, that they shall not be riveled or flaggie: and it is thought, that if a woman make three imaginarie circles round about them with a B Partridge egg, they shall continue knit up and well trussed, and not hang downeward illfavouredly: let a woman use to sup them off, she shall be both a fruitfull mother of many children, and also a good milch nource for to reare them up. Also it is a generall received opinion, that if womens paps be annointed all over with goose greace, it will allay the griefe and paine therof: likewise there is not a better thing for to dissolve and scatter moon-calves, and such like false conceptions in the wombe: or to mitigat the scurfe or mangineſſe incident to that member, than to apply to those parts a liniment made of punaises bruised, or stamped to the purpose.

Bats bloud hath a depilatorie facultie to fetch off haire, and lett the growing thereof; howbeit, sufficient it is not alone to worke that feat in boyes cheeks and chins whom we would keepe smooth and beardlesse, except the place bee rubbed afterward with the seed of rocket and hemlocke: and in this manner if they be dressed, either no haire at all will come up there, or else it C will never be but soft downe. It is thought that their brains also will worke the same effect. Now these brains be of two sorts, to wit, red and white: howbeit some give counsell, to mingle with the said brains, both the bloud and the liver. Others there be, who seeth in three hemines of oile, a viper, untill her flesh be throughly sodden and as tender as may be, having before rid her from all her bones; and it they use for a depilatorie: but first they plucke up all those hairs by the roots which they would not have to grow any more. The gall of an urchin is a depilatorie, especially if it be mixed with the brains of a batt and goats milke: *Item*, the ashes thereof simply, mingled with the milke of a bitch of her first litter; so that the haires which wee would not have to come againe, be plucked up; or if those places be annointed therwith where never yet grew any, none D shall spring there afterwards. The same effect (by report) hath the bloud of a ticke that was taken from a dog: and finally, the bloud or gall of a swallow.

* *Irino*, as followeth in the next chapter; not *araneo*, as it is in most prints.

* From swelling, hardnes, or the ague (as women call it.)

Chap. xv.

Many receits handled togither disorderly one with another for sundrie maladies.

IT is said, that Ants eggs stamped and incorporat with flies likewise punned togither, will give a lovely blacke colour to the hairs of the eyebrows: also, if a woman be desirous that her infant should be borne with blacke eyes, let her eat a rat whiles she goes with child. To preserve the haire from beeing grey or grisle, annoint them with the ashes of earthworms and oile olive E mixed togither. If sucking babes bee wrung or gnawne in the belly by reason of some cruddled milke which they draw from their nources, or doth corrupt so in their stomacke, it is good to give them in water the rennet of a young lambe to drinke: but in case this accident commeth by cailling of the milke, they use to give unto them the said rennet in vinegre, for to discusse the same. For the paine that they abide in toothing, the brains of an * hare is soveraigne to annoint their gumbs withall. It falleth out that young infants many times bee tormented with an unnaturall heat and burning of their head, called Siriasis; for to ease and cure them thereof, they use to take the bones that are found in doggs dung, and to hang them about their necks or armes. Young infants are subject to ruptures and descents of the guts, in which case it is good (some say) to apply a greene lizard unto their bodies whiles they lie asleep, and to cause it to bite the place; F but then afterwards the said lizard must be tied fast to a reed and hung up in the smoke: for looke how it decaieth and dieth by little and little, so shall the rupture knit and heale againe. The foamie moisture that shell-snails yeeld, if childrens eyes be annointed therewith, doth not onely rectifie and lay streight the hairs of the eyelids which grow crooked into the eyes, but also nourisheth and causeth them to grow. The ashes of burnt shell-snails reduced into a liniment with fran-

* *Leporis*, or *pecoris*, i. of a sheepe.

kincense

kincenſe and the white of an egg, doth in the ſpace of thirtie dais cure thoſe that are burſten bellied. In the little horns of ſhell-ſnails there is found a certaine hard ſubſtance reſembling grit or ſand, which if it be hanged about a yong infant, is a means that it ſhall breed teeth with eaſe. The aſhes of ſnaile ſhels when the ſnails are gone, incorporat in wax, and applied to the ſeat or fundament, putteth backe the end of the tiwill that is falne downe and readie to hang out of the bodie: but you muſt not forget to mingle with the ſaid aſhes the bloudie ſubſtance that is let out of a vipers brains when her head is pricked. The brains of a viper if they be put in a little fine skin and worne by a young child, helpeth it to breed teeth without any great paine: for the ſame purpoſe ſerve alſo the teeth of ſerpents, ſo there bee choſen the biggeſt that are in their heads: ravens dung lapped in wooll, and hung to any part of young infants, cureth the chincough. G

Some things there remaine as touching this argument, which hardly me thinks I ſhould not handle ſeriouſly and deliver in good earneſt: howbeit, ſince there be divers writers who have put them downe in writing, I muſt not paſſe them over in ſilence. They are of opinion and doe give order, to cure the rupture and deſcent of the guts in little children, with a lizard: but how? firſt, it ought to be of the male kind, which is taken for this purpoſe; and that may ſoone be knowne, if under the taile it have one hole and no more: then there muſt be uſed all means poſſible that the ſame lizard doe bite the tumor of the rupture through a peece of cloth of gold, cloth of ſilver, or purple: which done, the ſaid lizard muſt be tied faſt within a new cup or goblet that never was occupied, and ſo ſet in ſome ſmokie place where it may die. If little infants piſſe their beds, a readie way to make them containe their water, is to give them ſodden mice for to eat. If there be any ſuſpicion of ſorcerie, witchcraft, or enchantment, practiſed for to hurt yong babes; the great horns of beetles, ſuch eſpecially as bee knagged as it were with ſmall teeth, are as good as a countrecharme & preſervative, if they be hanged about their necks. There is (by their ſaying) a litle ſtone within the head of an ox or cow, which they uſe to diſcharge and ſpit out when they be in danger of death; the ſame if it be taken out of one of their heads, which is ſodainly ſtricken off before the beaſt be ware thereof, and hanged about an infants neck or other part of the bodie, is wonderfull good for breeding of teeth. Semblably they doe preſcribe their brains to be carried about them in like manner, and for the ſame purpoſe: alſo the little bone or ſtone found in a naked ſnailes backe. Moreover, the annointing of childrens goumbs with the brains of a ſheepe, is ſingular good and effectuall to cauſe them for to breed their teeth with facilitie: like as gooſe greace inſtilled with the juice of baſill into their ears, cureth the infirmities therof. There be in many prickly hearbs certaine rough and hairie worms, which if they be hung about the necks of young infants, do preſently cure them, if haply there be any thing in their meat that ſtucke and lay hard in their ſtomack, for they will cauſe them to puke it up. To provoke ſleep, there is not a better thing than the tried greace of unwaſhed wooll, with ſome myrrhe be it never ſo little, infuſed & diſſolved in two cyaths of wine; or els incorporat with gooſe greaſe and wine of myrtles: for which intent they uſe to take the bird called a cuckow, and within a hares skin tie it unto the patient; or els to bind the bill of a young heron to the forehead, within a peece of an aſſe skin: and they are of opinion, that the ſame bill alone is as effectuall, ſo it be well waſhed in wine: contrariwiſe, the head of a bat dried & hanged about the neck, keepeth one from ſleepe altogither. A lizard drowned to death in the urine of a man, diſableth him from the uſe of venerie who *dranke the liquor whereof that urine came: and no marvell; for why? the magicians repoſe a great thing in a lizard in love matters. The excrements of ſnails which reſemble dung, as alſo the dung of pigeons, tempered in a cup of wine & given to drink, coole fleſhly luſt. The right lobe or ſide of a vulturs lungs provoke men unto the ſports of *Venus*, if they carrie it about them enwrapped within a cranes skin. In like manner, the yelks of five pigeons egs incorporat with ſwines greace to the weight of one denier Roman in hony and ſo ſupped off, work the ſame effect. Some eat ſparrows ordinarily for this purpoſe; or ſup their egs. Alſo there be, who carie about them the right ſtone of a cocke, encloſed faſt within a peece of leather made of a rams skin, and to good effect, if all be true that magicians ſay: who affirme alſo, that thoſe women who are annointed with a liniment made of the aſhes of the bird Ibis, incorporat with gooſe greaſe and the oile of Ireos, ſhall if they be conceived with child go out their full time: and they ſay, that whoſoever be anointed with a liniment made of the ſtones of a fighting cocke and gooſe greace, ſhall have but little mind to performe the act of generation; or if the ſame be tied to any part of them, within a peece of leather made of a rams skin. In like manner, it is ſaid that the ſtones of any other dunghill cock, are of the ſame effect, H I K L M

* *Biberit*, ſome read *fecerit*, *i.* who made the ſaid water.

A effect, if togither with the bloud of the said cocke, they be but laid under ones bed. If one plucke the haires out of a mules taile while the stallion covereth her, and bind the same togither in a wreath or knot, and apply them to the legs or loins during the act of generation, they will cause (women) to conceive whether they will or no. Whosoever maketh water upon the very place where a dog hath lift up his leg and pissed, so as both urines be mingled togither; folke say, hee shall find himselfe thereby more unlustie to the worke of *Venus*. A wonderfull thing it is (if it be true) which they report likewise of the ashes of a star-lizard or Stellion; that if the same be enwrapped within some lint or linnen rag, & held in the left hand, it stirreth up the heat of lust; but shift the same into the right hand, it will coole one as much. Moreover, that if one put under the pillow where a woman laieth her head, a few flockes, or locke of wooll loked well in batts bloud, it will
B set her on to desire the companie of a man; or if she doe take a gooses tongue either in meat or drinke. The old skin or slough that snakes doe cast off in the Spring, whosoever drinketh in his ordinarie drink, it will kill all the vermin or lice of the bodie within three daies: so doth the whey of milke after the cheese is gathered, if one drinke the same with a little salt. If the braines of a weazill bee put into the rendles or rennet that goeth to the making of cheese, they say that the cheese so made, shall neither corrupt all summer long, nor be eaten by the mouse. The ashes of the same weazill given to chickens or young pigeons among the past that is made for to feed them, secureth them from the weazill. Furthermore, it is said, that if a batt be tied unto a horse or mare or such labouring beasts that are pained in their staling, they shall soone have an end of that griefe and impediment: if they have the wringing of the guts, or be troubled with the bots,
C there will ensue ease of their paine, presently upon the making three turnes or compasses round about their shap and naturall parts with a stockedove. But see a marveilous matter! the dove being let goe, dieth forthwith; and the beast immediatly is delivered from paine. Moreover, if you would know a remedie against drunkennesse, marke this experiment; Give for three daies togither unto great drunkards the eggs of an owle continually in their wine, they will take a loathing thereto and forbeare drinking. Whosoever taketh the lights of a mutton rosted, and eateth the same before he sit downe to drinking, shall not be overtaken or drunken, how freely soever hee powreth downe the wine. The ashes of swallowes bills incorporat with myrrhe, will secure any man from drunkennesse, and cause him to beare his drinke well, in case the wine that hee drinketh be spiced therewith: And *Horus* king of the Assyrians, devised first this receit against drun-
D kennesse.

Over and besides all this, there be many other singular properties behind, worthie to be noted, which are attributed unto sundrie beasts, and do properly pertain to this present treatise handled in this booke: for these magicians tell us of a certaine bird in Sardinia called Gromphæna, like unto a crane, but I beleeve verely that the Sardinians at this day know not what bird it is. Within the said Island and province, there is a beast called * Ophion, which in haire only resembleth a stag, but in no place els doth it breed: and the very same authors have told us of another by the name of Situlugus, but they set not downe in writing either the description what manner of beast it should be, nor the place where it should breed. I doubt not verely but such sometime there were, considering that they have shewed divers medecines that they do afford. And *M. Ci-*
E *cero* writeth of a beast named Byturos, which gnaweth the vines in Campania.

* A Muffle, as *Munster* taketh it.

CHAP. XVI.

Straunge wonders reported of certaine beasts.

THere remaineth yet certain wonderfull things to be spoken of, depending upon those brute creatures, of which I have treated alreadie: namely, that whosoever have about them the secondine of a bitch, that is to say, the skin wherein her whelps lay within her belly; or hold in their hands either the haire or dung of an hare, no dogs will barke at them whersoever they come. Also that there be a kind of gnats called Muliones, which live not above a day. Moreover,
F that as many as have about them the bill of a woodspeck when they come to take hony out of the hive, shall not be stung by bees: againe, let a man give unto swine among their meat, or in a mortcell of past or bread, the brains of a raven, they will follow him whithersoever he goeth. Furthermore, that if one be strewed with the dust wherein a mule hath wallowed & rumbled her selfe, hee shalbe well cooled in love, how amorous soever he were before. Over & besides, take a rat and cut

out his ſtones, and ſo let him goe againe, hee will make all other rats to run away. Make a maſh or drench of a ſnakes skin, ſalt, red wheat called Far, with ſome wild running thyme, ſtamped all together, in one and the ſame day; put all into wine and convey the ſame into the throat of a cow or ox, about the time that grapes begin to ripen upon the vine, the ſaid beaſts will ſtand to health for a whole yeere after: or give them young ſwallows, and cauſe them to let the ſame downe their bodie in ſome paſt or bread at three ſeverall times. Gather the duſt together out of the place where you ſee that a ſnake hath gone and made a tract, fling the ſame upon a ſwarm of bees, they ſhall returne againe to their hive. Tie up the right ſtone or cullion of a ram, he ſhall get none but ram-lambs. And looke whoſoever have about them the ſtrings or ſinewes taken from the wings and leggs of a crane, they ſhall not be tired and faint in any labour that they take. If you would have mules not to winſe and fling out with their heels, give them wine to drinke. Laſt of all, I cannot overpaſſe one notable and memorable example as touching the houſe of a mule: when *Antipater* ſhould ſend the venemous water of the fountaine Styx for to poiſon king *Alexander* the Great, hee could meet with no matter that would hold this poiſon, without piercing and running through it, but onely the houſe of a mule: and to the knowledge hereof he came, by the direction of *Ariſtotle* the philoſopher, who deviſed a cup to be made thereof. A foule ſtaine and blot of *Ariſtotles* name, for beeing privie to ſuch vilanie, and ſetting it forward as hee did. Thus much of Land-creatures: it remaineth now to returne againe to thoſe of the Waters, and their vertues in phyſicke.

THE XXXI. BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

¶ The Proëme.

CHAP. I.

The medicinable vertues of creatures living in water. The admirable nature of waters.

NOw followeth the diſcourſe of water-beaſts, and how beneficiall they be unto us in regard of phyſicke: wherein verely dame Nature (the mother and workemiſtreſſe of all things) ſheweth how little idle ſhe is, not ceaſing even there alſo by her continuall operations to make knowne her wonderfull power, among the waves and ſurging billows, amid the reciprocall tides of the ſea, ebbing and flowing in their alternative turns; yea and in the ſwift courſe and ſtreames of great rivers. And verely, to ſay a truth and ſpeake as it is, there is no part of the world wherein the might and majeſtie of Nature more appeareth, than in the waters: for this one Element ſeemeth to rule and commaund all the reſt. Waters devoure and ſwallow up the earth: waters quench and kill the flames of fire: they mount up aloft into the aire, and ſeeme to challenge a ſeignorie and dominion in the heavens alſo; whiles by a thick ſeeling and floore as it were of clowds, cauſed by the dim vapours ariſing from them, that vitall ſpirit which giveth life unto all things, is debarred, ſtopped,

A ſtopped,and choked. And what might the reaſon els be of thunders and lightnings flaſhing and breaking forth in that violence, and cauſing ſuch troubles and broils, as if the world were at war within it ſelfe? And can there bee any thing more woonderfull and miraculous, than to ſee the waters congealed above in the aire, and ſo to continue pendant in the skie? And yet as if they were not contented to have riſen thus to that exceeding heigth, they catch and ſnatch up with them into the upper region of the aire,a world of litle fiſhes:otherwhiles alſo they take up ſtones, and charge themſelves with that ponderous and weightie matter which is more proper to another Element. The ſame waters falling downe againe in raine, are the verie cauſe of all thoſe things here below which the Earth produceth and bringeth forth. And therefore conſidering the woonderfull nature thereof,and namely,how the corne groweth upon the ground,how trees
B and plants doe live, proſper, and fructifie by the means of waters, which firſt aſcending up into the skie,are furniſhed from thence with a lively breath,and beſtowing the ſame upon the herbs, cauſe them to ſpring and multiply; wee cannot chuſe but confeſſe, that for all the ſtrength and vertue which the Earth alſo hath, ſhee is beholden to the Waters, and hath received all from them. In which regard,above all things,and before I enter into my intended diſcourſe of Fiſhes and Beaſts living in this Element, I meane firſt to ſet downe in generalitie the marveilous power aud properties of water it ſelfe, and to illuſtrat the ſame by way of ſundrie examples: for the particular diſcourſe of all ſorts of waters,what man living is able to performe?

Chap. ii.

C

The diverſitie of waters: their vertues and operations medicinable: and other ſingularities obſerved therein.

THere is in manner no region nor coaſt of the earth,but you ſhall ſee in one quarter or other waters gently riſing and ſpringing out of the ground here and there, yeelding fountains in one place cold,in another hot; yea and otherwhiles there may be diſcovered one with another neare adjoyning: as for example, about * Tarbelli a towne in Guienne, and the Pyrenæan hills, there do boile up hot and cold ſprings,ſo cloſe one unto the other,that hardly any diſtance can be perceived between. Moreover, ſources there be, which yeeld waters neither cold nor hot but luke-warme, and the ſame verie holeſome and proper for the cure of many diſeaſes; as if Na-
D ture had ſet them apart for the good of man onely,and no other living creature beſide. To theſe fountains ſo medicinable,there is aſcribed ſome divine power, inſomuch as they give name unto ſundrie gods and goddeſſes,and ſeeme to augment their number by that means: yea & otherwhiles great towns and cities carrie their names: like as Puteoli in Campaine; Statyellæ in Liguria; Aquæ Sextiæ in the province of Narbon or Piemont: but in no countrey of the world is there found greater plentie of theſe ſprings, and the ſame endued with more medicinable properties, than in the tract or vale Baianus within the realm of Naples, where you ſhall have ſome hold of brimſtone, others of alume; ſome ſtanding upon a veine of ſalt, others of nitre; ſome reſembling the nature of Bitumen, and others againe of a mixt qualitie, partly ſowre and partly ſalt. Furthermore, you ſhall meet with ſome of them, which naturally ſerve as a ſtouph or hot-
E houſe; for the very ſteeme and vapour onely which ariſeth from them, is holeſome and profitable for our bodies: and thoſe are ſo exceeding hot, that they heat the bains, yea and are able to make the cold water to ſeeth and boile again which is in their bathing tubs: as namely, the fountaine Poſidianus within the foreſaid territorie Bajanus, which name it tooke of one *Poſidius*, a ſlave ſometime,and enfranchiſed by *Claudius Cæſar* the Emperour. Moreover, there be of them ſo hot, that they are able to ſeeth an egg or any other viands or cates for the table. As for the Licinian ſprings, which beare the name of *Licinius Craſſus*, a man may perceive them to boile and reeke againe, even out of the very ſea. See how good Nature is unto us,who amid the waves and billows of the ſea,hath affourded healthfull waters! But now to diſcipher their vertues in phyſick according to their ſeverall kinds: thus much in generalitie is obſerved in theſe bathes, That they
F ſerve for the infirmities of the ſinews,for gout of the feet, and ſciatica. Some more properly are good for diſlocations of joints,and fractures of bones: others have a propertie to looſen the belly and to purge: and as there be of them which heale wounds and ulcers,ſo there are againe that more particularly be reſpective to the accidents of the head and ears: and among the reſt, thoſe which beare the name of *Cicero* and be called Ciceronianæ,be ſoveraign for the eies. Now there

* Some thinke Bajon in Fraunce.

is a memorable manour or faire houſe of plaiſance, ſituat upon the ſea ſide in the verie high way G
which leadeth from the lake Avernus to the cittie Puteoli; much renowmed for the grove or wood about it, as alſo for the ſtately galleries, porches, allies, and walking places adjoyning thereunto, which ſet out and beautifie the ſaid place verie much: this goodly houſe, *M. Cicero* called Academia, in regard of ſome reſemblance it had unto a colledge of that name in Athens, from whence he tooke the modell and patterne: where hee compiled thoſe books of his which carrie the name of the place, and be called * *Academicæ quæſtiones:* and there he cauſed his monument or ſepulchre to be made, for the perpetuitie of his memoriall; as who would ſay, he had not ſuffi-
ciently immortalized his name throughout the world, by thoſe noble works which he wrote and commended unto poſteritie. Well, ſoone after the deceaſe of *Cicero*, this houſe and forreſt both fell into the hands and tenure of * *Antiſtius Vetus*; at what time, in the very forefront as it were H
and entrie thereof, there were diſcovered certaine hot fountains breaking and ſpringing out of the ground, and thoſe paſſing medicinable and holeſome for the eyes. Of theſe waters, *Laurea Tullus* (an enfranchiſed vaſſall of *Cicero*) made certaine verſes, and thoſe carying with them ſuch a grace or majeſtie, that at the firſt ſight a man may eaſily perceive how affectionat and devote he was to the ſervice of his lord and maſter: and for that the ſaid Epigram is worthie to be read not only there, but alſo in every place, I will ſet it downe here as it ſtandeth over thoſe bains to be ſeen, in this Decaſtichon.

* Like as *Tuſculanæ quæſtiones*, which hee made in Tuſculano, *i.* a ferm or houſe that he had in Tuſculum.

* A noble man of Rome, Conſull with *D. Lælius Balbus, anno ab urbe condita* 747.

Quo tua, Romanæ vindex clariſsime linguæ,
Sylva loco melius ſurgere juſſa viret, I
Atque Academiæ celebratam nomine villam
Nunc reparat cultu ſub potiore Vetus
Hic etiam apparent lymphæ non ante repertæ,
Languida quæ infuſo lumina rore levant.
Nimirum locus ipſe ſui Ciceronis honori
Hoc dedit, hac fontes cum patefecit ope,
Vt quoniam totum legitur ſine fine per orbem,
Sint plures, oculis quæ medeantur, aquæ.

O prince of Romane eloquence, loe here thy Grove in place
How greene it is, where planted firſt it was to grow apace: K
And *Vetus* now, who holds thy houſe, Faire Academie hight,
Spares for no coſt, but it maintains and keeps in better plight.
Of late alſo, freſh fountains here breake forth out of the ground,
Moſt holeſome for to bath ſore eyes, which earſt were never found.
Theſe helpfull ſprings, the Soile no doubt, preſenting to our view,
To *Cicero* her auncient lord, hath done this honour due;
That ſince his books throughout the world are red by many a wight,
More waters ſtill may cleare their eyes, and cure decaying ſight.

In the ſame tract of Campaine, and namely toward Sinueſſa, there be other fountains called L
Sinueſſan waters: which have the name not only to cure men of lunacie and madneſſe, but alſo to make barraine women fruitfull and apt to conceive. In the Iſland Ænaria there is a ſpring which helpeth thoſe that bee troubled with the ſtone and gravell: like as another water which they call Acidula, within foure miles of Teanum in the Sidicins country, & the ſame is actually cold: alſo there is another of that kind about Stabij, called by the name of Dimidia: like as in the territorie of Venafrum, that which proceedeth from the ſource Acidulus, and gave name to the foreſaid water Acidula. The ſame effect they find who drinke of the lake Velinus, for it breaketh the ſtone. Moreover, *M. Varro* maketh mention of ſuch another fountaine in Syria at the foot of the mountaine Taurus. So doth *Callimachus* report the foreſaid operation of the river Gallus in Phrygia: howbeit they that take of this water muſt keep a meaſure, for otherwiſe it diſtracteth their under-
ſtanding and driveth them beſides their right wits: which accident hapneth to thoſe (ſaith *Cteſias*) M
who drink of the red fountain (for ſo it is called) in Æthiopia. As touching the waters nere Rome called Albulæ, they are known to heale wounds: theſe waters are neither hot nor cold: but thoſe which go under the name of Cutiliæ in the Sabins country, are exceeding cold, and by a certain

mordi-

A mordication that they have, ſeem to ſuck out the humors & ſuperfluous excrements of the body; being otherwiſe moſt agreeable for the ſtomacke, ſinewes, and generally, for all parts. There is a fountain at Theſpiæ, a citie in Bœotia, which doth great pleaſure unto women that would faine have children; for no ſooner drink they of the water, but they are readie to conceive: and of this propertie is the river Elatus in Arcadia. In which region alſo the Spring Linus yeeldeth water, which if a woman with child do drink, ſhe ſhall go out her full time & not be in danger to ſlip an unperfect birth. Contrariwiſe, the river Aphrodiſium in Pyrrhæa, cauſeth barrenneſſe. The lake or meere *Alphion is medicinable, and cureth the foule Morphew. *Varro* mine author maketh mention of one *Titius*, a man of good worth, and ſometimes lord Prætour, who was ſo beraied and peinted all over his face with ſpots of Morphew, that he looked like an image made of ſpot-
B ted marble. Cydnus, a river of Cilicia, hath a vertue to cure the gout; as appeareth by a letter written from *Caſſius* the Parmezan unto *M. Antonius*. Contrariwiſe, the waters about Trœzen are ſo bad, that all the inhabitants are thereby ſubject to the gout and other diſeaſes of the feet. There is a citie in *Gaule named Tungri, much renowned for a noble *fountaine, which runneth at many pipes: a ſmack it hath reſembling the ruſt of yron, howbeit this taſt is not perceived but at the end and looſe only: This water is purgative, driveth away tertian agues, expelleth the ſtone and cureth the ſymptomes attending therupon: Set this water over the fire or neare unto it, you ſhall ſee it thicke and troubled; but at the laſt, it looketh red. Betweene Puteoli and Naples, there be certaine wels called Leucogæi, the water wherof cureth the infirmities of the eies, and healeth wounds. *Cicero* in his booke entituled Admiranda, *i.* Wonders; among other admirable things
C hath raunged the moores or fens of Reate; for that the water iſſuing from them, hath naturally a propertie from all others, to harden the houſes of horſes feet. *Eudicus* reporteth, That in the territorie of Heſtiæa, a citie in Theſſalie, there bee two ſprings, the one named Ceron, of which, as many ſheepe as drinke, prove black: the other Melas, the water whereof, maketh black ſheep turn white: let them drink of both waters mingled together, they will prove flecked and of divers colours. *Theophraſtus* writeth, That the river Crathis in the Thurians countrey, cauſeth both kine and ſheepe as many as drinke thereof, to looke white: wheras the water of Sybaris giveth them a blacke hew. And by his ſaying, this difference in operation is ſeene alſo upon the people that uſe to drink of them: for as many as take to the river Sybaris, become blacker, harder, and withall of a more curled hair than others: contrariwiſe the drinking of Crathis cauſeth them to look white, to
D be more ſoft skinned, & their buſh of haire to grow at length. Semblably in Macedonie they that would have any cattell to grow white, bring them to drinke at Aliacmon the river: but as many as deſire they ſhould be brown or blacke, drive them to water at Axius. The ſame *Theophraſtus* hath left in writing, That in ſome places there is no other thing bred or growing but brown & duskiſh, inſomuch as not only the cattell is all of that leere, but alſo the corn upon the ground, and other fruits of the earth; as among the Meſſapians. Alſo, at Luſæ, a city of Arcadia, ther is a certain well, wherin there keepe ordinarily land-mice. As for the river Aleos, which paſſeth through Erythræ, it maketh them to grow hairie all their bodies over as many as drinke thereof. In Bœotia likewiſe, neer unto the temple of the god *Trophonius* & hard by the river Orchomenas, there be two fountains; the one helpeth memorie, the other cauſeth oblivion, whereupon they *took their names. In
E Cilicia, hard at the town Creſcum, there runs a river called *Nus: and by the ſaying of *M. Varro*, whoſoever drinke thereof, ſhall find their wits more quick, and themſelves of better conceit than before. But in the Iſle *Chios there is a ſpring, which cauſeth as many as uſe the water to bee dull and heavie of ſpirit. At Zamæ in Affrick, the water of a certain fountain, maketh a cleare & ſhrill voice. Let a man drinke of the lake Clitorius, he ſhall take a miſliking and loathing of wine, ſaith *M. Varro*. And yet *Eudoxus* and *Theopompus* report, That the water of the fountaines beforeſaid make them drunke that uſe it. *Mutianus* affirmeth, That out of the fountain under the temple of father *Bacchus*, within the Iſle Andros, at certaine times of the yeare for ſeven daies together, there runneth nothing but wine; inſomuch as they call it the wine of god *Bacchus*: howbeit, re-
F move the ſaid water out of the proſpect and view (as it were) of the ſaid temple, the taſt will turne to be wateriſh againe. *Polyclytus* writeth of a certaine fountaine of Cilicia neare unto the cittie Soli, which yeeldeth an uncteous or oleous water, that ſerveth in ſtead of oile. *Theophraſtus* reporteth the ſame of another fountain in Æthyopia, which hath the like quality. And *Lycus* ſaith, That among the Indians there is a fountaine, the water whereof is uſed in lampes to maintaine light. And the like is reported of another water about Ecbatanæ [the capitall cittie of Media.]

Theopompus

*Otherwiſe called *Anger*: but this name it tooke of *Alphi*, which ſignifieth a kind of white Morphew.

*He meaneth the Low-countries, called ſometime Belgica Gallia.

*Called now the bath of Spaw or Spaw.

*For the former is called μνήμη, or μνημοσύνη, the later λήθη.

*Quaſi νῶς, wit and underſtanding.

*In Chio.

Theopompus writeth, That neare to Scotusa [in Macedonie] there is a lake, the water whereof is soveraigne for the healing of wounds. Moreover, king *Iuba* hath left in writing, That in the Troglodites countrey there is a lake, for the hurtfull water that it beareth, called the Mad-lake, which thrice a day becommeth bitter and salt: and as many times for it turneth to bee fresh and sweet: which course it keepeth also in the night season, breeding otherwise white serpents twentie cubits long, of which it is crawling full. The same prince (mine Author) reporteth, That in Arabia there is a spring boiling out of the ground with such a force, that it scorneth and checketh anie thing that is throwne into it, and cannot be kept downe with any weight whatsoever. *Theophrastus* maketh mention of the fountaine Marsyas in Phrygia, neare unto the towne Celænæ, which casteth up great stones. And not farre from it bee two other springs *Clæon and Gelon, so called by the Greekes for the contrarie effects which they worke. At Cyzicum there is a fountaine of *Cupid*, and whosoever drinke of the water thereof, shall lay aside and forget all affection of love, as *Mutianus* dooth both report and beleeve. At Cranon there is a hote spring, and yet not so boiling as many others be: the water thereof, if it be put into a bottle or flaggon of wine, will maintain the heat thereof for three daies together, that it shall drinke hote. In Germanie beyond the river Rhene, there be waters so hote, that whosoever drinketh thereof, shall sensibly find the heat in his bodie three daies after: The springs that yeeld this water be called Mattiaci. This peculiar propertie besides hath this water, that about the edges and brims thereof there engender pumish stones. Now if any man suppose some of these straunge reports to be incredible, let him learn & know, that in no part of the world Nature hath shewed more admirable workes than in this element of Water. And albeit in the beginning of this mine hystorie I have written in ample manner of many a wonder observed in the waters, yet somewhat remaineth still to bee related. For *Ctesias* saith, That the Indians have a lake or poole, wherein nothing will swim, but all sinkes to the bottome. And *Cælius* also our countreyman avoucheth, That the leaves which fall into the lake Avernus will settle downeward and not flote above. And *Varro* avoucheth moreover, That what birds soever flie over it, or approch the aire and breath thereof, they will die presently. Contrariwise, in Apuscidamus a lake of Affricke, nothing goes downe, but all swims aloft. The like dooth *Apion* report of Phinthia, a fountaine in Sicilie: as also of a lake in Media, and namely the pit or well of *Saturne*. The fountaine Limyra is wont ordinarily to chaunge his seat, and to passe into places adjoining, but never for nought, presaging alwaies thereby some straunge accident to ensue. And wonderfull it is, that the fishes therein should follow and doe the like. Now when this water is thus remooved, the inhabitants of the countrey, desirous to know the issue of things to come, repaire thither as to an Oracle, and seeke to be resolved by the foresaid fishes, and therwith offer unto them some meat: if they come unto it and swim away withall, it is a good token, & this they take for an affirmative answere, as if they said, Yea, to their demaunds: but in case they refuse the meat and flurt it away with their tailes, they collect the contrary, & this is their flat Nay. There is a river in Bithynia called Olachas, running close unto Briazus (which is the name both of a temple, and also of the god therein honoured) the water whereof will discover and detect a perjured person: for if he that drinketh thereof, feele (as it were) a burning fire within his bodie, take him for a false forsworne villaine. Furthermore, in Cantabria or Biscay the fountains of the river Tamaricus, are endued with a secret vertue to presage and foretell future events: and three heads or sources there be of them, eight foot distant one from another: they meet all at length in one channell, and maintain that great and mightie river Tamaricus. Howbeit, twelve times every day, yea, and otherwhiles twentie times they are drie, and have no shew at all or apparence of water; notwithstanding there be another fountaine or well neare unto them, that yeeldeth plenty of water, and never giveth over running. And this is held for an ominous and fearefull presage, if when folke are desirous to see them, they seeme not to run at all: as it was seene of late daies by *Lartius Licinius*, sometime lord Pretour and afterwards Lieutenant Generall under the Consuls. For within a seven-night after a great misfortune happened unto him. In Iurie there is a river which every Sabboth day is drie. Thus much of waters medicinable and miraculous, and yet not simply hurtfull. Contrariwise, there be others of as wonderfull a nature, but daungerous they are and deadly withall.

Ctesias writeth, That there is a fountaine in Armenia, breeding and bringing forth blacke Fishes: whereupon, as many as feed, are sure to die for it immediatly. I have heard the like reported of such daungerous fishes about the head of the river Danubius, untill a man come to a fountaine

*ἀπὸ τῦ κλαίειν, i. flere, καὶ γελᾶν, i. Risu. For the one causeth weeping, the other moveth to laughter.

A taine which presently dischargeth it selfe into the channell of the said rocke; for beneath that place such fishes goe not, nor enter lower into the river. And hereupon the fountaine is by the generall voice of people taken to bee the very source and head of Danubius aforesaid. The selfe-same accident as touching fish, is reported by a poole in Lydia, called the poole of the nymphes. In Arcadia neare unto the river Pheneus, there floweth a water out of the rockes called Styx, which is present death to as many as drinke thereof, as heretofore I have shewed: And *Theophrastus* saith moreover, That in this water there be certaine small fishes (a thing that a man shall never see in any other venomous fountaines) and those likewise are as deadly as the water. *Theopompus* writeth, That in Thracia there bee waters about the place called Chropsos, which kill those that drinke thereof. And *Lycus* maketh report of another fountaine in the Leontines countrey,
B wherof as many as drinke die within three daies. *Varro* hath left in writing, That neare to the hill Soracte there is a fountaine foure foot large, which at the rising of the Sunne overfloweth like boiling water: but the birds that have tasted of the water die presently, and are there to be seene lying dead. For this secret mischeefe there is besides in many of these waters, that they are faire and cleare to see too, and thereby seeme to allure both man and beast to drinke thereof, for their owne bane and destruction: as we may see by Nonacris in Arcadia; for surely this fountaine giveth no suspition at all, whereby we should mistrust a venomous qualitie; and yet some are of opinion, That the hurt which commeth thereby, proceedeth from excessive cold; and they ground their reason upon this, That the water issuing out of it into riverets and rils, will congeale and grow to a stonie substance. It fareth otherwise about the vale of Tempe in Thessalie, where the
C water of a certaine fountaine is fearefull to see too, and there is no man but abhorreth the sight thereof, besides the corrosive qualitie that (by folks saying) it hath, to fret and eat into brasse and yron: the best is, that (as I have shewed before) it runneth not farre, and the course that it holdeth is but short. But wonderfull it is, that a certaine wild Carob should environ this source round about with his roots, and the same continually beare purple flowers, as it is reported to doe. Also, in the very brinke and edge of this fountaine there is another hearbe of a kind by it selfe, which abideth fresh and greene from one end of the yeare to another. In Macedonie, not far from the tombe of *Euripides* the Poet, there be two rivers run together, the one yeeldeth water most holesome for to be drunke: the other is as noisome and deadly. Neer unto Perperenæ, a town in Troas, there is a spring, the water whereof giveth a stonie coat or crust to all the earth that it either o-
D verfloweth or runneth by: of which nature are the hot waters issuing out of a fountaine neare Delium in Eubœa; for looke what way soever the river runneth, you shall see the stones to grow still in height. About Eurymenæ, which is in Thessalie, there is a well, cast into it any chaplets or guirlands of flowers, they will turne into stones. There runneth a river by Colossi, a citie in Phrygia, into which if you throw brickes or tiles that be raw and unbaked, you shall take them foorth againe as hard as stones. Within the mines of the Isle Scyros there is a river, which converteth into stone all the trees that it runneth by or toucheth, as well the boughs as the bodies. In the famous and renowned caves called Corycia, all the drops of water that distill from the rocke, turne to bee as hard as stones: And no marvell, for at Meza in Macedonie, a man shall see the drops of water become stone, as they hang to the very vaults of the rocke, much like to ysickles
E from the eaves of houses in Winter time: wheras at Corycum abovenamed, the said drops turn into stone when they are fallen downe, and not before. In certaine caves they are to be seene converted into stone both waies, and some of them are so big, as they serve to make columnes and pilastres of, and those otherwhiles of diverse colours to the eye: as may be seene in the great cave of Phausia, which is within the Chersonese of the Rhodians. Thus much may suffice by way of examples, to shew the varietie of waters with their sundrie vertues and operations.

Chap. iii.

The qualitie that is in waters. How a man may know which be good and holesome from such as be naught and unholesome.

F

MVch question there is & controversie among Physicians, What kind of water is best? and yet with one generall consent they condemne, and that justly, all dead and standing waters; supposing those that run to be better: for it standeth with good reason, that the very agitation and beating upon the banks as they beare streame in their current, maketh them more subtile,

ſubtile, pure, and cleare, and by that meanes they get their goodneſſe. Which conſidered, I marveile verie much at thoſe who make moſt account of the *water gathered and kept in ceſternes: But they ground their opinion upon this reaſon, becauſe raine water is of all others lighteſt, as conſiſting of that ſubſtance which was able to riſe and mount up aloft, and there to hang above in the aire. Which is the cauſe alſo, that they preferre Snow water before that which commeth downe in ſhowers: and the water of yce diſſolved, before the other of melted Snow; as if the water were by yce driven together and reduced to the utmoſt point of fineneſſe. They collect hereby, that theſe waters, to wit, raine, ſnow, and yce, bee all of them lighter than thoſe that ſpring out of the earth: and yce among the reſt farre lighter than any water, in proportion. But this opinion of theirs is to bee reputed as erronious, and for the common good and profit of mankind to be refuted: For firſt and formoſt, that levitie whereof they ſpeake, can hardly or unneath bee found and knowne by anie other meanes than by the ſence and feeling of the ſtomacke: for if you goe to the weighing of waters, you ſhall perceive little or no difference at all in their poiſe. Neither is it a ſufficient argument to proove raine water to be light, becauſe it aſcendeth on high into the aire, for wee may ſee ſtones likewiſe drawne up into the clouds: and beſides, as the raine falleth downe againe, it cannot chuſe but be infected with the groſſe vapours of the earth. Whereby it commeth to paſſe, that wee find raine water ordinarily to bee moſt charged and corrupted with ordure and filthineſſe: and by reaſon thereof it heateth moſt quickly, and corrupteth ſooneſt. As for ſnow and yce, that they ſhould bee thought to be compoſed of the moſt ſubtile parts of this Element, and yeeld the fineſt water, I wonder much, conſidering the neare affinitie which is betweene them and haile, which might induce us alſo to thinke the ſame of it: but all men confeſſe and hold, that the ſame is moſt peſtilent and pernicious for to bee drunke. Moreover, there are amongſt them not a few, who contrarie unto the opinion of other Phyſicians their fellowes, affirme flatly and confidently the water of ſnow and yce to bee the unwholeſomeſt drinke that is, for that all the puritie and fineneſſe thereof hath beene drawne and ſucked out. And in verie truth, wee find it by experience, that any liquour whatſoever dooth deminiſh and conſume greatly by beeing frozen or congealed into an yce. Wee ſee beſides, That over-groſſe and foggie deawes breed a kind of ſcurfe or ſcab in plants: white froſts burne and ſendge them: and both of theſe, the hore froſt as well as the deaw, proceed from the ſame cauſes in a manner that ſnowes doe. Certes, all Philoſophers agree in this one point, That raine water putrifieth ſooneſt of anie other, and leaſt while continueth good in a ſhip, as ſaylers know full well. Howbeit, *Epigenes* avoucheth and affirmeth, That the water which hath beene ſeven times putrified and as often purified againe, is ſubject no more unto putrifaction. And as for ceſterne waters, the Phyſicians alſo themſelves confeſſe, That they breed obſtructions and ſchirrhoſities in the bellie, yea, and otherwiſe bee hurtfull to the throat. As alſo, that there is not anie kind of water whatſoever, which gathereth more mud or engendereth more filthie and illfavoured vermine than it dooth. Neither followeth it by and by, that all great river waters indifferently are the beſt: no more than thoſe of any brooke, or the moſt part of ponds and pooles are to bee counted and eſteemed moſt wholeſome. But of theſe kinds of water wee muſt conclude and reſolve with making diſtinction, namely, That there be of everie ſort thereof thoſe which are ſingular and very convenient, howbeit, more in one place than in another. The kings and princes of Perſia bee ſerved with no other water for their drinke but from the two rivers, Choaſpes and Eulæus onely: And looke how farre ſoever they make their progreſſe or voyage from them two rivers, yet the water thereof they carrie with them. And what might the reaſon bee thereof? Certes, it is not becauſe they bee rivers which yeeld this water, that they like the drinke ſo well: for neither out of the two famous rivers, Tygris and Euphrates, nor yet out of manie other faire and commodious running ſtreames doe they drinke. Moreover, when you ſee or perceive anie river to gather abundance of mud and filth, wote well, that ordinarily the water thereof is not good nor holeſome: and yet if the ſame river or running ſtreame bee given to breed great ſtore of yeeles, the water is counted thereby wholeſome and good ynough. And as this is a token of the goodneſſe, ſo the woormes called *Tineæ*, engendered about the head or ſpring of any river, is as great a ſigne of coldneſſe. Bitter waters of all others bee moſt condemned: like as thoſe alſo which ſoone follow the ſpade in digging, and by reaſon that they lie ſo ebbe, quickly fill the pit. And ſuch be the waters commonly about Troezen.

i. Rain water.

* Which ſome take for Sows.

A Troezen. As for the nitrous, brackish, and * salt waters, found among the desarts; such as travaile through those parts toward the red sea, have a devise to make them sweet and potable within two houres, by putting parched Barley meale into them; and as they drinke the water, so when they have done, they feed upon the said Barly groats, as a good and holesome gruell. Those spring waters are principally condemned which gather much mud and settle grosse in the bottome: those also which cause them to have an ill colour who use to drinke thereof. It skilleth also very much to marke if a water staine any vessels with a kind of greene rust; if it bee long before, pulse will be sodden therein; if being poured upon the ground, it bee not quickly sucked in and drunke up; and lastly, if it furre those vessels with a thicke crust wherein it useth to be boiled: for all these be signes of bad water. Over and besides, it is a fault in water, not onely to stinke, but also
B to have any smacke or tast at all, yea, though the same bee pleasant and sweet ynough, and enclining much to the rellice of milke, as many times it dooth in diverse places. In one word, would you know a good and holesome water indeed? Chuse that which in all points resembleth the air as neare as is possible. At Cabura in Mesopotamia there is a fountain of water, which hath a sweet and redolent smell: setting it aside, I know not any one of that qualitie in the whole world again: But hereto there belongs a tale, namely, That this Spring was priviledged with this extraordinarie gift, because queene *Iuno* (forsooth) sometimes bathed & washed her selfe therein. For otherwise, good and holesome water ought to have neither tast nor odour at all. Some there bee who judge of their holesomenesse by the ballance, and they keepe a weighing and poising of waters one against another: But for all their curiositie, they misse of their purpose in the end: for seldom
C or never can they find one water lighter than another. Yet, this devise is better and more certain, namely, to take two waters that be of equall measure and weight: for looke whether of them heateth and cooleth sooner, the same is alwaies the better. And for to make a triall hereof, lade up some seething water in a paile or such like vessell, and set the same downe upon the ground out of your hand, to ease your arme of holding it hanging long in the aire; and if it bee good water, they say it will immediatly of scalding hot become warme onely and no more. Well, what waters then, according to their sundrie kinds in generalitie, shall we take by all likelyhood to bee best? If we goe by the inhabitants of cities and great townes, surely, well-water or pit water (I see) is simply the holesomest: But then such wels or pits must bee much frequented, that by the continuall agitation and often drawing therof, the water may be more purified, and the terrene substance passe
D away the better by that meanes. And thus much may suffice for the goodnes of water, respectively to the health of mans bodie.

But if wee have regard to the coldnesse of water, necessarie it is that the well should stand in some coole and shadowie place not exposed to the Sunne, and natheless open to the broad aire, that it may have the full view and sight (as it were) of the skie. And above all this, one thing would bee observed and seene unto, that the source which feedeth it, spring and boile up directly from the bottome, and not issue foorth of the sides: which also is a maine point that concerneth the perpetuitie thereof, and whereby we may collect that it will hold still, and bee never drawne drie. And this is to be understood of water cold in the owne nature. For to make it seeme actually cold to the hand, is a thing that may be done by art, if either it bee forced to mount aloft, or fall from
E on high, by which motion and reverberation it gathereth store of aire. And verely, the experiment hereof is seene in swimming, for let a man hold his wind in, hee shall feele the water colder by that meanes. *Nero* the Emperour devised to boile water, and when it was taken from the fire to put it into a glasse bottle, and so to set it in the snow a cooling: and verely, the water became thereby exceeding cold to please and content his tast, and yet did not participat the grossenesse of the snow, nor draw any evill qualitie out of it. Certes, all men are of one opinion, That any water which hath been once sodden, is farre better than that which is still raw: like as, that after it hath been made hote, it will become much colder than it was before, which I assure you, came first from a most wittie and subtile invention. And therefore, if wee must needs occupie naughtie water, the only remedie that we have to alter the badnesse thereof, is to seeth it well, untill the one
F halfe be consumed. Now if a man desire to know the vertue and commoditie of cold water: First, it ordinarily stauncheth any flux of bloud, if it be cast upon the place. Also if one be not able to endure the heat in a baine or hote house, the best way to avoid this inconvenience, is to hold in his mouth cold water all the while. Moreover, many a man hath found by a very familiar experience,

* *Salsas.* Although some read *Salmacidas*, which be holden for waters that will effeminat those who drinke thereof. But such waters be impertinent to this place: neither do we read of the fountaine Salmacis to be in these desarts.

rience, That the coldeſt water in the mouth is not alwaies the coldeſt in the hand. And contrariwiſe, when it is exceeding cold without for to be felt, it is not ſo ſenſibly cold within to bee drunke. G

Of all waters in the world, that which we call here in Rome Martia, carieth the greateſt name by the generall voice of the whole citie, in regard both of coldneſſe and holeſomeneſſe. And verely we may eſteeme this water for one of the greateſt gifts that the gods have beſtowed upon our citie. In times paſt it was called Auffeia, and the very fountain from whence it commeth, Piconia. The head or ſource therof ariſeth at the foot of the utmoſt mountains of the Pelignians: it runneth through the Marſians country, and paſſing through the lake Fucinus, it tendeth (no doubt) even then directly toward Rome: but anone it is ſwallowed up within a hole under the ground, ſo as it is no more ſeene untill it ſhew it ſelfe againe in the territorie of the Tiburtines; from which H
place it is conveighed under vaults, and ſo caried through to Rome by arch-worke for the ſpace of nine myles. The firſt that began to bring this water to the citie, was *Ancus* Martius*, one of the Romane kings: afterwards, *Qu.* Martius Rex*, in his Pretorſhip finiſhed the ſaid worke: and when in proceſſe of time it was fallen to decay, *M. Agrippa* repaired it againe: who alſo brought the water named Virgo to the citie, which hath her head eight miles from Rome, in a certaine nouke or by-corner about two miles turning from the great port way leading to Prænеſte: Neare unto it runneth the river Herculaneus: but this water keepeth ſtill behind as though it fled from it, whereupon it tooke the name Virgo. Compare theſe two riverets together which are conveighed to Rome, you ſhall ſee the difference beforeſaid as touching the coldneſſe of waters: For looke how cold Virgo is to the hand, ſo much is Martia in the mouth. But long agoe have wee of I
Rome loſt the pleaſure and commoditie of theſe two rils, through the ambition and avarice of ſome great men, who have turned away theſe waters from the cittie, where they yeelded a publicke benefit to the Commonwealth; and derived them for their privat delight and profit into their owne manours and houſes in the countrey, for to water their gardens, and ſerve to other uſes.

*No marveile then if it were called Martia.

And here in this place I thinke it not impertinent to adjoine to this preſent Treatiſe, the maner and skill of ſearching and finding out waters. And firſt to ſpeake in generall tearmes: ſprings ordinarily bee found in valleyes, in the pitch or creſt of ſome little hill where it hath a fall and deſcent, or elſe at the foot of great mountaines. Many are of opinion, That in any tract whatſoever, that ſide or coaſt which regardeth the North is given to have water in it. And verely it were K
not amiſſe to ſhew how Nature diſporteth her ſelfe and worketh variably in this behalfe. Firſt a man ſhall never ſee it raine on the South ſide of the mountaines in Hyrcania, which is the reaſon, that on that part onely which lieth to the North they are given to beare wood, and bee full of forreſts. But Olympus, Oſſa, Pernaſſus, Apenninus, and the Alpes, bee repleniſhed with woods on all ſides, and are furniſhed with their ſprings and rivers every where. In ſome countries the hils bee greene, and watered on the South ſide onely. As for example, in Candie, the mountaines called * Albi: ſo that there is no heed to be taken by this, for the rule holdeth not alwaies. But to come now unto particulars. Looke where you ſee growing ruſhes, reeds, or the * hearbe whereof I made relation before, be ſure you ſhall find water underneath. *Item*, Where-
ſoever you find Frogs lying in any place upon their breaſts, make account of good ſtore of wa- L
ter there. As for the wild and wandering Sallow, the Aller tree, Agnus-Caſtus, or Yvie, they come up many times of their owne accord, in ſome low grounds where there is a ſettling or ſtay of raine water fallen from higher places: in ſo much, as they that goe by theſe ſignes to find ſome Spring, may be ſoone deceived. A ſurer aime yet by farre, is a miſt or exhalation, which a man may diſcover a farre off, a little before the Sunne-riſing. And for to ſpie it the better, ſome there bee who get up into an high place, and lay themſelves grovelong, with their chins touching the ground, and by that meanes diſcerne where any ſuch ſmoake or vapour ariſeth. There is another ſpeciall meanes beſides to find out waters, but knowne it is to thoſe onely who be skilfull and expert in this feat: For they that are guided by this direction to water, goe forth in the hoteſt ſeaſon of the yeare, and about the noonetide of the day to marke the reverberati- M
on of the Sunne beames in any place; for if this repercuſſion and rebounding appeare moiſt, and namely, when the face of the earth looketh drie and thirſtie, they make no doubt to find water there. But they had need to looke ſo intentive and wiſtly, that oftentimes their eyes ake

* Ἀλβὸς γῆ, i. White.

*To wit, wild Folefoot, *cap. 6 lib. 26*

and

A and be pained withall. For avoiding which trouble and inconvenience, ſome betake themſelves to other experiments; and namely, they dig a trench or ditch five foot deepe within the ground; the mouth whereof they cover all over with earthen veſſels of potters worke unbaked, or elſe with a barbars braſen baſon, well enhuiled: and withall a lampe burning: over all which, they make a little arch-worke of leaves and boughs, and mould thereupon. Now if they come within a while after to this place, and either ſee the earthen pots broken or wet, or perceive a dew or ſwet ſtanding upon the braſſe, or find the lampe aforeſaid gone out and yet no want of oile to maintaine light, or if they feele a locke of wooll which they hung within the trench to be moiſt, they aſſure themſelves they ſhall find water if they ſinke the pit deeper. Some there be, who for better aſſurance hereof, make a fire in the place, and burne it throughly; for then the veſſels aforeſaid, if
B they proove to be wet, give a more infallible hope of a ſpring. Moreover, the verie leire it ſelfe of the ſoile, if it be ſpotted with white ſpecks, or bee altogither of a reddiſh bright colour, promiſeth ſpring water to be underneath: for if the ground looke blacke, lightly the water will ſoon faile, if there bee any ſpring there found. If you chaunce to light upon a veine of potters cley + or chaulke, make account you ſhall meet with no ſpring there, ſinke as deepe as you will: and therefore workemen when they come to it, give over preſently: for a great regard they have to obſerve the chaunge of everie coat (as I may ſo ſay) of the earth as they digg, to wit, from the blacke delfe, untill they meet by degrees with the veins aforeſaid. Furthermore, it is to be noted, that the water which is found in cley grounds, is alwaies ſweet and potable; like as that which * *In Tophō.*
a ſtonie and grittie ſoile doth yeeld, is commonly colder than any other: and ſuch a kind of
C ground alſo, is allowable for the proofe of good waters; for it engendreth ſweet and holeſome water, light alſo of digeſtion and pure withall, by reaſon that as it paſſeth by a ſoft grit as it were through a ſtreiner, all the groſſeneſſe thereof it leaveth behind ſticking thereto. As for *thicke * *Sabulōſi.*
ſand and gravell, it affourdeth ſmall and ſlender ſprings, and thoſe not durable; beſides, the water will quickely gather mud. Ground given to beare * pebbles, or the groſſer ſort of gravell, * *Glarea.*
give us no ſecuritie that the ſprings therein will hold all the yeere long; howbeit, the water is verie good and pleaſant. The hard and compact gravell called the Male-gravell, and the ſand which ſeemeth full of blacke and burnt carbuncle ſtones, bringeth foorth holeſome waters, and the ſources be ſure and perdurable. But red ſtones yeeld the beſt ſimply, and thoſe that wee may be ſure will never give over and faile. And therefore when wee ſhall perceive the foot of a moun-
D taine ſtanding upon ſuch ſtone, or upon flint, wee may boldly reckon of holeſome and everlaſting ſprings; and this gift they have beſide, to be paſſing cold. Moreover, in digging or ſinking pits, marke this for an aſſured and infallible ſigne that you approach unto water; namely, if the earth appeare and ſhew moiſt more and more ſtill as you goe lower and lower: alſo if the ſpade enter more willingly, and goe downe with eaſe and facilitie. When pioners have wrought deepe under the ground, and then chaunce to meet with a veine of brimſtone or alume, the dampe will ſtop their breath and kill them preſently, if they take not the better heed: and therefore to foreſee and prevent this daunger, they uſe to let downe into the pit, a candle or lampe burning; for if it goe out, they may be ſure it hath met with the dampe. Therefore if pits be ſubject to the riſing of ſuch vapours, cunning and expert workemen make on either ſide of ſuch pits, both on
E the right hand and the left, certaine out-caſts, tunnels, or venting-holes, to receive thoſe hurtfull and daungerous vapours, whereby they may evaporat and breath forth another way. Otherwhiles it falleth out, that the aire which they meet with in digging verie low, doth offend the pioners, albeit there be no brimſtone or alume neare: but the readie means to amend the ſame and avoid the daunger, is to make wind and freſh aire, with continuall agitation of ſome linnen cloaths. Now when the pit is ſunke and digged as farre as to the water, the bottome muſt be laid, and the loweſt ſides of the wall reared of ſtone ſimply without any morter made of [lime and] ſand, for feare leaſt the veins of the ſource be ſtopped. Some waters there are, which in the verie prime and beginning of the ſpring, are of this nature, That they grow to bee exceeding cold; namely, ſuch as have their ſource or ſpring lying but ebb: for they are maintained onely of win-
F ter raine. Others againe, begin to be cold at the riſing of the Dog-ſtar. And verely we may ſee the experience both of the one and the other about Pella, the capitoll cittie of Macedonie: for the water of the meere or marriſh there before the towne, in the beginning of ſummer is cold; and afterwards, when the weather is at the hoteſt, the ſpring water in the higher parts of the cittie is ſo extreame cold, that it is readie to bee frozen. The ſemblable happeneth in Chios, where

there is the same reason of the haven and the towne it selfe. At Athens, the great and famous G
fountaine named Enneacrunos, in a rainie and stormie summer, is colder than the pit-water or well in *Iupiters* garden, within that citie; and yet the said well-water, if it bee a drie season, will stand with an yce at midsummer.

Chap. iiii.

The reason of certaine waters that appeare and be hidden againe sodainly.

* *i.* about the beginning of Iune.

But above all others, the waters of pits or wells be ordinarily most cold about the * retreat or occultation of Arcturus: yea and many times they doe faile in the mids of summer: and H
all of them in manner grow verie low for the space of foure daies at the time of the setting of the foresaid star. Many there be which have little or no water in them all winter long, & namely, about the hill Olympus, where it is spring first, ere the waters returne and find the way into their pits. And verely in Sicilia, about the cities Messana and Mylæ, during winter, the springs are altogither drie; but in summer time they run over the brinks of their wels and pits, and maintaine pretie rivers. At Apollonia, a citie in Pontus, there is a fen neare the sea side which in summer onely overfloweth, and especially about the rising of the great Dog star; mary if the summer be colder than ordinarie, it is not so free and plentifull of water. Some springs have this qualitie with them, To be drier for showres and raine water: as for example, in the territorie of Narnia, a citie in the duchie of Spoleto; which *M. Varro* hath not forgotten to insert among other I
admirable things in his treatise of Woonders: for of this territorie hee writeth in these tearms, That in a drought it was durtie, and in rainie weather dustie. Moreover, this is to be noted, That all waters are ordinarily in winter more sweet than in summer, but in autumne least of all; and in a drie season, lesse than at other times. Neither are the river waters most times of like tast, by reason of the great difference that is in their chanels: for commonly the water is such as the earth and soile through which it passeth, and doth participat the qualitie and tast of those hearbs alwaies which it washeth and runneth by. No marveile therefore, if the water of one and the selfesame river be found in one place more unholesome and daungerous than in another. It falleth out many times, that the brooks and rills which enter into great rivers, do alter their water in the verie tast (as we may see by experience in the famous river Borysthenes;) in so much as such great K
rivers be overcome with the influence of such riverets, and either their owne tast is delaied by them, or cleane drowned and lost. And some rivers there bee, which chaunge by occasion of raine: the proofe whereof was thrice seene in Bosphorus, when by reason of the fall of some salt showres the flouds that overflowed the fields, destroied all the corne upon the ground. The like also happened as often in Ægypt; for the raine that fell, caused all the washes arising from the river Nilus which watered the grounds, to be bitter, whereupon ensued a great plague and pestilence to the whole region. It chanceth many times, that presently upon the cutting and stocking up of woods, there arise and spring certaine fountains, which beforetime appeared not, but were spent in the nourishment of the tree-roots: as it fell out in the mountaine Hæmus, when as
* or Galatians. *Cassander* held the * Gallogreeks besieged: for when the woods thereupon were cut downe to L
make a palaisad for a rampier, sodainly there issued foorth springs of water in their place. Moreover, it hath been oftentimes knowne, that by occasion of spoiling some hills of the wood growing thereupon, the springs have met all togither in one streame, and done much hurt in sodaine overflowing the vale beneath; whereas the trees beforetime had woont to drinke up, digest, and consume all the moisture and wet that fell, and fed the said waters. And verely it availeth much for the maintenance of water, to stirre with the plough, and to till a ground; thereby to breake up and loose the uppermost callositie and hyde (as it were) of the earth, that kept it clunged and bound. Certes, it is recorded for a truth, that upon the rasing and destroying of Arcadia (a town so called in Creete) whereby the place was dispeopled, all the fountains waxed drie, and the rivers in that tract (which were many) came to nothing: but six yeeres after, when the said towne M
was reëdified, even as the inhabitants fell to earing and ploughing any grounds within their territorie, the foresaid fountains appeared againe, and the rivers returned to their former course.

Chap. v.

Divers historicall observations touching this point.

MOreover, Earthquakes, as they discover sometimes new springs and sources of water, so otherwhiles they swallow them up that they are no more seene: like as it hapned (as it is well knowne) five times about the river Pheneus in Arcadia. And in manner above-said, there issued forth a river out of the mountaine Corycus, so soone as the paisants of the countrey began to breake it up for tillage. But to returne againe to the chaunge and alteration of waters: wonderfull they must needs be (no doubt) when there is no evident cause thereof to be known: as
B namely in Magnesia, where all the hote waters of the baines sodainly became cold, without any other chaunge besides of the tast: also in Caria, where standeth the temple of *Neptune*, the river which was known before to be fresh and potable, all on a sodaine turned into salt water. Over and besides, is not this a straunge miracle, that the fountain Arethusa in Syracuse, should have a sent or smell of dung, during the solemne games and exercises at Olympia? But there is some probable reason to be rendred hereof, Because the river Alpheus passeth from Olympus under the verie bottom of the sea into that Island [of Sicilie] where Syracuse standeth, and so commeth to the foresaid fountain. The Rhodians have a fountain within their *Chersonese, which every ninth yeer purgeth it selfe and sendeth out an infinit deale of ordure and filthinesse. And as the tast and smell of waters do alter, so their colours also doe chaunge: as for example, there is a lake in the
C countrey of Babylon, which everie summer for the space of eleven daies, looketh red: and Borysthenes also in summer time, runneth with a blewish colour like * violets, or the skie; and yet a most pure and subtile water it is of all other: which is the reason, that it swimmeth aloft & floteth naturally upon Hypanis the river. In which two rivers, there is another marvaile reported, That all the while a Southerne wind bloweth, the river Hypanis is discerned above it. But there is one argument more besides, that proveth the water of Borysthenes to be passing light and thin, For that there arise no mists out of it; nay it is not perceived to yeeld any exhalation or breath at all from it. To conclude, they that would seem to be curious and skilfull in these matters, do observe and affirme, That generally all waters grow to be heavier after that mid-winter is once past.

* *i.* their demy-island, or rather a place environed round about with sea, save onely that it hath one bank or narow causey leading to the continent. * *Isaacus, Athen.*

D

Chap. vi.

The manner of water-conduits. How and when those waters which naturally are medicinable, ought to be used. Also for what diseases it is good to saile and take the aire of the Sea. The vertues and properties of sea waters as touching Physicke.

IF a man would conveigh water from any head of a spring, the best way is to use pipes of earth made by potters art; and the same ought to be two fingers thicke, and one jointed within another, so as the end of the upper pipes enter into the neather, as a tenon into a mortaise, or as a box into the lid: the same ought to be united and laid even, with quicklime quenched and dissolved in oile. The least levell for to carie and commaund water up hill from the receit, is one hun-
E dred foot; but if it bee conveighed but by one canell and no more, it may be forced to mount the space of two Actus, *i.* 240 foot. As touching the pipes by means whereof the water is to rise aloft, they ought to be of lead. Furthermore, this is to be observed, That the water ascend alwais of it selfe at the deliverie, to the heigth of the head from whence it gave receit; if it be fetched a long way, the worke must rise and fall often in the cariage thereof, that the levell may be maintained still. As for the pipes, ten foot long apeece they would be, if you doe well. Now if the said pipes of lead be but * five fingers in compasse, ordinarily they should weigh sixtie pound: * if they be of eight fingers size, they must carie the weight of one hundred pound: but in case they
F beare a round of * ten fingers, their poise would be at the least 120 pound; and so the rest more or lesse according to this proportion. Those pipes be called properly in Latin Denariæ, the web or sheet whereof beareth ten fingers in breadth, before it be turned in and brought to the compasse of a pipe: like as Quinariæ, when the same is halfe so broad. Moreover, this is to be observed, That in every turning and twining of an hill, the pipe ought of necessitie to be five fingers round and no more, for to represse and breake the violence of the water in the current. Likewise the vaulted heads which receive and containe water from all the fources meeting togither, must

* *Quinariæ.* * *Octonariæ.* * *Denariæ.*

be of that capacitie, as need requireth. G

And since I am falne into the treatise and discourse of Fountains, I woonder much at *Homer*, that he hath made no mention at all of hot springs, and yet otherwise throughout his whole poëme, he bringeth in oftentimes those who bathed and washed in hot bains. But it may verie well be, that the reason thereof is, because in those times there was not that use of them in physicke as at this present: for now adaies, if folke be amisse or ill at ease, straightwaies they run to the bains and bath, for remedie. And in truth, those waters which stand upon brimstone, bee good for the sinews: such as come from a veine of alume, are proper for the palsie, or such like infirmities proceeding from resolution of the nerves. Moreover, they that hold of bitumen or nitre (such as be the fountains Cutiliæ) be potable and good to be drunke, and yet they are purgative.

To come to the use of naturall bains and hot waters: many men in a braverie sit long in a bath, H and they take a pride in it, to endure the heat of the water many hours togither; and yet is there nothing so hurtfull for the bodie: for in truth, a man should continue little longer in them than in ordinarie artificiall bains or stouphs; and then afterwards when hee goeth forth, he is to wash his bodie with fresh cold water, not without some oile among. Howbeit, our common people here, thinke this to be very straunge, and will not be brought to it: which is the reason, that mens bodies in no place, are more subject to diseases: for the strong vapours that steme from thence, stuffe and fill their heads; and although they sweat in one part, yet they chill in another, notwithstanding the rest of their bodies stand deepe within the water. Others there are besides, who upon the like erroneous conceit, take great joy in drinking a deale of this water, striving avie who can poure most of it downe the throat. I have my selfe seene some of them so puffed up & swolne I with drinking, that their very skin covered and hid the rings upon their fingers, namely, when they were not able to deliver againe the great quantitie of water that they had taken in. Therefore this drinking of much water is not good to be used, unlesse a man doe eftsoons eat *salt withall. Great use there is and to good purpose, of the mud which these fountains do yeeld; but with this regard, that when the bodie is besmeared and bedawbed outwardly therewith, the same may drie upon it in the Sun.

*For to irritat and provoke the expulsive facultie to send all forth againe.

Well, these hote waters be commonly full of vertue; howbeit, this is not generall, That if a spring be hot, by and by we should thinke it is medicinable; for the experience of the contrarie is to be seene in Egesta of Sicilie, in Larissa, Troas, Magnesia, Melos, and Lipara. Neither is it a sure argument of a medicinable water (as many are of opinion) if a peece of silver or brasse which K hath been dipped therein, loose the colour: for there is no such matter to be seen by the naturall baths of Padua; neither is there perceived in them any difference in smell from others.

Concerning Sea waters, the same order and meane is to be observed, especially in such as be made hot, for to helpe the pains and infirmities of the sinews: and many hold them good to sowder fractures of bones, yea and to cure their bruises and contusions: likewise they have a desiccative vertue, whereby they drie rheumaticke bodies; in which regard, men bath also in sea water actually cold. Moreover, the sea affourdeth other uses in divers and sundrie respects, but principally the aire thereof is holesome for those who are in a phthysicke or consumption (as I have before said) and cureth such as doe reach or void bloud upward: And verely, I remember of late daies, that *Annæus Gallio* after that he was Consull, tooke this course; namely, to saile upon the L sea, for this infirmitie. What is the cause thinke yee, that many make voiages into Ægypt? surely it is not for the aire of Ægypt it selfe, but because they lie long at sea, and be sailing a great while before they come thither. Furthermore, the vomits also which are occasioned at sea by the continuall rolling and rocking of the ships never standing still, are good for many maladies of head, eyes, and breast; and generally they doe cure all those accidents, for which the drinking of ellebore serveth. As for sea water to be applied simply of it selfe unto the outward parts, physicians are of opinion, that it is more effectuall than any other, for to discusse and resolve tumors: and more particularly, if there be a cataplasme made of it and barley meale sodden togither, it is singular for the swellings behind the eares, called Parotides. They mingle the same likewise in plaistres, such especially as be white and emollitives: and if the head be hurt, and the *brain touched M and offended, it is soveraigne to be infused into the wound. It is prescribed also to be drunke: for albeit the stomacke take some offence and hurt thereby, yet it purgeth the bodie well, and doth evacuat melancholicke humors and blacke choller; yea and if the bloud be cluttered within the bodie, it sendeth it out one way or other, either upward or downward. Some have ordained it to

*Cerebro icto.

be

A be given for the quartan fever; others advise to save and keepe it a time, for to serve the turne in case of Tinesmes, which are unordinat streinings at the stoole to no effect: also of all gouts and pains of joynts: and in verie truth, by age & long keeping, it forgoeth all that brackish tast which it had at the first. Some boile it before: but all in generall agree in this, To use for these purposes that sea water which was taken out of the deepe far from the land, such as is not corrupt with any mixture of fresh water with it; and before their patients doe drinke it, enjoyne them to vomit; and then also doe they mingle with it, either vinegre or wine for that purpose. They that give little thereof, and by it selfe, appoint radishes to be eaten presently upon it, with honeyed vinegre or oxymell, for to provoke the patient to vomit againe. Moreover, they use otherwhile to minister a clystre made of sea water, first warmed: and verely there is not a better thing than it for to
B bath and foment the cods withall, if they be swelled either with ventosities or wateriish humors. Also it is much commended for kibed heels, if they bee taken before they are broken and exulcerat: and in like manner they kill the itch, cure scabs, tettars, and ringworms. Sea water serveth well to wash the head, & to rid it of nits and filthie lice: yea and reduceth blacke and blew marks in the skin, to the fresh and lively colour againe. In all these cures, after the use of salt water, it is passing good to foment the place affected, with vinegre hote. Over and besides, it is thought to be verie holesome and good against the venomous stings of serpents, and namely of the spiders Phalangia and scorpions. Semblably, it cureth those that be infected outwardly with the noisom salivation or spittle of the deadly aspis called Ptyas: but in these cases it must be taken hote. Furthermore, a perfume made with sea water and vinegre, is singular for the head-ach. If it be cly-
C sterized hot, it allaieth the wrings and grindings of the bellie; yea and staieth the violent motions of cholerique humours working upward and downward. Those that be once chafed and set into an heat with sea water, shall not so easily feele cold againe. When womens paps are overgrowne, and so exceeding great that they meet and kisse one another, there is not a better thing to take them downe, than to bath in a tub of sea water: the same also may serve to amend the griefe of the bowels and precordiall parts, yea and to restore those that be exceeding leane and worne away. The fumes and vapors of this water boiling togither with vinegre, are soveraign for those that be hard of hearing, or troubled with the head-ach. Sea water hath this especiall propertie, that of all things it scoureth away rust of yron soonest. The scab that annoieth sheepe, it healeth, and maketh their wooll more soft and delicat. But what meane I to say thus much of sea
D water, knowing as I doe full well, that for those who dwell far up into the maine, and inhabit the inland parts, all this may seeme needlesse and superfluous? And yet there hath been means devised to make artificiall sea water, wherewith everie man may serve his owne turne when he will. In which invention, one wonderfull thing is to be seene; namely, if a man put more than one sextar of salt to foure of water, the nature of the water will be so far overcome, that salt shall not dissolve nor melt therein: but if you mingle one sextar of salt just with foure sextars of water, you shall have a brine as strong as the saltest water that is in the sea: but to have a kind and most mild brine, it is thought sufficient to temper the foresaid measure of water with eight cyaths of salt: and this water thus proportioned, is very proper for to heat the sinews, without any fretting of the skin at all. There is a certaine compound sea-water kept in manner of a syrrup, which they call
E Thalassomeli, made of sea water, hony, and raine water, of each a like quantititie. Now the foresaid sea water, they fetch for this purpose out of the verie deepe, and this composition they put up in earthen vessels well pitched or varnished, and reserve it for their use. An excellent purgative this is; for besides that it cleanseth the stomacke without any hurt or offence thereof, the tast and smell both, are verie pleasant and delectable. As touching the mead called Hydromell, it consisted in times past of rain water well purified, and hony: a drinke ordained and allowed only to sicke and feeble persons when they called for wine, as beeing thought lesse hurtfull to bee drunke: howbeit, rejected it hath been these many yeers, and condemned: for by experience it was found at length, to have the* same discommodities that wine, but far short it was of the good and holesome qualities of wine.

* Namely, adverse to the head & sinews.

F Moreoveover, for as much as sea-faring men and sailers be many times at a fault for fresh water, and thereby much distressed, I thinke it good to shew the means how to be provided for the supply of this defect. First and foremost therefore, if they spread and display abroad certaine fleeces of wooll round about a ship, the same will receive and drinke in the vapours of the sea, and become moist and wet withall; presse or wring them well, you shall have water fresh enough.

Item, let downe into the ſea within ſmall nets, certaine pellets of wax that be hollow, or any other void and emptie veſſels well cloſed and luted, they will gather within them water that is freſh and potable: for we may ſee the experience hereof upon the land: take ſea water & let it run through cley, it will become ſweet and freſh. G

But to proceed unto the other medicinable properties of water: let there be any diſlocation in man or beaſt; by the ſwimming in water (it matters not of what kind it be) the bones will very quickely and with great eaſe be reduced into joynt againe.

It falleth out many times that travailers be in feare and daunger of ſome ſickneſſe, by change of waters, and ſuch eſpecially as they know not the qualitie and nature of. To prevent this inconvenience, they drinke the water cold which they doubt and ſuſpect, ſo ſoon as ever they be come out of the baine; for then they ſhall find it preſently. H

As touching the moſſe which is found in the water, ſoveraigne it is for the gout, in caſe it bee applied outwardly: mix oile thereto, and reduce it into the forme of a cataplaſme or liniment, it eaſeth the paine, and taketh downe the ſwelling of the feet about the ankles. The fome and froth that floteth above the water, cauſeth werts to fall off, if they be well rubbed therewith.

The very ſand likewiſe upon the ſea ſhore, eſpecially that which is ſmall and fine, and the ſame burnt as it were with the heat of the Sun, is a ſoveraigne remedie to drie up the waterie humors in a dropſie, if the bodie bee covered all over therewith; and to that purpoſe it ſerveth alſo for rheums and catarrhs. Thus much may ſuffice concerning water it ſelfe: it remaineth now to treat of ſuch things as the water yeeldeth. In which diſcourſe, begin I will (as my order and maner hath ben in all the reſt) with thoſe matters which be chiefe and principall, and namely, Salt & Spunges. I

Chap. vii.

The ſundrie kinds of Salt: the making thereof: the vertues medicinable of Salt: and divers other conſiderations reſpective thereto.

SAlt is either artificiall or naturall: and both the one and the other is to be conſidered in many and divers ſorts, which may be reduced all into two cauſes: for ſalt commeth either of an humor congealed, or els dried. In the gulfe or lake of Tarentum, the ſalt is made of the ſea water dried by the heat of the ſummer ſun; for then you ſhall ſee the whole poole converted into a maſſe of ſalt: and verely the water there, is otherwiſe verie low and ebb, and not above knee-high. The like is to be ſeene in Sicilie within a lake called Cocanicus; as alſo in another neare unto Gekas: but in theſe, the brims and ſides onely about the banks, wax drie and turne into ſalt, like as in the ſalt-pits about Phrygia and Cappadocia. But at Aſpenchum, there is more plentie of ſalt gathered within the poole there, for you ſhall have the ſame turne into ſalt, even the one halfe thereof to the verie mids. In which lake, there is one ſtrange and wonderfull thing beſides; for looke how much ſalt a man taketh out of it in the day, ſo much ordinarily will gather again by night. All the ſalt of this ſort is ſmall, and not growne togither in lumps. Now there is another kind of ſalt, which of the owne accord commeth of ſea water, and it is no more but the fome or froth which is left behind ſticking to the edges of the banks, or to rocks. Both the one & the other become thicke and hard in manner and forme of a candied dew: howbeit that which is found in the rocks, is more quicke and biting than the other. There is beſides of ſalt naturall, a third diſtinct ſort from the former: for in the Bactrians country there be two great and huge lakes, which naturally do caſt up a mightie quantitie of ſalt: the one lieth toward the Scythians, and the other bendeth to the Arians countrey: like as neare unto Citium, a citie in the Iſle Cypros, and about Memphis in Ægypt, they draw foorth ſalt out of lakes, and afterwards drie the ſame in the Sun. Moreover, there be certaine rivers which beare ſalt, and the ſame congealed aloft in their upper part, in manner of ice, and yet the water runneth underneath and keepeth the courſe well enough: As for example, about the ſluces and ſtreights of the mount Caſpius; and thereupon they bee called the Rivers of ſalt: as alſo in other rivers of Armenia, and about the Mardians countrey. Moreover, Oxvs and Othus, two rivers paſſing through the region Bactriana, carrie ordinarily downe with them in their ſtreame, great peeces and fragments of ſalt, which fall from the mountains adjoyning unto them. There are beſides in Barbarie, other lakes, and thoſe verely thicke and troubled, which engender and beare ſalt. But what will you ſay, if there bee certaine fountaines of hote waters which breed ſalt? and yet ſuch bee the baines or ſprings called Pagaſæi. K L M

Thus

A Thus farre forth have I proceeded in thoſe kinds of ſalt which come of waters naturally. There are beſides certaine hils alſo which are given by nature to bring forth ſalt, and ſuch is the mountaine Oromenus among the Indians, wherein they uſe to hew ſalt as out of a quarie of ſtone, and yet the ſame groweth ſtill: inſomuch, as the kings of that countrey make a greater revenue by farre out of it, than either by their mines of gold, or the pearles which thoſe coaſts do yeeld. Furthermore, it is evident, that in Cappadocia there is ſalt *Minerall, digged out of the earth: and it appeareth plainely, that it is a ſalt humor congealed within. And verely, they uſe to cut it out of the ground after the manner of *Glaſſe-ſtone, in lumpes: and thoſe exceeding heavie, which the peaſants commonly call *crums of ſalt. At Carrhæ, a citie of Arabia, all the wals thereof, as alſo the houſen of the inhabitants, be reared and built of ſalt ſtones: and the ſame be laid by Ma-
B ſons worke, and the joints cloſed and ſoudered by no other morter but plaine water. King *Ptolomæus*, at what time as he encamped about Peluſium, a citie of Ægypt, and caſt up a trench to fortifie the ſame, found ſuch a mine or quarrey of ſalt as theſe, which was a preſident to others afterward to ſinke pits betweene Ægypt and Arabia, even in the waſt and drie quarters, where under the delfe of ſand they met with ſalt. After which manner alſo they practiſed to dig in the deſart and drie ſands of Affricke, and found more as they went, even as farre as to the temple and Oracle of *Iupiter Ammon*. And verely they might perceive this ſalt to grow in the night ſeaſon, according to the courſe of the Moone. As for all the tract and countrey of Cyrenæ, famous it is, and much ſpoken of, for the ſalt *Ammoniacum, ſo called, by reaſon that it is found under the ſands. In colour and luſtre it reſembleth that Alume de Plume, which the Greekes call Schiſtos:
C It groweth in long lumpes or peeces, and thoſe not tranſparent: the taſt is unpleaſant, howbeit, this ſalt is of good uſe in Phyſicke. The cleareſt thereof is taken for the beſt, eſpecially when it will cleave directly into ſtreight flakes. A ſtraunge and wonderfull nature it hath if it be right: For ſo long as it lieth under ground within the mine, it is paſſing light in hand, and may bee eaſily welded; take it forth once, and lay it abroad above ground, a man would not beleeve or imagin how exceeding heavie it is. But ſurely the reaſon thereof is evident: for the moiſt vapours contained within thoſe mines where it lieth, bear up the ſaid peeces of ſalt, and are a great eaſe to thoſe that deale therewith, much like as the water helpeth much to the ſtirring and managing of any thing within it, be it never ſo weightie. Well, this Ammoniacke ſalt is corrupted and ſophiſticat, as well with the pit-ſalt of Sicilie called Cocanicus, as alſo with that of Cypreſſe, which is wonderfull like
D unto it. Moreover, neare Egelaſta, a cittie in high Spaine, there is a kind of ſal-gem or Minerall ſalt digged: the peeces or lumpes whereof are ſo cleare, as a man may in a manner ſee through them: and this hath of long time been in great requeſt and of ſuch name, as the Phyſicians give unto it the price and praiſe above all other kinds. But here is to be noted, that all places where ſalt is found, are ever barren, and will beare no good thing els. And thus much may bee ſaid concerning ſalt that commeth of the owne accord.

As touching ſalt artificiall, made by mans hand, there be many kinds thereof. Our common ſalt, and whereof we have greateſt ſtore, is wrought in this manner: Firſt they let into their pits a quantitie of ſea-water, ſuffering freſh water to run into it by certaine gutters, for to bee mingled therewith for to helpe it to congeale, whereto a good ſhower of raine availeth very much, but a-
E bove all the Sunne ſhining thereupon, for otherwiſe it will never drie and harden. About Vtica in Barbarie they uſe to pile up great heapes of ſalt in manner of Mounts: which after that they be hardened and ſeaſoned in the Sunne and Moone, ſcorne all raine and foule weather, neither will they diſſolve, inſomuch, as folke have ynough to doe for to breake and enter in with picke-axes. Howbeit, in Candie the ſalt is made in the like pits, but of ſea-water onely, without letting in any freſh water at all. Semblably, in Ægypt, the ſea it ſelfe overfloweth the ground, which (as I take it) is alreadie ſoked & drenched with the river water of Nilus, and by that means their ſalt is made. After the ſame manner they make ſalt alſo out of certaine wels, which are diſcharged into their ſalt-pits. And verely in Babylon, the firſt gathering or thickening of the water in their ſalt-pits, is a certaine liquid Bitumen or Petroleum, an oleous ſubſtance, which they uſe in their lampes, as
F we doe oile: and when the ſame is ſcummed off, they find pure ſalt underneath. Likewiſe in Cappadocia they doe conveigh and let in water out of certaine wels and fountaines into their ſalt-pits. In Chaonia there be certaine *ſprings of ſaltiſh water, which the people of that country doe boile, and when it is cooled againe, it turneth into ſalt: but it is but dull and weak in effect, and beſides, nothing white. In Fraunce and Germanie the manner is when they would make ſalt, to caſt ſea-

*Sal Gemma.

*Lapis ſpeculáris, vitrum vel glacies Marina; or Lapis Arabicus.

*Micas Salis.

*Of ἄμμος in Greeke, which is ſand.

This ſeemeth to be our Bay-ſalt.

*This is the order of ſalt with us in our Wiches here in England.

ſea-water into the fire as the wood burneth. [In ſome parts of Spaine there be ſalt ſprings, out of which they draw water in maner of that brine, which they call Muria.] But thoſe verely of France and Germanie be of opinion, that it skilleth much what wood it is that ſerveth to the making of ſuch fire. Oke they hold the beſt, as being a fewell, the ſimple aſhes whereof mixed with nothing elſe, may goe for ſalt. And yet in ſome places they eſteeme Hazell wood meeter for this purpoſe. Now when the ſaid wood is on fire and burning, they poure ſalt liquor among, whereby not only the aſhes but the very coales alſo will turne to bee ſalt. But all ſalt made in this ſort of wood, is blacke. I read in *Theophraſtus*, That the Iſlanders of Imbros were wont to boile in water, the aſhes of reeds and canes, untill ſuch time as there remained little moiſture unconſumed, and that which was left they uſed for ſalt. The brine and pickle wherein fleſh or fiſh hath beene kept ſalt, if it be boiled a ſecond time untill the liquor be ſpent and conſumed, returneth to the own nature, and becommeth ſalt againe. Certes, we find, That the ſalt thus made of the pickle of Pilchars or Hearings, is of all other moſt pleaſant in taſt. As touching the ſalt made of ſea-water, that of the Iſle Cypres, and namely, that which commeth from Salamis, is commended for the beſt. But of poole ſalt, there is none comparable to the Tarentine and Phrygian, eſpecially that which they call Tatteus, of the lake Tatta. And in truth, both theſe kinds of ſalt be good for the eyes. The ſalt brought out of Cappadocia in little earthen pipes, hath the name to make the skin ſlicke and faire: But for to lay the ſame plaine and even, and make it looke full and plumpe without rivels, the ſalt which I called Cittieus hath no fellow. And therefore women after they bee newly delivered of child, uſe to annoint and rub their bellies with this ſalt, incorporat together with Gith or Nigella Romana. The drieſt ſalt is evermore the ſtrongeſt in taſt. The Tarentine ſalt is taken for to be moſt pleaſant, and whiteſt withall. Otherwiſe, the whiter that ſalt is, the more brittle it is and readier to crumble and fall to pouder. There is no ſalt but raine water will make it ſweet & freſh. The more pleaſant it will bee and delicat to the taſt, in caſe the deaw fall thereupon: but North-eaſt winds engender moſt plentie thereof. In a Southerly conſtitution of the weather, and namely, when the wind is full South, you ſhall ſee no ſalt engendered. The * floure of ſalt (commonly called Sperma-Ceti) is never bred but when the Northeaſt winds doe blow. The ſalt Tragaſæus will neither ſpit, crackle, leape, nor ſparkle in the fire; no more will Acanthius (ſo called of a towne of that name:) neither doth the ſome of ſalt, nor the gobbets & fragments, ne yet the thin leaves or flakes thereof. The ſalt of Agrigentum, a citie in Sicilie, will abide the fire and make no ſparkling: put it into water, it will keepe a ſpitting and crackling. Great difference there is in ſalt, in regard of the colour. At Memphis [*i.* Caire] in Ægypt, the ſalt is of a very deep red: but about the river Oxus in Bactriana, more tawnie or enclining to a ruſſet. And the Centuripine ſalt within Sicilie is purple. About Gela in the ſame Iſland, the ſalt is ſo bright and cleare, that it will repreſent a mans face, as in a mirroir. In Cappadocia, the Minerall ſalt which they dig, is of a yellow Saffron colour, tranſparent, and of a moſt redolent ſmell. For any uſe in Phyſicke, the Tarentine ſalt was in old time highly commended above the beſt: after which they eſteemed moſt, all the ſea ſalts; and of that kind the lighter, and that which eſpecially is of the nature of ſome. For the *eyes of horſes and Bœufes, they made great reckoning of the Tragaſæan ſalt, and that of Granado or Bœtica in Spaine. For dreſſing of viands and cates; for to bee eaten alſo with meat; the better is that ſalt, which ſooner melteth and runneth to water. That alſo which by nature is moiſter than others, they hold to bee better for the kitchin or the table (for leſſe bitterneſſe it hath) and ſuch is that of Attica and Euboea. For to pouder and keepe fleſh meat, the drie ſalt & quick at tongues end is thought to be meeter than other, as we may ſee in the ſalt of Megara. Moreover there is a certaine confite or condited ſalt, compounded alſo with ſweet ſpices and aromaticall drougs: which may bee eaten as a daintie kind of gruell or ſauce; for it ſtirreth up and whetteth appetite, eat the ſame with any other meats: inſomuch, as amongſt an infinite number of other ſauces, this carieth away the taſt from them all; for it hath a peculiar ſmatch by it ſelfe, which is the cauſe, that the pickle Garum is ſo much ſought after for to give an edge to our ſtomack. And not onely we men are ſollicited and moved by ſalt more than by any thing elſe to our meat, but muttons, Bœufes, and Horſes alſo have benefit therby in that reſpect: they feed the better, give more ſtore of milke, and the cheeſe made thereof hath a more daintie and commendable taſt by that meanes. And to conclude all in one word, the life of mankind could not ſtand without ſalt, ſo neceſſarie an element (if I may ſo ſay) it is for the maintenance of our life, that the very delights and pleaſures of the mind alſo are expreſſed by no better tearme than ſalt: for ſuch gifts and conceits

G H I K L M

of

* *Hálos-anthos*, which he rendreth *Flos-ſalis*: wheras indeed *Flos-ſalis*, *i.* the floure of ſalt, is another thing, as himſelf ſheweth elſwhere, by the name of *tenuiſſima favilla ſalis*.

* *Sandivere.*

A of the spirit as yeeld most grace and contentment, we use in Latine to call Salis. All the mirth of the heart, the greatest cheerfulnesse of a lightsome mind, and the whole repose and contentment that a man findeth in his soule, by no other word can bee better shewed. Moreover, this tearme in Latine of Sal, is taken up and used in warre, yea, and divers honors and dignities bestowed upon brave men for some worthie service, goe under this name, and bee called Salaries. And how highly our auncestours accounted thereof, it may appeare by the name of that great port-way or street Salariæ, so called, because all the salt that went into the Sabines countrey, passed that way. Moreover, it is said, That *Ancus Martius* king of Rome, was the first that erected the salt-houses, and gave unto the people a congiarie or largesse of 6000 Modij of salt: And *Varro* writeth, That our auncestours in times past used salt ordinarily in stead of an houshold gruell: for they
B were wont to eat salt with their bread and cheese, as may appeare by the common proverbe that testifieth so much. But most of all we may gather in what request and account salt was in sacrifices and oblations to the gods, by this, that none are performed & celebrated without a cake of meale and salt. Furthermore, where salt is truly made without any sophistication, it rendereth a certaine fine and pure substance (as it were) the most subtile cindres of ashes: which as it is lightest, so none is so white as it. There is that also which is called the Floure of salt, altogether different from salt, as beeing a kind of deaw, of a moister nature; resembling Saffron in yellow colour, or else enclining rather to a sad red or russet colour, and is as a man would say the rust of salt: the strong and unpleasant smell likewise, which commeth neare unto that of the pickle Garum, bewraieth that it is a distinct thing from salt, as well as from the froth thereof. This Floure of salt came first
C from Ægypt, and it seemeth as though it floted upon the river Nilus, and were caried downe the streame thereof. And yet there bee some fountaines which doe beare and put up the same, upon which it swimmeth aloft. Of this kind, the best is that which yeeldeth a certaine fattie and unctuous oile: For this you are to thinke, that salt is not without a kind of fattinesse, wonderfull though it be. This flour of salt is sophisticated and commonly coloured with red ocre, or els many times with potshards reduced into pouder: but this deceit may be quickly knowne and found by water; for if it be a false and artificiall colour, water will wash it off: wheras the true floure of salt indeed, will resolve by nothing but by oile, and verely the Apothecaries and confectioners of sweet oiles and ointments, use it most of all for the colour sake, when they would give a fresh & lively hue to their compositions. Being put up in any vessell, it seemeth white and hoarie aloft: but the middle
D part within, is as I have said, more moist ordinarily. As touching the properties of this Floure of salt, by nature it is biting, hot, and hurtfull to the stomacke; it moveth sweat, and looseth the belly taken in wine and water: good also it is for to enter into those ointments which are devised for lassitude and wearinesse: and by reason of the abstersive facultie that it hath, fit for sope and scouring balls. Nothing so effectuall to cause the haire to fall from the eye lids. As for the residence or grounds thereof, setling in the bottome of the pot where this floure is kept; they use to shog and shake the same together, to bring it againe unto the colour of Saffron. Over and besides, there is in salt-houses another substance like brine, which in Latine is called Salsugo or Salsilago, altogether liquid; salter in taste than sea-water, but in strength farre short of it and different. And yet is there one kind more of an exquisit and daintie liquor in manner of a dripping, called Garum,
E proceeding from the garbage of fishes, and such other offall as commonly the cooke useth to cast away as it lieth soaking in salt: so as if a man would speake properly, it is no other but the humor that commeth from them as they do lie and putrifie. In old time this sauce was made of that fish which the Greekes called Garon. Where by the way this commeth to my mind, that if a woman sit over the perfume or suffumigation of the head of this fish whiles it burneth, it is of power to fetch away the afterbirth that staieth behind when the child is borne.

Chap. VIII.

Of the fishes called* Scombri. Of fish pickle: and the fish sauce, named in old time Alex.

*Commonly taken for Maquerels.

F NOw adaies the most daintie and exquisit Garum is made of the fish called Scomber: and that in new Carthage, where there groweth such store of Spart or Spanish broome; and namely, in the stewes and ponds by the sea side where fishes are kept salted. In times past, and yet, it beareth the name of The *Allies sauce, or their Garum: so costly and so much in re-

*Garum sociorū

quest,

queſt,that every two gallons thereof might not be bought, much under the price of a thouſand Seſterces. Certes ſetting aſide ſweet perfumes and odoriferous ointments,there was not a liquor almoſt in the world that began to grow unto a higher rate & reckoning; inſomuch as ſome places and people caried the name thereof,and were ennobled thereby. And verely in all Mauritania,Granade in Spaine,and Carteia,the inhabitants lie in wait to fiſh for theſe Scombri,and to take them as they enter out of the Ocean into the ſtreights of Gilbretar, and all for this Garum, being indeed good for nothing elſe. The citie Clazomenæ in Aſia, the townes Pompeij and Leptis,are much renowned for this ſauce: like as Antipolis,Thurij, and of late daies, Dalmatia for their pickle. The groſſe grounds or dregs of this ſauce,before it be ſtrained,purified,and fully finiſhed,is called Alex,even the very defect and imperfection therof. Howbeit,of late time men have gone in hand to make the ſaid Alex or Garum of one kind of fiſhes apart by themſelves, which otherwiſe are good for little or nothing,and of all others be ſmalleſt. This fiſh we in Latin call Apua,the Greekes Aphye,for that it is engendered of raine and ſhowers. In the territorie of Foro-julium,the fiſh whereof they make this ſauce,they call*Lupus. But in proceſſe of time Garum aroſe to exceſſe,both in price and varietie of uſe; inſomuch as there grew an infinit number,of diverſe kinds: For one ſort there was of Garum that in colour reſembled old honied wine, and became ſo cleare and ſweet withall,that it might well ynough have ben drunk for wine: another kind there was,which our ſuperſtitious votaries uſe, for to keepe themſelves chaſt and continent; & the Iewes alſo in their holy ſacrifices employed the ſame,eſpecially that which is made of skalie fiſhes. In like maner,the other ſauce,Alex, is come to be made of Oyſters, ſea Vrchins, ſea Nettles,Crabfiſhes,Lobſtars,and the livers of ſea Barbles. In ſumme,thus we have deviſed a thouſand waies to diſſolve ſalt with the conſumption of the ſubſtance of fiſh, and all to procure appetite to meat and to content the bellie.

*Which ſome take to be our Pike.

Thus much I thought good to note curſarily, as touching thoſe ſauces which are ſo greatly longed after in the world; and the rather for that in ſome ſort they ſerve in the practiſe of Phyſick: For the groſſe liquor or ſauce Alex,healeth the ſcab in ſheepe, if the skin be ſcarified or skiced, and the ſame Alex poured thereupon. Alſo it is ſingular againſt the biting of a mad dog, or the pricke of the ſea dragon. The ſame likewiſe ſerveth to ſoake linnen wreaths to bee laid in wounds; or tents made of lint to bee put into ſores. As for Garum, it healeth any freſh burne, if a man drop it upon the place, without naming it,or ſaying that it is Garum: Good it is beſides for the biting of mad dogs, but eſpecially for the Crocodiles tooth: as alſo for running ulcers which be either corroſive or filthie. Of wonderfull operation & effect beſides for the ſores of the mouth, and eares,as alſo for their pains. The pickle Muria likewiſe,or that ſalt liquor that commeth from ſalt fiſh,called in Latin Salſugo,it is aſtringent,biting, diſcuſſive, and drying: ſingular for to cure the dyſenterie or bloudie flix, yea, though there were an eating ulcer within the guts: for the Sciatica and inveterat fluxes of the ſtomacke, it is ſoveraigne: and to conclude,thoſe that dwell farre from the ſea in the midland parts of a countrey, uſe to bath and foment themſelves with it in lieu of ſea water.

Chap. x.

The nature of Salt, and the medicinable vertues thereof.

Salt,by nature ſtandeth much upon fire,& yet an enemie it is and contrary unto fire, it flieth from it; eating & conſuming all things whatſoever: aſtringent it is, deſiccative, binding, and knitting. It keepeth from putrifaction, bodies that be dead, and cauſeth them to endure ſo a world of years. In Phyſick it is held for mordant, burning, cauſtike, and mundificative. It doth ſubtiliat, extenuat, and diſſolve. Contrarie it is unto the ſtomacke,& ſerveth not but only to provoke appetite. With origan, hony,& hyſſope, it is ſingular againſt the ſting of ſerpents: and more particularly of the horned ſerpent Ceraſtes, if it be applied with origan, cedar-roſin, pitch, or hony. Being drunke with vinegre, it helpeth thoſe that be pricked with the Scolopendre: and applied as a liniment with oile or vinegre, and a fourth part of line ſeed, it is good againſt the ſting of ſcorpions: likewiſe with vinegre alone, for the ſting of hornets or waſps and ſuch like. Incorporat with calves tallow, it ſerveth much to cure the migraim, skals in the head, ſmall pocks, meaſels,& werts which begin to breed: alſo for the accidents of the eies,& namely, the excreſcence of ſuperfluous fleſh in thoſe parts, or the turning up of the skin about the naile roots either of fingers or toes.

But

A But principally for the eyes: and therefore it entreth into collyries and eyeſalves. Howbeit, for theſe purpoſes abovenamed, it is thought that the ſalt named Tattæus, of the lake Tatta, is moſt commended, as alſo the other like unto it called Caunites. If the eyes bee bloudſhotten, or looke blacke and blew upon ſome ſtripe, applie ſalt with an equall weight of Myrrhe and with honey, or els with *Hyſſope and hote water: with this charge, to foment or bath the place afterwards with a kind of ſalt brine. But above all, Spaniſh ſalt would be choſen for this effect: & the ſame is good againſt cataracts and ſuffuſions of the eyes: if it bee ground with milke upon ſome touchſtone, whetſtone, or hard porphyrite marble. More particularly, it is ſingular for the black bloud gathered in the eyes, if it be folded within a little linnen cloth, and ſo applied: but the ſame ought to be dipped eftſoones in hote water, and ſo the place to be oftentimes patted withall. For the cankers B of ſores in the mouth, it is good to lay ſalt upon fine lint. In caſe the gumbs be ſwelled, it were not amiſſe to rub them therewith. Beeing beaten and reduced into ſmall pouder, it ſerveth for the roughneſſe of the tongue. Moreover, it is ſaid; That whoſoever hold every morning under his tongue while he is faſting a little ſalt untill it be melted, he ſhal by that meanes preſerve his teeth from being worme eaten or rotten. The ſame incorporat in raiſins without their ſtones, and in Bœufe ſuet, with a little origan, levaine, or bread, is ſoveraigne for the leproſie, fellons, tettars, ringwormes, and the wild ſcab. But in all theſe accidents, the ſalt of Thebais in high Ægypt is moſt commended: And of this they make choice alſo to kill the itch. A gargariſme or colluti- on thereof with honey, is paſſing good for the inflammation of the Amygdales and the Vvula. There is no kind of ſalt but it helpeth the Squinancie: and the rather, if it be uſed inwardly with C oile and vinegre, ſo as at the ſame time it bee applied without the throat alſo in a liniment with tarre. If a cup of wine be dreſſed therewith, it ſofteneth the bellie being coſtive. The ſame alſo taken in wine, chaſeth out of the bodie all wormes and any hurtfull vermine beſides. Held under the tongue, it enableth them that have been weakened with ſome long diſeaſe and newly recovered, to endure the heat of baines or ſtouves the longer. Singular it is for the greeſe of the ſinewes: but in the practiſe and uſe of this receit, it would be obſerved eſpecially that there bee applied about the ſhoulders and reines of the backe, ſachels or bags full of ſalt, and the ſame made hote oftentimes in ſeething water: for ſo it eaſeth the paine. Being given in drinke, or laid too exceeding hot in the ſaid bags, it aſſuageth the collicke & other wrings of the bellie, yea, and the Sciatica. Beaten ſmall, and applied in manner of a cataplaſme, with meale, honey, and oile, it is ſove- D raigne for the gout of the feet. Where I may not forget the obſervation of this ſoveraign receit which putteth us in mind, that there is nothing better for the whole bodie [of ſuch eſpecially as be ſubject to the gout] than *ſalt and Sunne together: For thus we ſee, that our fiſhers at ſea ordinarily have bodies as hard and tough as horne. A principall thing this is therefore to be nominated and ſet downe, for the gout in the feet. But ſalt moreover taketh away cornes of the feet, and kibes in the heels. Being chewed in the mouth and ſo applied, or els with oile, it healeth any burn or skald, and keepeth the skin from riſing into bliſters. With vinegre or hyſſope, it cureth S. *Anthonies* fire, and all ulcers that bee corroſive. It healeth likewiſe cankerous ſores, if it bee applied with wild Vine grapes. Reduced into fine pouder and laid too with Barley meale, it is ſoverain for ulcers corroſive, ſuch as be called Wolves, and doe eat deepe to the very bone; ſo there bee laid E over the ſame and the part affected, a linnen cloth well ſoaked and bathed in wine. A proper remedie it is for the jaundiſe, and riddeth away the itch occaſioned thereby, if the patient be rubbed all the bodie over with it, oile, and vinegre, againſt a good fire untill he ſweat. But with oile alone it ſerveth for thoſe that feele themſelves wearie. Many Phyſicians have cured thoſe that bee in a dropſie with ſalt; and have ordained to rub their bodies with oile and ſalt together who are in an ague, for to avoid the extremitie of heat: and they hold opinion, That there is not a better thing to diſpatch away an old cough, than to bee licking ever and anone of ſalt. They have given order likewiſe to miniſter ſalt by way of clyſtre up into the bodie, for the Sciatica. To applie the ſame alſo, for to eat away either prowd or dead fleſh in any ulcers. Being lapped within a linnen cloth, & applied to the biting of Crocodiles, it is ſoveraigne, ſo that the place affected were well patted F withall, and preſſed hard before. Moreover, good it is to be taken in honied vinegre againſt the daungerous Opiconi. Brought into a cataplaſme with honey and meale, it is of great effect to rectifie any diſlocation of bones which be out of joint: and in that ſort it taketh down all tumors or ſwelling bunches. A collution or fomentation therewith, allaieth rhe tooth-ach: and a liniment alſo made with it and roſin, worketh the ſame effect. For all theſe accidents beforenamed, the

*Hyſſopo. Some read Oeſypo.

*Sale & ſolè.

the fome of ſalt found ſticking to rocks or floting upon the ſea water, is thought to be more convenient than any other ſalt. But to conclude, any ſalt whatſoever it is, ſerveth well for thoſe medicines that bee ordained either to take away laſſitudes, or to enter into thoſe ſope-bals which are to poliſh the skin and to rid it from wrinckles. If either a bœufe or mutton be rubbed with ſalt, it will kill the skab or mange in them: for which purpoſe alſo they give it unto the ſaid beaſts for to licke: and more particularly, it is ſpurted out of ones mouth into horſes eyes. Thus you ſee what may be ſaid as touching Salt. G

Chap. x.

Of Nitre, and the ſundrie kinds thereof. The manner of making Nitre. The medicines and obſervations to it belonging. H

I May not put off the Treatiſe concerning the nature of Salnitre, approching ſo near as it doth to the properties of ſalt: and the rather am I to diſcourſe of it more exactly, becauſe it appeareth evidently, that the Phyſicians who have written thereof were altogether ignorant of the nature and vertues of it: neither is there any one of them who in that point wrote more adviſedly than *Theophraſtus*. In the firſt place this is to be noted, That among the Medians there is a little Nitre engendred in certain vallies, which in time of drought became all hoarie and grey therwith, and this they call Halmirrhaga. There is found alſo ſome of it in Thracia neare unto the citie Philippi, but in leſſe quantitie, and the ſame all foule and beraied with the earth, and this they name Agrion. In times paſt men have practiſed to make Nitre, of Oke wood burnt; but never was there any great ſtore thereof made by that deviſe: and long it is ſince that feat was altogether given over. As for waters and fountaines of nitre, there bee ynow of them in many places, howbeit, the ſame have no aſtringent vertue at all. But the beſt Nitre is found about Clytæ in the marches of Macedonie, where there is moſt plentie thereof, and they call it Chalaſtricum: White and pure it is, and commeth neareſt to the nature of ſalt. And verely, a lake or meere there is ſtanding altogether upon Nitre, and yet out of the midſt thereof there ſpringeth up a little fountain of freſh water: In this lake there is engendred Nitre about the riſing of the Dogge-ſtar for nine daies together: then it ſtaieth as long, and beginneth freſh againe to flote aloft: and afterwards giveth over. Whereby it appeareth, that it is the very nature of the ſoile that breedeth it: for it is knowne by experience, That if it ceaſe once, neither heat of Sun nor ſhowers of raine will ſerve or doe any good. Beſides, there is another wonderfull propertie obſerved in this lake, that notwithſtanding the foreſaid Spring or ſource do ſeeth and boile up continually, yet the lake neither riſeth nor overfloweth. But during thoſe nine daies wherein it is given to yeeld Nitre, if there chaunce to fall any ſhowers, they make the Nitre to taſt the more of ſalt. And ſay that the North-eaſt winds do blow the while, the Nitre is nothing ſo good and cleare, by reaſon of the mud mingled withall, which thoſe winds doe raiſe. Thus much of Nitre naturall. I K

As for artificiall Nitre, great abundance there is made of it in Ægypt, but farre inferiour in goodneſſe to the other: for browne and duskiſh it is, and beſides full of grit and ſtones. The order of making it, is all one in manner with that of ſalt, ſaving onely that into the ſalt-houſes they let in ſea water, whereas into the boiling houſes of Nitre they conveigh the water of the river Nilus. Whiles Nilus doth riſe and flow, you ſhall have the ſaid nitre-pits or workhouſes, drie: but as it falleth and returneth againe toward the channell, they are ſeene to yeeld a certaine moiſture, (which is the humor of Nitre) and that for the ſpace of fortie dayes together, with no ſuch reſt or intermiſſion betweene, as there is about Clytæ in Macedonie aboveſaid. Moreover, if the weather bee diſpoſed to raine during that time, they employ not ſo much of Nilus water to the making of nitre. Now ſo ſoone as the ſaid humor beginneth to thicken, preſently they gather it in all haſt, for feare it ſhould reſolve againe and melt in the nitre pits. In this nitre as well as in ſalt, there is to bee found, betweene whiles, a certaine oleous ſubſtance; which is held to bee ſingular good for the farcin and skab of beaſts. The nitre it ſelfe is laid up and piled in heapes, where it hardeneth and continueth a long time. But admirable is the nature of the lake Aſcanius, and of certaine fountaines about Chalcis, where the water above, and which floteth uppermoſt, is freſh and potable; but all beneath and under it toward the bottome, is nitrous. The lighteſt of the nitre and the fineſt, is reputed alwaies beſt; and therefore the fome and froth thereof is better than any other part. And yet for ſome uſes the groſſe and foule ſubſtance is very good, and namely, L M

for

A for the ſetting of any colour upon cloth, and eſpecially the purple die. As touching the vertues of nitre it ſelfe, and how it is emploied many waies, I will write in place convenient. But to return againe to our nitre-pits, and their boiling-houſes, there be of them verie faire and goodly in Ægypt. In old time, they were woont to be about Naucratis and Memphis only; but thoſe at Memphis were nothing ſo good as the other: for there, the nitre lying upon heaps, groweth to the hardneſſe of a ſtone; inſo much, as by this means, you ſhall ſee whole mountains therof like rocks. Of this nitre they uſe to make certain veſſels to uſe in the houſe: and many time they melt it with ſulphur, and boile it over the coles for to give a tincture unto the ſaid veſſels: look alſo when they would keepe any * thing long, they uſe this ſtone-nitre. Moreover, there be in Ægypt other nitre-pits alſo, out of which there iſſueth a reddiſh kind of nitre, reſembling the colour of the earth B from which it ſweateth and ooſeth out. As for the foame of nitre, (which is commended for the beſt of all) the auncient writers were of opinion, that it could not be made but when the dew fell: at what time as the nitre-pits were (if I may ſo ſay) great bellied and full of nitre within, but not readie to be delivered thereof: and therefore if they be neare (as it were) to their time, there can no ſuch froth be gathered, notwithſtanding the dew doe fall. Others there be of this mind, that the ſaid uppermoſt coat or cruſt aloft, is engendred by reaſon of the fermentation of the ſaid nitre: but the moderne Phyſicians of late daies have thought and taught, That * Aphro-nitrum is gathered in Aſia, and found within certain ſoft and grittie caves diſtilling out of rocks: [Theſe caves becauſe they be vaulted and arched over head, the inhabitants call * Cochlacas] which afterwards they doe drie in the Sun: and the beſt is thought that of Lydia. The true marke to know C good ſal-petre, Is to be verie light in hand, exceeding brittle and eaſie to crumble; enclining alſo much to the colour of purple: this is brought from thence to us in trochiſchs. As for the Ægyptian Aphro-nitre or Sal-petre, it commeth in veſſels well pitched, becauſe it ſhould not melt and reſolve into water. Thoſe veſſels alſo beforenamed, ought to be throughly dried and dreſſed in the Sun. As for nitre, the beſt is choſen by theſe marks; namely, if it be paſſing fine and cleare, but withall, ſpongious and verie full as it were of pipes & holes. Many do ſophiſticat it in Ægypt with quickelime; but this deceit may bee eaſily found by the taſt: for the good and true ſal-nitre will ſoone melt and diſſolve at the tongues end; whereas the other that is not right, pricketh and biteth in the mouth: moreover, if it have a ſprinkling of lime among, it carieth a ſtrong ſmell with it. When it is calcined in ſome earthen pot, it ought to be well covered with a lid, leaſt it leap D or flie out; otherwiſe, in the fire it ſelfe, it ſparkleth not nor leapeth foorth: neither groweth any thing elſe in thoſe places where ſal-nitre is engendred, whereas in ſalt-pits graſſe commeth up. As for the Sea, what a number of living creatures breedeth it? and what plentie of reike and weeds beſides? And not only by this argument appeareth it, that there is more acrimonie and ſharpneſſe in ſal-nitre than in ſalt, but alſo herein, That no ſhoes will abide the nitre pits, but preſently fret and weare; for otherwiſe holeſome they be and ſoveraigne for the eyes: neither was it ever ſeen, that any men who handled theſe pits of nitre, and wrought therein, were ever blind. Moreover, this commoditie they have, That if a man come thither having a ſore or ulcer upon him, the ſame will ſoone be healed up and skinned cleane: but if one chaunce to bee wounded or hurt there, long it will be ere he be cured thereof. Salnitre provoketh ſwet, if the bodie be anoin-E ted with it and oile togither; and it maketh the skin ſoft and tender. That which is called Chalaſtræum, ſerveth in lieu of ſalt, in making bread; whereas the Ægyptian nitre is uſed with radiſhes, for it maketh them more tender. As for cates and meats, if they be powdred withall, they will looke white and bee worſe for it: whereas all woorts either for pot or ſallad, will ſeeme the greener.

* As dead bodies.

* This is our Sal-petre.

* Some read *Colycas*.

To come now unto Phyſicke and the medicinable vertues of ſalnitre: hot it is of temperature, and doth extenuat; biting beſides and aſtringent: a great drier it is, and doth exulcerat. In regard of which qualities, emploied it is in thoſe accidents which require either drawing to the exterior parts, or to bee diſcuſſed and reſolved: ſuch alſo as need ſome gentle mordication, or would be lightly extenuated; as meazils, ſmall pocks, wheals, & pimples. Some for this purpoſe, firſt make F it red hot in the fire, and then quench it with ſome auſtere and aſtringent wine: which done, they beat and reduce it to powder, and therewith rub and chauſe the bodie in the bains, without any addition of oile to it: mixed with the pouder of dried flour-delis, & incorporat in green oile olive, it repreſſeth immoderat ſwets: a liniment made therwith & figs togither, doth extenuat the films in the eies; and the aſperitie of the eye-lids it doth ſubtiliat: the ſame operation hath it beſides,

if it bee ſodden in wine cuit to the conſumption of the one halfe: and ſo is it good for the ſpots G
that ariſe in the eyes. The decoction of nitre boiled within the rind of a pomegranat in wine cuit, cure the ſore nailes and the raggedneſſe thereof: and reduced into an ointment with honey, it cleareth the eyeſight: a collution made thereof, ſodden in wine with pepper, eaſeth the tooth-ach, if the mouth and gums be waſhed therwith: ſo doth the decoction thereof with leeks. Burne or calcine nitre into powder, it maketh an excellent dentifrice for blacke teeth, & reduceth them againe to their naturall whiteneſſe: annoint the head with nitre & Terra Samia incorporat togither in oile, it killeth the lice and nits that breed therein: diſſolved in wine, and poured into the ears that run attyr, it cureth them: dtopped into them with vinegre, it eateth and conſumeth the filthie excrements of that part: conveyed drie into the ſaid ears, it diſcuſſeth the ſinging and ringing therein. A liniment made of nitre and Fullers earth, of each a like weight, incorporat with H
vinegre, taketh away the foule morphew, if the skin be annointed therewith: mixed with roſin, or with raiſons of white grapes ſtamped ſtones and all, it draweth uncoms and fellons to an head, and breaketh them: reduced into an ointment with ſwines greace, it preſerveth the genetoirs from inflammation, & cureth them: good likewiſe for the meaſils and ſmall pocks which breake out in all parts of the bodie: put roſin thereto, and incorporat them both in a liniment with vinegre, it healeth the biting of a mad dog, ſo it be taken betimes at the beginning: & in this manner, it cureth alſo the ſores occaſioned by the ſting of ſerpents, eating ulcers, which conſume to the bone; ſuch likewiſe as be corroſive & apt for putrefaction, ſo it be mixed with quicklime and tempered with vinegre. Stampe nitre with figs, and bring it into the forme of a cataplaſme or liniment, it doth much good for the dropſie: the ventoſities cauſing wringings and painfull gripes I
of the belly, it diſcuſſeth, if the decoction thereof be drunke; namely, when to the weight of one dram, it is ſodden with rue, dill, or cumin. Annoint their bodies all over who are wearie, with nitre, oile, and vinegre, you ſhall ſee how effectuall it is to refreſh them and drive away their laſſitude. Rub and chauſe both hands and feet, with nitre & oile wrought togither, it is ſingular good againſt quaking and ſhivering cold: given with vinegre, eſpecially in a fwet, to thoſe who are painted with the jaundiſe, it repreſſeth the itch that troubleth them: if a man bee poiſoned with taking venomous muſhroms, he ſhall find means to avoid the daunger therof by drinking nitre in oxycrat or vinegre and water mingled togither. Hath one ſwallowed down the hurtfull flie Bupreſtis? let him take a draught of ſal-nitre in water, & it will ſave him, for it cauſeth vomit: to thoſe that have drunke bulls bloud, it is uſually given with the ſpice Laſer: incorporat with honey and K
cow-milke, it healeth the breaking out and the exulcerations in the face. Torrifie nitre untill it begin to looke blacke, beat it then to powder and caſt the ſame upon a raw place that is burnt, it will take out the fire and skin it up again: for the paine of the belly and the kidnies, for the ſtiffeneſſe and ſtarkeneſſe of the lims, the grievance alſo of the ſinews, it ſerveth verie well in a clyſtre: lay it to the tongue with bread, it is ſoveraign for the palſie or reſolution of the ſinews: it helpeth thoſe that be ſhort-winded, if they take it in a ptiſan, or with husked barley. The floure of nitre incorporat in Galbanum, and the roſin called terpentine, of ech an equall weight, and reduced into a lohoch, ſo as the patient ſwallow downe the quantitie of a beane at once, cureth an old cough.

* *Vritur*, not *Coquitur*, Ex *Dioſc.*

*Burne or calcine nitre, temper it afterwards with liquid pitch or tar, and give it to drinke, it cureth the ſquinancie. The floure of nitre incorporat with the oile Cyprinum, maketh a pleaſant L
liniment to annoint the bodie withall in the Sun, for the gout or any paine of joynts: drunke in wine, it doth exterminat and drive away for ever, the jaundiſe; it ſcattereth and diſcuſſeth ventoſities; it ſtoppeth bleeding at the noſe, if the patient receive into the noſthrils the vapour of it out of boiling water: mixed well with alume, it riddeth away an itch: foment or bath the arme-pits duly everie day therewith in water, it correcteth the ranke ſmell therof. Make a liniment or cerot of nitre & wax tempered togither, it healeth the ulcers occaſioned by fleame: after which maner, it is good alſo for the ſinews. Being injected by a clyſtre, it helpeth the flux of the belly, proceeding from a feeble ſtomacke. Many Phyſicians have given direction to annoint the bodie all over with ſal-nitre and oile, before the cold fitts of agues: which ointment ſerveth likewiſe for the leproſie, and the unſeemly ſpots or freckles that blemiſh the skin. To ſit in a tub of nitre within the bains, M
and therewith to bath the bodie, is a ſoveraigne thing for thoſe that have the gout, be in conſumption, and either draw backeward with the crampe, or ſtretched and plucked ſo ſtreight and ſtiffe therewith, that they ſeeme all of one entire peece. Sal-nitre, if it bee boiled togither with ſulphur, turneth to be as hard as a ſtone.

CHAP.

Chap. xi.

The nature of Spunges.

MAny sorts there be of Spunges, according as I have shewed alreadie more amply in my treatise of water-beasts, and those especially of the Sea, and their severall natures: howbeit some writers distinguish them after another manner, into male and female: for some of them they have thought to be of the male sex, to wit, those which have smaller pipes or concavities, and those growing thicker and more compact, whereby they sucke up more moisture; and these, our delicat and daintie people, die in colours, and otherwhile give them a purple tincture.
B Others they count of the female sex, namely such as have bigger pipes, and the same running throughout one continuitie without interruption. Of the male kind, some be harder than others, which they call Tragos; the pipes whereof are the finest, and stand thickest togither. There is an artificiall devise to make spunges looke white; to wit, if the softest and tendrest of them be taken whiles they be fresh in summer time, and so bathed and soked well in the some of salt: after which they ought to be laid abroad in the moon-shine, to receive the thicke dew or hoarie frosts (if any fall) with their bellies upward into the aire, I meane that part whereby they cleave fast to rocke or sand where they grew, that thereby they may take their whitening. That spunges have life, yea and a sensible life, I have prooved heretofore; for there is found of their bloud settled within
C them. Some writers report, that they have the sense of hearing, which directeth them to draw in their bodies at any sound or noise made, and therewith to squize out plentie of water which they contained within: neither can they easily be pulled from their rocks, and therefore must be cut away; wherby they are seene to shed a deale of bloud, or that which resembleth bloud very neare. Many doe prefer the spunges growing in places exposed to the North-wind, before any other: neither doe any hold and maintaine longer in any place their owne breath, as Physicians doe hold; who affirme, that for this regard they be good for our bodies, namely, If wee entermingle their breath with ours by application: for which purpose, the fresher taken and the moister they be, the better they are thought: but this their operation is lesse perceived, in case they be wet in hot water, and so applied: likewise if they be soked in any unctuous liquor, or bee laid upon any part of the bodie annointed. This also is observed by them, that the thickest of them, to wit, such
D as have the least pipes, sticke not so hard to a place as others. As touching the softest and finest spunges, called Penicilli, if they be applied unto the eyes after they have been soked in honeyed wine, they doe allay and bring downe any swelling in them. The same are abstersive and singular good to clarifie and cleanse the eyes that be given to bleerednesse: but those (I say) ought to be of the finest and softest kind. For to stay the violent flux of rheumaticke humors into the eyes, there is nothing better than to apply spunges of any sort with oxycrat, that is to say, vinegre and water: but with vinegre alone actually hot, they be singular for the head-ach: and otherwise, any spunge that is fresh gotten, doth discusse, mollifie, & mitigat. Old spunges do conglutinat & souder any wounds. Ther is a generall use of all spunges, to wipe & mundifie any place, to foment and bath withall: to keep off the aire also and cover it after fomentation, untill another medecine be
E made readie for to be laid on fresh. Moreover, they be deficcative, and therfore if they be applied unto rheumatick and moist ulcers, and namely in old folke, they drie up the superfluous humors that find a way thither: neither is there any thing so fit for to foment a fracture or greene wound, as spunges. Also, when any part of the bodie is cut off or dismembred, what is so handsom to suck and soke away the bloud quickly, (that the cure may be throughly seen, and the order therof) as a spunge? Furthermore, spunges themselves serve to be laid unto wounds, somtime drie, and sometime dewed or sprinckled with vinegre; one while wet in wine, another while moistned with cold water, and all to defend them from inflammation: but if they be bathed in raine water, and so applied to members new cut, they will not suffer them to swell & impostumat. They are besides laid usually to the sound parts, where no skin is broken, if there be any hidden and secret humor that
F runneth under the place, and putteth it to paine and trouble, such as needeth to bee discussed or resolved: also to impostumes, if they be first annointed with boiled honey. In like manner, for the pain of the joynts they are proper to be applied, one while wet in vinegre with salt, another while dipped in vinegre and water: and if the gout be hot, they would be laid too soked in water onely. The same spunges ought for the dissolving of hard callosities, to be wet with salt water: & against

the ſting or prick of ſcorpions, with vinegre. In the cure of wounds, ſpunges may be uſed in ſtead of unwaſhed greaſie wooll, ſometimes applied with wine and oile, and ſometimes alſo with the ſaid wooll: this onely is the difference, That ſuch wooll doth mortifie, whereas ſpunges doe reſtraine and ſmite back: and yet a facultie they, have to fetch out and ſucke away the filthie excrements, attyr, and quitter, that gather in ſores and wounds. They may bee bound about the bodie of thoſe that have a dropſie, either drie, or elſe wet in warme water of vinegre; according as need requireth, either to goe gently to worke, or to cover and drie the skin. Over and beſides, good it is to apply ſpunges to thoſe accidents and infirmities of the bodie which require evaporation; namely, if they be well ſoked and throughly wet in hote water, and then preſſed and ſtreined between two tables or bourds. After which manner, they are good to be laid unto the ſtomack; and G
in a fever, againſt extremitie of heat. For thoſe that be troubled with the oppilation or hardneſſe H
of the ſplene, there is not a more effectuall remedy, than to apply ſpunges to the place affected, wet in oxycrat or vinegre and water togither: like as for ſhingles and S. *Anthonies* evill, with vinegre onely. But in this application of them, conſideration muſt bee had that they cover the ſound parts alſo round about as well as the other. Spunges wet in vinegre or cold water, ſtaunch any flux of bloud. If there be any place of the skin blacke and blew, upon a freſh or new ſtripe, lay thereto ſpunges well drenched in ſalt water, chaunging them often one after another, & it ſhall recover the naturall colour againe: in which order, they bring downe the ſwelling of the cods, and allay their paine. Beeing hacked and cut ſmall, they ſerve to good purpoſe for to be laid to the biting of mad dogs; ſo that eftſoons and ever and anon they be wet and refreſhed with vinegre, cold water, or honey good ſtore, one with another. The ſpunges of Africke or Barbarie be- I
ing burnt or calcined, doe make ſoveraigne aſhes for to be drunke with the juice of unſet leeks in cold water (ſo there bee put unto a draught thereof, a quantitie of ſalt) by ſuch as caſt or reach bloud upward at the mouth. The ſame aſhes reduced into a liniment, either with oile or vinegre, and ſo applied as a frontall to the forehead, drive away tertian agues. Theſe African ſpunges have this peculiar qualitie, to diſcuſſe any tumors, if they be applied unto them well ſoked in oxycrat or water and vinegre mixed togither. The aſhes of any ſpunges whatſoever, burnt togither with pitch, ſtaunch the bleeding of any wound: and yet ſome there bee, who in this caſe burne thoſe onely with pitch which are of a groſſe and looſe making, and not ſo compact as the reſt. Moreover, for the accidents of the eyes, ſpunges are many times burnt and calcined, in an earthen pot unbaked: and the aſhes which come thereof, doe much good alſo unto the pilling and aſperitie of the eyelids, the excreſcenſe of fleſh, and whatſoever in thoſe parts needeth aſtriction, or otherwiſe to be united, ſowdred or incarnat: and for theſe effects, it is much better to waſh the ſaid aſhes. Furthermore, ſpunges, in friction and rubbing of craſie bodies, may well ſtand in ſtead of currying combs, and courſe linnen cloaths: beſides, they ſerve right handſomly and fitly, to cover and defend the head againſt the extreame heat of the Sun. Moreover, the ignorance of our phyſicians, is the cauſe that all ſpunges be reduced to two onely kinds, to wit, under the name of African, which be of a more tough and firme ſubſtance; and the Rhodiacke, which are ſofter, and therefore meet for fomentations. At this day, the tendreſt and moſt delicat ſpunges are found about the walls of the cittie Antiphellus. And yet *Trogus* writeth, that about Lycia, the ſofteſt ſpunges called Penicilli, do grow in the deep ſea, and namely in thoſe places, from whence other L
ſpunges beforetime had ben plucked and taken away. Finally, *Polybius* doth report, That if ſpunges be hung about the teſter or ſeeling of a bed over ſicke perſons, they ſhall take the better reſt and repoſe all night for it. Now is it time for me to return unto Beaſts of the Sea, and other creatures living and bred in the waters.

K

THE

THE XXXII. BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

¶ The Proëme.

Medicines taken from living creatures of the Sea.

HAving so far proceeded in the discourse of Natures historie that I am now arrived at the verie heigth of her forces, and come into a world of Examples, I cannot chuse but in the first place consider the power of her operations, and the infinitnesse of her secrets, which offer themselves before our eyes in the Sea: for in no part else of this universall Frame, is it possible to observe the like majestie of Nature: in so much as we need not seeke any farther, nay we ought not to make more search into her divinitie, considering there cannot be found any thing equall or like unto this one Element, wherin she hath surmounted and gone beyond her owne selfe in a wonderfull number of respects. For first and foremost, Is there any thing more violent than the Sea, and namely, when it is troubled with blustring winds, whirlepuffs, storms, and tempests? Or wherein hath the wit of man been more employed (seeke out all parts of the whole world) than in seconding the waves and billows of the Sea, by saile and ore? Finally, Is there ought more admirable, than the inënarrable force of the reciprocall tides of the Sea, ebbing and flowing as it doth, whereby it keepeth a current also, as it were the streame of some great river?

Chap. I.

Of the fish Echeneis, and her wonderfull propertie. Of the Crampe-fish Torpedo, and the Sea-hare. The wonders of the Red sea.

THe currant of the Sea is great, the tide much, the winds vehement and forcible; and more than that, ores and sailes withall to helpe forward the rest, are mightie and powerfull: and yet there is one little sillie fish, named Echeneis, that checketh, scorneth, and arresteth them all: let the winds blow as much as they will, rage the storms and tempests what they can, yet this little fish commaundeth their furie, restraineth their puissance, and maugre all their force as great as it is, compelleth ships to stand still: A thing, which no cables be they never so big and strong, no ankers, how massie and weightie soever they be, sticke they also as fast and unmooveable as they will, can performe. Shee bridleth the violence, and tameth the greatest rage of this universall world, and that without any paine that she putteth her selfe unto, without any holding and putting backe, or any other meanes, save onely by cleaving and sticking fast to a vessell: in such sort, as this one small and poore fish, is sufficient to resist and withstand so great power both of sea and navie, yea and to stop the passage of a ship, doe they all what they can possible to the contrarie. What should our fleets and armadoes at sea, make such turrets in their decks and forecastles? what should they fortifie their ships in warlike manner, to fight from them upon the sea, as it were from mure and rampier on firme land? See the vanitie of man! alas, how fooliish are we to make all this adoe? when one little fish, not above halfe a foot long, is able to arrest and stay perforce,

perforce, yea and hold as priſoners our goodly tall and proud ſhips, ſo well armed in the beake-head with yron pikes and braſen tines; ſo offenſive and daungerous to bouge and pierce any enemie ſhip which they doe encountre. Certes, reported it is, that in the navall battaile before Actium, wherein *Antonius* and *Cleopatra* the queene were defeited by *Auguſtus*, one of theſe fiſhes ſtaied the admirall ſhip wherein *M. Antonius* was, at what time as he made all the haſt & means he could deviſe with helpe of ores, to encourage his people from ſhip to ſhip, and could not prevaile, untill he was forced to abandon the ſaid admirall and goe into another galley. Mean-while the armada of *Auguſtus Cæſar* ſeeing this diſorder, charged with greater violence, and ſoone inveſted the fleet of *Antonie*. Of late daies alſo, and within our remembrance, the like happened to the Roiall ſhip of the Emperour *Caius Caligula*, at what time as he rowed backe and made ſaile from Aſtura to Antium; when and where, this little fiſh detained his ſhip, and (as it fell out afterward) preſaged an unfortunat event thereby: for this was the laſt time that ever this Emperor made his returne to Rome: and no ſooner was hee arrived, but his owne ſouldiours in a mutinie fell upon him, and ſtabbed him to death. And yet it was not long ere the cauſe of this wonderfull ſtay of his ſhip was knowne: for ſo ſoone as ever the veſſell (and a galliace it was, furniſhed with five banks of ores to a ſide) was perceived alone in the fleet to ſtand ſtill, preſently a number of tall fellows leapt out of their ſhips into the ſea, to ſearch about the ſaid galley, what the reaſon might be that it ſtirred not? and found one of theſe fiſhes ſticking faſt to the verie helme: which being reported unto *Caius Caligula*, he fumed and fared as an Emperour, taking great indignation that ſo ſmall a thing as it, ſhould hold him backe perforce, and checke the ſtrength of all his mariners, notwithſtanding there were no fewer than foure hundred luſtie men in his galley that laboured at the ore all that ever they could to the contrarie. But this prince (as it is for certaine knowne) was moſt aſtonied at this, namely, That the fiſh ſticking onely to the ſhip, ſhould hold it faſt; and the ſame being brought into the ſhip and there laid, not worke the like effect. They who at that time and afterward ſaw the fiſh, report, that it reſembled for all the world a ſnaile of the greateſt making: but as touching the forme and ſundrie kinds thereof, many have written diverſly, whoſe opinions I have ſet downe in my treatiſe of living creatures belonging to the waters, and namely in the particular diſcourſe of this fiſh. Neither doe I doubt but all the ſort of fiſhes are able to doe as much: for this wee are to beleeve, that Pourcellans alſo be of the ſame vertue, ſince it was well knowne by a notorious example, that one of them did the like by a ſhip ſent from *Periander* to the cape of Gnidos: in regard whereof, the inhabitants of Gnidos doe honour and conſecrat the ſaid Porcellane within their temple of *Venus*. Some of our Latin writers doe call the ſaid fiſh that thus ſtaieth a ſhip, by the name of Remora.

As touching the medicinable properties of the ſaid ſtay-ſhip Echeneis or Remora (call it whether you will) a wondrous matter it is to ſee the varietie of Greeke writers: for ſome of them (as I have ſhewed before) doe hold, that if a woman have it faſtened either about her neck, arme, or otherwiſe, ſhe ſhall goe out her full time if ſhe were with child: alſo, that it will reduce her matrice into the right place, if it were too looſe and readie to hang out of her bodie. Others againe report the contrarie, namely, That if it be kept in ſalt and bound to any part of a woman great with child and in paine of hard travaile, it will cauſe her to have preſent deliverance; for which vertue, they call it by another name * Odinolyon. Well, however it be, conſidering that mightie puiſſance which this fiſh is well knowne to have in ſtaying ſhips, who will ever make doubt hereafter of any power in Nature her ſelfe, or of the effectuall operation in Phyſicke, which ſhe hath given to many things that come up by themſelves. But ſay wee had no ſuch evidence by the example of this Echeneis; the Cramp-fiſh Torpedo, found and taken likewiſe in the ſame ſea, were ſufficient alone to proove the might of Nature in her workes, if there were nothing elſe to ſhew the ſame: for able ſhe is to benum and mortifie the arms of the luſtieſt and ſtrongeſt fiſhers that be; yea and to bind their leggs as it were, how ſwift and nimble ſoever they are otherwiſe in running: and how? even by touching onely the end of a pole, or any part of an angle rod, which they hold in their hands, although they ſtand aloft and a great way from her. Now if wee cannot will nor chuſe, but muſt needs confeſſe by the evident inſtance of this one fiſh, that there is ſome thing in nature ſo penetrant and powerfull, that the verie ſmell onely or breath and aire proceeding from it, is able thus to affect, or infect rather the principall lims and members of our bodie; what is it that wee are not to hope for and expect from the vertue of all other creatures that Nature (through her bountie) hath endued with medicinable power for the remedie of diſeaſes?

* *i.* Looſe-throws, or eaſe-paine.

And

A And in very truth, no leſſe admirable be the properties which are reſpected of the ſea-Hare: for to ſome a very poyſon it is, taken inwardly either in meat or drinke: to others againe, the onely aſpect and ſight thereof is as venomous. For if a woman great with child chaunce but to ſee the female onely of this kind, ſhe ſhall ſenſibly thereupon feele a ſicke wambling in her ſtomack, ſhe ſhall preſently fall to vomiting, and anone to untimely labour, and the deliverie of an abortive fruit. But what is the remedie? Let her weare about her arme in bracelets, any part of the male, which ordinarily for this purpoſe is kept drie and hardened in ſalt, ſhee ſhall paſſe theſe daungerous accidents. The ſame fiſh is hurtfull alſo in the ſea, if it be touched onely. Neither is there any living creature that feedeth upon this fiſh, but it dieth thereupon, unleſſe it be the ſea Barbell only: all the harme that this fiſh catcheth by eating of it is this, that the fleſh is more tender by that
B means, and nothing ſo faſt as it was before: beſides, the meat is more unpleaſant, & not ſo much ſet by in the market, nor bought up by Caters for the kitchin. If man or woman chance to be infected by eating of the ſea-Hare, they preſently ſmell and ſent of the ſaid fiſh; and this is the firſt ſigne and argument to prove that they be empoyſoned therby: howbeit, they die not immediatly, but may continue ſo many daies as the ſaid Hare lived after it came out of the ſea. And therefore (according as *Licinius Macer* hath left in writing) this poyſon hath no ſet and prefinit time wherein it killeth any bodie. As touching the ſea-Hares among the Indians, it is conſtantly affirmed, that taken they cannot be alive; and that by way of counterchange, a man is their poyſon: for if he doe no more but touch one of them with his finger in the ſea, it will forthwith die. And it is ſaid withall, that farre bigger he is there than in other ſeas: like as all other beaſts whatſoever.
C King *Iuba* in thoſe bookes which he wrote unto *C. Cæſar*, ſonne to *Auguſtus* the Emperor, as touching the hyſtorie of Arabia, ſaith, That their limpins, muskles, and cockles, are ſo big in thoſe ſeas, that one of their ſhels will containe a meaſure of three hemines. Alſo that there have beene
† knowne Whales ſix hundred foot long, and carrying a breadth of three hundred and ſixtie foot, to have ſhot themſelves out of the ſea into the great rivers of Arabia: the fat of which Whales, (like as the greaſe of all other ſea-fiſhes there) is much ſet by and ſought after by merchants, who in all thoſe quarters uſe it for to annoint their travelling cammels, for to drive away the Breeſe or Gad-bee from them, which indeed cannot abide the ſmell of that oile.

Chap. II.

D *The naturall wit, docilitie, and gentleneſſe of ſome fiſhes. Alſo where they be ſo tractable, that they will take meat at a mans hand. Finally, in what part of the world fiſhes give anſwere by way of Oracle.*

WOnderfull in my conceit is the wit and ſubtiltie of ſome fiſhes, if all bee true which *Ovid* the Poet hath reported of them, in that booke of his which he entituled Halieuticon: For firſt and formoſt he ſaith, That the Goldenie *Scarus* perceiving himſelfe to be taken in a weire, or encloſed within a wicker-net or leape, never ſtriveth to get out againe with the head forward, or to thruſt his muffle betweene the oiſiers, for feare hee ſhould bee caught by
E the head: but turning his taile unto them, keepeth ſuch a flapping therwith, that he maketh himſelfe way by that meanes, and ſo breaketh forth of priſon backward. Now, in caſe whiles he ſtrugleth and laboureth thus to get out, another Goldenie that is without happen to eſpie him thus a priſoner, the ſame will take hold with his mouth of his fellowes taile, and helpe to get him forth out of the ſaid net, which hee endevoured to breake through. Alſo that the ſea pike Lupus, when he ſeeth that he is compaſſed about with nets, maketh a furrow with his taile into the ſands, wherin hee coucheth and lieth cloſe, that when the fiſhers draw their nets unto them, they may glide and paſſe over him. As for the Lampreis, knowing what a ſmooth, round, and ſlipperie back they have, they make no more adoe, but ſeeing themſelves within the net, get betwene the very maſhes, which with their much winding and wrigling they will wreſt wider and wider ſtill, untill they
F be gotten through and eſcaped.

The Poulpe fiſh or Pour-cuttell, maketh at the very fiſh hookes which he ſearcheth after, and thoſe he biteth not at, but claſpeth hard and gripeth round about with his clees and armes that he hath: and never letteth he his hold goe, untill hee hath gnawne and eaten off the bait cleane, unleſſe before he have done, hee perceive that he is like to bee drawne up out of the water by the angle.

angle. The Mullet alſo knoweth that the bait hath a hooke within it, neither is he ignorant that it is laid for to entrap and catch him; howbeit, ſo greedie he is thereof by nature, that he never linneth beating it with his taile, untill he have ſhaken off the meat from the hooke. The Pike is not ſo warie and provident in forecaſt, as to keep himſelfe from the danger of the hook; but of great ſtrength and force he is, when he bethinketh himſelfe and repenteth that he was ſo fooliſh as to be caught: for no ſooner hangs hee by the hooke, but hee runneth and girdeth with it in his mouth too and fro, forcing and wreſting his wound ſo wide, untill the ſaid hooke which had faſt hold on him before, be fallen out of his mouth againe. G

The Lampreies devour the hookes, yea, they gobble in and ſwallow more than ſo, untill they come to the very lines, which they ſet their ſharpe teeth unto, and never reſt untill they have fretted and gnawne them aſunder. And *Pytheas* is mine Authour, who writeth thus of them beſides, That if they find themſelves to be once upon the hooke, they turne their bodies and wryth with their backs, as knowing the ſame to be armed with trenchant and keen edged fins like knives, and ſo with their very ſharpe chine and fins cut the lines atwo. *Licinius Macer* writeth of Lampries, that they be all of the female ſex onely, and doe conceive by ſerpents engendring with them, as I have heretofore obſerved: which is the cauſe, that fiſhers lure them with hiſſing like unto ſerpents, and by that means call them forth of their holes and catch them. He ſaith moreover, That they will feed fat with *milke: and if a man give them a good knocke with a cudgill, they will not die thereupon: rap them onely with a Fennell ſtalke or ſome ſuch wand, you ſhall ſee them dead forthwith. And verely it is held for certaine, that their life lieth in the taile: which if it be ſmitten, they are very ſoone gone and bereft of vitall breath: ſtrike them upon the head, you ſhall hardly and with much adoe kill them. H I

*Lactatu: ſome read *jactatu*, others *luctatu*, with much ſtriving and ſtrugling.

There is a fiſh called a Raſoir: looke whatſoever toucheth it, ſenteth preſently of yron.

Confeſſed it is and knowne for certaine, that the Lompe, Paddle, or ſea-Owle, a fiſh called in Latine Orbis, of all others hath the toughеſt and hardeſt body. Shaped round it is without skales: a man that looketh upon it, would ſay it were all head.

Trebius Niger mine authour affirmeth, That ſo often as the ſea Kite is ſeene to launce himſelfe and flie without the water, *it threateneth tempeſts.

The Sword-fiſh, called in Greeke Xiphias, that is to ſay in Latine Gladius, *i.* a ſword, hath a beake or bill ſharpe pointed, wherewith hee will drive through the ſides and plankes of a ſhip, and bouge them ſo, that they ſhall ſinke withall. The experience whereof is ſeene in the ocean, neare unto a place in Mauritania called Gotta, which is not farre from the river Lixos. And the foreſaid writer *Trebius Niger* reporteth, That the ſea-cats or Cuttle fiſhes, called Loligines, will flie out of the ſea, and ſettle upon ſhips in ſuch multitudes, that they force them under water, and ſo drowne them. K

The Emperour *Cæſar* had many faire houſes of pleaſure in the countrey, where hee kept fiſhes that would ordinarily come to hand and take meat. Our aunceſtors made no ſuch marvell therat, namely, that they ſhould be ſo gentle and tractable in ſmall ſtewes and fiſh-ponds where they be kept to feed: but they have written the like of fiſhes in great lakes and ſtanding pooles: And namely, about Florus, a caſtle in Sicilie, not farre from Syracuſa: Likewiſe, in a well or fountaine of *Iupiter Labradius*, there be yeels will take meat at ones hand, & theſe weare ear-rings alſo about them. Semblably, in Chios neare unto the chappell of the auncients or elders called Veterum Delubrum: as alſo in a certaine ſpring of Meſopotamia, called Cabura, whereof I have alreadie written. As for the fiſhes which keepe about Myræ in Lycia, within the well or fountain of *Apollo*, called Curius, they will ſhew themſelves of purpoſe to give preſage and foreknowledge of things to come: and the manner is, to call them to the top of the water with three whiſtles of a fife or ſuch like pipe. The order is among thoſe that come to be reſolved by them in ſome future events, to caſt peeces of fleſh unto them: if they ſnatch the ſame and ſwim away therewith, it is a luckie and fortunat ſigne, preſaging a good iſſue of their affaires about which they come; but in caſe they reject the ſame, and flurt the meat from them with their taile, that is an ominous token, and foreſheweth ſome unhappie event to follow. About Hierapolis, a citie in Syria, the fiſh within the lake or poole of *Venus*, obey the voice of the wardens or ſextons who have the keeping of her chappell there; and orderly they come at their call, garniſhed with their ornaments of gold about them: they will abide to be ſcratched and clawed, they will wag their tailes like a dogge in a fawning and flattering manner; nay, they will gape with their mouths wide open, and ſuffer them L M

to

A to thruſt their hands or fingers into them. At Stabianum neare to the rocke or cape of *Hercules*, the blacke-tailed ruffles or ſea-breames, which the Greekes name Melanuri, if a man caſt crums of bread into the ſea unto them, they will catch the ſame, and ſcud away withall: throw them any other meat or bait with a hooke in it, they will not once come neare thereto. Neither are theſe to bee reckoned among the leaſt wonders and in the laſt place, namely, That about the Iſland Pele and the citie Clazomenæ, all the fiſh that is, taſteth bitter: Contrariwiſe, thoſe that keepe about the rock Scylla in Sicilie be ſweet, as alſo at Leptis in Affrick, Eubœa, and Dyrrhachium. Again ſome are ſo ſalt, that they may well bee taken for ſalt fiſh that hath lien in brine or pickle, to wit, neare the Iſlands Cephalenia, Ampelos, and Paros: likewiſe about the rockes and cliffes of Delos; and yet in the Bay or haven of the ſaid Iſland, their meat is ſweet ynough. This difference in
B the taſt of fiſh, proceedeth no doubt from the diverſitie of their food. Moreover, *Apion* ſaith, That the greateſt of all other fiſhes is the Mole-bout, which the Latines call Porcus, the Lacedæmonians Orthragoriſcos; and that when he is taken, hee will grunt like an Hog, whereupon it ſhould ſeeme he tooke the name Porcus. But as touching the foreſaid accident of the varietie in the taſt of fiſh, how ſome be ſweet, others ſalt, that it ſhould be a naturall thing (and therefore the more to be marvelled at) appropriat to certaine places, it may appeare by this inſtance, which fitly prooveth the ſame: For take the ſalt fiſh of Italie, what kind ſoever you will, for certaine it is knowne, That at Beneventum they may bee made freſh againe, as if they had never beene ſalted.

That ſea-fiſh hath been uſed at Rome from time to time, and ever ſince the very foundation
C of the citie, it may appeare by the teſtimonie of *Caſsius Hemina*: which I will ſet downe word for word as touching that point, in this very place. King *Numa* (quoth hee) ordained, That fiſhes without skales ſhould not be bought up by Caters for the furniſhing of any ſolemn funerall feaſt. By which inhibition his pollicie and purpoſe was, that the great dinners, as well publicke as privat; the feaſtivall ſuppers alſo which were kept at the ſhrines of the gods, ſhould not bee ſo coſtly and chargeable: for feare alſo leaſt the caters who made proviſion for ſuch ſumpteous feaſts, ſparing for no coſt, nor ſticking at the price were it never ſo high, might foreſtall the markets and buy the ſame up beforehand.

As touching Corall, we (here at Rome) ſet not more by the Indian orient pearles (whereof I have written at large in place convenient) nor eſteeme them at a greater price than thoſe Indians
D doe our Corall. And verely, if we deeme aright, it is the opinion and perſuaſion of people only, that ſetteth the price of theſe and ſuch like things. True it is verely, that there is Corall bred in the red ſea, but blacker it is than that which we have: likewiſe in the Perſian gulfe, and that is named Iace. Howbeit, the beſt ſimply is that which is found in the gulfe of Marſiles in France, about the Iſlands Stœchades: as alſo in the narrow ſeas of Sicilie, toward Helia and Drepanum. There is alſo thereof growing at Graviſcæ, and juſt before Naples in Campaine. But the reddeſt of all other, ſoft and tender withall, and therefore moſt commodious, is engendered about Erythræ in Barbarie. Corall reſembleth a buſh or ſhrub in forme, and of it ſelfe within the water, is of colour greene. The berries thereof under the water be white and ſoft: no ſooner be they taken forth, but preſently they wax hard, and turne red: much like both in ſhape and in bigneſſe to the grains or
E fruit of the gentle garden Corneil tree. It is ſaid that this plant whiles it groweth and is alive, if a man touch it never ſo little, becomes as hard immediatly as a ſtone. The fiſhers therefore to prevent that inconvenience (as knowing the nature thereof) either pluck it up with their nets, or cut it with ſome ſharpe edged yron tooles: which is the cauſe that it is commonly called * Curalium, as ſome make interpretation of the word. The reddeſt Corall is taken to be the beſt: the ſame alſo brauncheth moſt, is not rough and ragged under the hand to feele unto, or ſtone-hard: ſolide likewiſe it is and maſſie, not void and hollow. The berries or beads which it beareth, is of no leſſe account and price with the men of India, than the Indian pearls with our coſtly dames here. And verely among them, their Wiſards, Southſaiers, Prieſts, and Prophets have a religious opinion of them, and attribute great holineſſe to the uſe thereof; as being perſuaded, that whoſoever
F weare them, ſhall be ſecured againſt all perils and daungers whatſoever: and therefore a ſpeciall reckoning they make of them, as well in regard of beautie as devotion. Before that it was known in what eſtimation Corall was with the Indians, the Frenchmen adorned & ſet out their ſwords, targuets, ſhields, morrions, and head peeces therewith: But ſince time that there was a vent into India of this commoditie ſo vendible, great ſcarſitie there is of it, and hardly ſhall a man meet with

* ὅτι ἡ ἀλι κοπεῖ, because it is cut and ſhorne (as it were) in the ſea.

with any Corall, even in that part of the world where it groweth naturally. The branches of Corall hanged about the neckes of infants and young children, are thought to bee a ſufficient preſervative againſt all witchcraft and ſorcerie. Calcined by fire, and ſo reduced into aſhes or pouder and given to drinke in water, it helpeth thoſe who are troubled with the wringing paines of the belly, the greeſe of the bladder, and the diſeaſe of the ſtone. The like effect it hath if it be drunk in wine; or if the patient have a feaver upon him, in water, for to procure ſleep. This would be noted, that Corall doth withſtand the power of fire, and long it is before it be burned and reduced into aſhes. But ſurely a ſingular medicine it is, ſo prepared and uſed, inſomuch as (by report) if a man keepe to it ſtill and continue it long, the ſame will conſume the hardneſſe and ſchirroſitie of the ſpleene. The pouder of Corall is ſoveraign for ſuch as reach and caſt up bloud at the mouth. The aſhes enter into many mixtures and medicines for the eyes: for aſtringent they be, & cooling withall. Hollow ulcers and fiſtulaes they incarnat and fill up againe with new fleſh. Skars and cicatrices they doe extenuat. G H

If I ſhould ſpeake of the repugnancie and contrarietie in Nature (which the Greekes call antipathie) found in many creatures, there is not to be ſeene in the whole world any thing more venomous and adverſe to plants than the Puffens or Forkefiſh of the ſea, called Paſtinaca: for as I heretofore noted, it hath a prick in the tail, which is able to kill any trees that be perced or wounded withall. And yet a concurrent and enemie this hath, which doth perſecute and plague it, and namely the Lamprey called Galeos; ſo eager is it and greedie of the venome and poyſon of that fiſh. There be other fiſhes alſo which it purſueth, but thoſe Puffins eſpecially: and no Weazill hunteth more after ſerpents. In ſumme, whoſoever be hurt or wounded by the ſaid Puffin, this Galeos is a preſent remedie; ſo is the Barble alſo, and the gum Laſer or Benjoin. I

Chap. III.

Of certaine creatures which live as well upon the land as the ſea. Of Caſtoreum, or the genetoirs of a Bever: the medicinable vertues thereof, and other properties obſerved therein.

THe power and majeſtie of Nature is very conſpicuous and viſible, even in thoſe creatures alſo which live indifferently on land and in the water: and namely in the Bevers, which commonly the Phyſicians call Caſtores, like as their ſtones alſo Caſtorea. Some hold, that theſe Bevers when they be neare driven and preſſed by hunters, and at the point to be taken, bite off their owne ſtones. But *Sextius*, who hath written moſt exactly in Phyſicke, denieth it flatly. He ſaith moreover, that theſe cods be ſmall, knit ſhort and truſſed up, ſo as they ſticke cloſe unto the chine bone, and cannot poſſibly be taken from the beaſt but the life goes away withall. By his ſaying alſo they are ſophiſticated; and the kidneies of the Bever which are big, be obtruded and foiſted to us many times in ſtead of their ſtones, which indeed are never found but very little and ſlender. Furthermore hee affirmeth, That they bee not the right ſtones of a Bever when they are ſeene without a twofold burſe or skin, which no living creature hath beſides. In theſe two bags there is found (ſaith he) a certaine oleous liquor, which ordinarily is kept and preſerved with ſalt: And therefore among other markes to know falſe and ſophiſticat Caſtoreum is this, If you ſee a paire of cods, hanging (as it were) knit together by one ſtring in one bag. And yet the beſt may be falſified by the fraud and cunning of ſuch as put gum thereto with ſalt Ammoniack, becauſe the true Bevers ſtones ought to beare the colour of Ammoniacke; to bee encloſed alſo within their ſeverall tunicles; and to lie in a certaine liquour reſembling cereous honey, ſtanding much upon wax; to have a ſtrong and ranke ſmell, a bitter, hote and fierie taſt; and withall, apt to crumble betweene the fingers. The beſt Caſtoreum and moſt effectuall, is brought out of Pontus and Galatia: next to it is that of Affricke or Barbarie. The vertue of Caſtoreum is to provoke ſneeſing, if a man hold it to his noſe and ſmell thereto. If the head bee annointed with Caſtoreum incorporat with oile of roſes and Harſtrang, it will procure ſleepe: ſo will it doe alone by it ſelfe given in water to drinke: in which reſpect, proper it is for the phrenſie. And yet the perfume or vapor thereof will raiſe thoſe that lie in a ſleepie lethargie: like as a ſuffumigation* or peſſarie put up into the naturall parts of women, is ſoveraigne for the riſing of the mother; in which fit they lie as it were in a traunce and out of the world. Caſtoreum given to the weight of two drams with Peniroyall in water to drinke, moveth womens monthly ſickneſſe, and forceth the afterbirth to come away. It K L M

* *Vulvarumque examinationes vel ſubdici.* We practiſe the contrarie.

hel-

A helpeth those that have the dizzinesse or swimming of the braine; bee drawne backward with crampes, tremble and shake: are plucked with spasmes and convulsions, diseased in their sinewes, troubled with the Sciatica, sicke of a weake and feeble stomacke that keepeth nothing which it takes, and lie bedred of the palsie, if they be annointed throughly therwith in parts convenient. Or if Castoreum be reduced into pouder, and together with the seed of Agnus Castus, bee incorporat with vinegre or oile rosat, and so reduced to the consistence of honey: which beeing taken as an electuarie, is singular not onely for the former maladies, but also for the falling sickenesse: and if the same be given in drinke, it discusseth ventosities, appeaseth the wrings and torments of the bellie, yea, and represseth the mallice of any poysons. But in this case of poysons it ought to be prepared, mixed, & used diversly, according to the sundrie kinds thereof: for against
B the venome of scorpions it would be drunke in meere wine: to withstand the danger of the Phalangia and such venomous spiders, it ought to be given in honied wine especially, if the intention be to cast up the said poysons by vomit; or with Rue, if the drift and purpose bee to hold and retaine all still. To prevent the perill of the Lizards or venomous wormes Chalcidicæ, it should be taken in Myrtle wine. Against the sting of the horned serpent Cerastes, or the fierie vermine Prester, with Panax or Rue in wine. But generally for all other serpents, the only liquor to receive it in, is wine. Two drams at a time is thought to bee a sufficient dose of Castor it selfe, in any of these compositions: but of other drougs that are put thereto, there ought to be a proportion of the halfe, to wit, one dram. Moreover, a peculiar vertue it hath, if it be drunke in vinegre, to resist the venomous gum Ixias, growing upon the plant Chamæleon: but soveraigne it is for the poy-
C son of the hearbe Aconitum or Libard bane, in milke or faire water. Against white Ellebore it is good to be taken with mead of honied water and salnitre. Also, if it bee pulverized and incorporat with oile, a soveraigne remedie it is to ease the toothach, if it bee dropped or poured into the eare of the same side where the greefe is: but better it were to temper it with the juice of Poppie for paine of the eares. Mix Castoreum with the best honey of Attica, and bring it into an eye-salve, it is passing good for to cleare the sight. Given in vinegre, it staieth and keepeth downe the yex or hicquet. Furthermore, the urine of a Bever is a good countrepoyson: and therfore it goeth to the making of antidots and preservatives. But the best way of keeping it (as some thinke) is in the owne bladder.

D

Chap. IIII.

Of the Tortoise. The medicines taken from many fishes, and diverse observations to them pertaining.

Semblably, Tortoises live in two places, and haunt both land and waters. Their effectuall properties besides are such as deserve like honour, as well in regard of their manifold uses in sumptuous buildings (whereby they carie a great price) as of their sundrie vertues & operations which Nature hath given them. Now of these Tortoises there be many kinds, to wit, land Tortoises, and sea Tortoises. Tortoises found in muddie waters and marraies: Tortoises also that keepe in fresh river water; and these last named, some Greeke writers call Emydes. The flesh of
E land Tortoises serveth well in perfumes & suffumigations, for so it is as good as a countercharme to put by and repell all sorceries and enchantments: a singular countrepoyson also to resist any venome whatsoever. Great store of Tortoises bee found in Affricke: where they use to cut away the head and feet, and then employ the rest of the bodie as a soveraigne remedie against all poysons. If their flesh be eaten together with the broth wherein they are sodden, it is held to be very good for to discusse and scatter the wens called the kings evill, and to dissipat or resolve the hardnesse of the swelled spleene: likewise to cure the falling sickenesse, and to drive away the fits therof. The bloud of Tortoises clarifieth the eyesight & dispatcheth the cataracts, if they be annoin-
ted therewith. Many incorporat the said bloud in meale, and keepe them reduced into the forme of pils; which when need requireth, they give in wine as a present helpe for the poyson of all ser-
F pents, spiders, and such like, yea, and the venome of toads. The gall of Tortoises mixed with Atticke honey, serveth to cure the fierie rednesse of the eyes, if they bee annointed therewith: the same is good to be dropped into the wounds inflicted by the prick of scorpions. The ashes of the Tortoise shell incorporat with wine and oile and so wrought into a salve, healeth the chaps & ulcers of the feet. The skales scraped lightly from the upper part of the shell given in drinke, coole

the

the heat of luſt. And I marvell the more hereat, becauſe the pouder of the whole ſhell indeed G
hath the name to heat the appetite and deſire to venerie. As touching their urine, I hold it unpoſſible to meet with the ſame, unleſſe it bee found in their bladder when they bee cut in twaine. And yet the Magicians hold this to be one of the moſt rare things in the world, and that which worketh wonders, ſaying it is right ſoveraigne for the biting or ſtinging of the Aſpis, howbeit, much more effectuall (ſay they) if punaiſes bee mixed with it. Tortoiſe egges dried and hardened, are good to be applied to the wens called the kings evill; to any exulcerations, cauſed either by extreame cold or burning: The ſame being ſoft, are ſingular to be ſupped off in the pain of the ſtomacke.

The fleſh of ſea Tortoiſes mixed and incorporat with the fleſh of Frogs, is a ſoveraign remedie againſt the venome of Salamanders: neither is there any thing more contrarie in nature to H
the Salamander, than is the Tortoiſe. The bloud of the ſea Tortoiſe ſerveth to recover haire in places naked and bare, by occaſion of the diſeaſe called Alopecia: it riddeth away likewiſe the ſkales and dandruffe, yea, and healeth all the ſkalds of the head: But the ſame muſt drie upon the head and be waſhed off at leaſure by little and little. If it bee dropped into the eares with breaſt-milke, it eaſeth their paine. If it be chewed or eaten, tempered with the fine flower of Wheat, it cureth the falling ſickneſſe. But for the better preparing and ordering of this bloud in theſe caſes, it ought to be mingled in three hemines of vinegre, one hemine of wine put thereto, with an addition alſo of Barley meale, and the ſame tempered with vinegre: Of which compoſition the patient is to take and ſwallow downe the quantitie of a Beane every day, morning and evening; and after ſome daies paſt, in the evening onely. This bloud is likewiſe ſingular to be dropped into I
the mouths of thoſe that be fallen of the epilepſie or falling ſickneſſe, ſo the fit be but ſmall, for which purpoſe they muſt be forced to gape. In caſe of crampes and convulſions, the ſame is to be clyſterized with Caſtoreum. Whoſoever rubbeth their teeth with Tortoiſe bloud and uſe ſo to doe a whole yeare together, ſhall bee freed from the paine thereof for ever. If it bee mixed with Barley groats, and given to them that draw their wind ſhort, it diſcuſſeth the cauſe of that difficultie, yea, helpeth ſuch as cannot breath but ſitting upright. The gall of Tortoiſes cleareth the eyeſight, it dooth ſubtiliat the cicatrices and filmes that grow in the eyes: the inflammation of the tonſils it repreſſeth, aſſuageth the ſquinancie, and helpeth all the accidents of the mouth: and more peculiarly, a propertie it hath to heale the cankerous and corroſive ſores there breeding: as alſo to cure the inflammation of the genetoirs. The ſame conveighed up into the noſthrils, fetcheth thoſe againe to themſelves who are in a fit of the falling ſickneſſe, and ſetteth them upright upon their feet. And with the ſlough of a ſerpent incorporat in vinegre, and dropped into the eares that run, it is an excellent medicine to ſcoure them. Some put a Bœufes gall among, together with the broth of the Tortoiſe fleſh ſodden, and an addition of a ſnakes ſlough in equall quantitie; but firſt they ſeeth the ſaid Tortoiſe a long while in wine. Moreover, the gall of Tortoiſes mixed with honey, amendeth all the imperfections incident to the eyes, if they be annointed therewith: yea, if it were a cataract, the gall of a ſea Tortoiſe tempered with the bloud of a river Tortoiſe and womans milke, riddeth and ſcoureth it away. The ſaid gall is very proper to give a yellow die or colour to womens haire. Againſt the poyſon of Salamanders, ſufficient it is to drinke the broth or decoction of a Tortoiſe. K L

As touching thoſe kind of Tortoiſes that live and breed in mud and moorie waters, which I reckoned to be the third kind: broad they be and flat in the backe as well as upon the breaſt; neither doth their ſhell ariſe archwiſe in manner of a vault: Theſe are illfavoured to ſee to, and yet as loveleſſe as they be, they are not without ſome medicinable vertues and remedies: for take three of them and throw them into a fire made of Vine twigs, or their cuttings; when their ſhels or covers begin to devide in ſunder and part one from another, pull them haſtily out of the fire, plucke the fleſh out of their ſhels, ſeeth them in a gallon of water, with a little quantitie of ſalt put thereto; thus let them boile untill a third part of the liquor be conſumed: This broth or decoction if it be drunken, is thought to bee ſoveraigne for thoſe that bee troubled either with the palſie, gout, or paine of joints. The gall of theſe Tortoiſes purgeth alſo phlegmatick humors and M
corrupt bloud out of the bodie. And after that this medicine hath done his part, and ſet the bellie in a looſeneſſe, a draught of cold water knitteth it againe and ſtaieth all.

To come now unto the fourth kind of Tortoiſes which keepe in freſh rivers, they affourd an excellent remedie for to rid away a quartane ague, in this manner prepared and uſed: Firſt take

certaine

A certaine tortoiſes, devide one peece from another and take out the fat within, ſtampé the ſame with the hearbe called houſleeke and lineſeed; incorporat all into an ointment; let the patients be annointed herewith before the fit commeth, all over the bodie ſave the head only; and when they be well lapped with cloaths about them, give them ſome hot drinke: This (I ſay) is thought to be a ſoveraigne medicine againſt the ſaid ague. But a tortoiſe to be emploied for this purpoſe, ought to be taken at the full of the moone, becauſe there may be more fat found in her: marry the ſicke bodie muſt not bee annointed (men ſay) at any time, but two daies after. The bloud of tortoiſes which are of this fourth kind, if it be dropped upon the head by way of embrochation, appeaſeth the head-ach that uſeth to returne and come often by fits: the ſame alſo applied unto the kings evill, cureth it. Some are of opinion, that the better to let tortoiſes bloud and accor-
B ding to Art, (as requiſit it is in theſe caſes of phyſicke) they ought to be laid along with their bellies upward, and ſo their heads to bee cut off with a braſen knife: and then they give order, to receive the bloud in a new earthen veſſell, never occupied before: which bloud, is excellent to annoint the ſhingles, or any kind of S. *Anthonies* fire: likewiſe the running ſcalls of the head, and alſo werts. The ſame authours doe promiſe and warrant, that with the dung of all ſorts of tortoiſes, the biles called Pani may bee diſcuſſed and reſolved. And although it bee incredible and not to be ſpoken, yet ſome there be who have written, That any ſhip maketh way more ſlowly at ſea, that carrieth within it the right foot of a tortoiſe. And thus much ſhall ſuffice as touching tortoiſes.

And now from henceforth as touching the fiſhes and other water creatures, I meane to diſ-
C courſe of them and their medicinable properties, according to everie diſeaſe which they ſerve for: And yet I am not ignorant, that many a one will be deſirous to know all at once, the vertues of ech living creature, which indeed maketh them to ſeeme more admirable a great deale. Howbeit, this courſe that I meane to take, I hold to bee more expedient and profitable to this life; namely, to ſet downe receits and remedies digeſted by order, of each diſeaſe and maladie: conſidering that one thing may be good for this patient, and another for that; and ſome medicines are ſooner found and gotten, than others.

Chap. V.

D *Sundrie medicines and receits taken from thoſe living creatures which converſe in waters, and the ſame digeſted orderly into diſeaſes. And in the firſt place, ſuch as be appropriat to poiſons and venomous beaſts.*

HEretofore have I written of venomous honey, and the countries wherein ſuch is gathered and made: now, if any be poiſoned therewith, good it is to eat the fiſh called Aurata, *i.* a Guilt-head: or ſay that one bee glutted with pure honey, or have taken a ſurfet thereof, which of all other is moſt daungerous, whereby the appetit is cleane gone, and the ſtomacke oppreſſed with crudities: for to prevent farther daunger, *Pelops* ordained for a ſpeciall antidot or
E detenſative, the meat of tortoiſes boiled, after the head, feet, and taile, were cut away: But *Apelles* in this caſe attributeth as much to Scincus. Now what this Scincus is, I have declared heretofore. Shewed alſo I have often times in many places, how venomous the monthly fleurs of women are: but yet (as hath been ſaid alreadie) the fiſh called a Barble, is a ſingular remedie againſt the venome thereof: like as, both applied outwardly in a liniment, and taken inwardly as meat, it is a ſoveraigne thing for the pricke of the Puffin or Forkfiſh, of Scorpions as well of the land as the ſea, and of the malicious ſpiders Phalangia. The aſhes of a Barble, freſh taken and calcined, is a generall countrepoiſon; but more particularly it helpeth thoſe who have eaten deadly muſhroms. Moreover, it is ſaid, That if the fiſh called a Sea-ſtar, well beſmeared and annointed all over
F with the bloud of a fox, be faſtened to the lintell, or hanged to the braſen naile or ring of a dore, it will put by all charms, ſorceries, and witchcrafts, that none ſhall come into the houſe; or if any doe, yet they ſhall not worke any harme. As for the prick or ſting of ſea-dragons and ſcorpions, a cataplaſme of Sea-ſtars fleſh applied thereto, healeth them: ſo it doth alſo the venomous bit of ſpiders. In ſum, the broth of their decoction is thought to bee a ſoveraigne remedie againſt all

manner of poiſons; whether it be that a man have taken it by the mouth, or bee ſtung and bitten G
by any venomous beaſt.

As touching fiſhes kept in ſalt, they are not without their medicinable vertues: for to eat ſalt-fiſh, is verie good for them who are ſtrucken with ſerpents, or otherwiſe bitten or ſtung by any venomous beaſt, ſo they drinke to it eftſoons pure wine of the grape, and withall be ſure to caſt up againe by vomit toward evening their foreſaid meat which they did eat that day. The ſame ſaltfiſh more peculiarly ſerveth for them who have been hurt and wounded with the venomous
* or *Chalcidica.* lizard * Chalcis, the horned ſerpent Ceraſtes, or the venomous horne-fretters called Sepes: being otherwiſe ſingular to heale thoſe who have ben ſmitten with the ſerpent Elops, or bitten with the thirſtie tooth of the worme Dipſas: but if a man be pricked by the ſcorpion, good it is for him to feed fully of ſaltfiſh, howbeit in no wiſe to vomit the ſame up again, but rather to endure H
the drineſſe and thirſt occaſioned thereby: and many hold, that it is a proper remedie to applie unto the ſore, a cataplaſme made of the foreſaid ſaltfiſh. Verely againſt the biting of crocodiles, there is not thought to be a more preſent and effectuall remedie, than it. But to grow unto particulars, Sprots ſalted have a ſpeciall propertie to heale the biting of the beetle or venomous flie Preſter: alſo in caſe a man be bitten with a mad dog, it is verie good to lay ſaltfiſh unto the ſore: yea though the wound were not cauterized with a red hot yron, nor the patients bodie emptied by a clyſtre, this cataplaſme alone of ſaltfiſh is thought ſufficient to cure it: the ſame ſoked in vinegre, ſerve alſo to be laid unto the place that is hurt with a ſea-dragon. Of the ſame operation
* *Cybium.* and effect is a * ſquare peece or canton of the fiſh Tunie ſalted and condited. And ſince I have named the ſea-dragon, this would be noted, That himſelfe outwardly applied, is a remedie for I
the venome inflicted by the pricke or finne of his ridge-bone, wherwith his manner is to ſtrike: yea and his verie brains alſo, if you take nothing els, are as effectuall. The decoction of ſea-frogs ſodden in wine and vinegre, is a ſoveraigne drinke for all poiſons, but eſpecially for the venome of the hedge-toad and ſalamander. As for the froggs of rivers and freſh waters, if a man either eat the fleſh or drinke the broth wherein they were ſodden, he ſhall find it verie good againſt the poiſon of the ſea-hare, or the ſting of ſerpents abovenamed: but more particularly againſt the pricke of ſcorpions, they would bee boiled in wine. Moreover, *Democritus* ſaith, that if a man take out the tongue of a frog alive, ſo that no other part thereof ſticke thereto, and after he hath let the frog goe againe into the water, apply the ſaid tongue unto the left pap of a woman whiles ſhe is aſleepe, in the very place where the heart beateth, ſhee ſhall anſwer truly and directly in K
her ſleepe, to any interrogatorie or queſtion that is put unto her. But the magicians tell more woonders than ſo of the frogg; which if they bee true, certes froggs were more commodious and profitable to a common-wealth, than all the poſitive written lawes that wee have: for they would make us beleeve, that if the husband take a frogg and ſpit her (as it were) alength upon a reed, ſo as it goe in at the skut or mature behind and come foorth againe at the mouth; and then pricke the ſaid reed or broch in the menſtruall bloud of his wife, ſhe will never have mind afterwards to entertaine any adulterers, but deteſt and loath that naughtie kind of life. Certein it is, that if frogs fleſh be put within a net, or that a hooke be baited therewith, Purple fiſhes above all others, will come flocking thither. Moreover, it is commonly ſaid, that a frog hath a double liver, which ought to be laid before ants; and looke which of the two lobes or flaps there- L
of they make unto and ſeeme to gnaw, the ſame is a moſt ſingular antidot againſt all poiſons whatſover.

Some frogs there be that live onely among buſhes and in hedges, which thereupon wee call
Our toads. in Latine by the name of * Rubetæ, and the Greeks tearme them Phrynos: the biggeſt they are of all other, with two knubs bearing out in their front like horns, and full of poiſon they be. They that write of theſe toads, ſtrive a-vie who ſhall write moſt wonders of them: for ſome ſay, that if one of them be brought into a place of concourſe where people are in great number aſſembled, they ſhall be all huſht, and not a word among them. They affirme alſo, that there is one little bone in their right ſide, which if it be throwne into a pan of ſeething water, the veſſell will coole M
preſently and boile no more, untill it be taken forth againe. Now this bone (ſay they) is found by this means: If a man take one of theſe venomous froggs or toads, and caſt it into a neſt of ants for to bee eaten and devoured by them, and looke when they have gnawed away the fleſh to the verie bones, each bone one after another is to be put into a kettle ſeething upon the fire, and ſo

A it will be ſoone knowne which is the bone, by the effect aforeſaid. There is another ſuch like bone (by their ſaying) in the left ſide; caſt it into the water that hath done ſeething, it will ſeeme to boile and waulme againe preſently: this bone (forſooth) is called Apocynon: and why ſo? becauſe ywis, there is not a thing more powerfull to appeaſe and repreſſe the violence and furie of curſt dogs, than it. They report moreover, that it inciteth unto wanton love; and yet natheleſſe if a cup of drinke bee ſpiced therewith, it will breed debate and quarrels among thoſe that drinke thereof: alſo, whoſoever carrieth it about him, ſhall be provoked to fleſhly luſt: and contrariwiſe, if the bone in the right ſide bee likewiſe uſed, it will coole as much, and take downe the pride of fleſh and heat of concupiſcenſe. Others there be who are of opinion, that if it bee but worne about one, either hanging to the necke, or faſtened unto any other part of the bodie, enB folded within a little peece of a new lambs skin, it will cure a quartan ague, or any other fever beſides. The ſame alſo repreſſeth the affection of love. Moreover, they beare us in hand, that the milt of theſe toads is a countrepoiſon againſt their owne venome: but the heart (ſay they) is much more effectuall.

There is a certaine kind of ſerpent or ſnake haunting the water, called in Latine Coluber; the fat and gall of which ſerpent, if they have about them who uſe to hunt after crocodiles, it is woonderfull (ſay they) how they bee armed and defenced againſt them; for they will not attempt to turne againe upon the hunters and give any aſſault: and yet of greater effect and force they ſhall find it, in caſe there bee incorporat withall, the pond-weed or water-ſpecke called Potamogiton.

C The river Creifiſhes, if they be taken freſh, ſtamped and given in water to drinke, are ſoveraigne againſt all poiſons: ſo is their aſhes alſo a countrepoiſon; but more particularly againſt the ſting or pricke of ſcorpions, if it bee drunke in aſſes milke; or for default thereof, in goats milke, or any other whatſoever: but then the patient ought to drinke wine upon it. And verely, ſo adverſe and contrarie are they unto ſcorpions, that if they bee punned with baſill into a certaine compoſition, it will kill them, if the ſame bee but laid upon them. Of the ſame force they are againſt the ſting or biting of any other venomous beaſt beſides, and more eſpecially of the pernicious hardiſhrew Scytale, of ſnakes, ſea-hares, and hedge-toads. Many there be who uſe to ſave the aſhes of Creifiſhes calcined, as a ſoveraigne remedie for all ſuch as be in daunger to fall into the ſymptome of fearefulneſſe to drinke, incident to thoſe that are bitten by mad dogs:
D ſome add thereto the hearbe Gentian, and give both togither in wine to drinke: but if the ſaid ſymptome of Hydrophobie have ſurprized them alreadie, then the ſaid aſhes or powder ought to be reduced (by the means of wine) into troſches or pills, which they preſcribe unto their patients for to be ſwallowed downe. The magicians proceed farther and affirme, that if a man take ten Creifiſhes and tie them all togither with a good bunch or handfull of baſill, all the ſcorpions that bee thereabout, will aſſemble togither to that one place: and they give order, that if a man be hurt alreadie with a ſcorpion, there ſhould bee a cataplaſme made of them, or at leaſtwaies of their aſhes mixed with baſill, and ſo applied to the place affected. The Sea-crabs are nothing ſo good of operation in all theſe cauſes, as the Land-crabs or Creifiſhes aforeſaid, according as *Thraſillus* mine author doth report. Howbeit, hee ſaith nevertheleſſe, that there are
E no ſuch enemies to ſerpents, as Crabs: and hee affirmeth moreover, That if ſwine be ſtung or hurt by ſerpents, they helpe and cure themſelves by feeding upon Sea-crabs onely, and ſeeke for no other helpe or remedie. Hee addeth furthermore and avoucheth, that ſerpents are ill at eaſe yea and much tormented with paine when the Sun is in the ſigne of the Crab, called commonly Cancer.

To come now to the river ſhell-ſnailes: moſt certaine it is, that their fleſh, whether it bee raw or boiled, is ſingular good to reſiſt the venome of ſcorpions inflicted by their pricke or ſting: and ſome there be, who for to have them in a readineſſe to ſerve in theſe caſes, keepe them in ſalt: and they ordaine them to be applied unto the very ſore it ſelfe, occaſioned by their fore-
F ſaid ſting.

As for the [blacke] fiſhes named Coracini, they are peculiar and appropriat unto the river Nilus: howſoever my determination and purpoſe is to deliver medecines profitable and beneficiall to all parts of the earth in generall. Their fleſh is good to be applied unto the ſores cauſed by ſcorpions.

The Sea-ſwine or Porpuis, hath prickie finns upon his backe, and thoſe are counted among other venomous things that the ſea yeeldeth, putting them to much paine that are wounded or hurt thereby: but what helpe therefore? ſurely the verie muddie ſlime that gathereth about the bodie of the ſame fiſh, is the onely remedie. G

The Sea-calfe, otherwiſe named a Seale, hath a certaine greace, wherewith it is good to annoint the face or viſage of thoſe, who by reaſon that they are bitten with a mad dog, are afraid to drinke and cannot away with water: but it will worke the better, if there be mingled therewith the marrow of an Hyæna, the oile of the maſtich tree and wax, that all may bee reduced into a liniment.

As for the biting of a Lamprey, there is not a better thing to heale it than the aſhes of a lampreys head. The Puffin likewiſe or Forke-fiſh, cureth the wound that himſelfe inflicted; namely, if the place be annointed with his owne aſhes, tempered with vinegre, or mixed with the aſhes of any other fiſh. If a man would make meat of this fiſh, there ought to be taken out of the backe whatſoever is there found like unto ſaffron: likewiſe the head all and whole would be taken away: and yet to maintaine and keepe the taſt thereof, the ſame muſt be waſhed but a little and no more than all ſhell fiſhes, for otherwiſe all the pleaſantneſſe in the eating would be cleane gone. H

The miſchievous venome of the Sea-hare, [called otherwiſe Imbriago] is quenched cleane and mortified, by taking the fleſh of the Sea-horſe any way in drinke.

Againſt the poiſon of deadly dwale, the meat of ſea-urchins is ſoveraign: and whoſoever have drunke the daungerous juice of * Carpaſum, find much eaſe and helpe eſpecially by ſupping their decoction. To conclude, the broth of ſea-crabs likewiſe taken, is thought to be effectuall againſt the foreſaid dwale, named Dorycnium. I

*Named afterward *Opocarpaſum*.

Chap. vi.

Of Oiſtres and Purple ſhell-fiſhes: of Sea-moſſe, or Reits: and the remedies which they affourd.

MOreover, Oiſters have a ſpeciall vertue to reſiſt the venome of the Sea-hare. And albeit I have written already of Oiſters, yet me thinks I cannot ſpeake ſufficiently of them, ſeeing that for theſe many yeers they have ben held for the principall diſh & daintieſt meat that can be ſerved up to the table. This fiſh loveth to have freſh water, and joyeth to be in thoſe coaſts where moſt rivers doe run into the ſea: which is the reaſon, that few of them are found in the deep, called thereupon Pelagia; and thoſe thrive not, but are in compariſon very ſmall. Howbeit, they breed and engender otherwhiles among rocks, & in ſuch holes which want the recourſe of ſweet waters; as for example, about Grynia and Myrina. They wax big and full according to the encreaſe of the moone, as I have ſhewed alreadie in my treatiſe of creatures living in waters: but principally about the ſpring prime, when they be full of a certaine humor or moiſture like unto milke; and in thoſe ſhallow places where the Sun pearceth with his beams to the very bottome of the water. And this ſeemeth to be the reaſon, that in other coaſts and parts of the ſea, they be found far leſſe: for ſhade hindreth their growth, and for want of the cheerefull ſight of the Sun, they have leſſe appetit to meat and feed not. Moreover, this is to be noted, that oiſters differ one from another in colour. In Spaine they be reddiſh; whereas in Sclavonia they be browne & duſkiſh: but about the cape Circeij in Italie, their ſhell and fleſh both, bee blacke. In what coaſt or countrey ſoever they be found, the beſt and principall thoſe are held to be, which be maſſie and compact; not glib and ſlipperie without, with their owne humor and moiſture: and rather bee they choſen which are thicke, than broad and flat: ſuch alſo as be taken neither in muddie nor yet in ſandie places, but upon the ſound and firme ground in the bottome; having their white meat truſſed up ſhort and round, and not flaggie as fleſh: the ſame not jagged and fringed about in the edges with ſmall ſtrings, but lying all cloſe united togither as it were couched within the belly. They that be more expert and practiſed in the choice of oiſters, add one marke more to chuſe them by, namely, if there be a purple thread or ſtring that compaſſeth them about the edges: and by this ſigne they know the oiſters of the beſt kind and race, from others, and call them by a proper name Calliblephara. Oiſters delight (as I may ſo ſay) to travaile into ſtraunge quarters, to be tranſported from their naturall ſeat into other unknowne waters. Thus the oiſters bred about Brindis, and remooved from thence to the lake Avernus; and beeing there fed, are ſuppoſed K L M

A posed by that means to keepe ſtill their own native juice and humiditie, and beſides to gain nouriture by the moiſture of Lucrinus. Thus much as touching the ſubſtance and bodie of Oiſters: it remaineth now to ſpeake of thoſe parts and tracts where the beſt oiſters are to be had; to the end that ſuch coaſts may not be defrauded of the honour due and appertaining unto them. But of this point ſpeake I will by the tongue of another, and alledge his ſpeech who is thought to have written hereof with beſt judgement of any man in our time. Theſe therefore bee the verie words of *Mutianus*, which I will put downe as followeth: The oiſters (quoth he) of Cyzicum taken about the ſtreights of Callipolis, bee the faireſt of all other, and bigger than thoſe which are fed or bred in the lake Lucrinus, ſweeter than thoſe of Britaine, more pleaſant in the mouth than the Edulian, quicker in taſt than theſe of Leptis, fuller than the Lucenſian, drier than thoſe
B of Coryphanta, more tender than the Iſtrian, and laſt of all, whiter than the oiſter of Circeij: and yet there have not been found any oiſters either more ſweet or tender than theſe laſt named. The hiſtoriographers who wrote of *Alexanders* voiages and exploits, have left in writing, That within the Indian ſea there be oiſters found a foot long every way. Moreover, there is among us a certain Nomenclator or Controller belonging to one of our prodigall and waſtfull ſpendthrifts here at Rome, who have given a proper name to certaine oiſters, and tearmed them Tridacna; his deſire was by that ſignificant name, to expreſſe thus much, That they were ſo big as that they would make three good bits or mouths-full apeece.

Now proceed I will to their medicinable vertues, and before I goe any further, in this verie place ſet downe how far forth they ſerve in phyſicke. Firſt and foremoſt, they bee the onely meat
C to comfort and refreſh a decaied ſtomacke: they recover an appetit that was cleane gone. But ſee the practiſe of our delicat wantons! to coole oiſters forſooth, they muſt needs whelme and cover them all over with ſnow; which is as much as to bring the tops of mountains and bottom of the ſea togither, and make a confuſed medley of all. This good moreover doe oiſters, that they gently looſe the belly, and make a bodie ſoluble: ſeeth the ſame with honyed wine, they cure the Tineſmus, which is an inordinat and bootleſſe deſire to the ſtoole without doing any thing, eſpecially if the tiwill (which is the place affected) be not exulcerat. Oiſters likewiſe ſo prepared, clenſe and mundifie the ulcers of the bladder: eat them in their ſhell with their water, as they came cloſed and ſhut from the ſea, you ſhall find them wonderous good for any rheums or diſtillations.
3 The aſhes of an oiſter ſhell calcined, and incorporat with honey, be ſingular for the paine of the
D uvula, and aſſuage the inflammation of the tonſils: ſemblably, they repreſſe the ſwelling kernels that riſe under the ears, aſſuage the biles and botches called Pani, mortifie the hard tumours of womens breaſts, and heale the ſores or ſcalls of the head, if they be applied accordingly with water: and in the ſame order prepared, they rid away wrinkles, and make womens skin to lie ſmooth and even. Theſe aſhes are a ſoveraigne powder to be caſt upon any place that is raw, by reaſon of a burne or ſcalding: and the ſame is commended for an excellent dentifrice to cleanſe and whiten the teeth withall: temper the ſaid aſhes with vinegre, it killeth the itch, and healeth angrie wheals; the ſmall pocks alſo and meazils. Oiſters punned raw and reduced into a cataplaſme, heale the kings evill, and kibed heels, if they be applied accordingly.

Moreover, the ſhell-fiſhes called Purples, are verie good againſt poiſon.

E As for the reits Kilpe, Tangle, and ſuch like ſea-weeds, *Nicander* ſaith, they are as good as treacle. Sundrie ſorts there be of theſe reits, going under the name of Alga, as I have alreadie declared: ſome are long leaſed, ſome large; others of a reddiſh colour; and ſome have curled and jagged leaves. The beſt ſimply of all others, be they of the Iſland Creta, which gow near the ground upon rocks; and namely for to die wooll and woollen cloth: for they ſet ſo ſure a colour, as never will ſhed or be waſhed off afterwards. *Nicander* giveth direction, to take the ſaid treacle in wine.

Chap. VII.

Medecines againſt the ſhedding of haire. For to colour the haire of the head. Alſo againſt the accidents of the ears, teeth, and viſage.

F

IF by occaſion of ſome infirmitie the haire be falne off or grow verie thin, the aſhes of the fiſh called the Sea-horſe, mingled with ſal-nitre and ſwines greace, or applied ſimply with vinegre, repleniſh the bare places with new haire, and cauſe it to come up thicke againe: and for to apply ſuch medicines for this purpoſe, the powder of a cuttle-bone prepareth the skin well before-

Muris marini. hand. Alſo the aſhes of the *ſea-tortoiſe incorporat with oile: of a ſea-urchin likewiſe burnt and G
calcined fleſh and all togither: as alſo the gall of a ſcorpion, be appropriat medicines to recover
haire that was loſt. In like manner, take the aſhes of three frogs burnt togither alive in an earthen
pot, meddle them with honey, it is a good medecine to cauſe the haire to grow: but the opera-
tion will be the better, in caſe the ſame be tempered with liquid pitch or tar. If one bee diſpoſed
to colour the haire of the head blacke, let him take horſe-leeches which have putrified and been
reſolved togither in ſome groſſe red wine for the ſpace of threeſcore daies, hee ſhall find this to
be an excellent medecine. Others there be who give order, to put as many horſleeches as a ſextar
will hold, in two ſextars of vinegre, and let them putrifie within a veſſell of lead as many daies to-
gither; and when they bee reduced into the forme of a liniment, to annoint the haire in the ſun-
ſhine for the ſame purpoſe. And *Sornatius* attributeth ſo much power unto this compoſition, H
that unleſſe they that have the annointing of the haire with it hold oile in their mouths all the
while, their teeth alſo (by his ſaying) who have the doing of it, wil turn black. The aſhes of Burrets
or Purples ſhells incorporat in honey, ſerve paſſing well in a liniment to heale ſcald heads: and
the powder of the foreſaid fiſh ſhells (although they be not burnt and calcined) tempered with
water, is as good for the head-ach. Of the ſame operation is Caſtoreum, incorporat with Har-
ſtrang in oile roſat. The fat or greaſe of all fiſhes whatſoever, as well thoſe of the ſea as rivers, be-
ing diſſolved in oile and tempered with honey, is ſoveraigne for to cleare the eies: and of the like
effect is Caſtoreum, applied with honey. The gall of the fiſh Callionymus, healeth the cicatri-
ces or skars that overgrow the skin about them: and the ſame eateth and conſumeth the excreſ-
cenſe of ſuperfluous fleſh in the corners of the eyes. And verely there is not a fiſh that hath more I
gall than it, as teſtifieth *Menander* the Poët in his comœdies. The ſame fiſh is otherwiſe called
** i.* Looking up to heaven. *Vranoſcopus, by reaſon of the eyes which he hath in the uppermoſt part of his head. Semblably the gall of the blacke fiſh Coracinus quickeneth the eye-ſight. Alſo the gall of the reddiſh ſea ſcorpions, mixed with old wine or the beſt honey of Athens, ſerveth to diſcuſſe the filmes of the eyes like to breed a cataract: and thrice muſt the eyes be annointed therewith, letting a day goe ever betweene. The ſame cure ſerveth likewiſe to take away the pearle in the eye. As for Barbles, it is commonly ſaid, that if one doe feed ordinarily upon them, hee ſhall ſenſibly feele his eyes to decay and wax dim therby. The Sea-hare it ſelfe verely is venomous; but his aſhes keepe the diſorderly and hurtfull haires of the eye-lids from growing any more, if they bee once plucked up by the roots: and for this purpoſe, the leaſt of this kind are the beſt. In like manner, the lit- K
tle Scallops kept in ſalt, and ſtamped togither with the roſin or oile of cedar: the ſmall frogs like-
wiſe which uſually they call Diopetes and Calamitæ, have the like effect to hinder the comming
up of hairs in the eyelids, after they be once pulled up; in caſe their bloud be tempered with the
gum of the vine tree, and therewith the edges of the ſaid eyelids be annointed. The ſwelling and
redneſſe of the eyes is by nothing better delaied and diſcuſſed, than by a liniment made of a cut-
tle bone pulverized and mixed with womans milke. And in verie truth, the ſaid cuttle-bone ſim-
ply by it ſelfe, cureth the aſperitie and roughneſſe of the ſaid eyelids. But for to worke this cure,
the chirurgian uſeth to turne up the ſaid eye-lids, and to apply thereto the medicine, which hee
ſuffereth not to ſtay there long, but taketh it away within a while: hee annointeth the place alſo
with oile roſat, and over night layeth thereto white-bread crumbs [with breaſt-milke] for to aſ- L
ſuage the paine. The ſelfeſame ſhell or cover of the cuttle-fiſh beaten to powder and brought in-
to a liniment with vinegre, cureth thoſe who can ſee never a whit towards night. The aſhes of the
ſaid cuttle-bone draw forth the ſcales or films which grow in the eyes: the ſame incorporat with
honey, heale the skars of the eies; but tempered with ſalt and braſſe ore, of each one dram, they
rid away the pin and web growing in the eye: the ſame helpe horſes of the haw that offendeth
their eyes. Some ſay moreover, that the little bones within the cuttle, if they be ſtamped to pow-
der, heale the eyelids of any ſore or accident befalling unto them. The Sea-urchins fleſh applied
with vinegre, taketh away the accidents of the eies called Epinyctides. The magicians give dire-
ction to burne the ſame with vipers skins and froggs, and to ſpice the drinke with the aſhes that
come thereof, aſſuring thoſe who uſe to drinke the ſame, that they ſhall have a verie cleare ſight. M
[A fiſh there is named Ichthyocolla, which hath a glewiſh skin, and the very glue that is made
thereof, is likewiſe called Ichthyocolla. The ſame glue taketh away the night-toes, commonly
named in Greeke Epinyctides. Some affirme, That the ſaid glue Ichthyocolla is made of the
belly and not of the skin of the ſaid fiſh, like as Buls glue. This fiſh glue is thought to be beſt, that

is

A is brought out of Pontus: the ſame alſo is white without any veines, ſtrings, or skales, and verie quickly melteth and reſolveth. Now the ſame ought firſt to be cut or ſhred ſmall, and then to lie infuſed or in ſteepe a whole day and a night in water or vinegre, which done, to be punned and beaten with the pebbles found about the ſea ſhore, that the ſame may the ſooner melt and diſſolve. This glue thus ordered, is held to be ſoveraigne for the headach: and a good thing to enter into thoſe medicines or compoſitions which are deviſed to ſmooth the skin and rid away the wrinckles.] Take the right eye of a Frog, lap it within a peece of ſelfe ruſſet cloth (ſuch as is made of blacke wooll as it came in the fleece from the ſheepe) and hang it about the neck, it cureth the right eye, if it be enflamed or bleared. And if the left eye be ſo affected, doe the like by the contrarie eye of the ſaid Frog, &c. Now, if it were poſſible to plucke out theſe eyes as the Frog is en-
B gendring, it would heale alſo the white cicatrices or skars in the eie, if it were hung about the neck of the patient in like ſort within an eggſhell. The reſt of the Frogs fleſh applied unto the eye, ſucketh out and conſumeth the bloud that is congealed under the tunicles of the eye, & lieth there blacke and blew. They affirme moreover, That the eyes of a crab or craiſiſh being hanged about the necke, are a ſoveraigne remedie for bleared eyes.

A little Frog there is, delighting to live moſt among graſſe and in *reed plots: mute the ſame is and never croaketh, greene alſo of colour: If Kine or Oxen chaunce to ſwallow one of them downe with their graſſe, it cauſeth them to ſwell in the bellie, as if they were deaw blowne. And yet (they ſay) that if the ſlime or moiſture wherewith their bodies be charged outwardly, bee ſcraped off with the edge of ſome penkniſe, it cleareth the ſight, if the eyes bee annointed therewith.
C As for the fleſh it ſelfe, they lay it upon the eyes for to mitigat their paine. Furthermore, ſome there are who take fifteene Frogs, pricke them with a riſh, and draw the ſame through them, that they may hang thereto, which done, they put them in a new earthen pot: and the humor or moiſture that paſſeth from them in this manner, they temper with the juice or liquor which in manner of a gum iſſueth out of the white vine Brionie, wherewith they keep the eyelids from having any haires growing upon them. But firſt they plucke up thoſe diſorderly haires which grew there to offend and hurt the eyes: and with a fine needle point drop the foreſaid liquour into the very places where the haires were fetched out by the roots. *Meges* the Chyrurgian deviſed another depilatorie for to hinder the growing of haires, made of Frogs which hee killed in vinegre, & permitted them therein to putrifie and reſolve into moiſture: and for this purpoſe his manner was
D to take many freſh Frogs, even as they were engendred in any raine that fell during the Autumn. The ſame depilatorie effect, the aſhes of Horſeleeches are ſuppoſed to have, if they bee reduced into a liniment with vinegre, and uſed accordingly: Now muſt they bee burnt and calcined in a new earthen veſſell that never before was occupied. And of the like operation is the liver of the ſea-fiſh Tænia, if the ſame be dried, and thereof the weight of foure deniers Romane incorporat in oile of Cedar to the forme of a liniment, for to annoint the haires of the eielids by the ſpace of nine months together.

*Calamarij.

The freſh gall of a Ray or Skeat, yea, and the ſame preſerved and kept long in old wine, is an excellent medicine for the eares: ſo is the gall likewiſe of the fiſh * Banchus, which ſome call Myxon: alſo of Callionymus the fiſh aforeſaid, if it be dropped into the eares with oile roſat: ſem-
E blably, Caſtoreum with the juice of Poppie. There be alſo in the ſea certaine creepers engendred, called Pedunculi, *i.* ſea-lice, which being ſtamped and tempered with vinegre, they give counſell to drop into the eares. Alſo a locke of wooll died in the bloud of the purple ſhellfiſh Conchylium, of it ſelfe alone is a very good thing to be applied unto the eares: howbeit ſome doe wet the ſame in vinegre and ſalnitre mixed together. But the ſoveraigne remedie in the opinion of moſt Phyſicians for any greevance and infirmitie of the eares, is this, namely, *Recipe* of the beſt ſauce or pickle called Garum Sociorum that may be gotten, one cyath, of honey one cyath and an halfe, of vinegre one cyath, ſeeth them all together gently over a ſoft fire in a new pot, eſtſoones skimming it in the boiling with a feather; and when it hath left caſting up a skum and is ſufficiently purified, take it from the fire: and of this decoction warme drop into the pained eares. If the eares be
F ſwelled withall, they ordaine and preſcribe to mitigat and aſſuage the ſame firſt, with the juice of Coriander. The fat of Frogs dropped into the eares, allaieth their paine preſently. The juice or decoction of craiſiſhes incorporat with fine Barly meale, is a ſingular and moſt effectuall ſalve to heale the wounds of the eares. As for the ſwellings or inflammations riſing behind the ears: there is not a better thing to cure them, than to applie thereto the aſhes of Burrets ſhels tempered with

*Banchi. Some read *Bacchi.*

honey,

honey,or of the Purples Conchylia,with honied wine. G

If the teeth ake,the readie meanes to assuage them,is to scarifie the gums and let them bloud with the sharpe bones of the sea dragon: and withall,to make a collution with the braines of the sea dogfish boiled in oile and saved for the purpose,to wash the mouth and teeth therewith once in a yeare. Likewise in the paine of the teeth,found it is most soveraigne to scarifie the gums with the prickie bone or finne of the Puffin or Forkefish,untill they bleed againe. The same also being pulverized,brought into a liniment with white Ellebore,and applied to the teeth,causeth them to fall out of the head without any great paine. Moreover,the ashes of salt fish burnt in a new earthen vessell,and mixed with the pouder of the marble stone,is reckoned among the remedies for the teeth. In like manner the quadrants or square cantons of the old Tunie fish,*burnt to a coale in a new earthen pan,and afterward beaten to pouder,are thought to be good for the tooth-ach. H Of the like operation and effect (they say) be the prickes and finnes of all kinds of salt fish, if they be first burned to a coale,then pulverized,and therewith the teeth well rubbed. Furthermore, to make a collution to wash the teeth withall,& to hold the liquor in the mouth, some seeth Frogs in vinegre,with this proportion,that to every Frog they take one hemin of vinegre. But because many a mans stomack lothed & abhorred such a medicine,*Sallustius Dionysius* found the means to hang many of them by the hinder legs over a vessell or pan of seething vinegre, that out of their mouth there might fall the humour within their bodies into the said vinegre. But to those who had good stomackes and were of stronger complexions,he prescribed to eat the very Frogs broth and all wherein they were sodden. And in very truth,many are of this opinion,That if the grinders and great jaw teeth doe ake,this is a speciall medicine for them; but in case they be loose in the head,then the best way to confirme and set them fast,is a collution with the vinegre aforesaid. I And for this purpose some there bee,who after they have cut off the feet of two Frogs, lay their bodies to infuse and steepe in one hemine of wine, and so advise their patients to wash their unsteedie teeth with the said infusion. Others applie them whole as they be,legs and all outwardly to the chawes,and keepe them fast thereto. Whereas some againe seeth ten of them in three sextars of vinegre,untill a third part of the liquor bee consumed, and with this decoction thinke to fasten the teeth sure that shake in their sockets. Moreover, others you shall have who take the hearts of six and thirtie Frogs,& bake or boile them in one sextar of old oile under a pan or oven of brasse; the gravie or liquor whereof they poured into the eare of that side where the cheeke or jaw doth ake: whereas many other besides seeth the liver of a Frog, and when they have stamped and incorporat it with honey,put it into the hollow teeth,or applie it thereto. K But all these medicines abovesaid you must thinke to be more effectuall,if they be made of sea Frogs. Now if the teeth be worm eaten and stinke withall, they give order to drie a hundred of them in an oven all night long: afterwards to put unto them as much salt in proportion as they come to in weight, and therewith to rub the said faultie teeth. There is a kind of serpent or water-snake called in Latine Coluber,and of the Greekes Enhydris; divers there be,who with foure of the upper teeth of this serpent,scarifie the gums of the upper chaw,in case the teeth therein doe ake: and semblably with foure of the nether teeth, if the other bee in paine: And yet some there bee who content themselves with the eyetooth onely. They use also the ashes of sea-Crabs, and no marvaile: for the ashes of Burrets is a dentifrice well knowne for to keepe the teeth clean,and make them neat and white. L

Exusta,not *Eluta*, according to *Galen*.

The fat of a sea-Calfe or Seale taketh away the foule tettars called Lichenes, and the filthie leprosie: so doe the ashes of Lampreies, if the same bee incorporat with honey to the weight of three oboli. The liver also of the Puffin boiled in oile. Finally,the ashes of a sea-Horse and a Dolphin mixed with water,so that the part affected be well rubbed withall untill it blister. Now, when it is thus exulcerat,it must be followed with that manner of cure which is appropriat therto, and namely,untill it be healed and skinned againe. Some take the liver of a Dolphin,and frie or torrifie it in an earthen pan,untill there come from it a kind of grease in manner of oile, and therewith annoint the patients in the cases abovesaid.

If women desire to be rid of the foule freckles, spots, and morphew that doe injurie to their beautie; if they would looke young, and have their skin plumpe and void of all rivels, let them M take the ashes of Burrets and Purple shells calcined, incorporat the same with honey into the forme of a liniment: within one weeks space if they plie it with annointing, they shall see the effect thereof; namely, the skin cleare and neat,even and smooth without wrinkles,and the cheeks

not

A not hollow,but faire and full. Marie upon the eight day they muſt not forget to foment & bath the place with the white of an egg well beaten. Among the kinds of Burrets called Murices, are to be raunged thoſe ſhell-fiſhes which the Greekes ſome call Colycia, others Corythia, ſhaped in the ſhell like to the reſt in manner of a turbant, but that they be farre leſſe, howbeit more effectuall: for that beſides the other properties abovenamed this ſpeciall gift they have, to maintain a ſweet breath. As for the fiſh or glue called Ichthyocolla, it hath vertue to lay the skin even without rivels, and to make it riſe and appeare trim, but then it ought to boile in water the ſpace of foure houres, afterwards to be ſtamped, *ſtrained, and wrought to the liquid conſiſtence of hony and no more. Thus prepared, it muſt be put up into a new veſſell never occupied, and there kept. When time ſerves to uſe it, to every foure drams weight thereof proportion two of brimſtone, of
B Orchanet as much, of litharge of ſilver eight drams: put them all together, and ſtamp them, with ſome ſprinckling of water among. Herewith let the face bee annointed, and after foure houres waſh it off againe. For the ſpots and pimples in the face, called Lentils, as alſo for all other deformities, the aſhes of Cuttill bones are thought ſingular, if the skin bee rubbed therewith: and the ſame conſume the excreſcence of proud and ranke fleſh, like as they drie up any moiſt and rheumaticke ulcers.

*Colata.

Chap. viii.

& Diverſe receits, ſet downe diſorderly one with another, for ſundrie maladies.

C ONe Frog boyled in five hemines of ſea-water, is ſingular for to cauſe the skurfe of the mange or wild ſcab to fall off: but ſodden ſo long it muſt be, untill the decoction bee riſen to the height of honey.

There is engendred in the ſea alſo that which is called Halcyoneum, made as ſome thinke of the neaſts of the birds Halcyones and Ceyces: but as others ſuppoſe, of the filthie ſome of the ſea thickened and indurat: and according to the opinion of ſome, it proceedeth from the muddie ſlime or a certaine *hoarie drie ſcum or froth of the ſea. Foure kinds there be of it. The firſt of an aſh colour, thicke and maſſie, of a quicke and hote ſmell. The ſecond is ſoft and more mild ſavouring in manner like to ſea weeds. The third reſembleth the whiter kind of checquer worke in marquetrie. The fourth is more hollow and fuller of holes in manner of a pumiſh ſtone, and in
D that reſpect reſembleth a rotten ſpunge, enclining much to the colour of purple: & this is ſimply the beſt, called alſo by the name of Halcyoneum Mileſium; yet in this kind the whiter that it is, the worſe is it to be liked. The propertie of them all in generalitie, is to exulcerat and mundifie. Vſed they are being torrified, even without any oile. Wonderfull is their operation, if they be tempered with Lupines, and the weight of two oboli in ſulphur, for to take away the wild ſcab or leproſie, the foule tettars Lichenes, and the pimples or ſpots of the skin called Lentils. Halcyoneum alſo is commonly emploied about the skars or thicke filmes appearing in the eyes. *Andreas* the Phyſician uſed much the aſhes of a ſea-crab incorporat with oile in curing the leproſie. *Attalus* occupied as uſually the fat of a freſh Tunie, new taken, for the healing of ulcers. The pickle of Lampreies, together with the aſhes of their heads calcined, and brought into a liniment with honey, healeth the kings evill. And many are of opinion, That to pricke the wens named the kings evill aforeſaid, with the ſmall bone or pricke that ſticketh in the taile of that ſeafiſh which is called *Rana marina, with this gage and rule of the hand that it wound not deepe, is very good for that diſeaſe: but the ſame muſt bee done every day untill they bee throughly cured and whole. Of the ſame operation is the ſharp prick in a Puffen: of the ſea Hare alſo applied unto them, ſo as neither the one nor the other bee ſuffered to lie long unto the place, but bee ſoone renewed. Alſo the ſhellie skin of the ſea Vrchin ſtamped to pouder and brought into a liniment with vinegre: as alſo the aſhes of the ſea Scolopendre incorporat with honey: and the river craifiſh either pulverized or calcined, and the duſt or aſhes thereof likewiſe tempered with hony, are
F good to be applied unto the ſame diſeaſe. Wonderfull effectuall be the bones alſo of the Cuttill fiſh beaten to pouder, and with old ſwines greaſe brought into the forme of a liniment: And in this manner they applie this medicine to the tumors behind the eares: like as the livers of the ſea fiſh Scarus. Moreover, the ſheards of ſuch earthen veſſels wherein ſalt fiſh was poudered & kept, beaten to pouder and tempered with old ſwines greaſe: the aſhes alſo of Burrets ſhels incorporat in oile, ſerve in right good ſtead for the ſwellings behind the eares, and the tumours or wens

*Halofachnum.

*The Frenchmen tearme it *Diable de mer*, i the devill of the ſea.

called

called the kings evill. The ſtiffe cricke in the necke is mollified and made pliable againe, ſo as it may turne which way a man would have it, with drinking of one dram weight of thoſe creepers or inſects which be called ſea-lice; and yet ſome take for the ſame Caſtoreum in honnied wine, adding thereto a little Pepper, and drinke this compoſition in the broth of Frogs boiled in oyle and ſalt. After which manner, many Phyſicians cure the crampe that draweth the necke backeward: the generall convulſion alſo that ſtretcheth the bodie ſo, as if it were of one peece: and other particular ſpaſmes and crampes of any part, ſo there be ſome Pepper put thereto. The aſhes of ſalt Cackerels heads burnt and reduced into a liniment with honey, diſcuſſe and reſolve the Squinancie cleane, like as the broth of Frogs boiled in vinegre; and the ſaid broth is ſingular alſo for the inflammation of the tonſils. The Creifiſhes of the river dried and beaten to pouder, then put into water (ſo as there be to every one a hemine of water) make a good liquor to gargarize withall for the ſquinancie. The ſame alſo drunke in wine or hote water, worke the like effect. The ſauce made of Maquerels called Garum, put with a ſpoone under the uvula, and there held a while, putteth it up and reduceth it again to the right place. The fiſh *Silurus eaten at the table either freſh or poudered, helpeth the voice much. The barbles kept untill they be dried, & then pulverized, provoke vomit, if a cup of drinke be ſpiced with the pouder. If a man or woman bee ſhort winded, there is not a medicine againſo good to helpe that difficultie of breath, as to drink whiles they be faſting, Caſtoreum, with a little quantitie of Ammoniack in honied vinegre. The ſame potion taken likewiſe with honied vinegre hot, allaieth the convulſion of the ſtomack proceeding from exceſſive yexing or hicquets. *Item*, it is ſaid, That Frogs boiled in ſome broth betweene two platters after the manner of fiſhes, are good for a cough: And being hanged by the heels, after that their ſalivation and humiditie is dropped from them into a pan or platter underneath, they are to be rid of their garbage, and when the ſame is flung away, they ought to be kept and preſerved for the purpoſe aforeſaid. There is a little Frog that uſeth to climbe trees, & from thence crieth and croaketh: if a man ſpit into the mouth of one of them, and then let her goe again, it is thought he ſhall be deliverd by that means from the cough. To conclude, many give counſell for the cough that bringeth up bloud withall, to drinke in hote water the fleſh of a raw perwinckle well punned.

*Some take it for the Sturgeon, but untruly

G H I

Chap. ix.

Proper receits for the accidents of the liver and the ſides: for the infirmities alſo of the ſtomacke and bellie. Beſides other medicines huddled together confuſedly.

K

MAny uſe to ſuffocat and kill in wine a ſea Scorpion, and to drinke thereof for the paine of the liver. For the ſame purpoſe many are wont to take in honied wine and water of each a like quantitie, the fleſh of the long muskles or ſhell fiſhes: or if they have a fever, in honied water. In caſe of pleuriſie or pain of the ſides, the fleſh of the ſea horſe roſted, eaſeth the ſame: ſo doth the fiſh Tethea, which reſembleth an Oyſter, taken as meat. The pickle of the fiſh Silurus injected by way of clyſter, allaieth the paine of the Sciatica. To the like effect there are given for fifteene daies together, Cockles or Muskles, to the weight of three oboli infuſed in two ſextars of wine. The broth of Silurus ſofteneth the bellie: like as the crampefiſh Torpedo, eaten as meat. The *ſea-wort is like unto that of the garden, hurtfull to the ſtomacke, but moſt eaſily it purgeth the belly. In regard of the acrimonie that it hath, they uſe to ſeeth it with ſome fat fleſh. The broth of any fiſh whatſoever is laxative: The ſame provoketh urine, eſpecially if it be made of wine. The beſt fiſh broth commeth from the ſea ſcorpions, and thoſe which they call Iulides: of ſtone fiſhes alſo that keepe about rockes, and have no ranke or ſtrong taſt; and ſuch muſt be ſodden with dill, parſely, coriander, and leekes, putting thereto oile and ſalt. The ſquares alſo or cantons of the Tunie, that have been old kept, are purgative: for particularly they evacuat crude and wateriſh humors, beſides fleagme and choller. The ſhell fiſhes alſo named Myaces, have a qualitie purgative: as touching whoſe nature I purpoſe to write fully in this verie place. They gather together by heapes after the manner of Burrets; they live in places given to breed reits and ſea moſſe; moſt delicat and pleaſant meat they be in Autumne, and eſpecially in thoſe coaſts where good ſtore of freſh water is entermingled in the ſea, which is the reaſon that thoſe of Ægipt be moſt commendable. As winter groweth on, they begin to gather a kind of bitterneſſe, and a red colour beſides.

*Olus marinum: haply he meaneth *Braſica marina*, i. *Soldanella*, yet it is nothing like to our Colewort.

L M

The

A The broth of theſe fiſhes hath the name to evacuat both the bellie and the bladder, to ſcour and mundifie the guts, to open any obſtructions whatſoever, to purge the reines, to take down the rankeneſſe of bloud and fat: In which regards, they be ſoveraigne for the dropſie, for the monthly tearmes of women, the jaundiſe, all gouts and diſeaſes of the joints whatſoever, and ventoſities: Singular they are holden to bee for to cleanſe the humours either chollericke or phlegmaticke; which annoy or ſtuffe the lights, or which engender obſtructions about the liver: Likewiſe to cure the infirmities of the ſpleene, and all rheumes or deſcent of humors to any place. Onely they be hurtfull to the throat, and make a man to looſe his voice, this is all the harme they do. The ulcers that corrode and be full of filthie matter, and require mundification, they heale: ſo doe they all cankerous ſores. Being calcined after the order of Burrets, they cure the biting both of dog and
B man, if their aſhes be incorporat with honey: and ſo they cleanſe the leproſie, and rid away the pimples or ſpots in the skin called Lentils. Their aſhes *taken in drinke, have a vertue to diſcuſſe the dimneſſe and miſtineſſe of the eyeſight, to cure the accidents of the gums and teeth; & beſides to drie up the ſmall pockes, and ſuch like breaking forth of wheales, by occaſion of fleagme. Furthermore, they are as good as a countrepoyſon againſt the juice of the deadly Dwale, called Dorycnium, or of Carpaſum, which is commonly named Opocarpaſum. Moreover, this would be noted, that they grow all to be of two kinds of them: the one *Mituli, [i. Limpins] which have a taſt of ſalt, and carie a ſtrong ſavour; the other *Myſcæ, which differ from the other in roundneſſe: leſſe alſo they be a good deal and hairie: and as their ſhels be thinner, ſo their fleſh is more firme and hard. The ſaid Limpins alſo, as well as Burrets, yeeld aſhes when they be calcined, which
C have a cauſticke qualitie, whereby they ſerve properly to mundifie the skin from leproſie, lentils, and other pimples and illfavoured ſpots. The ſame being waſhed after the manner of lead, be ſingular for to ſubtiliat the thicke eye-lids, to ſcatter and diſcuſſe the pearles in eyes, to diſſipat the cloudie and miſtie dimneſſe: to cleanſe filthie ulcers in any part of the body, and namely the puſhes and bliſters that ariſe in the head. As touching the fleſh that they have, it ſerveth in a cataplaſme to be laid unto the biting of mad dogs. The Palours alſo doe mollifie and ſoften the bellie: ſo doth Caſtoreum, beeing drunke to the weight of two drams in honied water. They that would have this medicine more quicke in operation and to worke throughly, put thereto of the garden Cucumber root dried one dram, and of ſal petre two drams. As for the fiſhes named Tetheæ, they are ſingular againſt the wringing torments of the bellie and all ventoſities. Theſe fiſhes
D be found ordinarily about the rockes of the ſea, ſucking the leaves of Reits and ſuch like weeds, more like indeed to Muſhromes and Puffes than to fiſhes: But the ſame have a ſpeciall propertie to cure the Tineſme and the accidents of the kidneies.

Moreover, there groweth in the ſea a kind of Wormewood, which ſome call Seriphium, and principally toward * Tapoſiris in Ægypt, the which is more ſmall and ſlender than that of the land: it looſeth the bellie, killeth the wormes in the guts, and expelleth them. The Cuttill fiſh alſo is laxative: And ordinarily given it is to be eaten, after it hath beene ſodden with oile, ſalt, and meale. Salt Cackerels likewiſe provoke unto the ſtoole, in caſe they bee reduced into a liniment with Buls gall, and therwith the navill annointed. Generally, the broth of fiſh ſtewed between two platters with Lectuce, diſpatcheth thoſe ſharpe and fretting humours which are the cauſe of the
E Tineſme. The crai-fiſhes of the river ſtamped and drunke in water, ſtop a lask, and be diureticall: but yet in wine they move appetite to the ſiege. Take away their feet and armes whereby they crawle, then pun and incorporat the reſt of their bodie with Myrrhe, they drive out the ſtone. But this proportion muſt bee obſerved, that to every dram weight of them there be put three oboli of Myrrhe.

To appeaſe the painefull paſſion called Iliaca, to allay and reſolve ventoſities alſo and inflations, there is not a better thing than to take in foure cyaths of mead or honied wine hote, Caſtoreum, with Carot & Parſely ſeed, as much as may be comprehended with three fingers. The ſame is ſingular to allay the wrings and torments of the belly, with vinegre and wine mingled together. The fiſhes named Erythini eaten as meat, doe ſtay the looſeneſſe of the bellie. For to cure the dy-
F ſenterie or bloudie flix, ſeeth Frogs with the ſea Onion commonly named Squilla, and thereof make certaine trochisks, to bee given unto the patient in that caſe. The ſame effect hath their gall or heart ſtamped and incorporat with honey, as *Niceratus* mine author doth teſtifie. Eat ſalt fiſh with Pepper, ſo as you abſtaine from all fleſh beſides, if you would bee cured of the jaundiſe. Lay the fiſh named a Sole, to the region of the ſpleene, it cureth the opilation and hardnes there-

of:

* *Potus*, rather *illitus*, that is, brought into a liniment, & ſo uſed outwardly.

* *Salem.* Some read *Scilla*, i. ſea Onion or Squilla.

* or Muskles.

* Haply Cockles.

* *Taphoſiris.*

of: ſo doth the crampefiſh Torpedo: and a Turbet in like manner, being applied alive; but afterwards you muſt let it looſe againe into the ſea. A ſea ſcorpion killed in wine, healeth the infirmities of the bladder, it breaketh and expelleth the ſtone. The ſame effect hath the ſtone which is found in the taile of a ſea ſcorpion, if it bee drunke to the weight of one obolus: the liver alſo of the water ſnake Enhydris: and the aſhes likewiſe of thoſe kind of Mullets which be called Blennij, if they be taken with Rue. Moreover, there be found alſo in the head of the fiſh Banchus, certaine little ſtones as it were, which if they be drunke in water, are ſoveraigne for them which bee troubled with the gravell and the ſtone. And it is commonly ſaid, That the ſea fiſh named a Nettle, taken in wine, is very good therefore: like as another knowne in Latine by the name of Puluco Marinus, boyled in water. The egges or ſpawne that the Cuttill fiſh doth caſt, bee diureticall, and provoke urine, whereby alſo they cleanſe the kidneies from the phlegmaticke humours there gathered. River crabs or craifiſhes ſtamped and taken in aſſes milke eſpecially, doe cure ruptures and inward convulſions. And as for ſea Vrchins, if they be ſtamped prickes and all, and ſo drunke in wine, they expell ſtone and gravell: but to every Vrchin there muſt bee taken one hemine of wine, and the patient ought to drinke it continually untill he find help: and otherwiſe their meat is very good to be eaten ordinarily for this purpoſe. To feed alſo upon Cockles and Scalops, is holeſome for to ſcoure the bladder. Of theſe ſhell fiſhes, thoſe of the male ſex be called by ſome Donaces, by others Auli, whereas the female are named Onyches. The male doe provoke urine: but the female are the ſweeter in taſt, and of one colour. The egges or ſpawne alſo of the Cuttill fiſh, move urine as hath been ſaid before, and purge the reines. For that rupture wherein the guts fall downe into the cods, it is ſaid, That the ſea Hare punned and applied to the place in forme of a cataplaſme with honey, is ſingular to reduce them up into their place. The liver alſo of the water ſnake or adder, called otherwiſe Hydrus or Enhydris, beaten to pouder and put in drinke, helpeth thoſe that be given to breed the ſtone and gravell. The pickle that commeth of the fiſh Silurus ſalted, infuſed or injected by a clyſtre into the guts, ſo that the bellie were before emptied from the groſſe excrements, cureth the Sciatica. The aſhes of Barbles and Mullets heads calcined, heale and skin up the gals and frets of the fundament. Now the manner of burning or calcining them, is in an earthen pot: and reduced they ought to be into a liniment with honey, before the place bee therewith annointed. The aſhes alſo of Cackerels heads burnt, doe cure and cloſe up againe the chaps in the ſeat: which alſo are good for the ſwelling piles and bigs in thoſe parts: Like as the aſhes of the young Tunies heads ſalted, called Pelamides: or the Squares named Cybia, with honey. If the tiwill be ſlipped downe and readie to hang out of the bodie, applie thereto the crampefiſh Torpedo, it preſently reduceth it and ſtaieth it up. The aſhes of craifiſhes broght into a liniment with oile and wax, healeth the chaps and fiſſures in thoſe parts: ſo dooth the fine pouder of the ſea crab dried and pulverized. The pickle alſo of the fiſhes Coracini, diſcuſſeth and reſolveth the biles called Pani: The ſame effect worke the aſhes of the garbage and skales of the ſhadow like Sciæna: The ſea ſcorpion alſo boiled in wine, ſo that the ſaid biles or impoſtumes be fomented therewith. But the hard and ſhell-like skins of ſea Vrchins being well ſtamped and with water brought into a liniment, keepe the ſaid biles downe, and repercuſſe them in the beginning. The aſhes likewiſe of Murrets or purple fiſhes ſerve both waies whether it bee needfull to diſcuſſe them in the beginning, or to ripen them, and after they be brought to maturation, for to breake them and let them forth. Some Phyſicians for this intent compound a medicine or ointment in this manner, *Recipe* of Wax and Frankincenſe twentie drams, of litharge of ſilver fortie drams, of Burrets aſhes ten drams, of old oile one hemin, *Fiat unguentum*. The very fiſhes alone by themſelves ſalted, ſodden, and ſo applied, ſerve in this caſe. Craifiſhes of the rivers punned into a cataplaſme and applied unto the ſecret parts, reſolve and diſcuſſe the puſhes that there ariſe: ſo doe the aſhes of Cackerels heads: their fleſh alſo boiled and laid to the place affected. In like manner, the aſhes of Perches heads ſalted and reduced into a ſalve with honey. The aſhes of young Tunies heads, whiles they are Pelamides, or the rough skin of the fiſh called * Squatina, burnt: This is the skin, which as I ſaid before, is proper to poliſh wood and make ſmooth any workes made thereof: whereby you may ſee, that even the ſea alſo dooth affourd inſtruments to fit the Ioiners and Carpenters hand. The ſmall fiſhes named Smarides applied unto the puſhes of the ſaid privie parts in the forme of a liniment, doe much good: as alſo the aſhes of Burrets or Purples ſhels incorporat with honey: and the ſame would be more effectuall, in caſe that the fiſhes bee burnt whole, ſhell, fleſh and all. Salt fiſh ſodden in honey, and applied, ſerve particularly

G H I K L M

*Some take it for a Sole, others for a Skeat.

A larly to extinguiſh the heat of carbuncles and botches in the ſaid ſecret parts. If one of the cods hang downe flagging unſeemely lower than his fellow, ſome would have it annointed with the froth that commeth from ſhell-ſnails or periwinkles. The fleſh of the Sea-horſe roſted, helpeth them that cannot hold their urine, in caſe they uſe ordinarily to eat thereof: likewiſe the little fiſh called Ophidion, ſo like unto a Congre, if it be taken with a Lillie root. The ſmall fiſhes found in the bellies of the greater who have devoured and ſwallowed them downe, taken forth and burned to aſhes, are good in this infirmitie to be drunke in water. The aſhes of ſhell-ſnails, meat and all, burnt, are preſcribed by ſome phyſicians to be given in Signine wine againſt incontinency of urine; but principally of Barbarie ſnails. For the gout in the feet, and the diſeaſes of other joints, the oile wherein a frog was boiled, is ſoveraigne: ſo are the guts of the ſaid frog, and the aſhes of
B a toad incorporat with old oile: ſome put thereto the aſhes of all the three kinds of barly, of each an equall weight. And they give direction to rub alſo the goutie feet, with a Sea-hare: alſo to be ſhod with the skinns of Bevers, eſpecially thoſe which are bred in Pontus: like as, to weare ſhoes made of Seals skin: the fat of which fiſh, is likewiſe verie good. Alſo the ſea-moſſe or reits called Bryon, like to lettuce, but that the leaves be more riveled, and grow to no ſtalke; whereof I have written heretofore: of a ſtypticke and aſtringent nature it is; no marveile therefore, if being applied unto the gout, it mitigat the furie and violence thereof. Moreover, the common ſea-weeds named Alga, of which alſo I have treated alreadie: but this caution there would be in the application thereof, That it be not drie. The ſea fiſh called Pulmo Marinus, cureth the kibes in the heels: the aſhes alſo of the Sea-crab, tempered with oile: yea and the river Crabs or Creifiſhes burnt and calcined to aſhes, if the ſame be incorporat with oile: like as the fat of the fiſh Silurus. Moreover, if other joynts be diſeaſed, it were verie good for the eaſement of their griefe, eftſoons to lay thereto frogs, freſh and new taken: mary the beſt way, by the direction of phyſi-
C cians, is to ſplit them through, and ſo to apply them warme. The broth of Limpins, Muſcles, Cockles, and Wilkes, is verie nutritive, and maketh them fat that uſe it. Thoſe that bee ſubject to the falling ſickneſſe, uſe ordinarily (as it hath been ſaid before) to drinke the rennet of the Seale or Sea-calfe, either with mares milke or aſſes milke, or els with the juice of the pomgranat: and ſome are woont to take it in oxymell or honeyed vinegre: and yet there be others that ſwallow the ſame downe by it ſelfe in forme of pills. And for the ſame purpoſe, Caſtoreum is uſually given unto ſuch patients faſting, to bee drunke in three cyaths of honeyed vinegre or oxymell
D aforeſaid: but thoſe that eftſoons be ſurprized with the fitts, and oftentimes fall therof, find wonderfull much good by this clyſtre following: Take of Caſtoreum two drams, of honey and oyle one ſextar, and of water as much. But ſay that one be preſently in a fitt, the readie means to raiſe him and ſet him upright upon his feet againe, is to preſent unto his noſthrills Caſtoreum with vinegre, for to ſmell unto. The liver alſo of the fiſh named the Sea-cat or Weazill, is given in like caſe: even as the bloud either of Sea-mice or Tortoiſes.

Chap. X.

Remedies for fevers of all ſorts: alſo for divers other infirmities.

E THe liver of a Dolphin eaten before the acceſſe, cureth all thoſe agues which be not continuall, but returne by fitts and keepe their courſe. Oile roſat wherein the fiſhes called Sea-horſes were ſuffocated and killed, is ſingular good to annoint thoſe that be ſicke of ſuch agues as come with a cold fitt: and the very fiſh it ſelfe is moſt effectuall to rid away the ſame, in caſe it bee hanged about the necke, or to the arme of the patient. Semblably, the little ſtones which are found in a Haddocks head at the full of the moone, if they bee taken foorth and hung about the patient, lapped handſomly in a little linnen bag, ſerve to drive away ſuch fevers. Moreover, it is ſaid, that the longeſt tooth in the head of a river fiſh called Pagrus, tied to one of the hairs of the patients head, ſo as he doe not ſee the partie who faſtened or hung it thereto, in five daies ſpace, will doe the deed: as alſo that the oile wherein a frog hath been boiled in ſome carre-
F four or croſſe ſtreet turning three waies, cureth thoſe who are ſicke of a quartan ague, if they be all over annointed therewith; provided alwaies, that the fleſh be firſt thrown away. And yet ſome ordaine, that they ſhould be ſtrangled or ſtifled in oile, and then the bodies hung privily about ſome part of the patient without his knowledge; and that he be afterwards well rubbed and annointed with the foreſaid oile. If one carrie about him the heart of a frog either hanging by his

necke or tied to his arme, ſurely it will diminiſh and ſhorten the cold fitt of an ague: like as the oile will doe no leſſe, wherein the entrails of the ſaid frog were boiled, in caſe hee be annointed therewith. But above all, either frogg or toad (the nails whereof have been clipped) hanged about one that is ſicke of a quartan ague, riddeth away the diſeaſe for ever: alſo, whoſoever have about him hanging to any part of his bodie the heart of a toad, enfolded within a peece of cloth of a white ruſſet colour, hee ſhall be delivered from the quartane ague. Stampe river-crabs or creifiſhes, concorporat them with oile and water, and herewith annoint the patient all over before the fit of any ague, you ſhall find it to doe very much good; but ſome put pepper thereto: other for the quartan particularly, boile the ſame in wine untill a fourth part be ſodden away, and then give counſell unto the ſicke parties to drinke of that broth, preſently after they be come out of the baine. You ſhall have ſome adviſe, for to ſwallow downe whole, the left eye of a creifiſh in this caſe. Moreover, the magicians ſeeme to aſſure us, that whoſoever bee ſicke of a tertian ague, ſhall be rid of it, in caſe the eyes of the ſaid creifiſhes bee tied or hanged about them one morning before the Sun be up; ſo as withall, they that have the doing hereof, let them goe againe blind as they are, into the water: and they would beare us in hand, That if the ſaid eyes plucked out of the head of a creifiſh, be wrapped togither with the fleſh of a nightingale, within a peece of a ſtags skin, and ſo worne either about the necke, or otherwiſe tied faſt to ſome part of the bodie, they will cauſe him or her that weareth them, to be watchfull and not enclined one whit to ſleepe. They uſe likewiſe the rennet of a Whale or elſe of a Seale, giving it unto thoſe that bee growing into a lethargie, for to ſmell unto: and ſome of them annoint thoſe that be alreadie in a lethargie, with the bloud of tortoiſes. The fiſh likewiſe called Spondylus, is ſaid to rid away the tertian ague, in caſe the patient weare one of them without any thing elſe, about the necke: like as the river ſhell-ſnails eaten freſh and new gathered, cure the quartan: howbeit, ſome there be, who for that purpoſe keepe them condite in ſalt, & give them after they be punned, for to drinke. The wilks alſo or wrinkles called Strombi, ſuffered to lie and putrifie in vinegre, doe with their verie ſmell awaken and raiſe thoſe that lie in a lethargie. The ſame are good likewiſe for ſuch as be readie to faint and fall into cold ſweats, through feebleneſſe of the heart and ſtomacke. The fiſhes named Tetheæ, eaten with rue and honey, are ſoveraigne for to reſtore them whoſe fleſh is falne away in a conſumption. The fat of a dolphin melted and drunke in wine, cureth ſuch as bee in a dropſie. In caſe the head be heavie and readie evermore to * fall aſleepe, there is not a better thing than to rub the noſthrils with ſome convenient ointment, or to hold therto ſome perfume, or elſe to ſtop the ſame any way it makes no matter how. Alſo, the meat of the foreſaid wilkes or wrinkles, ſtamped and given in three hemins of honeyed wine, with as much water, or in mead or honeyed water if the patient have a fever withall, is ſingular good againſt the ſaid drowſineſſe: likewiſe the juice or decoction of creifiſhes with honey. Moreover, water-froggs boiled in old wine with the red wheat Far, and eaten as meat; ſo as the patient drinke alſo of the broth out of the ſame veſſell where they were ſodden, are thought to bee ſoveraigne for ſuch ſleepie diſeaſes: or elſe take a tortoiſe, cut away his head, feet, and taile, plucke out his guts and garbage; the reſt of the fleſh condite, ſo as it may be taken without any loathing or riſing of the ſtomacke; for this is held to bee ſingular in this maladie. Moreover, freſh-water creifiſhes eaten with their broth, have the name to reſtore ſuch as be in a phthyſicke or conſumption of the lungs. The aſhes either of a ſea-crab or river-creifiſh, be excellent either for burne or ſcald: and this manner of eure alſo ſerveth for to reſtore haire againe; but then they hold opinion, that togither with the aſhes of the river creifiſhes, there be wax uſed and bears greace. Alſo the aſhes of frogs gall is thought good for a fever. As for ſhingles and S. *Anthonies* fire, the bellies of live froggs applied to the place, doe extinguiſh and quench the extremitie of their heat: but in any caſe order is given, that they be tied by the hinder leggs with their mouths bending forward; to the end, that their often breathing alſo upon the place, may coole and doe good. Furthermore, many there be who uſe for that purpoſe, the aſhes of the heads of the fiſhes called Siluri: as alſo of ſaltfiſh with vinegre, and apply the ſame to ſuch wildfires and inflammations. The liver of a Puffen or Forkefiſh ſodden in oile, beeing outwardly applied, killeth not onely the itch and ſcab of men, but alſo the ſcurfe and mange of foure-footed beaſts, moſt effectually. The calloſitie or thicke skin wherwith Purple fiſhes cover their heads and hollow concavitie, if it bee punned and applied unto wounded ſinews, doth conſolidat and ſowder them againe though they were cut aſunder. The rennet of a Seale or Sea-calfe taken in wine to the weight of one obolus, helpeth thoſe that lie

* *Gravitati ſoporis.*

A in a lethargie: ſo doth fiſh-glew Ichthyocolla. Such as are given to the ſhaking and trembling of their lims, find much benefit by Caſtoreum, if they bee rubbed and annointed with it and oile togither. I read, that Barbles are hurtfull meat for the ſinews: and many are of opinion, that as much feeding upon fiſh * cauſeth bleeding, ſo the ſame may be ſtaunched with the poulpe or pourcuttle, if it bee ſtamped and applied to the place: of which fiſh, thus much moreover is reported, That of himſelfe he yeeldeth a certaine ſalt pickle, and therefore there ſhould be no ſalt put into the liquour while hee is ſeething: *Item*, that it ought to bee ſliced and cut with an edged reed; for with an yron knife it will take infection, and the nature of it is ſuch as to * keepe and retaine it ſtill. For the ſtaunching of bloud, they uſe alſo the aſhes of frogs, or elſe their bloud dried, to be applied accordingly. But ſome would have the aſhes to be made of that kind of frog, which

B the Greeks name Calamites, becauſe it liveth among reeds, buſhes, and ſhrubs, and of all others is the leaſt and greeneſt: and yet many doe ordaine, if the flux of bloud be from the noſthrils, to take the aſhes of young frogs breeding in the water, whiles they be tadpoles and have little wriggling tailes, (and thoſe muſt be calcined for that purpoſe in a new earthen veſſell) and to put up the ſaid aſhes into the noſe. On the contrarie ſide, the horſleeches which wee call in Latine Sanguiſugas, [*i.* Bloudſuckers] are uſed for to draw bloud. And verily it is judged, that there is the ſame reaſon of them, as of ventoſes and cupping-glaſſes uſed in phyſicke, for to eaſe & diſcharge the bodie of bloud, and to open the pores of the skin. But here is all the harme and diſcommoditie of theſe horſleeches, That if they be once ſet too for to draw bloud, the bodie will looke for the ſame phyſicke againe everie yeere after, about the ſame time, and be ill at eaſe for want thereof. Many phyſicians have thought it good to uſe them for the gout of the feet alſo. Well, ſet them to the hæmorrhoids, and where you will, they fall off lightly when they are full and ſatisfied, even with the verie weight of the bloud which pulleth them down; or elſe by ſtrewing ſome ſalt about the place where they ſticke too: and otherwhiles it falleth out, that they leave their heads behind them faſt fixed in the place where they ſettled, and by that means make the wound incurable and mortall, which hath coſt many a man his life: as it happened to *Meſſalinus* a noble man of Rome, and who in his time had been a Conſull, whoſe fortune it was to die thereupon, having ſet them to his knee: whereby we may ſee, that oftentimes they bring a miſchiefe for a remedie: and the red ones are they that in this reſpect ought to be feared. To prevent therfore this daungerous inconvenience, they uſe with a paire of ſizzers to clip them at the verie mouth

D as they be ſucking; and then ſhall you ſee the bloud ſpring out, as it were at the cocke of a conduit, and ſo by little and little as they die, they will gather in their heads, and the ſame will fall off, and not tarrie behind to doe hurt. Theſe horſleeches naturally are enemies to Punaiſes, in ſo much as their perfume killeth them. Furthermore, the aſhes of Bevers skins burnt and calcined togither with tar, ſtaunch eth bloud guſhing out of the noſe, if the ſame bee tempered and mingled well with the juice of porret. The ſhells of cuttles applied to the bodie with water, draw forth arrow heads, pricks, or ſpills, that ſticke deepe within the fleſh: ſo doth any ſaltfiſh if the fleſhie ſide be laid thereto; yea and freſh-water creifiſhes have the ſame effect: likewiſe the fleſh of the freſh-water Silurus (for this fiſh breedeth in other rivers beſides Nilus) applied to the place, either freſh or ſalted it makes no matter, worke with the ſame ſucceſſe. The aſhes of the

E ſame fiſh, and the fat, bee of the ſame operation, and verie attractive. As for the aſhes of their ridge-bone and prickie finns, they are taken to bee as good as Spodium, and are uſed in ſtead thereof. As touching thoſe ulcers which bee corroſive, as alſo the excreſcence of prowd fleſh growing in ſuch ſores, there is not a better thing to repreſſe and keepe them downe, than the aſhes of Cackerels or the fiſh Silurus aforeſaid. The heads of ſalted Pearches be ſingular good for cancerous ulcers: and the more effectually they will worke, in caſe there be ſalt mingled with their aſhes, and togither with knopped Majoram or Savorie and oile, be incorporat into a liniment. The aſhes of the Sea-crab burnt and calcined with lead, repreſſe cancerous ſores: and for this purpoſe, ſufficient it were to take the aſhes onely of the river creifiſh, medled with honey and lint: but ſome chuſe rather to mingle alume and honey with the ſaid aſhes. As for the ea-

F ting ſores called in Greeke Phagedænæ, they may be healed well with the fiſh Silurus, kept untill it be dried, and ſo togither with red orpiment, reduced into a powder. Likewiſe morimals, and other conſuming cankers, and thoſe ſores which be filthie and growing to putrefaction, are commonly healed with the old ſquares of the Tunie fiſh. Now if there chaunce to bee wormes and vermine breed in the ſaid ulcers, the onely means to cleanſe them is with the gall of froggs.

* *Sanguinem cieri.*

* *Retinente.*

But the hollow ſores commonly knowne by the name of Fiſtuloes, are enlarged, kept open, yea and brought to drineſſe, with tents made of ſaltfiſh conveyed into them within fine linnen rags: and within a day or two at moſt, they will rid away all the calloſitie, togither with the dead and putrified fleſh within the ſores, yea and repreſſe the eating and corroſive humor in them, if they be wrought into the forme of a ſalve or emplaſtre, and ſo applied. To mundifie ulcers, there is not a fitter thing than ſtockfiſh made into a tent with fine lint of rags, and ſo put into the ſore. Of the ſame effect are the aſhes of the ſea-urchins skin. The peeces of the fiſh Coracinus ſalted, diſcuſſe and reſolve the hote apoſtems named carbuncles, if they be applied: ſo doe the aſhes of the Barble ſalted and calcined. Some uſe the aſhes of the head of the ſaid fiſh onely with honey, or els the verie fleſh of Coracinus. The aſhes of Murrets tempered with oile, delay and take down any ſwelling. The gall likewiſe of the Sea-ſcorpion, taketh off the rouſe of ſores, and bringeth skars that overgrow the fleſh unto the levell of the other skin. The liver of the fiſh Glanus, cauſeth werts to fall off, if they be rubbed withall. Alſo, the aſhes of Cackerell heads doe the like, if they be tempered with garlick: but for the thyme werts particularly, they uſe them raw: the gall likewiſe of the reddiſh ſea ſcorpion, and the ſmall ſea fiſh Smarides, punned and brought into a liniment, doe the like. The groſſe pickle ſauce called Alex, if it be made through hot, cureth the raggedneſſe of nails: the aſhes alſo which come of Cackerell heads, do extenuat and make them fine. The fiſh Glauciſcus eaten in the owne broth, cauſeth women to have ſtore of milke: ſo doe the ſmall fiſhes called Smarides, taken with ptiſan or barley grewell; or els boiled with fennell: and in caſe they have ſore breaſts, the aſhes of Burrets or Purple ſhells incorporat with honey, doe heale effectually. A liniment made of Sea-crabs or freſh-water Creifiſhes, taketh away the offenſive hairs that grow about womens nipples or breaſt heads: the fleſhie ſubſtance alſo of the Burrets applied unto them, worke the ſame effect. A liniment made of the fiſh called a Skate, will not ſuffer womens paps to grow big. A candle-wieke or match made of lint, and greaſed all over with the oile or fat of a dolphin, and ſo ſet a burning, yeeldeth a ſmoake which will raiſe women againe, lying as it were in a traunce and dead upon a fit of the mother: the ſame doe Macquerels putrified in vinegre. The aſhes either of Pearch or Cackerell heads tempered and incorporat with ſalt, ſaverie, and oile, ſerve for all the accidents of the matrice, and more particularly in a perfume, bring downe the after-birth. Semblably, the fat of a Seale or Sea-calfe, conveighed by means of fire in a perfume up into the noſthrils of a woman lying halfe dead upon the riſing and ſuffocation of the matrice, bringeth her to her ſelfe againe: ſo doth it alſo, if with the rennet of the ſame Seale, it be put up in wooll after the manner of a peſſarie, into the privie parts. The aſhes of the Sea-fiſh called Pulmo, applied conveniently to the region of the matrice, and kept faſt thereto, purgeth women paſſing well of their monethly fleurs: of the ſame operation are Sea-urchins ſtamped alive, and drunke in ſome ſweet wine: but the river Creifiſhes likewiſe punned and taken in wine, doe contrariwiſe ſtay the immoderat flux thereof. Likewiſe it is ſaid, that a ſuffumigation of the fiſh Silurus, eſpecially that which breedeth in Africa, cauſeth women to have more ſpeedie and eaſie deliverance in childbirth: as alſo, that Crabfiſhes drunke in water, doe ſtop the exceſſive overflowing of their monethly terms; whereas with * hyſſop they ſet them a going and purge them away. Say that the infant ſticke in the birth, and by reaſon of painfull labour be in daunger of ſuffocation, let the mother drinke the ſame in like maner, there will preſent helpe enſue. Women with child uſe alſo either to eat them freſh, or drink them dried, that they may goe out their full time, and not ſlip an abortive fruit. *Hippocrates* uſeth the ſame, and preſcribeth unto women for the bringing downe of their ſickneſſe, and likewiſe to thruſt out the infant dead in their wombs, to drinke them in honeyed wine with five docke roots, ſtamped togither with rue and ſoot: and in verie truth, ſodden with ſorrell or docks and parſley, they force womens months to come downe ſpeedily, if the broth be drunke; and withall, bring plentie of milke into nources breaſts. If women have an ague, and the ſame accompanied with head-ach and much twinkling or inordinat palpitation of the eyes, it is thought they ſhall find much good by drinking them in ſome hard and auſtere wine. Caſtoreum taken inwardly in honeyed wine, is ſingular to helpe forward womens monthly purgation: the ſame beeing held to their noſthrills with vinegre and pitch to ſmell unto; or put up beneath in manner of a ſuppoſitorie, after it is reduced into the forme of trochiſques, helpeth them when by riſing of the mother they are in daunger of ſtrangulation. For to bring away the after-birth, it availeth much alſo for women to drinke the ſaid Caſtoreum with Panaces in foure cyaths of wine: as alſo it is certaine, that whoſoever

G H I K L M

*Hyſſopo, otherwiſe *Oeſypo*, i. the tried greace of unwaſhed wooll.

A ſoever take the weight of three oboli thereof, ſhall avoid the daunger that may come unto them by extremitie of cold. Moreover, if a woman great with child chaunce to goe over a place where lieth Caſtoreum, or to ſtep over the Bever it ſelfe (which is the beaſt that beareth it) ſhe ſhall be delivered before her time; yea ſhee ſhall be in great daunger upon her deliverance, if the ſame be but borne over her where ſhe lieth. A wonderfull thing it is that I read of the crampfiſh Torpedo, namely, That if it bee taken while the moone is in the ſigne Libra, and be kept for three daies togither abroad in the open aire; ſo often afterwards as it is brought into the roume where a woman is in travaile of childbirth, ſhe ſhall have eaſie and ſpeedie deliverance. In this buſineſſe alſo it is thought expedient, that the pricke which a Puffin or Forkefiſh hath in the taile, be ap-
B plied and tied faſt to the navell of a woman; provided alwaies, that it be taken foorth of the fiſh alive, and then the ſame fiſh be let goe againe and throwne into the ſea. I read in ſome writers of that which they call Oſtracium, to be the ſame that others name Onyx; but call it what you will, a ſuffumigation made thereof, is of woonderfull effect to eaſe the paine and griefe of the matrice. I find, that it hath the ſmell of Caſtoreum, and if it be burnt togither therewith in a perfume, the more good will enſue: as alſo that the aſhes thereof calcined, heale all inveterat ulcers, and ſuch as are morimals and ſcorne any ordinarie cure. And verely, the ſame authors doe report, that for carbuncles, cancres, and ſuch untoward ſores, as ariſe ſometimes about the privities of women, the moſt preſent and aſſured remedie that is to heale them, is the female Sea-crab, ſtamped after the full of the moone with the fineſt powder of ſalt, called the floure thereof, and water togither, and ſo reduced into the forme of a ſalve or liniment. The bloud, gall, and liver, of the
C fiſh Tunie, either taken freſh or old kept, be all of them depilatories, for they fetch away hair and hinder it from growing: the liver thereof punned, and togither with the roſin or oile of cedar incorporat and kept in a leaden box, hath the ſame effect. This was the deviſe that the famous midwife *Salpe* had for boies, to make them beardleſſe and appeare alwais young, and to ſet them out the better for ſale. Of the ſame operation is the fiſh called Pulmo Marinus, the Sea hare likewiſe, I meane the bloud and gall of them both: and as for the ſaid Sea-hare, being but ſtifled & killed in oile, it is as effectuall. The aſhes of the Sea-crab and Scolopendre both; the Sea-nettle [a fiſh ſo called] incorporat with vinegre ſquilliticke; the brains of the crampfiſh Torpedo tempered with alume, be all depilatories, if the place be annointed therewith the morrow after the moon is at the full. The bloudie moiſture that commeth from the little frog, which I deſcribed heretofore
D in the cure belonging to eies, is the ſtrongeſt depilatorie that is, and worketh moſt effectually, in caſe the part be dreſſed therwith while it is freſh and new: and the frog it ſelfe dried and ſtamped, and anon after boiled in three hemins of vinegre untill one of them be conſumed; or in oile after the ſame manner in ſome braſen pan, is a ſure medicine to take away haire, & hinder the comming up of it againe. In the ſame meaſure of liquor, ſome put fifteen frogs, and make therof an excellent depilatorie; like as I have ſaid alreadie among the remedies appropriat to the eyes. Moreover, horſleeches torrified in ſome earthen pan, and brought into a liniment with oile, work the ſame effect in the hairs: the very perfume or ſmoke which they caſt as they be burnt or torrified, killeth Punaiſes, if they either flie or be brought into the aire thereof. Furthermore, divers have been knowne to uſe Caſtoreum and honey in a liniment for many daies togither, as a nota-
E ble depilatorie. But in uſing any depilatorie whatſoever, this one point is generally to be obſervad, That the haires be firſt pulled up by the roots, in any place, where you would not have them to grow.

To come now unto the gumbs of children, and their breeding of teeth: the aſhes of dolphins teeth mixed with hony, is a ſoveraign medicine: yea or if you doe but touch their gumbs with a dolphins tooth all whole as it is, the effect thereof is admirable: the ſame hanged about their necks, or tied to any part of the bodie, riddeth them of ſodain frights, whereunto infants are much given. Of the ſame effect is the tooth alſo of a dogfiſh. As for the ulcers or ſores incident to their ears, or any other part of their bodie, the broth of river creifiſhes thickned with barly meale, healeth them. For other diſeaſes alſo of breaking out, a liniment made of them and oile incorporat
F togither in a mortar, is ſingular good, if they be annointed all over therewith. Touching the hot diſtemperatures and inflammations of the head, whereto little babes be much ſubject, a ſponge actually cold applied to the place, & oftentimes wet, is a good means to cure the ſame: but a frog turned inſide outward hath no fellow, if it be bound faſt unto the head: for they ſay, that it may be found all drie upon the head with drawing the heat ſo forcibly to it.

A Barble drowned in wine, or the fiſh called a Rochet, or elſe two Eels; likewiſe the fiſh named G
the Sea-grape putrefied in wine, doe infuſe this vertue into the foreſaid wine, That whoſoever drinke thereof, ſhall have no mind afterwards to any wine beſides, but fall into a diſlike and loathing thereof.

The ſtay-ſhip Echeneis, the skin of a Sea-horſe forehead, eſpecially toward the left ſide, wrapped within a little linnen cloth, and ſo hanged about one; or the gall of a live Crampe-fiſh, applied unto the genitall members in manner of a liniment, bee all means to coole the wanton luſt of the fleſh: contrariwiſe, the fleſh of river Creifiſhes powdred and kept in ſalt, given in wine to drinke, doe ſtir and provoke the appetit unto venerie. Moreover, to feed upon the fiſhes called Erythrines ordinarily at the table; to hang about the necke the liver of the frog called Diopetes or Calamita, within a little peece of a cranes skin; or the jaw-tooth of a Crocodile faſtened H
to any arme; either elſe the Sea-horſe, or the ſinews of a Toad, bound to the right arme, incite greatly to wantonneſſe and lecherie. Put a toad within a peece of a ſheeps skin newly flayed, and let one weare it tied faſt about him, he ſhall forget all love and amitie for ever.

The broth of froggs boiled in water, doe extenuat the ſcurvie thicke rouſe in the farcins or mange of horſes, and make way that they may be bathed and anointed: and verely it is credibly affirmed, that if they be cured after this manner, the skab will never returne againe. The expert midwife *Salpe* affirmeth for certein, That doggs will not barke, if there be given unto them in a morcell of bread or gobbet of fleſh, a live frog.

In this diſcourſe of Water, and the things concerning it, ſomewhat ought to bee ſaid as touching Calamochnus, which otherwiſe in Latin is named Adarca: it groweth about ſmall canes I
or reeds, and is engendred of the froth of ſea water & freſh water togither, where they both meet and are intermingled: a cauſticke qualitie it hath; in regard whereof, it entreth into the compoſitions called Acopa, which ſerve for laſſitude, and thoſe that are benummed with cold. It is emploied alſo in taking away the pimples or ſpots in womens faces like to lentils.

As for Reeds and Canes, this is their verie proper place alſo, wherein they ſhould be treated of. And to begin with that reed or cane called Phragmitis, which is ſo good for mounds & hedges; the root thereof greene gathered and punned, is ſingular for diſlocations, and the paine of the backebone, if the place affected be annointed with it, incorporat in vinegre. But the rind of the Cyprian cane, which alſo is named Donax, burnt into aſhes, is ſingular for to recover haire againe where it was ſhed by occaſion of ſickneſſe, and to heale old ulcers. The leaves alſo ſerve K
verie well to draw forth any ſpills, pricks, or arrow heads that ſtick within the fleſh, yea and to extinguiſh S. *Anthonies* fire. As for the floure or downe of their catkins, if it chaunce to enter into the ears, it cauſeth deafeneſſe. The blacke liquour reſembling inke which is found in the cuttle-fiſh, is of that force, that if it be put to the oile of a lampe burning (*Anaxilaus* ſaith) it will drown and put out the former cleare light, and make all thoſe in the roume to looke like blackamores or Æthiopians. The hedge-frog, otherwiſe called a toad, boiled in water & given to ſwine among other draffe to drinke, cureth all their diſeaſes: and of the ſame effect are the aſhes of any other frogs beſides. Rub a peece of wood with the fiſh called Pulmo Marinus, it will ſeeme as though it were on a light fire; in ſo much as a ſtaffe ſo rubbed or beſmeared with it, may ſerve in ſtead of a torch to give light before one. L

Chap. xi.

That there be of fiſhes and other creatures living in the Sea, one hundred ſeventie and ſix ſeverall and diſtinct kinds.

HAving thus treated before ſufficiently of the natures and properties of Fiſhes, and ſuch creatures as the water doth yeeld; it remaineth now for a finall concluſion, to preſent under one view, all thoſe fiſhes name by name, which are engendred and nouriſhed not only in thoſe mediterranean and inland arms of the ſea, which for many a mile take up a great part of the continent and firme land, but alſo in that vaſt and wide ocean without the main, bounded as M
it were and limited only by the compaſſe and circumference of the heaven: and thoſe, namely as many as be knowne, may be reduced all into 176 kinds: a thing which cannot bee done either in the beaſts of the land or foules of the aire. For how is it poſſible to decipher and particularize the wild beaſts and foules of India and Æthyopia, of the deſarts, and of Scythia, which we are not come

A come to the knowledg of, seeing we have found so many different sorts in men, of whom we have some notice and intelligence? To say nothing of Taprobane, and other Islands lying within the Ocean, whereof so many fabulous reports are delivered: certes, there is no man but hee must needs confesse and agree to this, that it was not possible in this hystorie of Nature to comprise al sorts of creatures which the earth and aire doe yeeld. Howbeit, those that are bred in the Ocean, as huge and vast as it is, may bee comprehended under a certaine number: a woonderfull matter that we should be better acquainted with those, considering how Nature hath plunged and hidden them in the deepe gulfes of the maine sea!

To begin then with the greatest monsters and beasts that this unruly element of the water doth breed: we find therin the sea-Trees, Whirlepooles, greater Whales, Pristes, Tritons [*i.* sea
B Trumpetters] Nereides [*i.* Meremaids] Elephants, sea Men and Women, Wheeles, sea Tuns or Pipes, [1] Rams, and smaller Whales accompanying the bigger. Besides, other [2] Rams that resemble the ordinarie shape of fishes; Dolphins, and the sea Calves or Seales, whereof the Poët *Homer* writeth so much. Furthermore, the sea Tortoises, which serve for [3] roiot, wantonnesse, and excesse: the Bevirs, which are so much in request among [4] Physicians. As for the Otters, albeit a kind of Bevers they are, yet because I never heard that they came into the salt water, I make no great reckoning of them; for my purpose is to rehearse those onely which inhabit or haunt the sea: moreover, the sea Dogs: the Curriors, Posts, or Lacquies of the sea: the horned fishes: the Swordfish or Emperour of the sea, and the Sawfish. Over and besides, those which live indifferently in the sea, the land, and the river, to wit, the water Horses and the Crocodiles: others again
C that ordinarily keepe in the sea, and yet come up into the rivers, but never land, to wit, the Tunies, as well the browne Thunnies, as the younger sort, [5] Thunnides or Pelamides. The Siluri, the blacke Coracini, and Perches. As touching those that never came forth of the sea, the [6] Sturgeon, the Guilthead, the Kod, the Acarne, Aphya, Alopecias, the Yeels, and [7] Araneus. The bellowing fish Box, Batis, Banchus, [8] Barrachus, and Belone, with all the kind of those which wee call Needle fishes, and also Balanus. The sea Raven Corvus, and [9] Cytharus: all the sorts of the Chrombi: the Carpe, Chalcis, and [10] Cobio: Callarias of the Cods kind, but that it is lesse: Colias, whether it be Parianus [of Parium the Colonie] or Sexitanus, so called of a citie in Granado or Bætica, a fish *resembling Lizards: of which and of the young Tunie Pelamis (both bred in Mœotis) being chopped and cut into peeces and so salted, are made those Quadrants or Square-
D rands, called Cybia. For this you must understand, that the Tunie is called Pelamis, *when after 40 daies he returneth out of Pontus or the Euxine sea into Mœotis: wheras the said small Pelamis taketh the name of Cordyla, when it goeth first forth of the said great lough or lake Mœotis, and entreth into the sea beforenamed. Moreover, in the said meer Mœotis be these fishes besides, to wit, Cantharus, Callionymus, otherwise named Vranoscopus, and Cinædi, which bee the onely fishes that be all over yellow; Cnide, which we in Latin call Vrtica, *i.* the Nettle: all the sorts of Crabs, the gaping small Cockles and Muskles, whether they bee the rough Chamæ-trachaæ, the smooth Chamæ-leoi, or the Chamæ-pelorides: which be of divers kinds distinct one from another, both in forme of roundnesse, and varietie of colours: as also the Cockles named Chamæ-glycymerides, which be bigger than the former Pelorides, together with those that the
E Greekes call Colycia or Corophya. Moreover, sundrie sorts of other shell fish, and among them those that engender and beare pearles, and thereof be called Mother-pearls. The wilkes also and winckles which resemble shell-snailes: of which kind are the Pentadactyles, Melicembales, and the prickly Echinophoræ, whose shels serve to sound or wind withall. Over & besides these shell fishes, are those winckles of a round forme, the shels whereof are much used to lade up oyle. Furthermore, the sea Cucumber and Cynopus, the sea Craifish Cammarus, Cynosdexia, and the sea Dragon. As for that which is named Dracunculus, some are of opinion, That it differeth from the foresaid Draco; and like it is to the Chough-fish Gracculus: sharpe prickes it hath in the gils, and those pointing toward the taile: like as the sea scorpion, which thereby woundeth and hurteth those that would seeme to take it up in their hands. There is besides the Erythinus,
F the stay-ship Echeneis, and the sea Vrchin. The black Elephants also, which be the blacke kind of the Lizards, having foure feet, and those cloven and two-forked; besides two arms with two joints apeece, and each of them armed with a little forked cley, and closing in manner of teeth. Then have you the fish called Faber or Zeus, that is, the Goldfish or Doree. All the sorts of Glauciscus, the Glanis, the Gonger or Conger, the Hearing or Pilchard Gerries, Galeos, and *Garus. Also the

[1] So called of the forme of warlick engins of batterie, called in Latin *Arietes*.
[2] And yet have some proport ō of the land beast so called.
[3] *Luxuriæ*, haply because the form of a Lute was devised first by the shel thereof: or sumptuous buildings either framed archwise according to the, or els adorned & fecled with their shels by Marquetage.
[4] By reason of their stones, which yeeld Castoreum.
[5] Some take *Thunni* for the Milters, and *Thunnides* for Spawners.
[6] *Acipenser*.
[7] A kind of Crab, which some cal S. *Bernard* the Heremite.
[8] *Diable de mer*.
[9] A kind of Turbot.
[10] A Gougeon.
* *Lacertorum æmulus*, as *Dalechampius* readeth.
* *Dalechampius* readeth it contrariwise, and correcteth the place out of *Aristotle*.

* Which some take for the Pikerell.

the coaſt Crabfiſh called Hippeus, or Stay-horſeman Hippuros; the ſea Swallow fiſh, Halipleumon, or Pulmo Marinus; the ſea-lights, heart-fiſh, the liver of the ſea, and Helacathenes. All the ſorts of the ſea-Lizards: the flying Calamarie: the Locuſts and Lanternes of the ſea, Lyparis, Lamyrus, the ſea Hare and ſea Lions, which have cleſes or armes in manner of Crabfiſhes, but in other reſpects reſembling Locuſts. The Barble, the Merling or Whiting (among ſtone-fiſhes well eſteemed) and the Mullet: the blacke taile Perch [which ſome take for a Ruffe, others for a ſea Breame:] the Cackerell, the Meryx, the Lamprey, the little Muskle, the Limpin, the Myſcus, and the Burret. The ſeven-eye Oculata, the Ele-port Ophidion, the Oyſtre, the *eares of the ſea called Otia, and Orcynus. This fiſh of the Tunie kind named Pelamides is the biggeſt, and never returneth againe into Mœotis, like unto a Triton; and the meat therewith is the better for age. The Lompe, Puddle, or ſea Owle, and the grunting Molebout: moreover, the fiſh Phager, the Mole or Lepo counted among ſtonefiſhes, and the Pelamis, the greateſt of which kind is called Apolectus, and harder it is than the Triton: alſo the ſea-god Phorcus, and Phtitharus: the Plaice or Hallibut, and the Puffin: all the kinds of Pulpes or Pourcuttils. The greateſt Scallops alſo, and thoſe which during Summer bee blackeſt, whereof the beſt ſort bee thoſe which are taken about Mytelenæ, Tyndaris, Salonæ, Altinum, Antium, and the Iſland Pharos neare to Alexandria in Ægypt. Alſo the little Scallops, the Purples, & the ſea Perches, named Percides: the Nacres and their hunters, called Pinnotheræ. Over and beſides, the fiſh called Skate, which ſome will have to be Rhina in Greeke, and named by us in Latine Squatus, and the Birt or Turbot: the Guilthead Scarus, which at this day is thought to be a principall fiſh: the Sole, the Sargus, the Shrimp, and the Sarda, for ſo they call the long Pelamis when he commeth out of the Ocean. The Maquerel or Scomber, the Stockfiſh, the Sparus, Scorpæna, Scorpios, Sciadeus, Sciæna, the Scolopendra, the ſerpent fiſh Smyrus, the Scepines: the ſhell-fiſh pointed like a Turbant, Strombus: & Solen, otherwiſe called Aulus, Donax, Onyx, or Dactylus, all ſhell-fiſhes made like knives: the aſſe-houſe oyſtre Spondylus, and the ſhell-fiſh Smarides, the Starre, and the Spunge. Then follow the noble ſtonefiſh Turdus, and the Thomus Thurianus, ſold in peeces or rands cut forth, which fiſh ſome call Xiphia, or the Sword fiſh. The Theſſa, Torpedo or Crampefiſh, and Tethea. Triton alſo, which is reckoned among the greater kind of the Pelamides, whereof are made thoſe ſquare taile-peeces of the Tunie, called Vræa Cybia. Laſt of all, the Vrenæ, the ſea Grape or the Emperour with a ſword, called Xiphias. And here I thinke it not amiſſe to annex the names of diverſe fiſhes ſet downe by the Poët *Ovid*, which are not to be found in any other Authour: But haply thoſe breed in the great ſea of Pontus, in which realme he began that booke *De Ponto* in his latter daies. In the firſt place he nameth *Bopgyrus, which liveth among the rockes: the red Orphus, and the blacke Rhacinus, the painted and ſtreaked Mormyræ, and the golden coloured Chryſos. Moreover, the little Teragus, and Labrus with the faire and pleaſant taile. Likewiſe the Epodes, which are of the broad or flat kind, named Lati. All theſe be notable fiſhes: but over and beſides, he reporteth the ſpeciall properties & nature of ſome: as namely that the Chaune dooth conceive of it ſelfe without a male: that the Glaucus never is to bee ſeene in Summer: that Pompilus alwaies accompanieth the ſhips under ſaile: and Chronius buildeth a neaſt in the very water. He ſaith moreover, That Helops is a ſtranger to us in this part of the world, and not knowne in our ſeas: whereby it is evident that they be deceived who take it for the Sturgeon Acipenſer; and yet many reckon this Elops to have the daintieſt taſt, and to be the moſt delicat meat of all fiſhes. There are over and beſides other fiſhes, named as yet by no writer, to wit, that which in Latine wee call Sudis, the Greekes Sphyræna, which (as it ſhould ſeeme by the name) hath a ſnout or muſſle reſembling a ſharpe ſtake or ſpit, and may for quantitie be counted among the biggeſt: a rare fiſh, but of no baſe and baſtard kind. There bee alſo of the Nacres thoſe which are called Pernæ, taken and gathered in exceeding great plentie about the Iſlands of Pontus: their manner is to ſtand or ſticke faſt planted upon the ſea ſand, and made they are in faſhion of the long ſhanke of a Swine; they gape alwaies toward the coaſt which is cleare; and never doe they hunt for their food, but they yawne at leaſt a foot wide. Teeth there bee growing round about the edges of the ſhell, and thoſe ſtand thicke together, and when they ſhut or cloſe their ſhels, the foreſaid teeth run one betweene another in manner of a combe. In ſtead of a calloſitie within, they have a great lumpe of fleſh. As for the fiſh Hyæna, I my ſelfe have ſeene one of them taken in the Iſland Ænaria, which uſed to put forth and draw in his head at his pleaſure.

* Which are a kind of oyſtres

*Some read *Bos-piger.*

Thus

A Thus much of Fishes worth the naming. For besides these, I am not ignorant that there bee other base excrements that the sea voideth and purgeth, which I hold to be verie unfit and not worthie to be ranged among Fishes and living creatures, but rather to be reckoned as Kilpes, Reike, and other sea weeds.

B

THE XXXIII. BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

C

Of Mettals and Minerals, and their natures.

¶ The Proëme.

NOw is it time to enter into the discourse of the Mettals and Minerals, the very riches and precious treasure of the world, which men so curiously and carefully seeke after, as that they sticke not to search into the verie bowels of the
D *earth by all the meanes they can devise: for some you shall have (to enrich themselves) for to dig into the ground for mines of gold and silver, base mettall Electrum, Copper and Brasse: others again, upon a desire of daintie delights and braverie, to lay for gems and precious stones, for such minerals (I say) which may serve partly to adorne their fingers, and partly to set out the walls of sumptuous buildings with costly colours, rich marbles, and perphyries. Lastly, there bee many, who to maintaine rash quarrels and audacious attempts, spare for no labour to get yron and steele, and esteeming it better than gold, for cruell warres and bloudie murthers. In summe, there is not a veine in the whole earth but wee prie and search into it: we follow it also as farre as it goeth. Thus having undermined the poore ground, wee live and goe aloft upon it, as over hollow vaults and arches under our feet: and yet wee would seeme to wonder, that otherwhiles she cleaveth asunder into wide and gaping chinkes, or else trembleth and quaketh againe: and we will not see how these be apparent signes of the*
E *wrath of this our blessed mother, which wee wring and force from her, to expresse the indignation that she taketh for this wrong and misusage. We descend into her entrailes: we goe downe as far as to the seat and habitation of the infernall spirits, & all to meet with rich treasure: as if the earth were not fruitfull ynough and beneficiall unto us in the upper face thereof, where she permitteth us to walke and tread upon her. Howbeit, in all this paines that we take to ransacke the mines thereof, the least matter of all other is to seeke for any thing that concerneth Physicke and the regiment of our health: For among so many maisters as there be of mines, where is there one that would bee at such expence of digging, in regard of any medicines. And yet I must needs say, that as the earth otherwise is no niggard, but bounteous and liberall, readie also and easily entreated to bring forth all things good and profitable for us: so in this behalfe she hath furnished us sufficiently with holesome drougs and medicinable simples growing*
F *above and fit for our hand, without need of digging deepe for the matter. But the things that shee hath hidden and plunged (as it were) into the bottome, those be they that presse us downe, those drive & send us to the devill in hell: even those dead creatures (I say) which have no life nor doe grow at all. In such sort, as to consider the thing aright, and not to captivat our spirits to such base matters, How far thinke we, will covetous minded men pierce & enter into earth? or when will they make an end of these mines,*

hollowing

hollowing the ground as they doe in all ages from time to time, and making it void and emptie? Oh how innocent a life, how happie and blessed, nay, how pleasant a life might we lead, if we coveted nothing else but that which is above the ground: and in one word, if we stood contented with that which is readie at hand and even about us. But now, not sufficed with the gold which we fetch out of the mines, we must seeke for the greene earth Borras also, which lieth hard by, yea, and give it a name respective unto gold, whereby it might be thought more deare and precious. For why? we thought not the invention and finding out of gold alone to be ynough for to infect and corrupt our hearts, unlesse we made great account also of that vile and base minerall, which is the very ordure of gold, and no better. Men upon a covetous mind would needs seeke for silver, and not satisfied therewith, thought good withall to find out Minerall vermillion, devising meanes how to use that kind of red earth. Oh the monstrous inventions of mans wit! What a number of waies have we found to enhaunce the price and value of every thing! for painters of the one side with their artificiall painting and enamelling: the gravers on the other side with their curious cutting and chasing, have made both gold and silver the dearer by their workemanship: such is the audacitie of man, that he hath learned to counterfeit Nature, yea, and is so bold as to challenge her in her workes. And wherein is the art and cunning of these artificers so much seene, as in the workmanship of such pourtraitures upon their gold and silver plate, which might incite & provoke men to all kind of vices: for in processe of time we tooke pleasure to have our drinking bols and goblets engraven all over with those works which represent lust and wantonnesse: and our delight was to drink out of such beastly cups which might put us in mind of sinfull and filthie letcherie: but afterwards these cups also were cast aside and laid away, men began to make but base account of them; gold and silver was so plentifull and common, that we had too much thereof. What aid we then? Forsooth wee digged into the same earth for Cassidonie and Crystall, and we loved to have our cups and other vessels of such brittle minerals; and the more precious we held them, as they were more subject to breaking: so as now adaies he is thought to have his house most richly furnished, who hath his cupbourds best stored with this tickelish ware: and the most glorious shew that we can make of excesse and superfluitie, is this, To have that which the least knocke may breake, and being once broken, the peeces thereof might bee worth nothing. Neither is this all, for stay we cannot here, we are not yet at cost ynough, unlesse we may drink out of a deale of precious stones. Our cups otherwise chased, engraved, and embossed in gold, must be set out with hemerealds besides: to maintaine drunkennesse, to make a quarrell to carouse and quaffe, we must hold in our hand and set to our mouth the riches of India. So as, to conclude, our golden plate comes behind precious stones and pearles, and we count it but an accessarie and dependant, which may be spared.

*Chrysocolla, i. Gold-soder.

Chap. I.

When mines of gold grew first into request. The beginning of gold rings. The quantitie of gold in treasure among our auncestors in old time. Of the Cavallerie and Gentrie of the Romanes. The priviledge of wearing golden Rings.

OH that the use of gold were cleane gone: Would God it could possiblie be quite abolished among men, setting them as it doth into such a cursed and excessive thirst after it, if I may use the words of most renowned writers: a thing that the best men have alwaies reproched and railed at, and the onely means found out for the ruine and overthrow of mankind. What a blessed world was that, and much more happier than this wherein wee live, at what time as in all the dealings betweene men, there was no coine handled, but their whole trafficke stood upon bartering & exchanging ware for ware, and one commodity for another; according as the practise was in the time of the Trojane war, as *Homer* (a writer of good credit) dooth testifie. And in that manner (as I take it) began first the commerce of negotiation among men for the maintenance of their societie and living together: for so hee reporteth, That some bought that which they stood in need of, for Bœufes hides; others, for yron or such commodities as they had gotten in bootie from their enemies. And yet I must needs say, that even *Homer* himselfe esteemed gold of great price, as may appeare by the æstimate that he made thereof in comparison of brasse, when hee saith, That *Glaucus* exchaunged his golden armour, worth 100 *oxen, for the [brasen] harneis of *Diomedes*, which

*It is thought that hereby are meant certaine peeces of silver coine, stamped with the portraiture of a bull or ox, called *Didrachma*, & were worth two drams or deniers Romã. χρύσια χαλκεῖα, ἑκατόμβοια ἀντιτύπων.

A which was valued but at nine Bœufs: according to which manner practiſed in thoſe daies, even at Rome alſo (as it may appeare by the old records) there were no other penalties and fines impoſed upon thoſe that tranſgreſſed the lawes, but ſuch as conſiſted in Bœufes and Muttons, and under that name paſſed all the amercements that were levied. Well, a bad example and precedent gave he unto the world, who firſt deviſed to weare rings upon the fingers: But who hee was that did this harm unto mankind, it appeareth not for certaine upon any record. For as touching the reports that goe of *Prometheus*, I hold them all but fabulous tales: and yet in all the auncient pictures and portraitures of him, he is to be ſeene by a generall conſent of antiquitie, with a ring of yron: howbeit, I ſuppoſe that they repreſented thereby his bonds and impriſonment, rather than any cuſtome that hee had to weare a ring as an ornament upon his finger. And verely con-

B cerning the ring of king **Midas*, which if the collet were turned about toward the palme of the hand, cauſed them to goe inviſible that ſo wore it: is there any man (thinke you) that judgeth it not more fabulous than the other of *Promotheus*? But to come more particularly unto gold, the greateſt credit and authoritie that it got, was by wearing it in rings upon the fingers, and thoſe onely and altogether of the left hand. And yet this was no faſhion at firſt among the Romanes, whoſe manner was to uſe no other but of yron, to ſhew that they were good ſouldiours, skilfull and expert in feats of armes. Whether the ancient kings of Rome were wont to have gold rings upon their fingers, I am not able to ſay for certaine. Sure it is, that the ſtatue of king *Romulus* in the Capitoll hath none. Neither is there any to be ſeene in the other ſtatues of the Roman kings, ſave onely of *Numa*, and *Servius Tullius*; no nor in that of *Lucius Brutus*: Whereat I marveile

C much, and eſpecially at the two *Tarquines* kings of Rome, conſidering that they were deſcended of the Greeks, from whence came up the firſt uſage of theſe gold rings, howſoever yet at this day in Lacedæmon there be none worne but of yron. Howbeit, this is recorded and knowne for a truth, That *Tarquinius Priſcus*, the firſt of all the *Tarquins*, honoured a ſon of his with a brooch or tablet of gold pendant at his necke, for that whiles he was under ſixteene yeares of age, and as yet in his Prætexta, he had killed an enemie in plaine fight. And therupon was taken up the maner firſt (which alſo continued afterward) to hang that *ornament about the necks of thoſe gentlemens ſonnes who were men at armes and ſerved in the wars on horſeback, in token of knighthood and chevalrie: whereas other mens ſonnes ware a ribband onely. And therefore great marveile I have at the ſtatue of the ſaid prince king *Tarquine*, ſurnamed *Priſcus*, that it ſhould bee

D without a ring on his finger. And yet beſides all this, I read, that there hath beene ſome variance and difference in old time about the naming of rings: The Greeks impoſed a name derived from the finger, and called it Dactylios. The Latines here with us in old time named it Vngulus: but afterwards, as well we as the Greekes, tearmed it Symbolum. Certes, long it was firſt (as appeareth evidently by the Chronicles) ere the very Senatours of Rome had rings of gold. For plaine it is, that the State allowed and gave rings only to certain eſpeciall lieutenants when they were to go in embaſſage to forraine nations: and in mine opinion, it was for their credit and countenance, for that the moſt honourable perſonages in ſtrange countries were diſtinguiſhed from others by that ornament. And verely, no perſon (of what degree ſoever) was wont to weare rings, but ſuch as had received them firſt from the Commonwealth upon that occaſion: and ſo it ſerved them or-

E dinarily in triumph, as a token and teſtimoniall of their vertue and valour. For otherwiſe, he that triumphed in Rome, although there was a Tuſcane coronet all decked with ſpangles of gold, born up behind and held over his head, had no better than a ring of yron upon his finger, no more than the ſlave at his backe, who haply caried the ſaid Tuſcane chaplet. For certainly in that maner triumped *C. Marius* over king *Iugurtha*: and as the Chronicles doe ſhew, received not a golden ring, nor tooke upon him to weare it before his third Conſulſhip. And even thoſe alſo who from the State had golden rings given them, in regard of embaſſage aforeſaid, never uſed them but when they came abroad into open place, for within dores they might wear none but of yron: which is the reaſon, that even at this day the wedding ring which the bridegroome ſendeth as a token *of eſpouſals to his bride, is of yron ſimply without *any ſtone ſet in it. Neither, ſo farre as I

F can find by reading, were there any golden rings in uſe and requeſt about the time of the Trojan warre: for ſure I am, that the Poët *Homer* maketh no mention of them at all, who otherwiſe ſpeaketh of the braverie and rich attire of thoſe times. And when he talketh of writing tablets, ſent ordinarily in ſtead of letters miſſive; when hee writeth of clothes and apparels beſtowed in chiſts and coffers; when he telleth us of veſſell, as well gold as ſilver plate; he ſaith they were all bound

and

*Gyges rather, as appeareth by *Plato* and *Cicero*.

*Called *Bulla*, which was in forme of the Heart: & after they were growne to be men, *i.* at ſeventeene yeares of age they offered it up to the Lares: like as yong maidens manageable preſented *Venus* with yong babies of clouts ſuch as they were wont to make and play withall, as being now deſirous to have babes indeed of their owne bodies. *Alex. ab Alex. lib. 2. cap. 25. & lib. 5 cap. 18.*

* It was called *Pronubus Anulus.*

* ἀπείρατον ξύλου ἄλλου.

and truſſed faſt with ſome ſure knot, and not ſealed up with any marke of a ring as the order is in G
theſe daies. Moreover, when he reporteth of any challenge made by the enemie to ſingle fight,
and ſheweth how the captaines fell to caſt their ſeverall lots for the choiſe of them which ſhould
performe the combat, this was never done by the ſignets of rings, but by ſome other eſpeciall
markes that every one made. Alſo, when he taketh occaſion to ſpeake of the workmanſhip of the
*As of *Vulcan.* gods, he rehearſeth buckles, claſpes, and buttons of gold, other jewels and ornaments alſo belon-
ging to the attire of women, as eare-rings and ſuch like of their making, which at the beginning
were commonly made, but he ſpeaketh not one word of golden rings. And verely in my conceit
whoſoever began firſt to weare theſe rings, did it covertly by little and little, putting them upon
the fingers of the left hand, the better to hide them, as if they were aſhamed to have them open-
ly ſeene: whereas if they might have avowed the honouring of their fingers by that ornament, H
they ſhould have ſhewed them at the firſt upon the right hand. Now if any man object and ſay,
that the wearing them on the right hand might be ſome impeachment to a ſoldior for uſing his
offenſive weapon which he beareth in that hand; I alleadge again, that the hinderance was more
in the left hand, which ſerveth to hold and manage the targuet or buckler defenſive. I read in the
ſame Poët *Homer* aforeſaid, that men uſed to plait & bind up the treſſes of their hair with gold:
and therefore I wot not well whether men or women firſt began the manner of ſuch braiding the
lockes of the haire.

As touching gold laid up for treaſure, little was there of it at Rome for a long time: For ſurely,
when the citie was taken and ſacked by the Gaules, and that the Romans were to buy & redeeme
their peace for a ſumme of money, there could not bee made in all Rome above one thouſand I
pound weight of gold. Neither am I ignorant, that in the third Conſulſhip of *Cn. Pompeius* there
was embezeled and ſtollen two thouſand pound weight of gold out of the throne or ſhrine of *Iu-*
*By *M. Craſſus.* *piter* within the Capitoll, which had ben there beſtowed and laid up by **Camillus*: wherupon ma-
ny men have thought, that there were two thouſand pound weight of gold gathered for the ran-
ſome of the citie. But ſurely look what overplus & ſurcreaſe there was above the foreſaid weight
of one thouſand pound it was of the very bootie and pillage of the French, and taken out of the
temples and chappels in that part of the citie whereof they were maiſters. Moreover, that the
Gaules themſelves were wont to goe to the warres bravely ſet out and enriched with gold, it ap-
peareth by this one example of *Torquatus*, who ſlew a Gaule in combat, and tooke from him a
maſſie collar of gold. Apparent it is therefore, that all the gold, as well that of the Gaules, as that K
which came from the temples aboveſaid, amounted to the ſaid ſumme, and no higher: to the
light and knowledge whereof we come by meanes of revelation from Augurie, which gave us
to underſtand, That *Iupiter Capitolinus* had rendered again the foreſaid ſumme in duple propor-
tion. And here by the way there commeth to my remembrance another thing, not impertinent
to this place, conſidering I am to treat againe of rings: when the ſexton or keeper of this cell was
apprehended, and the queſtion demanded, What was become of the treaſure aforeſaid of 2000
pound which *Iupiter* had in cuſtodie, and which now was out of the way and gone? hee tooke the
ſtone that was in the collet of his ring which hee ware, crackt it betweene his teeth, and preſently
died thereupon: whereby the truth was not bewraied & revealed, as touching the theefe that rob-
bed the ſaid treaſure. Well, reckon the moſt that can be, ſurely there was not above 2000 pound L
weight of gold to be had in Rome, when the citie was loſt; which was in the 364 year after the firſt
foundation thereof, at what time (as appeareth by the rols of the Subſidie booke) there were in
Rome, to the number of 152580 free citizens. And what was 2000 pound in proportion to ſuch
a multitude of people. Three hundred and ſeven years after, when the temple of the Capitoll was
on fire, all the gold to bee found therein, as alſo in all the other chappels and ſhrines aroſe unto
thirteen thouſand pound weight, which *C. Marius* the yonger ſeazed upon and conveighed away
to the citie Prænеſte. And all the ſame was recovered againe and brought backe again by *Sylla*
his enemie, who under that title caried it in triumph, beſides ſeven thouſand pound weight of ſil-
ver, which hee raiſed out of the ſpoile of *Marius*. And yet nevertheleſſe, the day before hee had
cauſed to be caried in a pompe of triumph fifteene thouſand pound weight of gold, & one hun- M
dred and fifteene thouſand pound of ſilver, which came of the reſt of the pillage gotten by that
victorie of his.

But to returne againe unto our diſcourſe of gold rings: I doe not read that they were ordina-
rily uſed, before the daies of *Cn. Flavius* the ſonne of *Annius*: This *Flavius* being otherwiſe a
man

A man of meane and base parentage, as whose grandsire by his fathers side had been no better than a slave enfranchised: howbeit having a pregnant wit of his owne, and brought up daily under a good schoolemaster *Appius Claudius* surnamed the Blind (whom he served as his Scribe, Clerke, or Secretarie) he grew into inward credit and favour with his master, that for his better advancement, he opened unto him the whole course of daies pleadable and not pleadable, exhorting and perswading him withall, to publish that secret & mysterie to the view and knowledge of the whole citie: which the said *Flavius* (after much conference and consultation with *Appius*) did, and effected accordingly: whereupon he became so gracious with the whole bodie of the people, (who alwais before were woont to hang everie day upon the lips of some few of the chiefe & principall Senators, for to have the information and knowledge of the said daies) that in the end a Bill pro-
B mulged by him, passed by general assent of them all, for to be created Ædile Curule togither with *Q. Anicius* of Præneste (who not many yeers before had been a professed enemie & borne arms against the Romans;) without any regard had in this election, either of *C. Petilius* or *Domitius*, who were nobly born, and had two Coss. to their fathers, who notwithstanding stood for the said dignitie & honourable place. And more than that, this *Flavius* had a speciall grace besides granted, To bee at the same time one of the Tribunes also or Provosts of the comminaltie: At which indignitie, the Senat tooke such disdaine, and chafed so for despight and anger, that as we read in the ancient annals and chronicles of our citie, there was not one Senatour of them all but laid away his golden rings, & gave up his place. Many are of opinion (although they be far deceived) that the knights and men of arms also did the semblable, and left off their rings the same time.
C And this likewise goeth currant and is generally received, That they cast aside the caparisons and trappings of their bard horses; for these be the two badges and marks which causeth them to be called Equites, as one would say, knights, men of arms, or horsmen. True it is besides, that in some annals we find recorded, that it was the nobilitie onely of Rome that gave over their gold rings, and not generally the whole bodie of the Senat. Well, howsoever it was, this hapned in that yeer when *P. Sempronius Longus* and *L. Sulpitius* were Consuls. But *Flavius* abovesaid, seeing what trouble and discontentment was arisen hereupon throughout the citie, vowed to erect and build a temple in the honour of *Concord*, if he could reconcile the estate of the Senat, and the order of the Gentlemen againe to the common people. And seeing that he could not be furnished with mony out of the publick treasure of the citie for the defraying of charges requisit to this peece of
D worke, he made means to have certain extreame usurers condemned to pay good round sums of money: and with these fines, a little chappell he caused to be made all of brasse, and reared it in the place appointed for Embassadours out of straunge countries to wait and give attendance in, called Græcostasis, the which was at the head of the publicke grand place or hall of assemblies called Comitium: where, in a table of brasse hee tooke order, there should bee cut and engraven the veritie of the dedication of the said chappell, which was 104 yeers after that the temple in the Capitoll was dedicated, and in the 448 yeere from the foundation of the citie. This is the first and most ancient evidence that may be collected out of all the antiquities of Rome now extant, as touching the usage and wearing of Rings. Another testimonie we have thereof in the second Punicke war, which implieth, that rings in those daies were used more ordinarily, as well by com-
E mons as gentlemen and nobles: for otherwise, if they had not ben so usually worne as well by one as another, *Annibal* could never have sent to Carthage those three modij of rings which were plucked from the fingers of those Romanes who died in the battaile of Cannæ. Moreover, the Chronicles doe beare witnesse, that the great quarrell betweene *Cæpio* and *Drusius* (from which arose the sociall war of the Marsians, and the ruine of the state) grew by occasion of a ring sold in portsale, which both of them would have had, the one as well as the other. Neither at that time verily did all Senators weare gold rings; for knowne it hath been within the remembrance of our grandfathers, that many of them (even such as bare the Pretourship) in their old age and to their verie dying day, never wore any other rings but of yron. The same doth *Festella* report of *Calphurnius*; and of *Manilius* also, who was lieutenant under *Caius Marius* in the war against
F king *Iugurtha*. And many other Historians affirme the like of *L. Fusidius*, him I meane, unto whome *Scaurus* dedicated that booke which hee compiled of his life. There is a whole house or familie at Rome, of the *Quintij*, wherein (by auncient custome and order) there was never any knowne, so much as the verie women, to weare any gold about them. And even at this day, the greater part of those nations and people who live under the Empire of Rome, know not what

theſe rings meane. All the countries of the Eaſt throughout, and Ægypt generally, at this time G
content themſelves with ſimple writings and bare ſcripts, without any ſeale or ſigne manuell ſet
unto them. But ſo far off are we in theſe daies from keeping us to the plaine houpe rings of our
aunceſtors, that as in all things elſe, ſo in them alſo we love to chaunge and alter everie daie; ſo
given wee are to exceſſe and ſuperfluitie: for now, many muſt have curiouſly ſet in their rings,
pretious ſtones of excellent beautie and moſt exquiſit brightneſſe; and unleſſe their fingers be
charged and loden againe with the riches and revenews of a good lordſhip, they are not ador-
ned and decked to their mind: But I purpoſe more fullie to ſpeake hereof in my treatiſe of gems
and precious ſtones. Others againe will have in their rings and ſtones ſundrie figures and pour-
traitures as they liſt themſelves engraven, that as there bee ſome rings coſtly for the matter, ſo
others againe ſhould be as pretious for the workemanſhip. Yee ſhall have many of theſe wan- H
tons and delicat perſons make conſcience (forſooth) to cut and engrave ſome of their pretious
ſtones for hurting them; and (to ſhew that their rings ſerve for ſomewhat elſe than to ſeale and
ſigne withall) doe ſet the ſaid ſtones whole and entire as they be. And divers there are, who will
not encloſe the ſtone with gold on the inſide of the colet which is hidden with the finger, to the
end (forſooth) that it may touch the naked skin, and be ſeen through. And ſuch an opinion they
have of theſe ſtones, that gold is worth nothing in compariſon of many thouſands of them now
in uſe and requeſt. Contrariwiſe, many there are who will have no ſtone at all in their rings, but
make them all of maſſive gold, and therewith doe ſeale: a deviſe that came up in the time of
Claudius Cæſar the Emperour. Furthermore, in theſe our daies ſome ſlaves ſet yron within a col-
let of gold, in ſtead of a ſtone: and others againe having their rings of yron, yet they adorn and I
ſet them out with the moſt pure and fine gold that may be had. This licence (no doubt) and li-
bertie of wearing rings in this order, began firſt in Samothrace, as may appeare by the name of
ſuch rings, which therefore are called Samothracia. Now to come againe to our golden rings:
the manner was in old time to weare rings but upon one finger onely, and namely that which is
the fourth or next to the little finger, as wee may ſee in the ſtatues of *Numa* and *Servius Tullius*,
kings of Rome: but afterwards, they began to honour the fore-finger which is next unto the
thumbe, with a ring; according to the manner which wee ſee in the images of the gods: and in
proceſſe of time they tooke pleaſure to weare them upon the leaſt finger of all: and it is ſaid, that
in Fraunce and Britaine they uſed them upon the middle finger. But this finger now adaies is ex-
cepted onely and ſpared, whereas all the reſt be ſped and charged with them; yea and every joint K
by themſelves, muſt have ſome leſſer rings and gemmals to fit them. Some will have the little
finger loden with three rings; others content themſelves with one and no more upon it, where-
with they uſe to ſeale up the ſignet that is to ſigne ordinarily: for this ſigne manuell (I may tell
you) the manner was to lay up ſafe among other rare and pretious things: this might not come
abroad everie daie, as being a jewell that deſerved not to bee miſuſed by handling commonly,
but to be taken foorth out of the cabinet or ſecret cloſet, never but when need required: ſo that
whoſoever weareth one ring and no more upon the leaſt finger, hee giveth the world to under-
ſtand, that he hath a ſecret cabinet at home ſtored with ſome ſpeciall things more coſtly and
pretious than ordinarie. Now, as ſome there bee that take a pride and pleaſure to have heavie
rings upon their fingers, and to make a ſhew how maſſie and weightie they are, ſo others againe L
are ſo fine and delicat, as they thinke it a paine to weare more than one. Some hold it good, for
ſaving of the ſtone or collet (if the ring ſhould chance to fall) to have the round houpe or com-
paſſe thereof wrought hollow and enchaſed within, yea and the ſame filled up with ſome lighter
matter than is gold, that it may fall the ſofter. You ſhall have many that uſe to carrie poiſon hid-
den within the collet under the ſtone, like as *Demoſthenes* did, that renowmed prince of Greeke
oratours; ſo as their rings ſerve for no other uſe or purpoſe but to carrie their owne death about
them. Finally, the greateſt miſchiefs that are practiſed by our mightie men in theſe daies, are
for the moſt part performed by the means of rings & ſignets. Oh the innocence of the old world!
what a heavenly life led men in thoſe daies, when as there was no uſe at all of ſeale and ſignet?
But now wee are faine to ſeale up our ambries and hogſheads with our ſignets, for feare wee be M
robbed and beguiled of our meat and drinke. This is the good that commeth of our legions
and troups of ſlaves, which wee muſt have waiting and following at our heels: this commoditie
we have by our traine and retinue of ſtraungers that we keepe in our houſes: inſomuch as we are
Nomenclatores driven to have our controllers and *remembrancers, to tell us the names of our ſervants and

people

A people about us, they are ſo many. It was otherwiſe ywis by our auncеſtours and fore fathers daies, who had no more but one yeoman or groome apeece, and thoſe of the linage and name of their lords and maſters: as may appeare by the ordinarie names of * *Marci-pores* and *Lucipores*: and theſe had all their victuals and diet ordinarily at their maſters bourd. And therefore there was no great need to keepe ſafely any thing under locke and key from ſuch houſhold ſervitours: whereas now adaies the cater goeth to the market to provide cates and viands for to bee ſtollen and caried away as ſoone as they come home, and no remedie there is againſt it: for no ſeale will ſerve to make ſure either ſuch lurchers themſelves for filching, or keepe the very locks and keies ſafe and whole that lead to the proviſion. And why? an eaſie matter it is to plucke the rings from their lord and maiſters fingers that are oppreſſed with dead ſleepe, or when they lie a B dying. And verely wee hold in theſe daies a ſeale to bee the beſt aſſurance in contracts that may be: but I wot not how long it is ſince that cuſtome firſt came up. And yet if wee conſider the faſhions and manners of ſtraunge nations, we may peradventure find how theſe ſignets came into ſuch credit and authoritie: and namely by the hyſtorie of *Polycrates* the tyrant or king of the Iſle Samos: who having caſt into the ſea a ring which he loved and eſteemed above all other jewels, met with the ſame againe by meanes of a fiſh which was taken, in the bellie whereof the ſaid ring was found. Now this king was put to death, about the two hundred and thirtieth yeare after the foundation of our cittie. Howbeit, the ordinarie uſe of theſe ſignets (as I ſuppoſe by all reaſon and likelyhood) began together with uſurie: for proofe whereof, marke how ſtill at this day, upon any ſtipulation and bargaine paroll made, off goes the ring preſently to confirme and ſeale C the ſame. The which cuſtome no doubt came from old time, when there was no earneſt nor gods-penie more readie at hand than a ſignet. So as wee may conclude aſſuredly and affirme, That among us here at Rome, when the uſe of money and coine was taken up, ſoon after came the wearing of rings in place. But as touching the deviſe and invention of money, I will write anon more at large.

And now to returne againe unto my diſcourſe of rings: after they began once to be in any requeſt, there were none at Rome under the degree of a knight or gentleman that caried rings on their fingers; inſomuch, as a man might know a gentleman from a commoner by his ring, like as a Senatour was diſtinguiſhed from the Gentlemen, wearing rings, by his coat embrodered with broad gards and ſtuds of purple. Howbeit, long it was before this diſtinction was obſerved. For D I find that the publicke criers wore ordinarily ſuch coats likewiſe embrodered, as Senators do: as appeareth by the father of *L. Aelius Stilo*, ſurnamed upon that occaſion *Præconinus*, becauſe his father had beene a publicke crier. Certes, theſe rings ſignified the middle degree, inſerted betweene the Commons and the Nobles: and that name which in times paſt horſes of ſervice gave unto men of armes and *gentlemen of Rome; the ſame now adaies ſheweth men of worth, and thoſe who are of ſuch and ſuch revenues. But long it is not ſince this diſorder and confuſion begun. For when as *Auguſtus Cæſar* late Emperor of happie memorie, ordained decuries of judges in criminall matters, the greater part of them conſiſted of thoſe who wore no other rings but of yron: and thoſe were ſimply called Iudges, and not Knights or Men of arms: for this name continued ſtill appropriat unto the troupes of thoſe gentlemen, who ſerved upon horſes allowE ed by the Senate. Moreover, at the firſt there were no more but decuries of judges, and hardly might there be found in each of thoſe decuries, a bare thouſand: for as yet thoſe of our provinces might not bee admitted unto this eſtate to ſit and judge upon criminall cauſes: and even at this day preciſely obſerved it hath been, That none but auncient citizens might be judges: for never any that came newly to their free burgeoiſie, were taken into this order and degree.

* *i.* the pages or groomes of *Marcus* or *Lucius*.

*Who thereupon were called *Equites*.

Chap. II.

Of the Decuries or chamber of Iudges upon record at Rome. How often the name and title of the Romane Cavallerie chaunged. The gifts and rewards repreſented unto valiant ſouldiours for their brave ſervice. And at what time Coronets of gold were ſeene.

F

THe chamber of the foreſaid judges conſiſted of divers eſtates and degrees, diſtinguiſhed all by ſeverall names: for firſt and foremoſt, there were of them called Tribuni æris, as it were

Generall receivers or Treaſurers : ſecondly, Electi, choſen from among the Senatours : and G
laſt of all, thoſe who ſimply were named Iudices or Iudges, taken from among the Knights or men of arms. Over and beſides theſe, they had others called Nongenti, choice men ſelected from out of all the eſtates, who had the keeping of thoſe chiſts or caskets wherein were put the voices of the people in their ſolemne elections. And by reaſon of a prowd humour in men, chuſing themſelves names to their owne liking, great diviſions and factions aroſe in this houſe and chamber of the foreſaid Iudges; whiles one would needs bee called Nongentus, another Selectus, and a third gloried in the title of Tribune or Receiver. But at length, in the ninth yeere of the reigne of the Emperor *Tiberius Cæſar*, the whole eſtate of the gentrie or cavallerie of Rome, was reduced to an uniformitie; and an order was ſet downe whereby it was knowne, who might weare rings, and who might not? which fell out to bee in that yeere when *C. Aſinius Pollio*, and H
C. Antiſtius Vetus were Conſuls togither, and in the 775 yeere after the foundation of Rome citie. And verely this uniforme regularitie was occaſioned by a trifling cauſe to ſpeake of, and whereat we may well marveile: And thus ſtood the caſe: *C. Sulpitius Galba* deſirous in his youth to win ſome credit with the foreſaid Emperour *Tiberius*, and namely, by deviſing means how to bring taverns, cooks ſhops, and victualling houſes in daunger of the law, and to forfeit penalties; pleaded againſt them, and complained before the Senat, That thoſe who were the undertakers and tenants as it were of the ſaid taverns, &c. and made their gaine thereby, had no other means to beare themſelves out, nor plea to defend their faults and diſorders, but their rings. The Senat taking knowledge hereof, ordained an act, That none from that time forward might bee allowed to weare the ſaid rings, unleſſe he were free borne, and that both himſelfe, his father, and I
grandſire by the fathers ſide were aſſeſſed in the Cenſors booke woorth 400000 ſeſterces; and by vertue of the law Iulia as touching the publicke theatre, had right to ſit and behold the plaies in the firſt and foremoſt fourteen ranks or ſeats for knights appointed. Howbeit afterwards, everie man laboured and made means one with another, to be allowed for to weare this ornament of a ring. Now in regard of theſe diſorders and variances above rehearſed, prince *Caius Caligula* the Emperour, adjoyned to the former foure, a fifth Decurie. And ſhortly after, men grew to that heigth and pride in this behalfe of wearing rings, and the companie ſo ſurcreaſed, that whereas in *Auguſtus Cæſars* daies there could not be found knights and gentlemen ſufficient throughout all Rome to furniſh thoſe Decuries, by this time they could not bee contained all within the chamber of Iudges or Decuries aboveſaid: in ſo much as now adaies, no ſooner are there any K
ſlaves manumiſed and affranchiſed, but preſently (by their good will) they muſt be at their rings. A thing that never before was known in Rome: for aforetime when a man ſpake of the iron ring, he was underſtood preſently to point at the Gentlemen and Iudges before-named: But the ſaid ornament or badge became ſo commonly to be taken up by one as well as another, that a gentleman of Rome (*Flavius Proculus* by name) endited 400 at once before *Claudius Cæſar* Cenſor for the time being, & declared againſt them for this abuſe & offence. See what inconvenience enſued upon the act of Rings! for whiles thereby a diſtinction was made between that degree & other free-borne cittizens, ſtraightwaies baſe ſlaves leapt in, and were ſo bold as to take that ornament upon them. And here by the way it is to be noted, that the two *Gracchi*, *Tiberius* and *Caius*, brethren, upon a certain deſire and inbred affection that they had to maintaine and nuzzle the peo- L
ple in ſedition, and to beare a ſide alwaies againſt the Senate, for to currie favour with the Commons and to doe them a pleaſure, deviſed firſt to have all them called Iudges, who by vertue of the foreſaid ſtatute or edict, might weare rings: and this hee did to croſſe and beard the * Senat. But after the fire of this ſedition was quenched, and the popular authors thereof who ſtirred and blew the coles were murdered, the denomination of theſe criminall judges (after divers troubles and ſeditions with variable and alternative fortune) fell in the end to the Publicans and Farmers of the revenews of the State; and being thus devolved upon them, there continued: inſomuch as for a good while the ſaid Publicans made up the third degree between the Senatours and the Commons. Howbeit, *M. Cicero* when he was Conſull reeſtabliſhed the Knighthood & Cavallerie of Rome in their former eſtate and place; and ſo far prevailed, that hee reconciled them a- M
gaine unto the Senat: giving out openly, that hee himſelfe was come of that degree, and by that means by a certaine popularitie, ſought to draw them all to ſide with him. From this time forward, the men of arms were enſtalled as it were in the third eſtate of Rome; inſomuch as all edicts and publicke acts paſſed in the name of the Senat, People, and Cavallerie of the citie. And for that

*Who onely indeed were to judge cauſes.

A that theſe knights or gentlemen were laſt incorporated into the bodie of the Common-weale; this is the onely reaſon that even now alſo they are written in all publicke Inſtruments, after the People.

As touching the name or title, attributed to this third eſtate or degree of Horſemen or men of Arms, it hath been chaunged and altered often times: for in the daies of *Romulus* and other KK. of Rome, they were called Celeres, afterwards Flexumines, and in proceſſe of time Troſſuli, by occaſion that theſe horſmen without any aid at all of the Infanterie, had woon a towne in Tuſcane nine miles on this ſide Volſinij, called Troſſuli: which name continued in the Cavallerie of Rome, untill the time of *C. Gracchus* and afterward. And verely *Iunius* (who upon the great amitie betweene *Gracchus* and him, was ſurnamed *Gracchanus*) hath left theſe words in writing
B as touching this matter: Concerning the degree of Knights (quoth hee) thoſe who now are called Equites, [*i.* Horſemen] beforetime had to name Troſſuli: the chaunge of which name aroſe upon this; That many of theſe Gentlemen, ignorant in the originall and firſt occaſion of the foreſaid name Troſſuli, and what the meaning thereof was, were aſhamed ſo to be called. He alledgeth moreover the cauſe of the ſaid name: And yet notwithſtanding (quoth hee) they cannot away with the name at this day, but are ſo called againſt their wills.

To come againe unto our former diſcourſe of Gold. There be yet ſome other points beſides to bee conſidered therein, which cauſe diſtinction in divers conditions of men: for our auncеſtors, willing at all times to honour thoſe ſouldiors who had borne themſelves valiantly in wars,
C were woont to beſtow chains of gold upon ſtraungers and auxiliaries, ſuch I meane as came to aid and ſuccour the Romans: but unto their owne naturall cittizens they gave none other but of ſilver: and true it is, that Romane cittizens had bracelets given them over and above, which forreiners had not. They were woont alſo (a thing to bee marveiled at) to give unto cittizens, coronets of gold; but who hee was whome they honoured firſt with this reward, I could never find in any Chronicle: and yet *L. Piſo* hath ſet downe in his annals, the firſt giver thereof: For *A. Poſthumius* L. Dictatour (quoth hee) upon the winning of the fortified campe of the Latines neare the lake Regillus, was the firſt that beſtowed upon that ſouldiour, by whoſe valorous ſervice principally the ſaid hold was forced, a coronet of gold; which hee cauſed to be made of the pillage taken from the enemie. *L. Lentulus* in like manner, being Conſull, gave a crowne of gold unto *Sergius Cornelius Merenda*, at the winning of a certaine towne within the Samnites countrey.
D Semblably *Piſo* ſurnamed *Frugi*, beſtowed upon his owne ſonne a coronet of gold weighing five pound, which hee cauſed to be made of his owne privat money: and yet among other legacies in his laſt will and teſtament, the ſaid coronet hee bequeathed to the ſtate and commonwealth of Rome.

Chap. iii.

Other uſes beſides of Gold, as well in men as women. Of Gold, in money. When Braſſe, Silver, and Gold, were firſt ſtamped and coined. Before Braſſe was converted into ſtamped money, how they uſed it in old time. At what rate and proportion of money were aſſeſſed the beſt houſes of Rome, at the
E *firſt levying of Subſidies. And at what time Gold came into credit and requeſt.*

ALl the gold emploied in ſacrifices to the honour of gods, was in guilding the hornes of ſuch beaſts as were to be killed, and thoſe onely of the greater ſort. But in warfare among ſouldiours, the uſe of gold grew ſo exceſſive, that the field and campe ſhone againe withall: inſomuch as at the voyage of Macedonie, where the marſhals of the field and colonels bare armour ſet out with rich buckles and claſps of gold, *M. Brutus* was offended and ſtormed mightily at it, as appeareth by his letters found in the plaines about Philippi. Well done of thee, ô *M. Brutus*, to find fault with ſuch waſtfull ſuperfluitie: but why ſaideſt thou nothing of the gold
F that the Romane dames in thy time wore in their ſhoes? And verely this enormitie and abuſe, I muſt needs impute unto him (whoſoever he was) that firſt deviſed rings, and by that means cauſed gold to bee eſteemed a mettall of much woorth: which evill precedent brought in another miſchiefe as bad as it, which hath continued a long time; namely, that men alſo ſhould weare about their armes, bracelets of gold next to their bare skin: which deviſe and ornament of the arme

is called Dardanium, becauſe the invention came from the Dardanians: like as the fine golden carkanets Viriæ, we tearme Celticæ; and the neck-laces of gold Viriolæ, Celtibericæ. Oh the monſtrous diſorders that are crept into the world! But ſay that women may be allowed to weare as much gold as they will, in bracelets, in rings on everie finger and joynt, in carkanets about their necks, in earings pendant at their ears, in ſtaies, wreaths, & chinbands; let them have their chains of gold as large as they liſt under their arms or croſſe over their ſides, ſcarfe-wiſe; be gentlewomen and miſtreſſes at their collars of gold, beſet thicke and garniſhed with maſſie pearls pendant from their necke, beneath their waſt; that in their beds alſo when they ſhould ſleep they may remember what a weight of pearls they carried about them: muſt they therefore weare gold upon their feet, as it were to eſtabliſh a third eſtate of women anſwerable to the order of knights, between the matrons or dames of honour in their ſide robes, and the wives of meane commoners? Yet me thinks, we men have more reaſon and regard of decencie, thus to adorn with brooches and tablets of gold, our youths and young boyes, and a fairer ſight it is to ſee great men attended upon to the bains by beautifull pages thus richly decked and ſet out, that all mens eyes may turne to behold them. But what mean I thus bitterly to inveigh againſt poore women; are not men alſo growne to ſuch outrageous exceſſe in this kind, that they begin to weare upon their fingers either * Harpocrates, or other images of the Ægyptian gods engraven upon ſome fine ſtone? But in the daies of the Emperour *Claudius* there was another difference and reſpect had, That none might carrie the pourtraiture of that prince engraven in his ſignet of gold, without expreſſe licence given them by thoſe gratious enfranchiſed ſlaves who were in place to admit unto their lord the Emperour, whome it pleaſed them: which was the occaſion and means of bringing many a man into daunger, by criminall imputations. But all theſe enormities were happily cut off ſo ſoone as the Emperour *Veſpaſian* (to the comfort and joy of us all) came once to the crowne: for by an expreſſe edict, he ordained, That it might be lawfull for any perſon whatſoever to have the image of the Emperour in ring, brooch, or otherwiſe without reſpect. Thus much may ſuffice concerning rings of gold, and their uſage.

* Called alſo *Sigalion.*

To come now to the next miſchiefe that is crept into the world; I hold that it proceedeth from him who firſt cauſed a * denier of gold to be ſtamped: although, to ſay a truth, I know not certainly who hee was that deviſed this coine. As for the people of Rome, ſure I am that before king *Pyrrhus* of Epirus was by them vanquiſhed, they had not ſo much as ſilver money ſtamped and currant. Well I wot alſo, that in old time the maner was to weigh out braſſe by the As, which was a pound weight, and thereupon called As Libralis; and yet at this day, Libella: like as the weight in braſſe of two pound, they named Dipondius [As.] And hereupon came the cuſtome of adjudging any fine or penaltie under the tearme of [Æris gravis] that is to ſay, of braſſe Bullion or in Maſſe. From hence it is alſo, that ſtill in reckonings and accounts whatſoever hath ben laid out or delivered, goeth under the name of Expenſa, [*id eſt*, Expences] as a man would ſay, weighed forth, becauſe in times paſt all paiments paſſed by weight. The Latines likewiſe uſe the nowne Impendia, for coſt beſtowed, or the charges of intereſt in uſurie above the principall; even as the verbe Dependere, betokeneth (to pay) becauſe paiments ordinarily were performed by poiſe. Moreover, the under-treaſurers of warre, or paymaſters in the campe, were in auncient time named Libripendes, for weighing out unto the ſouldiours their wages; and their verie pay thereupon was called Stipendiam, from whence commeth Stipend, a word commonly received. According to which manner and cuſtome, all buyings and ſellings at this day which paſſe with warrantiſe, are uſually perfourmed by interpoſition of the ballance, which ſerveth to teſtifie the realitie of the contract and bargaine on both parts.

* He ſpeaketh κατὰ χρῆσιν, as I take it; for *Denarius* was a ſilver peece: but hee meaneth any peece of coine.

Touching braſſe money, *Servius Tullius* a king of Rome, cauſed it firſt to bee coyned with a ſtampe: for before his daies, they uſed it at Rome rude in the maſſe or lumpe, as *Remeus* mine author doth teſtifie. And what was the marke imprinted thereupon? even a sheepe, which in Latine they call Pecus: and from thence proceedeth the word Pecunia, that ſignifieth money. And note here by the way, that during the reigne of that king, the beſt man in all Rome was valewed to be worth in goods not above 110000 Aſſes in braſſe: and at this rate were aſſeſſed the principall houſes of the citie in the kings books; and this was counted the firſt Claſſis.

Afterwards, in the 485 yeare from the foundation of the citie, when *Q. Ogulnius* and *C. Fabius* were Conſuls, five yeares before the firſt Punicke warre, they began to ſtampe ſilver money at Rome, and three ſeverall peeces were coined. At what time ordained it was, That the Denarius

or

A or Denier ſhould go for tenne Aſſes or pounds of braſſe money; the halfe Denier, Quinarius, ſhould be currant for five; and the Seſterce reckoned worth two and a halfe. Now, for as much as during the firſt Punick warre againſt the Carthaginians, the citie was growne much behind hand and farre endebted, ſo as they were not able to goe through the charges which they were to defray, agreed it was and ordained to raiſe the worth of the braſen monie by deminiſhing the poiſe: whereas therfore the Aſſe weighed a pound of twelve ounces, they made the Aſſe of two ounces: By which deviſe, the Commonwealth gained five parts in ſix; and the Fiſque or citie chamber by that meanes was ſoone acquit of all debts. But if you would know what was the matke of this new braſen Aſſe: of the one ſide it was ſtamped with a two-faced *Ianus*, on the other ſide with the beake-head of a ſhip, armed with braſen pikes. Other ſmaller peeces there were, according to
B that proportion, to wit, Trientes, the third part of an Aſſe; and Quadrantes the fourth; which had the print of *punts or ſmall boats upon them. As for the peece Quadrans, it was before time called Triuncis, becauſe it weighed three ounces. Howbeit, in proceſſe of time, when *Annibal* preſſed hard upon the citie, and put them to an exigent for money to maintaine the warres againſt him, driven they were to their ſhifts and forced (when *Q. Fabius* was Dictator) to bring down the foreſaid Aſſe of two ounces unto one. Yea, and enacted it was, That the ſilver Denier, which went beforetime for tenne Aſſes, ſhould be worth *ſixteen; the halfe Denier or Quinare, eight; and the Seſterce foure: and by this means the State gained the one halfe full. And yet I muſt except the money paied unto ſouldiors for their wages: for a Denier unto them was never reckoned above tenne Aſſes. As for the ſilver Deniers, ſtamped they were with the pourtraiture of coches drawne
C with two horſes or foure horſes, whereupon they were called Bigati and Quadrigati. Within a while after there paſſed an act promulged by *Papyrius*, by vertue whereof the Aſſes weighed not above halfe an ounce. Then came *Livius Druſus* in place, who beeing one of the Provoſts or Tribunes of the Commons, brought in baſe money, and delaied the ſilver with one eight part of braſſe. Touching that peece of coine, which now is called Victoriatus, ſtamped it was by an Act propoſed by *Clodius*; for before his time, thoſe peeces of money were brought out of Sclavonia, and reckoned as merchandiſe: and ſtamped it is with the image of Victorie, of which it tooke that name.

Concerning gold coined into money, it came up threeſcore and two years after the ſtamping of ſilver peeces: and a ſcriptule of gold was taxed and valued at twentie ſeſterces, which ariſeth in
D every pound according to the worth of Seſterces as they were rated in thoſe daies, to nine hundred Seſterces. But afterwards it was thought good to caſt and ſtampe peeces of gold, after the proportion of fiftie to a pound: And thoſe, the Emperors by little and little deminiſhed ſtill in poiſe, untill at length *Nero* brought them downe to the loweſt, and cauſed them to be coined after the rate of five and fiftie peeces to the pound. In ſumme, the very ſource and originall of all avarice proceedeth from this money and coine, deviſed firſt by lone and uſurie, and continued ſtill by ſuch idle perſons that put foorth their monies to worke for them, whiles they ſit ſtill, and find the ſweetneſſe of the gaine comming in ſo eaſily. But this greedie deſire of having more ſtill, is growne after an outrageous manner to be exceſſive, and no more to be named covetouſneſſe, but rather unſatiable hunger after gold: inſomuch as *Septimuleius*, an inward and familiar friend
E of *C. Gracchus*, forgat all bonds of amitie, and having cut off his friends head, upon promiſe to have the weight of it in gold, brought the ſame unto *Opimius*: howbeit, hee poured molten lead into the mouth thereof to make it more heavie, and ſo together with this parricide and unnaturall murther, couſened alſo and beguiled the Commonweale. But to ſpeake no more of any particular citizen of Rome, the whole name of the Romanes hath beene infamous among forraine nations for avarice and corruption in this kind: as may appeare by the conceit that king *Mithridates* had of them, who cauſed *Aquilius* (a Generall of theirs, whoſe hap was to fall into his hands) for to drinke molten gold. See what covetouſneſſe brings home with it in the end.

Now when I behold and conſider no more but theſe ſtraunge names of our veſſell in plate, which are newly deviſed in Greeke from time to time, according as the ſilver is either double or
F parcell guilt, or the gold encloſed and bound within worke, I am aſhamed of it; and the rather, for that in regard of theſe deviſed names and daintie toies, ſuch plate as well of beaten gold, as guilded onely, ſhould be ſo vendible and ſell ſo deare: eſpecially knowing as we doe full well, the good order that *Spartacus* held in his campe, expreſſely commanding that no man ſhould have any plate of gold or ſilver. A great reproch to us Romans, that our fugitives & baniſhed perſons

ſhould

*And therfore they were called *Ratiti* of *Rates*.

*Ordinarily the Romane ſilver Denier had the letter *X.* ſtamped upon it, but theſe Deniers had *X V I. Vrſin.*

ſhould ſhew a more nobler ſpirit than wee our ſelves. *Meſſala* the great Oratour hath left in writing, That *M. Antonius* uſed to diſcharge all the ordure and filthie excrements of the bodie into veſſels of gold, yea, and allowed *Cleopatra* likewiſe to doe the ſame by her monthly ſuperfluities, moſt ſhamefully. Noted it was among forrain nations for exceſſive licentiouſneſſe, & that in the higheſt degree, That king *Philip* of Macedonie was never wont to go to bed and ſleepe without a ſtanding cup of gold under his pillow: alſo, That *Agnon Teius* (a great captaine under *Alexander* the Great) was given to ſuch waſtfull prodigalitie, as to faſten his ſhoes and pantophles with buckles of gold. But *Antonie* abovenamed, to the contumelie and contempt of *Nature, abuſed gold, and emploied it to the baſeſt ſervice that is: An act (as much as any other) deſerving proſcription and outlawing indeed. G

*Which had given us gold for veſſels of honour.

But among diverſe things beſides, I wonder much at this, That the people of Rome, upon the conqueſt of ſo many nations, impoſed upon them a tribute to be paied alwaies in ſilver, & never made mention of gold: as for example, when Carthage was ſubdued, and *Annibal* vanquiſhed, the Carthaginians were enjoined for fiftie years together to make paiment yearly of *[12000] pound of ſilver onely, and no gold at all. Neither can it be thought that there was little gold at that time to be had abroad in the world; for *Midas* and *Cræſus* both, were poſſeſſed of infinit ſums and huge maſſes of gold: and *Cyrus* upon his conqueſt of Aſia, met with 34000 pound weight of gold, beſides the golden plate and veſſell, and other gold which he found readie wrought: and among the reſt, certaine *leaves, a Plane and a Vinetree, both of beaten gold. In the pillage alſo of this victorie, he caried away five hundred thouſand talents of ſilver, and one ſtanding cup that he tooke from *Semiramis*, that weighed fifteene talents. And *Varro* mine Author ſaith, That the poiſe of the Ægyptian talent ariſeth to *80 pound. Beſides, there had raigned beforetime over the Colchians, *Salauces* and one *Eſubopes*: who having newly broken up a peece of ground in the Samnians country, is reported to have gotten out thereof great ſtore of ſilver and gold, notwithſtanding that the whole kingdome is renowmed for the golden fleeces there. And verely this prince had the arched and embowed rouſes of his pallace made of ſilver and gold: the beames and pillars alſo ſuſtaining the ſaid building, yea, the jambes, poſts, principals, and ſtanderds, all of the ſame mettall, namely, after he had vanquiſhed *Seſoſtres* king of Ægipt, ſo prowd a prince, that (as the Chronicles make mention) hee was wont every yeare to have one or other (as the lot fell out) of thoſe kings who were his tributaries and did homage unto him, for to draw in his charriot like horſes, when he was diſpoſed to ride in triumph. Theſe and ſuch like things have bin thought fabulous tales: but have not our Romanes done ſemblable acts, which the age and poſteritie hereafter will thinke incredible? *Cæſar* afterwards Dictatour, was the firſt that in his Ædileſhip, when hee exhibited a ſolemne memoriall in the honour of his father departed, did furniſh the whole Cirque and ſhew-place, with all things meet for ſuch a ſolemnitie, of cleane ſilver; inſomuch as the chaſing ſtaves and boreſpeares were of ſilver, wherewith the wild beaſts were aſſaulted: a ſpectacle never ſeene before. And not long after, *C. Antonius* ſet forth his plaies (when he was Ædile) upon a ſtage or ſcaffold of ſilver: after whoſe example, diverſe free cities and towns of the Empire have done the like. Semblably, *L. Muræna* and *C. Caligula* the Emperour, erected a frame or pageant to goe and riſe up of it ſelfe with vices, ſupporting images and jewels in the place of publick paſtimes, which was thought to have in it 124000 pound of ſilver. *Claudius Cæſar* who ſucceeded Emperour after him, when he rode in triumph for the conqueſt of Brittaine, among other crownes of beaten gold, ſhewed twain that were principall, the one of ſeven pound weight, which high Spaine had given unto him; the other weighing nine pounds, ſent unto him as a preſent from that part of Gaule which is called Comata: as appeared by the inſcriptions and titles which they bare. *Nero* his ſucceſſor, to ſhew unto *Tyridates* king of Armenia what abundance of treaſure he had, kept the great Treatre of *Pompeius* for one whole day covered all over with gold. But what was that furniture in compariſon of his golden houſe, which tooke up a great part of the citie, and ſeemed (as it were) to compaſſe it about. In that yeare when *Sex. Iulius* and *Lucius Aurelius* were Conſuls (which fell out to be ſeven years before the third Punick war) there was found in the treaſurie or chamber of Rome, *700026 pound weight of gold, in Maſſe or Ingots; of ſilver likewiſe in Bullion, 92000 pound weight; beſides the coine and readie money, which amounted to 375000 Seſterces. The yeare wherein *Sex. Iulius* and *L. Marcius* were Conſuls, to wit, in the beginning of the ſociall warre againſt the Marcians and other Romane allies, the treaſure of Rome aroſe to 846 pounds of gold in Bullion. *C. Cæſar* at his firſt entrance into H I K L M

*For in al they were to pay 10000 talents: reckō a talent at 60 pound, which is the leſſe Atticke.

*Folia, I thinke rather *ſolia*, i. bathing veſſels.

*Some ſay 75.

*According to *Budæus*.

the

A the citie of Rome, when the civile warre betweene him and *Pompey* was begun, tooke out of the citie chamber 15000 wedges or ingots of gold, 35000 lumpes or maſſes of ſilver, and in readie money 40000 Seſterces. And to ſay a truth, never was the citie of Rome wealthier than at this time. Moreover, *Æmylius Paulus*, after he had defeated and vanquiſhed *Perſeus* the Macedonian king, brought into the treaſurie of the citie a bootie of 3000 pound of gold in weight. After which time the common people of Rome had never any tributes or taxes levied of them by the State.

* According to *Budæus*.

Moreover, this is to be obſerved, That after the overthrow and deſtruction of Carthage, the beames began firſt to bee guilded within the temple of the Capitoll, whiles *Lu. Mummius* was Cenſor. And now adaies you ſhall not ſee any good houſe of a privat man, but it is laid thick and
B covered over with gold. Nay, the braverie of men hath not ſtaied ſo, but they have proceeded to the arched and embowed roufs, to the wals likewiſe of their houſes, which we may ſee every where as well and throughly guilded as the ſilver plate upon their cupbourds. And yet *Catulus* was diverſly thought of in the age wherein he lived, becauſe he was the firſt that guilded the braſen tiles of the Capitoll.

Touching the firſt inventors, as well of gold, as alſo of all other mettals to ſpeake of, I have alreadie written in my ſeventh booke. As for the eſtimation of this mettall, that it ſhould bee cheefe as it is, I ſuppoſe it proceedeth not from the colour, for ſilver hath a brighter luſtre, more like to the day, and in this reſpect more agreeable to the enſignes of warre than that of gold, becauſe it glittereth and ſhineth farther off: And hereby is their errour manifeſtly convinced, who
C commend the colour of gold, in this regard, that it reſembleth the ſtarres: for well it is knowne that their colour is not reputed richeſt, either in precious ſtones or in many things beſides. Neither is gold preferred before other mettals, becauſe the matter is more weightie or pliable than the reſt; for lead ſurmounteth it, both in the one and the other. But I hold, that the reputation which it hath, commeth from hence, That it alone of all things in the world, looſeth nothing in the fire: for ſay that a houſe be burnt wherein gold is, yet it waſteth not: and looke what gold is committed to the funerall flames, it conſumeth not with the dead bodie, but is found all againe among the aſhes. Nay, the oftener that it hath been in the fire, the better it is and the more refined: in ſuch ſort, that the beſt gold which they call Obryzum, is knowne by this, if it bee of the ſame deepe red colour that the fire is wherein it is tried. And a principall argument this is of fine
D gold, if it hardly be kindled and ſet on fire red hote. Moreover, this is wonderfull in the nature of *gold, that in a fire made of light ſtraw or chaffe, it will moſt quickly become red hot and melt; put the ſame among the whoteſt burning coales that can bee of wood, unneath or hardly will it yeeld to the heat thereof and reſolve: as alſo for the purifying thereof, it ought to be melted with lead. A greater reaſon there is beſides that maketh gold ſo precious: for that with uſe or handling there is little of it loſt and waſted; whereas ſilver, braſſe, and lead, if you draw any lines therewith, colour as they go and leave ſomewhat behind: they ſoile their hands alſo who occupie the ſame with the ſubſtance and matter that ſheddeth from them. Over and beſides, there is not a mettall will bee driven out broader with the hammer, or devide eaſily into more parcels than gold, inſomuch as every ounce of it may be reduced into ſeven hundred & fiftie leaves, or more,
E and each one of them foure fingers large every way. The thickeſt gold foile beareth the name at this day of Prænestium, for that the image of Fortune at Prænesте is above all other moſt richly guilded. The next thereto in goodneſſe is the foile or leafe of gold named Quæſtoria. In Spaine they uſe to call by the name of Strigiles, the ſmall peeces of that fine gold which is found naturally alone above all the reſt either compact in ſome maſſe, or in manner of ſand and gravell; whereas all other parcels of gold taken out of the mines, need to bee fined and brought to their perfection by the meanes of fire. But this gold that I ſpeak of, is gold preſently at the firſt, and no ſooner is found, but the matter thereof by and by is conſummat and accompliſhed. Lo how gold is found in the owne nature pure and perfect! As for the other manner of finding and fining gold, whereof I meane to ſpeake anone, it is forced (as it were) and upon conſtraint. But above all
F other properties to commend the goodneſſe of gold, this eſpecially is to be obſerved, That there is no ruſt nor canker, no nor any filth beſides breeding of it ſelfe therein, which is able either to corrupt the goodneſſe, or deminiſh the weight and ſubſtance thereof. What ſhould I ſay how firme it continueth and durable againſt ſalt and vinegre, ſcorning all their injuries: & yet otherwiſe their moiſture is able to eat into any other mettals, yea, and to conſume and tame all things

* This haply may be true in ore, for otherwiſe in fined gold it is not ſo: & the finer that it is, the ſtronger fire it asketh to be melted by.

els

els whatsoever. But this passeth all, that spun it may be as wooll and silke, woven also in manner of yearne, chuse whether you will work it twisted with [silke] thred, or single in wier by it selfe. *Verrius* the Hystoriographer reporteth, That king *Tarquinius*, surnamed *Priscus*, rode in triumph in a robe of wrought gold. I my selfe have seene the Empresse *Agrippina*, wife to *Claudius Cæsar*, sitting by her husband the Emperour to behold the brave shew of a navall skirmish upon the water which he exhibited, all gorgeously arraied in a royall mantle, woven without any other matter save onely pure gold. Cloth of gold and tissue I know there is besides, called Vestis Attalica, wherein gold is wrought with other stuffe: and long since it is, that this invention hath been devised by the rich and sumptuous kings of Asia. Furthermore, to guild marble or any other thing that will not abide to be guilded by the fire, gold foile must bee laid on with the white of an egge. As for wood and timber, they use to guild it by the meanes of a certaine compound glue or size, which is commonly called *Leucophoron: but what a glue this is, and how it is made, I will declare in place convenient. As touching the manner how to guild brasse, it was performed ordinarily heretofore by quicksilver naturall, or else artificiall named Hydrargyron: and herein there hath been devised much fraud & deceit; according as I will hereafter shew in their proper chapters, when I practise to set downe their nature and properties. But now after that brasse hath been much knocked and beaten, they use to put it into the fire: and so soone as it is perceived red hote, they quench it againe in salt, vinegre, and allum. Now afterward, when it is well scoured & cleansed with sand, and knowne by the brightnesse and lustre thereof that it hath beene sufficiently frobished and purified, againe it must into the fire to take a new heat by the ardent exhalation thereof; that being thus (as it were) mortified and besmeared with a size of the pumish stone, allum and quicksilver mixed together, it may take gold foile laid upon it the better, and keepe it more surely. To conclude, allum hath the verie same vertue to trie and cleanse gold, as I said before lead had.

*or *Chrysoporon*

Chap. iiii.

The manner of finding gold naturally in the Mine. When were knowne the first statues of gold. The medicinable vertues and properties of gold.

IN these parts of the world wherein we live, gold mines are found: so that wee need not to stand so much upon the gold of India, nor that which the ants cast up out of the ground, or the griffons gather in Scythia. And verely the gold here with us commeth naturally in three sorts, to wit, among the sands of some great rivers, like as Tagus in Spaine, the Po in Italie, Hebrus in Thrace, Pactolus in Asia, and the Indian Ganges do yeeld it: neither is there any gold more fine and perfect, as beeing throughly polished by that rubbing and attrition which it meeteth withall in the course and streame of the water. Another manner there is to come by gold, namely, by digging it out of pits which are sunke of purpose for it: or else to light upon it within the caves and breaches happening by the fall of mountains undermined or cut through. And my meaning is to discourse of the one way as well as the other, of searching for gold.

K

To begin then with those who seeke for this mettall: First above all they hit upon a veine of earth called Segullium, and this is it that giveth them the first light and shew that gold is there to bee had. This they take up: the bed and couch wherein it lieth: the gravell likewise and the sand about it they wash, observing diligently that which setleth in the bottome, for by it they have a good guesse and aime that directeth them to gold, whether it lie deepe or shallow. And by this conjecture, otherwhiles their hap is so good, as to find that which they desire, aloft, even ebbe under the upmost coat of the earth: but I must needs say, a rare felicitie is this. And yet of late daies during the Empire of *Nero*, there was found in Dalmatia a vaine of gold ore within one spades griffe in the first turfe of the ground, which yeelded every day the weight of fiftie pound. This manner of earth, if it be found also under a vaine of gold, they call Alutatio. Moreover, this is to bee noted, That ordinarily the drie and barraine mountaines in Spaine which beare and bring foorth nothing else, are forced (as it were) by Nature to furnish the world with this treasure, and doe yeeld mines of gold. As for that gold ore which is digged forth of pits, some call it in Latin Canalitium, others Canalense. And verely this is found sticking to the grit and utmost crust of hard rockes of marble; not after the manner of drops or sparkes glittering in orient saphire, or

L M

the

A the Thebaicke marble, and in many other precious ſtones, which are marked here and there with ſpeckes of gold: but this ore or mettall dooth claſpe and embrace whole peeces of marble and ſuch like, found in rockes. And commonly theſe canales, (as I may ſo ſay of gold ore) follow the vaines of ſuch marble and ſtone in the quarrey, deviding and ſpreading as they do here & there; whereupon the gold tooke the foreſaid name of Canalitium: they wander alſo along the ſides of the pits as they are digged, ſo that the earth had need to bee borne up and ſupported with poſts and pillers for the getting of it, leaſt by hollow undermining, it fall upon the pioners. This mine or vaine of gold ore when it is once digged up and landed above ground, the manner is to bray and ſtampe, to waſh, burne, and melt, yea, and otherwhiles to grind into pouder. As for that which (as they pun thus and beat in morters) is knocked from it, they call * Apilaſcus: but the

B mettall which ſweateth out and commeth forth by the violent heat of the furnace where the foreſaid ore is melted, they name Argentum, *i.* ſilver. The groſſe ſubſtance caſt up from the pot or veſſell, & ſwimming aloft (whether it be the droſſe comming of gold thus tried, or any other mettall) is named Scoria. Howbeit, this droſſe that gold dooth yeeld from it in the trying, is ſet over the fire againe to take a new melting, and is ſtamped in manner aforeſaid. As for the pans or veſſels wherein gold is thus tried and refined, they be made of a certaine earth named Taſconium: and the ſame is white like unto a kind of potters cley. For ſurely there is no other earth or matter whatſoever will abide either the heat of the fire underneath, plied continually with the bellowes, or the matter within it when it is melted. And thus much of the two firſt waies of finding out gold.

C 3 The third manner of ſearching for this mettall, is ſo painefull and toileſome, that it ſurpaſſeth the wonderfull workes of the * Geants in old time: For neceſſarie it is in this enterpriſe and buſineſſe, to undermine a great way by candlelight, and to make hollow vaults under the mountains. In which labour the pioners worke by turnes ſucceſſively, after the manner of the releeſe in a ſet watch, keeping every man his houres in juſt meaſure: and in many a month ſpace they never ſee the Sunne or day light. This kind of worke and mines thus made, they call Arrugiæ, wherein it falleth out many times, that the earth above head chinketh, and all at once without giving anie warning, ſetleth and falleth, ſo as the poor pioners are overwhelmed and buried quick: inſomuch as conſidering theſe perils, it ſeemeth, that thoſe who dive under the water into the bottome of the levant ſeas for to get pearles, hazard themſelves nothing ſo much as theſe pioners. A ſtrange

D thing, that by our raſhneſſe and follie we ſhould make the earth ſo much more hurtfull unto us than the water. Well then, to prevent as much as poſſibly may be, theſe miſcheefes and daungerous accidents, they underprop the hils, and leave pillars and arches (as they goe) ſet thicke one by another to ſupport the ſame. And yet, ſay they worke ſafe ynough and bee not in jeopardie of their lives by the fall of the earth, yet there bee other difficulties that impeach their worke: for otherwhiles they meet with rocks of flint and rags, as well in undermining forward, as in ſinking pits downe right; which they are driven to pierce and cleave through with fire and vinegre. But for that the vapour and ſmoke that ariſeth from thence, by the means, may ſtifle and choke them within thoſe narrow pits and mines, they are forced to give over ſuch fire-worke, & betake themſelves oftentimes to great mattockes and pickaxes; yea, and to other engines of yron, weigh-

E ing 150 pound apeece, wherewith theey hew ſuch rockes in peeces, and ſo ſinke deeper or make way before them. The earth and ſtones, which with ſo much adoe they have thus looſed, they are faine to carie from under their feet in ſcuttles and baskets, upon their ſhoulders, which paſſe from hand to hand evermore to the next fellow. Thus they moile in the darke both day and night in theſe infernall dungeons, and none of them ſee the light of the day, but thoſe that are laſt & next unto the pits mouth or entrie of the cave. If the flint or rocke that they worke into, ſeeme to run in a long graine, it well cleave in length, and come away by the ſides in broad flakes; and therefore the pioners with eaſe make way, trenching and cutting round about it. Howbeit, be the rocke as ragged as it will, they count not that their hardeſt worke: For there is a certaine earth reſembling a kind of tough cley (which they call White Lome) and the ſame entermingled with grittie ſand,

F ſo hard baked together, that there is no dealing with it; it ſo ſcorneth and checketh all their ordinarie tooles and labour about it, that it ſeemeth impenetrable. What doe the poore labourers then? They ſet upon it luſtily with yron wedges, they lay on lode unceſſantly with mightie beetils: and verely, they thinke that there is nothing in the world harder than this labour, unleſſe it be this unſatiable hunger after gold, which ſurpaſſeth all the harneſſed & difficultie that is. Well,

when

* *Quaſi ad pilas cuſum.*

* Who were ſaid to reare one mountain upon the head of another.

when the worke is brought to an end within the ground, and that they have undermined & hollowed the hils as farre as they thinke good, downe they goe with their arch-worke abovesaid, which they builded as they went: They begin first at those props which are farthest off, cutting the heads of the stancheons still as they returne backward to the entrance of the worke. Which done, the sentinell onely, who of purpose keepeth good watch without upon the top of the same mountaine that is thus undermined, perceives the earth when it beginneth to sinke and cleave, menacing by that token a ruine thereof anone. Whereupon presently hee giveth a signe either by a loud crie or some great knocke, that the pioners underneath may have warning thereby to get them speedily out of the mines, and runneth himselfe apace downe from the hill as fast as his legs will give him leave. Then all at once on a suddaine the mountaine cleaveth in sunder, & making a long chinke, falleth downe with such a noise and cracke, as is beyond the conceit of mans understanding, with so mightie a puffe and blast of wind besides, as it is incredible. Wherat these miners and pioners are nothing troubled, but as if they had done some doughtie deed, and atcheeved a noble victorie, they stand with joy to behold the ruine of Natures workes, which they have thus forced. And when they have all done, yet are they not sure of gold: neither knew they all the whiles that they laboured & undermined, that there was any at all within the hill: The hope (only) that they conceived of the thing which so greatly they desired, was a sufficient motive to induce them to enterprise, and endure so great dangers, yea and to goe through withall and see an end. And yet I cannot well say that here is all: for there is another labour behind as painefull every way as the other, and withall of greater cost and charges than the rest, namely, to wash the breach of this mountaine (that is thus cloven, rent, and laid open) with a currant: For which purpose they are driven many times to seeke for water a hundred myles off, from the crests of some other hils, and to bring the same in a continued channell and streame all the way along unto it. These riverets or furrows thus devised and conveighed, the Latins expresse by the name of *Corrugi: a word as I take it derived *à Corrivando, i.* of drawing many springs and rils together into one head and channell. And herein consisteth a new peece of worke as labourious as any that belongeth to mines. For the levell of the ground must bee so taken aforehand, that the water may have the due descent and currant when it is to run: and therefore it ought to bee drawne from the sources springing out of the highest mountaines: in which conveiance, regard would bee had as well of the vallies as the rising of the ground betweene, which requireth otherwhiles that the water bee commanded by canels and pipes to ascend, that the cariage thereof bee not interrupted, but one peece of the worke answere to another. Otherwhiles it falleth out, that they meet with hard rockes and crags by the way, which doe impeach the course of the water: and those are hewed through, and forced by strength of mans hand to make roume for the hollow troughes of wood to lie in, that carrie the foresaid water. But a straunge sight it is to see the fellow that hath the cutting of these rockes, how he hangeth by cables and ropes betweene heaven and earth: a man that beheld him a farre off, would say it were some flying spirit or winged devill of the air. These that thus hang, for the most part take the levell forward, and set out by lines the way by which they would have the water to passe: for no treading out is there of the ground, nor so much as a place for a mans footing to rest upon. Thus you see what ado there is. And these good fellowes whiles they be aloft, *search with their hands and plucke forth the earth before them, to see whether it be firme and fast, able to beare the trunks or troughs for the water; or otherwise loose and brittle, which defect of the earth they call *Vrium: for the avoiding whereof the fountainers feare neither rockes nor stones to make passage for their pipes or trunkes aforesaid. Now, when they have brought the water thus to the edge & brow of the hils where these mines of gold should be, and from whence as from an head there is to be a fall thereof to serve their purpose; they dig certaine square pooles to receive the water, two hundred foot every way, and the same tenne foot deepe: in which they leave five severall sluces or passages for the deliverie of the water into the mines, and those commonly three foot square. When the said pooles stand full, as high as their bankes, they draw up the floud-gates: And no sooner are the stopples driven and shaken out, but the water gusheth foorth amaine with such a force, and carieth so violent a streame therewith, that it rolleth downe with it any stones be they never so big, lying in the way. And yet are we not come to an end of the toile, for there remaineth a new peece of worke to doe in the plain beneath. Certaine hollow ditches are to be digged for to receive the fall of the water both from the pooles above, and the mines also. These trenches the Greekes tearme Agogæ, as a man would say

Conduits,

*For rather *Corrivi.*

**Manus trahuntur ad omen.*

* or rather *Aræum, Græc.* ἀραῖον.

A Conduits, and thoſe are to bee paved by degrees one under another. Beſides, there is a kind of ſhrub or buſh, named Vlex, like unto Roſemarie, but that it is more rough and prickly, and the ſame is there planted becauſe it is apt to catch and hold whatſoever peeces of gold doe paſſe beſide. The ſides moreover of theſe canals or trenches, are kept in with planks and bourds, and the ſame borne upon arches pendant through ſteepe places, that by this means the canale may have paſſage and void away at length out of the land into the ſea.

Loe what a worke it is to ſearch out and meet with gold! And verely by this meanes Spaine is growne mightily in wealth, and full of treaſure. In the former worke alſo of ſinking pits for gold, an infinit deale of labour there is to lade out the water that riſeth upon the workemen, for feare it choke up the pits; for to prevent which inconvenience, they derive it by other draines. As tou-
B ching the gold gotten by cleaving and opening mountains, (which kind of worke I called Arrugia) it needeth no trying by the bloume-ſmithie, for fine it is naturally & pure of it ſelfe: & found there be whole lumps and maſſes of this kind, and in this manner. In pits likewiſe yee ſhall have ſuch peeces, weying otherwhiles ten pounds and more. Theſe groſſe and maſſie peeces of gold, the Spaniards call Palacræ or Palacranæ: but if they bee but ſmall, they have a pretie name for them, and that is Baluces. But to come againe to the ſhrub or plant Vlex, whereof I ſpake before; after it is once dried, they burn it, and the aſhes that come thereof, they waſh over turfs of greene graſſe, that the ſubſtance of gold may reſt and ſettle therupon. Some writers have reported, that the countries of Aſturia, Gallæcia, and Luſitania, were woont to yeeld everie yeere 20000 pound weight of good gold gotten after this ſort: yet ſo, as they all do attribute the grea-
C teſt proportion thereof to Aſturia: and there is not any part of the world comparable unto it either for ſo great fertilitie of mines, or ſo long continuance, holding out as they do ſo many ages. As for Italie, our auncient Senat in old time thought good to have it ſpared, and they made an Act, forbidding expreſſely to breake any ground for mines: otherwiſe there is not, I dare bee bold to ſay, a land more plentifull in gold and other mettals. And here there commeth to my remembrance an Act of the Cenſors extant upon record, as touching the gold mine of Ictimulum, a towne in the territorie or countrey of Vercelles; which Act contained an inhibition, that the publicans who fermed that mine of the citie, ſhould not keepe above five thouſand pioners togither at worke there.

Moreover, there is one deviſe to make atificiall gold, to wit, of Orpiment, a minerall digged
D out of the ground in Syria, where it lyeth verie ebb, and the painters uſe it much: in colour it reſembleth gold, but brittle it is in ſubſtance like as glaſſe-ſtones. And verely *C. Caligula* the Emperour (a covetous prince and greedie of gold) was in great hope to extract gold out of this minerall, & thereupon cauſed a huge maſſe thereof to be boiled, melted and calcined: and in truth, he made therof moſt excellent gold, but in ſo ſmall a quantitie, that it would not quit for the coſt and paines about it; inſomuch, as he loſt by the bargaine: yet his avarice was ſuch, as hee would needs make the experiment, notwithſtanding that orpiment it ſelfe was worth fourteen deniers the pound: but he ſped ſo bad, that no man afterwards would go about to trie the like concluſion.

Gold untried is of a divers touch; and generally there is not any but it hath ſilver in it more or leſſe: for in ſome places, the gold ore hath a tenth part in weight of ſilver, in others a ninth, and
E there is again that hath a mixture of the eigth part. In one gold mine within Fraunce, called Albicrarenſe, there is found in gold the ſix and thirtieth part of ſilver and no more: ſuch mettall is not elſewhere found to my knowledge, and therefore it paſſeth all other whatſoever.

There is a baſe kind of pale and whitiſh gold, which hath in it a fifth part of ſilver: and whereſoever this is found, they call it Electrum. Such mettall lieth commonly in trenches and pits minerall, and namely with that gold which I called before Canalienſe. Moreover, there is an artificiall Electrum made, namely by entermingling gold with ſilver according to the naturall mixture: but if it exceed that proportion of one part to five, it will not abide the hammer and the anvill. This white gold alſo hath been of great account, time out of mind, as may appeare by the teſtimonie of the Poët *Homer*, who writeth, that the palaice of prince *Menelaus* glittered with
F gold, electrum, ſilver, and yvorie. At Lindos (a cittie within the Iſland of the Rhodians) there is the temple of *Minerva*, wherein ladie *Helena* did dedicat unto that goddeſſe a cup made of Electrum: and as the ſtorie ſaith moreover, it was framed and wrought juſt to the proportion and bigneſſe of one of her owne paps. This propertie hath Electrum naturally, To ſhine by candle light, more cleare and bright than ſilver. This ſingularitie and proper vertue it hath beſides (if it

be naturall) to discover and shew any poison: for, be there poison in a cup of this mettall, a man G
shall see therein certaine semicircles resembling rainbows, & perceive besides the liquor to keep a hissing & sparkling noise as the fire doth; which two signs, do certainly give warning of poison.

As touching statues of gold: it is said, that the first image that ever was knowne to bee solid and massie, was that of the goddesse *Diana* surnamed *Anaïtis*, which stood within a temple dedicated unto her, which in my Cosmographie I have signified under that name; and this was before any brasen statue of that making. This temple in those parts was accounted in regard of the divine power of this goddesse, most holy and sacred; and such a kind of Image they call Holosphyraton. Howbeit, as religious as the church was, *Antonie* in his voyage into Parthia, spoiled it, and carried away the said image. And here I cannot forget to put downe a prettie speech, which (by report) an old gentleman and souldior of Bononie delivered to *Augustus Cæsar*, at what H
time as he was entertained as a guest and supped with the said Emperour at his owne table: for being demaunded by *Augustus*, whether it was true, that the man who first violated this goddesse, died blind, lame, and bereaved of all his lims? he answered, Yea sir, that it is; and that me thinks you should know best, for even now a leg of his you have at supper, and * all your wealth besides is come unto you by that saccage.

* Fot *Augustus Cæsar* defeited *Antonie*, & was mightily enriched by the spoile of him.

The first man that * caused his owne statue to be made of gold, and the same solid and massie, was *Georgius Leontinus* the great Orator and Rhetorician, which (to immortalize his own name) he set up in the temple at Delphos; and this was about the 70 Olympias: whereby wee may see what wealth and gain was gotten in those daies by teaching Oratorie and the Art of Rhetoricke.

* And yet other writers say, that all Greece erected that image to honor him withall.

But to come at length unto the medicinable vertues of gold: certes, divers waies effectuall it I
is in the cure of many diseases: for first of all, soveraigne it is for greene wounds, if it be outwardly applied: and if young children weare it about them, lesse harme shall they have by any sorcerie, witchcraft, or enchantments, that be brought into the house, or practised where they are: howbeit, gold it selfe if it be carried over one, is thought to bee mischievous and hurtfull: for in that sort it doth harme also to hens that couve and sit, or ewes that are great with lambe and readie to yeane. But what is the remedie to prevent this mischiefe? marry take the same gold that is thus brought in place to doe a shrewd turn, wash it well, and with that water besprinkle them that you would cure. Moreover, gold may bee torrified once with corns of salt taken to the triple weight thereof; and a second time with two parts of salt, and one of the stone which they call Schistis: by this manner of preparing, all the venomous and hurtfull qualitie that is therein, it doth transK
fuse into the other things that be calcined or burnt therewith (which must be done upon an earthen vessell) and it selfe continueth pure and incorrupt still. Now the rest of the ashes separated from the gold, saved in an earthen pot, and incorporat with water into the forme of a liniment, healeth the foule tettar that appeareth in the face: it cureth the same disease also, if the face bee rubbed with the said ashes and beane floure togither, but then it must be afterwards washed off. These ashes thus prepared, cure the hollow ulcers called fistuloes, and also the hæmorrhoids: but in case you put therto the * floure of salnitre, it healeth corrupt & putrified ulcers, and such as stink againe: the same being boiled in hony with Nigella Romana, doth gently loose the belly, if the navell be anointed therw th. To conclude, *M. Varro* saith, that gold will cause werts to fall off.

* *Nitrispama*, or *Aphronitrũ*, *i.* Saltpetre.

L

Chap. V.

Of Borras, and the six medicinable properties that it hath: the wonderfull nature thereof in sodring one mettall with another, and in bringing all mettals to their perfection.

Chrysocolla, called otherwise Borax, or greene earth, is found in those pits and mines that are digged for gold: and a humor it is at the first, running along the veine of gold, which as it thickneth and groweth muddie, congealeth at length by the extreame cold of winter to the hardnesse of a pumish stone. Howbeit, the best kind of Borax we have knowne by experience to be engendred in mines of brasse; and the next to it for goodnesse, in those of silver: otherM
whiles also men meet withall in leaden mines, but the same is not so good as that which the gold mines do yeeld. Moreover, there may be an artificiall Borras made in all the said mettall mines, but far inferior to that which is naturall; namely, by letting water gently to run amoug their veins all winter long untill the month of Iune: the which water, in Iune and Iuly will grow to be dry and

proove

A proove Borras; whereby a man may perceive plainly, that Borras is nothing els but a putrified veine of mettall. But this minerall, if it bee of the owne kind, differeth from this other which is made by art of man, eſpecially in hardneſſe, for much harder it is, and called the yellow Borax, or in Latin, Lutea: and yet it may be brought to that colour by artificiall means, namely by dying with an hearb called likewiſe *Lutea: for of this nature it is, that it will take colour & drinke it in, as well as linnen or woollen. But for to dreſſe and prepare it for the purpoſe; firſt, they pun it in a mortar, then they let it paſſe through a fine ſerce; afterwards it is ground or beaten againe, and ſo it is ſerced a ſecond time through a finer ſerce; whatſoever paſſeth not through but remaineth behind, muſt be punned once more in a mortar, & ſo ground into a ſmall powder: and ever as they have reduced any into powder, they put it into ſundrie pots or cruſes: then they let the

B ſame to lie infuſed & ſoked in vinegre, untill the hardneſſe therin be wholly reſolved: which done, to the mortar it goeth againe, where it muſt be throughly ſtamped for altogither: and ſo when it is well waſhed out of one trey or boll into another, they let it drie: after it is thus prepared, they give it a colour with the hearbe Lutea (beforeſaid) and alume de plume: and thus you ſee, it muſt be painted and died firſt, before it ſelfe ſerve to paint or die withall. And herein it skilleth much how pliable & apt it is to receive the ſaid colour; for unleſſe it have willingly taken a deep tincture, they uſe to put therto Schytanum and Turbyſtum, for ſo they call two drugs which ſerve to make it take a colour the better. This Borax thus died, our painters uſe to call Orobitis: and two kinds they make therof; to wit, Lutea, *i.* the yellow, which they keep for the pouder or colour *Lomuntum; the other liquid, namely when the ſaid grains or pellets be reſolved into a kind of moiſture

C like drops of ſweat. This Borax of both ſorts, is made in the Iſle Cypros. The principall and beſt of all other, commeth from Armenia: in a ſecond degree, from Macedonia: but the greateſt quantitie thereof is in Spaine. The excellent Borax is knowne by this marke eſpecially, If it reſemble perfectly in colour the deepe and full greene that is in the blade of corne well liking. In our time, and namely in the daies of the Emperour *Nero*, the floore of the grand cirque or ſhew-place at Rome, was ſeene paved all over with greene Boras, at what time as he exhibited goodly ſights and paſtimes to the people; and namely, when he meant himſelfe to run a race with charriots, and tooke pleaſure to drive his horſes upon a ground ſutable to the colour of the cloth or liverie that he * wore himſelfe at that time: and in truth, a world of workemen he brought thither to lay the ſaid paving. All the ſorts of Boras may be reduced into three diſtinct kinds: to wit, the

D rough, valued at ſeven denarij a pound; the meane, which is worth five; and the powdred Boras, called alſo the graſſe-greene Borax, which coſteth not above three deniers the pound. As for the ſandie or powdred Boras, the painters before they uſe it, lay the firſt ground underneath it, of vitrioll and *Parætonium, and then the Borax aloft: for theſe things take it paſſing well, & beſides give a pleaſant luſtre to the colour. This Parætonium (for that it is moſt fattie & unctuous by nature, & for the ſmoothnes beſides moſt apt to ſticke too and take hold) ought to be laid firſt; upon which muſt follow a courſe of the vitrioll over it, for feare leaſt the whiteneſſe of the foreſaid Parætonium doe pall the greenneſſe of the Borax, which is to make the third coat. As for the Borax called Lutea, ſome thinke it tooke that name of the hearbe Lutea; which alſo, if it bee mixed and tempered with azure or blew, maketh a greene, which many doe lay and paint withall in ſtead

E of Borax; which as it is the cheapeſt greene of all other, ſo is it a moſt deceitfull colour.

Borax doth not onely ſerve painters, but is much uſed alſo by Phyſicians; and namely, to mundifie wounds and ulcers, if it be made into a ſalve with wax and oile: and drie as it is of it ſelfe in powder, it hath a deſiccative qualitie, and doth conglutinat and ſoder verie well: being mixed with honey into an electuarie, they give it inwardly unto thoſe that have the ſquinancie, and cannot draw their wind but ſitting upright, & ſo it provoketh vomit. Moreover, it entreth into many collyries or eyeſalves, eſpecially to conſume and diſcuſſe the cicatrices and films growing within the eyes: it goeth alſo to the making of greene plaſtres, ſuch as bee applied either to mitigat paine, or to heale the skin. And verely this Borax not artificially died, thus emploied in phyſick, the Phyſicians call Aceſin; and is not that which men name Orobitis, and which receiveth a tin-

F cture from mans hand.

Furthermore, there is a Borax or Chryſocolla, which goldſmiths occupie eſpecially about ſodring their gold: & of this kind all the reſt take the name alſo of Chryſocolla. This is altogither artificiall, and is made of Cyprian verdegris or ruſt of braſſe, the urine of a yong lad, and ſalnitre, tempered all togither and incorporat in a braſen mortar, ſtamped with a peſtill of the ſame met-

* Some take it to be weld or yellow.

*Lomuntum, See the beginning of the next booke.

* For ſome were called *Praſſini* that ran for the priſe, *i.* Greenkins.

* A kind of chalkie earth, or clay, growing neare the ſea ſhore.

* Whereupon it tooke the name *Chryſocolla, i.* goldglew or ſoder.

tall. Our countrymen in Latin call this Borax Santerna: with it they use to soder that gold especially which standeth much upon silver, and is therfore called Argentosum. This kind of gold may be known thus; namely, if it will looke bright and cleare upon the putting of Santerna unto it: whereas contrariwise, if it hold much upon brasse (and such gold is named Æroſum) it will have no lustre at all, but looke dim and duskish upon the laying of Borax upon it, and besides will hardly be sodred. But to soder such gold, there is a proper glew or soder made, with an addition of gold and the seventh part of silver to the rest abovenamed, and all the same stamped and united togither. And since I am entred into the feat of sodring, it were verie meet and convenient to annex unto this present discourse, all things else concerning it, that wee may under one view behold the admirable works of Nature in this kind. The soder of gold then, is Borax, which I have shewed alreadie. Iron is sodred with the stiffe potters cley Argilla. Brasse ore or Chalamine called Cadmia, serveth to unite and knit peeces of brasse togither in masse. Alume is good to hold plates of brasse one to another. Rosin doth soder lead, and besides is the proper cement of marble: but blacke lead will joyne well, by the means of the * white: and one peece of tin with another, with the helpe of oile. In like manner, tin will hold sure with a soder of brasse file-dust; and silver, with tin. Both brasse or copper, and also iron ore, melt best with a fire made of Pine-wood; as also with the Papyr reed in Ægypt: but contrariwise, gold soonest melteth with a fire of chaffe and hulls. Quickelime will catch an heat and burne, if water be cast upon it, and so doth the * Thracian stone: but the same, oile doth quench. Fire is most of all extinguished and put out with vinegre, with birdlime, and the white of an egg. No kind of right earth will burne light or flame. Finally, charcole which hath been once on fire, then quenched and afterwards set a burning againe, is of more force and giveth a greater heat, than that which commeth new from the hearth.

G

H

I

* Some take this for Tinglasse.

* Which some take for pitcole, or seacole rather, such as commeth frō Newcastle by sea: or rather a kind of jeat.

Chap. vi.

Of Silver, Quicke-silver naturall, Stibium, or Alabastrum. The drosse or refuse of silver, and litharge of silver.

IT followeth by good order to write in the next place, of silver mines, from whence proceedeth the second rage that hath set men a madding: where first and formost this is to be noted, that there is but one means to find silver, and that is in pits sunke of purpose for it: neither is there any shew at all of silver to give light thereof, and to put us in hope of finding: no sparks shining, like as there be in gold mines which direct us to it. The earth that engendreth the veine of silver, is in one place reddish, in another of a dead ash colour. But this a generall rule, that it is not possible to melt and trie out silver ore, but either with lead, or the veine and ore of lead. This minerall or mettall they call * Galena, found for the most part neare to the veins and mines of silver. Now by the means of fire, when these are melted togither, part of the silver ore settleth downeward and turneth to be lead, the pure silver floteth aloft, like as oile upon water. In all our provinces, yea and parts of the world to speake of, there be mines of silver to be found: howbeit the fairest be in Spaine, and yeeld the finest and most beautifull silver: and the same also like as gold, is engendred in a barraine soile otherwise and fruitlesse, and even within mountains: looke also where one veine is discovered, there is another alwaies found not far off: which is a rule observed not in mines of silver onely, but also in all others of what mettall soever; and hereupon it seemeth that the Greeks doe call them * Metalla. And verely, straunge it is and woonderfull, that the mines of silver in Spaine which were so long agoe begun by *Annibal*, should continue still as they doe, and retaine the names of those Carthaginians who first found, discovered, and brought them to light: of which, one named then Bebelo, & so called at this day, yeelded unto *Annibal* daily 300 pound weight; which mine even at that time had gone under the ground and hollowed the mountaine a good mile and a halfe: and all that way the Aquitans at this day standing in water, lade the same up, labouring night and daie by the candle or lampe-light, everie man in his turne, and during the burning of a certaine measure of oile, in such wise as they divert the water from thence, and make a good big river thereof, to passe and run another way. A veine of silver which lieth but ebb within the ground, and is there discovered, the miners call Crudana, as it were a raw veine. In old time those that digged for silver, if they met once with alume, were woont to give over their worke and seeke no farther: but of late daies it happened, that under alume there was found a veine of white brasse or laton, which fed mens hopes still,

* or, *Molybdæna.*

* *quasi μετ' ἄλλα*, one after another.

and

A and cauſe them now to ſinke lower, and never reſt ſo far as they can dig. And yet there is a dampe or vapour breathing out of ſilver mines, hurtfull to all living creatures, and to doggs eſpecially. Moreover, this point is well to be marked, that gold and ſilver both, the ſofter that they bee and tender, the better they are eſteemed: and ſilver beeing white as it is, moſt men marveile how it commeth to paſſe, that if one rule paper or any thing therewith, it will draw blacke lines, and ſullie as it doth.

Furthermore, within theſe veins and mines aboveſaid, there is a certaine ſtone found, which yeeldeth from it an humor continually, and the ſame continueth alwais liquid: men call it *Quick-ſilver (howbeit, being the bane and poiſon of all things whatſoever, it mought be called Death-ſilver well enough) ſo penetrant is this liquor, that there is no veſſell in the world but it will eat B and break through it, piercing and paſſing on ſtill, conſuming and waſting as it goeth: it ſupporteth any thing that is caſt into it, and will not ſuffer it to ſettle downeward but ſwim aloft, unleſſe it be gold onely; that is the only thing which it loveth to draw unto it and embrace: verie proper it is therefore to affine gold; for if gold and it bee put togither into earthen pots, and after often ſhaking be poured out of one into another, it will mightily purifie the gold and caſt forth all the filthie excrements thereof; and when it hath rid away all the impurities and groſſe refuſe, it ſelfe ought then to be ſeparated from the gold: for which purpoſe, poured forth the one & the other ought to be, upon certaine skins of leather well tewed and dreſſed untill they bee ſoft; through which the quick-ſilver may paſſe; and then ſhall you ſee it ſtand upon the other ſide in drops like unto ſweat ſent out by the pores of our skin, leaving the gold pure and fine behind it: and verely C the affinitie between gold end quick-ſilver is ſo great, that if any veſſels or peeces of braſſe are to be guilded, rub the ſame over firſt with quicke-ſilver before the goldfoile bee laid on, it will hold the ſame moſt ſurely: mary this one diſcommoditie there is in it, that if the leaves of gold be either ſingle or verie thin, the whiteneſſe of the quick-ſilver will appeare through, and make the guilding more pale and wan: and therfore our cunning goldſmiths who would make their chapmen to pay for their plate as double guilt (when it is indeed but thin laid and ſingle) and ſo picke their purſes, ſet a rich and deepe colour upon their worke for the time, by laying under the gold in ſtead of quicke-ſilver naturall, the white of an egg, and then upon it artificiall quick-ſilver named Hydrargyrum, whereof I purpoſe to write in place convenient. And to ſay a truth, the right quick-ſilver which is of the owne kind, is not commonly found in great plentie.

D Over and beſides, within the ſame mines and among the veins of ſilver, there is found a minerall, which to ſpeake properly, is a ſtone concreat of a certaine ſcum or foame, white and ſhining, howbeit not tranſparent, which is called by ſome Stimmi, by others * Stibium, Alabaſtrum, or Larbaſon. And hereof there be two kinds, the male and the female: but the female Antimonie or Stibium is the better eſteemed: for the male is more rude, rough, and rugged; and yet for all that, not ſo weightie, bright, and radiant; beſides that, it is more charged with ſand: whereas the female contrariwiſe, ſhineth and glittereth plentifully; beeing alſo brittle and tender, apt to cleave eaſily into plates or flakes, and not to breake into lumps and gobbets.

Touching the vertues of Stibium pertinent unto phyſicke; aſtringent it is and refrigerant, but a principall and peculiar medicine to be emploied about the eyes; for thereupon it was that E moſt men called it Platyophthalmon, for that beeing put into thoſe ointments which are to *beautifie the eyes of women, (named thereupon Calliblephara) it ſeemeth to extend the compaſſe of the eyes, and make them appeare more open, faire, and *large withall. Antimonie pulverized and incorporat with the powder of frankincenſe, by the means of gum withall, ſtayeth the flux of humors into the eyes, and healeth the fretting and exulcerations incident thereto: being otherwiſe a proper medecine to ſtaunch the bloud that guſheth or iſſueth from the brain. But for to ſtop the bleeding of any freſh wound, the powder of Antimonie alone is thought to be more effectuall, if the place be ſtrewed withall: which alſo is a ſingular thing to heale the old bitings of doggs. It cureth moreover, any burne occaſioned by fire, in caſe it bee tempered in ſome convenient ſewet and wax, with litharge of ſilver and ceruſe or white lead, and ſo reduced F into a ſalve. But for to prepare Antimonie aright, it ought to be well luted all over with a certaine kind of paſt made of cow-dung, and then burnt and calcined in an oven: which beeing done, to bee quenched with womans milke, and then ſtamped and brayed well in a mortar, putting thereto raine water among, and ever and anon the troubled water ought to be transfuſed into a veſſell of braſſe; and clarified therein togither with ſal-nitre. As for that which ſettled in the

*Or life-ſilver.

* We call it *Antimonium*.

*And therfore *Jon* called it μέλαναν στίμμι ἰμματοχοίφον, when hee reckoneth up the devices that queen *Omphale* had to paint & trim her ſelfe.

* Which was coũted a grace in old time, as may appeare by *Homer*, who giveth to Qu. *Juno* the Epithet of βοῶπις, i. broad eied, as is a cow or heifer.

the bottome of the mortar, is held to be the droſſe and dregs thereof, ſtanding moſt upon lead, C
and is throwne away as good for nothing: but the pot or veſſell whereinto the troubled water aforeſaid was powred, after it is well covered and ſtopped with a linnen cloth, muſt be ſuffered to ſtand all night to take a ſettling; and the next morrow that which floteth aloft, is to be powred out by little and little, and the reſt of the liquor to be ſoked forth with ſpunges, and ſeparated from the antimonie. Now, that which reſteth in the bottome, is taken to bee the floure of antimonie, and ſo called; which they lay forth in the Sun a drying, covered with a fine linnen cloth, that it ſhould not be overmuch dried: which done, they beat this fine floure againe in a mortar, and ſo reduce it into trochiſques. But in this operation of preparing antimonie, above all things regard would be had in the burning thereof, that it be not overmuch calcined and ſo turne into lead. Some, in the burning of antimonie, uſe not dung as is beforeſaid, but rather lap the ſame H
about with ſome greace or tallow: others, after it is well beaten and punned, ſtreine it with water through a threefold linnen cloth, & caſt away the dregs remaining behind: but the liquor which paſſed through, they poure out of one veſſell into another, and the reſidence alwaies they gather and ſave, which they mix in the compoſition of plaſtres and eyeſalves or collyries.

As touching the droſſe or refuſe in ſilver, the Greeks call it Helcyſma: the nature thereof is aſtringent and refrigerative: it entreth into plaſtres, like as lead ore doth, (which is named Molybdæna, and whereof I entend to write in my treatiſe of lead) eſpecially thoſe that are made for to heale, cicatrice, and skin. Alſo being injected by way of clyſtre with oile of myrtles, it cureth tineſms and dyſenteries. It is uſed much alſo in thoſe lenitive and uncteous plaſtres named Liparæ; and ſerveth likewiſe for the excreſcenſe of proud fleſh in ulcers; for thoſe exulcerations which I
come of rubbing and fretting, or the running ſores and ſcalls in the head.

Within the mettall mines aforeſaid, there is engendred another minerall, knowne by the
3 name of Spuma argenti, [*i.* the ſome of ſilver] commonly called litharge; and three ſorts there be found of it. The beſt litharge, of gold, which they call Chryſitis: the ſecond, of ſilver, named Argyritis: and a third, of lead, which is Molybditis: and many times all theſe kinds ſo diſtinct in colour, are found in one and the ſame lumpe or puffed loafe of litharge. The beſt litharge is brought out of the region Attica: the next in goodneſſe commeth from Spaine. Litharge of gold named Chryſitis, is made of the verie mine and veine of ſilver; Argyritis, of ſilver it ſelfe; and Molybditis, of the lead which is melted with the ſilver: as wee may ſee at Puteoli, where great ſtore of it is made, and of that place tooke the name Puteolana. All the ſorts of them are made, K
after that the mettall or matter appropriat unto them, is throughly melted and tried; for it runneth downe from the upper pan into that underneath: out of which, it is taken up with yron broches; and to the end that it might be of a ſmall weight, ſome wind it about the broch in the
* *Spuma argenti.* verie flame of the furnace: and as it may appeare by the verie * name, it is no other thing but the ſcum of the ore or mettall boiling and melting over the furnace: from droſſe it differeth as much as ſcum or froth above, may from dreggs or lees beneath: and as the one is an excrement caſt up from a matter whiles it is purging it ſelfe, ſo the other is the refuſe or grounds thereof after it is purged and ſetled. Howbeit, many there bee, who make but two kinds of this ſome or
* or rather, *Stereotis.* litharge; the one * Stereſitis, as it were ſolide and maſſive; the other * Peumene, as one would
* or rather, *Pneomene.* ſay, puffed up and full of wind. As for the third, named Molybdæna, they reckon as a thing by L
it ſelfe; to be treated of in the diſcourſe or chapter of Lead. Now the Litharge aboveſaid, ought for the uſe that it is emploied about, for to be prepared in this manner: Firſt, the lumps aforeſaid are broken into ſinall peeces as big as hazell nuts, and ſet over the fire again: thus when it is once red hot by the blaſt of bellows, to the end that the coles and cinders might be ſeparated one from another, there is wine or vinegre caſt upon it, both to waſh, and alſo withall to quench the ſame. Now if it be Argyritis, to the end that it may looke the whiter, they uſe to breake it to the bigneſſe of beans, and give order to ſeeth it in water within an earthen pot, putting therto wheat and barly lapped within peeces of new linnen cloth, and ſuffer them to boile therwith untill they
* *Rumpuntur.* * burſt: which done, for ſix daies togither they pun it in mortars, waſhing it thrice everie day in cold water, and in the end with hot; and ſo at length put to everie pound of the ſaid litharge, the M
weight of one obolus of Sal-genum: the laſt day of all, they put it up in a pot or veſſell of lead. Some there be who ſeeth it with blaunched beans and husked barley, and after that, drie it in the Sun: others thinke it better to ſeeth it with beans and white wooll, untill ſuch time as it colour the wooll no more blacke: then they put thereto Sal-genum, chaunging eftſoons the water, and

drie

A drie it for the space of fortie daies together in the hotest season of the Summer. There be againe who thinke it best to seeth it in water within a swines bellie, and when they have taken it forth, rub it well with salnitre, & pun it in morters as before, with salt. Ye shall have them that never bestow seething of it, but onely beat it with salt, and then put water thereto and wash it. Well, thus prepared as is beforesaid, it serveth for collyries and eye-salves: in a liniment also, to take away the foule cicatrices or scars, the pimples and speckes likewise that marre the beautie of women, yea, and our dames wash the haire of their head withall to make it cleane and pure. And in very truth litharge is of power to drie, mollifie, coole, and attemper; to cleanse also, to incarnat ulcers, and to assuage or mitigat any tumors. Beeing reduced into the unguents and plastres abovesaid, and namely, with an addition of rue, myrtles, and vinegre, it is singular for S. *Anthonies* fire. Sembla-
B bly, being incorporat with oile of Myrtles and wax into a cerot, it healeth kibed heeles.

Chap. VII.

Of Vermillion: and of what estimation it was among the old Romanes: the first invention thereof. Of Cinnabaris, the use thereof in pictures and in Physicke. The sundrie sorts of Minium or Vermillion, and how it is to be ordered to serve Painters.

C THere is found also in silver mines a minerall called Minium, *i.* Vermillion, which is a colour at this day of great price and estimation, like as it was in old time: for the ancient Romans made exceeding great account of it, not only for pictures, but also for divers sacred and holy uses. And verely *Verrius* alleadgeth and rehearseth many authors, whose credit ought not to be disprooved, who affirme, That the manner was in times past to paint the very face of *Iupiters* image upon high and feastivall dayes, with Vermillion: as also, that the valiant captaines, who rode triumphant into Rome, had in former times their bodies * coloured all over therewith: after which manner, noble *Camillus* (they say) entered the citie in triumph. And even at this day, according to that auncient and religious custome, ordinarie it is, to colour all the unguents that are used in the feastivall suppers at a solemne triumph, with Vermillion. And no one thing do the
D Censors give charge & order for to be done, at their entrance into office, before the painting of *Iupiters* visage with Minium. The cause and motive that should induce our aunce stors to this ceremonie, I marvaile much at, and cannot imagine what it should be. True it is and well knowne, That in these daies the Æthyopians in generall set much store by this colour, and have it in great request, insomuch, as not onely the princes and great lords of those countries have their bodies stained throughout therwith, but also the images of their gods are painted with no other colour: in which regard I am moved to discourse more curiously and at large of all particulars that may concerne it.

* To shew what bloudie battels they had fought, & what carnage of their enemies they had made: for without much effusion and drawing of their bloud, they might not triumph.

Theophrastus saith, That 90 yeares before that *Praxibulus* was established cheefe ruler of the Athenians, (which falleth out just upon the 249 yeare after the foundation of our city of Rome)
E *Callias* the Athenian was the first that devised the use of Vermillion, and brought the lively colour thereof into name: For, finding a kind of red earth or sandie grit in the mines of silver, and hoping that by circulation there might be gold extracted out of it, tried what he could doe by fire, and so by that meanes brought it unto that fresh and pleasant hue that it hath: which was the first originall of Vermillion. He saith moreover, That even in those daies there was found Minium in Spaine, but the same was hard and full of grittie sand: likewise among the Colchi, in a certaine rocke inaccessible; by reason whereof, the people of the countrey were constrained by shooting at it, to shake and drive it downe: howbeit the same was but a bastard Minium. But the best simply (saith he) was gotten in the territorie of the Cilbians, somewhat higher in the countrey, than Ephesus: in summe, That the said Minium or Vermillion, is a certaine sandie earth, of a
F deepe skarlet colour, which was prepared in this order: First they pun and beat it into pouder, and then washed it being thus pulverized. Afterwards, that which setled in the bottome, they washed a second time. In which artificiall handling of Minium, this difference there is, that some make perfect Vermillion of it with the first washing: others thinke, the Vermillion of that making to be too pale and weake in colour, and therfore hold that of the second washing to be best.

And

And verely, I wonder not that this colour was ſo highly eſteemed: for even before time, during the eſtate of Troy, the red earth called Rubrica, was in great requeſt, as appeareth by the teſtimonie of *Homer*, who being otherwiſe ſparie ynough in ſpeaking of pictures and colours, yet commendeth the ſhips *painted therwith. The Greeks call our Minium by the name of Miltos, and yet ſome tearme it Cinnabari: And hereof aroſe the error occaſioned by the Indian name Cinnabari. For ſo the Indians call the bloudie ſubſtance of a Dragon cruſhed and ſqueaſed with the weight of the Elephants lying upon them readie to die, to wit, when the ſaid Dragons are full with ſucking out the bloud of Elephants before: and now their own and it are mingled together, according as I have ſhewed heretofore in the ſtorie of thoſe beaſts. And verely, there is not a colour beſides, which expreſſeth the lively colour of bloud in pictures ſo properly as Minium. As for that other Cinnabaris of India, it is moſt holeſome to be put into antidots, preſervatives, and countrepoyſons, yea, and other ſoveraigne medicines to be taken inwardly. But our Phyſicians (beleeve me) for that by an error Minium or Vermillion is called Cinnabaris, uſe in ſteed of Sanguis Draconis, the ſaid Minium; which in very truth is no better than a meere poyſon, as I will ſhew anon. Well, in old time they uſed to draw thoſe pictures and pourtraits which conſiſt of one ſingle colour, & be called Monochromata with this colour Cinnabaris. They painted alſo with the Minium of Epheſus, but they gave it over in proceſſe of time, becauſe ſuch colours were ſo coſtly, and required ſuch paines ere they were prepared and made perfect. Beſides, both the one and the other were thought to be over-quicke and ſtinging in hand: and therefore they betooke themſelves to the red earth Rubrica and Sinopum, of which colours I will ſpeake more in their proper places. But to returne again to Cinnabaris or Sangdragon: it is ſophiſticated and corrupted either with Goats bloud, or elſe with the fruit of Cervoiſes punned. But the true Cinnabaris or Sangdragon is worth fiftie ſeſterces by the pound. As for Minium or Vermillion beforeſaid, king *Iuba* ſaith, That it groweth plenteouſly alſo in Carmania. And *Hermogenes* affirmeth, That Æthyopia likewiſe is not without good ſtore of it. But from neither of thoſe two countries is it brought unto us, nor (to ſay a truth) out of any other place but Spaine. The beſt and moſt excellent is that which commeth out of the territorie of Siſapone in the realme of Granada or Bœtica, a part of Spaine, even from a mine of Vermillion there, which paieth a great cuſtome, and yeeldeth much revenue to the people of Rome: and there is nothing looked unto more ſtreightly for feare of fraud and impoſture: for, lawfull it is not there to dreſſe and refine it; but uncocted and crude is it brought to Rome in the maſſe as it lay within the veine, ſealed by the ſworne maiſters of the mine, which yeeldeth one year with another tenne thouſand pound weight or much thereabout. At Rome it is waſhed, and a price there is ſet upon it by an expreſſe act, namely, That it ſhould not be ſold above ſeventie deniers the pound. But many waies is it ſophiſticated, whereby the ſocietie and fellowſhip of the Publicanes, who had the ordering of it at Rome, robbed the Commonweale, and gained themſelves. For a ſecond kind there is of Minium, found almoſt in every mine of ſilver and lead, the which is made of a certaine ſtone intermingled in the veines of thoſe mettals after the ſame is burnt; and not of that red ſtone which yeeldeth forth the humour that I named before Quickſilver: for this ſtone may it ſelfe with boiling bee brought to ſilver, but of other red peeces of earth found together with the ſaid true Vermillion, which are knowne to be barraine and void of the right Vermillion, onely by the leaden hue which they have: for unleſſe it bee in the furnace they never wax red, and then beeing fully burnt and calcined, they are beaten to pouder. This is that Minium of a ſecond ſort, and much inferiour unto thoſe naturall pouders and ſands of the true Minium, notwithſtanding very few there be that know it. Well, this is that Minium wherewith the true Vermillion is ſophiſticated in the worke-houſes and ſhops of thoſe Publicanes, whoſe companie and fellowſhip had the ordering of it: like as it is corrupted alſo with Scyricum. But how this colour Scyricum is made, I will in due place write hereafter. Certes, our painters to give the better luſtre unto Minium, yea, and to ſave charges, have deviſed to lay the firſt ground under it of this Scyricum. Beſides this, they have another caſt to gaine (or ſteale rather) by Minium; for by reaſon that it ſticketh unto their penſils ever and anon, they waſh it off when they be full: this ſetleth downe to the bottome of the water where it remaineth, and the painters take it for their availes: but they were as good picke their maiſters purſe who ſetteth them aworke. But if a man would know the true and ſyncere Vermillion indeed, it ought to have the rich and freſh colour of skarlet. As for the brightneſſe that is in the ſecond ſort, if a wall bee painted therewith, the naturall moiſture and dankeneſſe that commeth from thence, will abate

the

*Such are called by *Homer* μιλτοπάρῃοι.

A the luſtre ſoone. And yet this Minium is taken to be but a kind of ruſt in mettals, either ſilver or lead, as they lie in the mines. Moreover, the minerall Vermillion found naturally in the foreſaid Minium mines of Siſapona, have no ſilver mixed therewith, boyle and trie it in the fire as much as you will. Alſo the way to find true Minium from falſe, is by the meanes of gold: for touch the ſophiſticat Minium with a peece of gold red hot, it will wax blacke: whereas the true Minium keepeth colour ſtill. [Where by the way note, That I read it may be falſified with Quickelime:] And after the ſame manner, if there be no gold at hand to trie it by, you ſhall ſoone ſee the proofe and find the falſhood by a plate of yron red hot, and uſed accordingly. Furthermore, this hath beene obſerved, That the ſhining beames either of Sun or Moone, doe much hurt to the luſtre of Vermillion, or any thing painted therewith. But what meanes to prevent this inconvenience? Even
B to verniſh the wall after the colour is dried upon it in this manner: Take white Punicke wax, melt it with oile, and while it is hote, waſh the ſaid painting all over with penſils or fine bruſhes of briſtles, wet in the ſaid verniſh. But when this vermiſh is laid on, it muſt be well chafed & heat againe with red hot coales made of Gall-nuts held cloſe unto it, that the wall may ſweat and frie againe: which done, it ought afterwards to be rubbed over well with cerecloths, and laſt of all, with cleane linnen cloths, that it may ſhine againe and be ſlicke as ſtatues of marble be.

Moreover, the workmen that are emploied in their ſhops about the making of Vermillion, do bind unto their faces in manner of Maskes, large bladders, that they may take and deliver their wind at libertie, and yet not bee in daunger of drawing in with their breath that pernicious and deadly pouder, which is no better than poyſon: yet ſo, as they may ſee out of the ſaid masks ne-
C vertheleſſe.

To conclude, Vermillion is uſed much in limning the titles and inſcriptions of rols and books, it ſetteth foorth the letters alſo, and maketh them more faire and beautifull which are written in tables over ſepulchres, be they enriched otherwiſe either with gold or marble ſtone.

Chap. VIII.

Of Quickſilver artificiall, called Hydrargyrum. Of guilding ſilver. Of Touch-ſtones for to trie the diverſe kinds of ſilver.

D SO inventive is the wit of man, that there hath beene deviſed in the world a meanes to make an artificiall Quickſilver in ſtead of the true and naturall, and that out of the ſecond kind of Minium which before I called Secundarium. I ſhould erewhile have ſpoken thereof in the chapter of the right Quickſilver, but deferred it I have no farther than to this preſent place. Firſt therefore this is to be underſtood, that made it is two manner of waies, ſometimes of the Minium aforeſaid punned with vinegre in morters, and with peſtles all of braſſe; otherwhiles it is drawne by fire: for they put ſecundarie Vermillion in an earthen pot well luted all over with cley, upon which there is ſet a pan of yron, & the ſame covered over the head with another pot well cemented; under which earthen pot abovenamed, there ought to be a good fire made, & the ſame kept continually with blowing: and thus by circulation there will appeare a dew or ſweat in the uppermoſt veſſell proceeding from the vapors reſolved, which beeing wiped off, will in ſubſtance ſhew
E liquid as water and in colour reſemble ſilver: The ſame liquor is eaſie to devide into drops, and as apt againe by the lubricitie thereof, to run into an humor. This Quickſilver beeing by the judgement of all men a ranke poyſon, I ſuppoſe, that all things repotted of Minium as medicinable, be dangerous remedies, unleſſe haply that by inunction of the head or belly, it ſtaieth flux of bloud; with this caution and charge notwithſtanding, that it neither perce and enter into the inward noble parts, nor touch the wound: for otherwiſe my conceit is, that it ought not to be uſed. I ſee that now adaies ſilver onely, and in manner nothing elſe, is guilded by the meanes of this artificiall Quickſilver: wheras gold foile ſhould be laid alſo after the ſame maner upon veſſels, or any workmanſhip of braſſe: but (as I have beforeſaid) the deceit and fraud that is every where in the world, which maketh men ſo wittie as they be, hath deviſed other meanes of guilding, and thoſe of leſſe
F diſpence and charge than with any Quickſilver, according as I have before declared.

I cannot thus write as I doe ſo much of gold and ſilver, but me thinks I muſt of neceſſity ſpeak of the ſtone which they call in Latin *Coticula, which in times paſt was not uſually found in any place but in the river Tmolus, as ſaith *Theophraſtus*: but in theſe daies wee find it every where: ſome call it Heraclius, others Lydius. Now theſe ſtones all the ſort of them are but ſmall, not

* *i.* The touch-ſtone,

excee-

exceeding foure inches in length, and two in bredth. That part or ſide which lieth above toward G
the Sunne when it is found, is thought better for touch, than the other which lieth to the earth.
By meanes of theſe touchſtones, our cunning and expert mine-maſters, if they touch any ore of
theſe mettals, which with a pickax or file they have gotten forth of the veine in the mine, will tell
you by and by how much gold there is in it, how much ſilver or braſſe, and they will not miſſe a
ſcruple: a wonderfull experiment and the ſame infallible.

As touching ſilver, two degrees there be of it, different in goodneſſe, which may bee knowne
and diſcerned in this manner: For lay a peece of ſilver ore upon a ſcliſe, plate, or fire pan of yron
red hot, if it continue white ſtill, it is very good, if the ſame become reddiſh, goe it may for good
too in a lower degree; but in caſe it looke blacke, there is no goodneſſe at all in it. Howbeit, there
is ſome deceit alſo in this triall and experiment, which may croſſe a man in his judgement: for H
let the ſaid ſcliſe or plate lie a time in a mans urine, be the ore never ſo baſe that is laid thereupon
when it is burning red hot, it will ſeeme to take a white colour for the time, and deceive him that
ſhall ſee it. To conclude, there is another pretie proofe of ſilver fine, if it be bright and burniſhed,
and that is by breathing upon it: for if the breath be ſeene therupon preſently as a ſweat, and the
ſame paſſe away incontinently as a cloud, it is a ſigne of perfect ſilver.

Chap. ix.

Of mirroirs or looking glaſſes. And of the Ægyptian ſilver.

AN opinion it was ſometime generally received and beleeved, That no plates might be dri- I
ven by the hammer, nor mirroirs made, but of the beſt and pureſt ſilver: And even this ex-
periment is falſified and corrupted by deceit. But ſurely a wonderfull thing in Nature this
is of theſe mirroirs of ſilver, that they ſhould repreſent ſo perfectly the image of any thing that
is before them, as they doe: which muſt needs be (as all men confeſſe) by the reverberation of the
aire from the ſolid bodie of the mirroir, which beeing beaten backe againe from it, bringeth
therewith the ſaid image expreſſed therin. The ſame reverberation is the cauſe that ſuch looking
glaſſes as by much uſage are poliſhed and made ſubtile, doe in that ſort gently drive backe the
image repreſented within them, that it ſeemeth infinitly big in proportion of the bodie it ſelfe:
ſuch difference there is in them, and ſo materiall it is, whether they repercuſſe and reject the aire,
or receive and entertaine it. Moreover, there bee drinking cups ſo framed and faſhioned with a K
number of mirroirs within, that if there doe but one looke within them, he ſhall imagine that he
ſaw a multitude of people, even as may images as there bee mirroirs. There are deviſed looking
glaſſes alſo, which will repreſent monſtrous ſhapes; and ſuch be thoſe mirroirs that are dedicated
in the temple at Smyrna: but this commeth by reaſon that the matter wherof they be made, is in
that ſort faſhioned. For it skilleth much whether mirroirs be hollow, either in manner of a drin-
king pot, or of a Threcidian buckler: whether the middle part lie low and inward, or riſe & beare
out with a bellie: whether they bee ſet croſſe and overthwart, or ſtand bias: whether they hang
with their heads bending backward, or bolt upright: For according as the matter which receiveth
the image, is diſpoſed to this or that faſhion, or ſet one way or other, ſo it returneth the ſhaddows
backe againe: for verely the ſaid image repreſented in a mirroir, is nothing els but the brightnes L
and cleareneſſe of the matter which receiveth the ſame, returned and beaten backe againe. But
to goe through in this place with all things concerning ſuch looking glaſſes, the beſt knowne in
old time unto our auncеſtors, came from Brindis, and thoſe conſiſted of tin and braſſe tempered
together. But when ſilver mirroirs came in place, thoſe went downe, and theſe were preferred be-
fore them. The firſt that made them of ſilver, was *Praxiteles* in the dayes of *Pompey* the great. Of
late, men had this opinion of ſilver mirroirs, That they would repreſent an image more lively and
truly, in caſe their backe part were laid over with gold.

But to returne again to ſilver, the Ægyptians uſe a deviſe to paint it, to the end that they would
drinke more devoutly, ſeeing their god *Anubis* painted within their pots. And in truth they reſt
contented with painting their plate, and never grave or chaſe any peeces. This deviſed faſhion is M
grown into ſuch credit by the precedent received from thence, that the ſtatues of ſilver caried in a
ſhew at triumphs, be nought ſet by, unleſſe they be alſo enamelled and painted blacke: & wonder-
full it is how much more precious they are thought to be when the native brightnes therof is hid-
den, & the light therof quite put out or blindfolded. The maner of making this black ſilver, is thus:

They

A They take of ſilver and ſulphur vif as much of the one as the other, of Cyprian braſſe or latton plates(which braſſe they call Coronarium) as thin as may be, a third part: theſe they mix together and melt them in an earthen pot well luted all over with cley: and boile they muſt ſo long, untill the lid of the pot doth riſe up and flie open of it ſelfe. Moreover, ſilver will looke blacke with the yolke of an egge roſted hard and well beaten with vinegre and Tripoli.

To come now unto thoſe that counterfeit money. *Antonius* whiles hee was one of the three uſurping Triumvirs, mixed yron with the Romane ſilver denier. He tempered it alſo with the braſen coine, and ſo ſent abroad falſe and counterfeit money. Others there be that make money too light (namely, under the lawfull proportion) which is, to coin and ſtampe for every pound weight of ſilver foureſcore and foure deniers. This enormitie grew to this paſſe, that *M. Gratidianus* pub-
B liſhed a law, by vertue whereof there was an act inſtituted and ordained for the proofe and allowance of ſilver deniers, what touch & what poiſe they ſhould have: by which act of his he ſo pleaſed the Commons of Rome, that there was not a ſtreet throughout all the citie, but they erected a ſilver ſtatue, pourtraied all whole in a gowne in the favour and honour of *Marcius Gratidianus*. But ſtrange it is, and a man would not think it, that this art and cunning deviſed for the detecting of falſhood and forgerie, is the onely meanes to teach deceit and wickedneſſe, for many a man will give too too much for falſe money: yea, and many ſilver deniers for one counterfeit, well and cleanely made; to take forſooth a patterne thereby, and learne to deceive others.

Chap. X.

C

Of exceſsive ſummes of money in mens hands. Who they were in old time that were thought richeſt. And when there began largeſſes at Rome, and money to be ſcattered and caſt abroad to the people.

IN old time men knew no number above a hundred thouſand: and therfore at this day alſo inſtead of a million we multiplie the ſaid number by tenne, and ſay thus in Latine, *Decies centina millia*, *i.* A hundred thouſand tenne times told, and ſo forward, *repeating alwaies a hundred thouſand to the numerall adverbe, as the ſumme doth amount. Vſuries, intereſts, and coined mo-
D ney have been the cauſe of theſe multiplications: and by that occaſion alſo came debts to be called even to this age, by the name of *Aes alienum*. And thereof aroſe the proud name of *Divites*, *i.* Rich, for great monied men were ſo called. Yet take this withall, That the firſt man that ever was knowne by that ſurname *Dives*, brought a ſhilling to nine pence in the end, prooved Banquerout, and defeated his creditours. As for *M. Craſſus*, one of that ſame houſe, and who gave the ſame armes, would commonly ſay, That no man was to be counted rich, and worthie of that title *Dives*, unleſſe he were able to diſpend by the yeare as much in revenues as would maintaine a legion of ſouldiors. And verely his owne lands were eſteemed worth *Bis millies ſeſtertium*, that is to ſay, Two hundred millions of ſeſterces, Roman: and ſetting aſide *Sylla*, he was the richeſt Roman that ever was knowne. And yet ſuch was his avarice, that hee could not content himſelfe with that wealthie eſtate, but upon a hungrie deſire to have all the gold of the Parthians, would needs un-
E dertake a *voiage againſt them. And albeit by his ineſtimable wealth he uſurped the title and addition of *Optimus*, *i.* The beſt, in his time, yet (for me thinks it doth me good to proſecute ſtill, and inveigh againſt this inſatiable deſire of having more) we have knowne many after him, and thoſe otherwiſe of baſe condition, and no better than ſlaves newly enfranchiſed, to have growne unto greater wealth; and namely three at one time, to wit, during the Empire of *Claudius Cæſar*: and thoſe were *Pallas*, *Calliſtus*, and *Narciſſus*, late bondſlaves all to the ſaid Emperour. But to let theſe men paſſe, as if they were lords ſtill of wordly wealth: in that yeare wherein *C. Aſinius Gallus* and *C. Marcius Cenſorinus* were Conſuls of Rome, died *C. Cæcilius Claudius*, who ſignified by his laſt will and teſtament, bearing date the ſixth day before the Calends of Februarie, the yeare above written, That albeit he had ſuſtained exceeding great loſſes during the troubles of the civile war,
F yet he ſhould leave behind him at the houre of his death, of ſlaves belonging to his retinue four thouſand one hundred and ſixteene; in Oxen, three thouſand and ſix hundred yoke; of other cattaile 257000 head; and in readie coine, H-S DC. *i.* threeſcore millions of ſeſterces Romane. And beſides, he ſet out for defraying of his funerall charges, *eleven thouſand ſeſterces, and gave order expreſſely, to bee enterred ſo ſumptuouſly. But what of all this? Set caſe theſe and ſuch like men

*To wit, twentie times, or a hundred times; a hundred thouſand, &c.

*i. Craſſus.

* In which expeditiõ he was taken priſoner by *Surinas*, lieutenant general for the king of Parthia: who ſtrake off his head, & poured gold melted into his mouth to ſatisfie his hunger after it.

*H-S. XI. which if you read by the numerall adverbe (*undecies*) amounteth to the ſaid ſum a hundred times told.

men gathered together innumerable ſummes of money, and an infinit maſſe of goods, yet they ſhall come nothing neare to the wealth of king *Ptolomæus*, who according to the teſtimonie of *M. Varro* (at what time as *Pompey* the Great warred about Iurie) maintained eight thouſand horſmen in pay continually with his owne privat purſe: kept an ordinarie table within his court of a thouſand perſons, and thoſe had every man his owne cup of gold to drinke out of, and at each courſe and change of meats that came in, new plate was ſerved up ſtill to the bourd. Theſe gueſts of his fared ſo highly, that a man would have ſaid they had beene franke-fed. But how far ſhort was this mightie and ſumptuous prince thinke yee (for I will ſay no more now of kings) in compariſon of one *Pythius* a Bithynian, who ſent unto *Darius* the king a preſent of a Plane-tree, all entier of beaten gold, and withall, that famous gold Vine, ſo much renowmed by all writers: feaſted the whole armie of that mightie monarch, & thoſe were *788000 men: promiſing over and above five months pay for them all, and corne for ſo long to ſerve the whole campe, if of five ſonnes that he had of his owne, the king would ſpare him but one to beare him companie in his old age, and not preſt him for to ſerve in the wars. Certes, a man that heareth thus much of this *Pythius*, might compare him with that rich *Cræſus* king of Lydia. But what follie and madneſſe in the devils name is this, to hunger & thirſt ſo much in this life after that, which either is common to baſe ſlaves and may fall unto them, or els whereof kings themſelves can find no end? And thus much of gathering good and heaping riches together.

*Vide Eudæum.

To come now to the ſcattering thereof, I find in the Chronicles, That in the yeare wherein *Sp. Poſthumius* and *Qu. Martius* were Conſuls, they began at Rome to make largeſſes, and to fling money abroad to the common people. And at that time ſuch plentie of coine there was ſtirring at Rome, that the citie beſtowed by a generall contribution upon *Lu. Scipio*, as much as bare out his charges in exhibiting the ſolemne games and plaies unto the people. As for that purſe which was made for the funerals of *Agrippa Menenius*, wherein every man put his ſextant, *i.* the ſixt part of an As, I take it to have beene no largeſſe, but a benevolence to teſtifie how the people honoured *Agrippina*, and a ſupplie of meere neceſſitie, conſidering how poore the man died.

Chap. xi.

Of the ſuperfluitie and frugalitie both, of men in times paſt, touching plate and ſilver veſſell. Of beds and tables of Silver. Alſo when there were deviſed chargers and platters of Silver to be made of huge capacitie beyond all meaſure.

THe world is given to ſuch inconſtancie as touching ſilver plate, that a wonder it is to ſee the nature of men how variable they bee in the faſhion and making of ſuch veſſell: for no workmanſhip will pleaſe them long. One while we muſt have our plate out of *Furnius* his ſhop, another while wee will bee furniſhed from *Clodius*: and againe in a new fit, none will content us but of *Gratius* his making (for our cupbourds of plate and tables, forſooth, muſt beare the name of ſuch and ſuch Goldſmiths ſhops.) Moreover, when the toy takes us in the head, all our delight is in chaſed and embоſſed plate; or elſe ſo carved, engraven, and deepe cut in, as it is rough againe in the hand, wrought in imagerie or floure-worke, as if the painter had drawne them. And now adaies we are growne to this paſſe, that our diſhes are ſet upon the table, borne up with feet and ſupporters to ſuſtaine the viands and meat therein, but in any wiſe their ſides muſt bee pared very neare; for herein I may tell you lieth a great matter, and the more that the ſides and edges hath loſt by the file, the richer is the plate eſteemed to be.

As touching the veſſell ſerving in the kitchin: did *Calvus* the noble Oratour complaine in his time that it was of ſilver? Why, wee in theſe dayes doe more than ſo, for wee have deviſed that our coaches ſhould bee all ſilver, and thoſe curiouſly wrought and engraven. And within the remembrance of man, even in this age, *Poppæa* the Empreſſe, wife to *Nero* the Emperour, was knowne to cauſe her Ferrers ordinarily to ſhoe her coach-horſes and other palfreis for her ſaddle (ſuch eſpecially as ſhee ſet ſtore by, and counted more daintie than the reſt) with cleane gold. To what exceſſe and prodigalitie is the world now growne unto? *Scipio Africanus* the ſecond of that name when he died, left no more unto his heire in ſilver plate and coine than two and thirtie pound weight: and yet this worthie knight, when he rode in triumph for the conqueſt

A queſt of the Carthaginians ſhewed in that ſolemne pompe, and brought into the chamber of Rome as much treaſure as amounted to *foure thouſand foure hundred and ſeventie pounds weight of ſilver, a thouſand times told. This was all the treaſure in ſilver that the whole ſtate of Carthage was able to make in thoſe daies; Carthage (I ſay) that great and proud cittie which pretended a title to the Empire of the world, and maintained the ſame againſt Rome: and yet ſee! in this age there is as much laid out in our cupbourds of plate, and furniture of our tables. The ſame *Africanus* afterwards, upon the winning and finall ruine of Numantia, gave among his ſouldiors in a triumph, 17000 pound weight of ſilver. O brave ſouldiors, and worthie ſo noble a captaine, who ſtood contented with ſuch a reward. A brother of this *Scipio*, ſurnamed *Allobrogius*, was the firſt knowne to have in plate, one thouſand pound weight: but *Livius Druſus*,
B whiles he was but Tribune or Provoſt of the comminaltie, had in ſilver veſſell as much as weighed eleven thouſand pounds. Now if I ſhould tell you that the Romane Cenſors upon a time diſgraced, yea and degraded an ancient captain and one who in his time had rode in triumph, only for that he had in plate five pound weight, it would bee taken in theſe daies for a meere tale and vaine fable: as alſo that *Catus Aælius* in his Conſulſhip, was found ſitting at dinner ſerved with earthen veſſell of potters worke, when the Embaſſadors of the Ætolians came unto him: that he refuſed alſo ſilver plate preſented unto him for the furniture of his bourd, and to his dying day had never in ſilver more than two drinking cups, which *Lucius Paulus* his wives father beſtowed upon him after the deſeiture of K. *Perſeus*, in regard of his valiant ſervice; we hold it now for no leſſe than an untruth & incredible. And here I call to mind a merry conceited ſpeech that I have
C read in the Chronicles, of certaine Carthaginian Embaſſadours, who ſaid, That no men in the world had more good fellowſhip in their houſes, and lived more friendly togither, than the Romans: for why? when they feaſted one another (ſay they) the ſame *ſilver plate went round about amongſt them all from one to another without chaunge. But howſoever this frugalitie whereof I ſpeake, may ſeeme ſtraunge and fabulous to the world wherein wee live, certes we all know this to be true and no fable, that *Pompeius Paulinus* (the ſonne of a Romane knight or man of armes borne at Arles) was not only baniſhed out of the country and nation where his father was born, but confined alſo to the marches of moſt ſavage and barbarous people and expoſed to their cruD eltie, onely for this, That he had in his campe (to the evill example of the armie) as much ſilver plate as weighed twelve pounds. But long agoe it is ſince the faſhion came up at Rome, that our dames had their beds covered all over with ſilver, yea & ſome dining roums with tables laid with the ſame: which invention came firſt (as it is reported) from *Carvilius Pollio*, a gentleman or knight of Rome, who deviſed to garniſh his bourds with ſilver, not covering them full & whole throughout with plates thereof, nor after the manner of Deliacke workemanſhip, but onely by parcels, and according to the Punicke or Carthaginian faſhion. The ſame *Pollio* made beds and tables of gold: but not long after, thoſe ſilver beds and bourds came to the order of thoſe in the Iſle Delos. But all this ſumptuoſitie was puniſhed ſufficiently and expiat by the civile warre of *Sylla*: for a little before thoſe troubles, this exceſſe and theſe ſuperfluities came up: as alſo about the ſame time, men fell to make great chargers and platters of ſilver, weighing one hundred pound a peece; of which there were at Rome (as it is well knowne) when the ſaid warre began, to
E the number of five hundred and above: which was the cauſe that many a man fell into the daunger of proſcription and confiſcation, for that their rich plate ſet their enemies teeth on water; who for the love and deſire thereof, practiſed by all cunning means their utter undoing. Certes our hiſtorians heretofore, who attributed this curſed and unhappie civill warre betweene *Sylla* and *Marius*, unto ſuch ſuperfluities and vices of thoſe times which reigned ſo rife, might be aſhamed and bluſh to ſay ſo; for our age hath been more hardie, and hath proceeded farther without any ſuch feare of puniſhment from above. No longer ſince, than in the daies of *Claudius* the Emperor, *Druſillanus* a ſlave of his ſurnamed *Rotundus*, (the Seneſchol or Treaſurer under him in hiigh Spaine) had a ſilver charger of five hundred pound weight (for the working whereof, there was a forge framed beforehand of ſet purpoſe:) and the ſame was accompanied and at-
F tended with eight more of a ſmaller ſize, weighing fiftie pound apeece. Now would I gladly know (if it might pleaſe you) how many of his fellows (ſuch ſlaves I meane as himſelfe) there muſt be to carie the ſaid veſſell and ſerve it up to the table? or what gueſts they mought be who were to be ſerved with ſuch huge plate? *Cornelius Nepos* writeth, That before the victorie of the ſaid *Sylla* who defeited *Marius*, two dining tables and no more there were throughout Rome, all of ſilver.

* *Quater millies, quadringena ſeptuagena millia pondo*: which is foure millions of milliõs foure hundred & 70 thouſand pound weight. An incredible ſum, conſidering that which preſently followeth: and therefore I ſuppoſe this place in *Plinie* is corrupted.

*This was ſpoken by way of jeaſt, and ſeemes ſo: for that all their veſſell being plate of potters clay & no better, ſeemed alwaies the ſame: whereas in ſilver plate, men were delighted with diverſitie of workmanſhip, and varietie of faſhion.

Feneſtella ſaith, that in his time (and hee died the laſt yeere of the reigne of *Tyberius Cæſar* the Emperor) men began at Rome to beſtow ſilver upon their cupbords and ſide liverie tables: and even then alſo (by his ſaying) tortoiſe worke came in requeſt and was much uſed. Howbeit, ſomwhat before his daies, he writeth, that thoſe cupbourds were of wood, round and ſolid of one entire peece, and not much bigger than the tables whereupon men eat their meat: but when hee was a young boy, they were foure ſquare, and of many peeces joyned togither; and then they began to be covered over with thin bourds or painels, either of maple or citron wood. Soone after, they fell to lay ſilver plates upon them at the corners onely, and along the joynts where the planks were ſet togither: but by the time that hee was come to bee a well growne young man, they were at their drinking mazers or round-bottome diſhes like balances, whereupon they were called Stateræ: alſo at thoſe platters, which in old time were named Magides. Howbeit, men reſted not contented to have furniſhed themſelves with plentie of ſilver in their plaine plate and about their houſes, unleſſe the curious workmanſhip alſo thereof were more coſtly than the mettall and matter it ſelfe. But leaſt this ſuperfluitie ſhould bee imputed unto us in theſe daies, be it knowne, that ſuch curioſitie was crept into the world long agoe: for *C. Gracchus* had in the furniture of his houſe, certaine veſſels of ſilver called Dolphins, which coſt him at the goldſmiths hand 5000 ſeſterces a pound: an exceeding price for the faſhion & workemanſhip, conſidering *L. Craſſus* the orator had two pots artificially engraven by the hand of *Mentor* that cunning workman, the faſhion and making whereof coſt* 100 ſeſterces a pound: and yet he confeſſed and proteſted, that he was abaſhed to uſe them, and durſt not for ſhame bring them abroad. Moreover, knowne it is, that he had in his cabinet peeces of plate, which to be bought and ſold were woorth everie pound 6000 ſeſterces. But in breefe, the conqueſt and reducing of Aſia under our Empire, was the firſt occaſion that brought into Italy ſuch waſtfull exceſſe: for *L. Scipio* ſhewed in triumph of ſilver plate, entailed & engraven, 400 thouſand and 50 pounds weight, beſides veſſels of gold amounting to the weight of 100 thouſand pound: And this was in the yeere from the foundation of Rome, 565. But the free * donation and beſtowing of the ſaid Aſia upon the cittie of Rome, (which fell unto the Romans by the death of king *Attalus*, who in his laſt will and teſtament ordained them his full heires) did moſt hurt unto our ſtate: and this ſucceſſion which our auncients enjoyed by vertue of that gift, did greater damage to the integritie of manners, & brought more corruption into our citie, than the former victory atchieved by force of arms: for from that time forward men grew to bee ſhameleſſe, and without regard of modeſtie everie mans fingers itched to be tempering with the treaſure of K. *Attalus*, and to buy the ſame at any price, ſold in open portſale to them that would give moſt: which hapned in the 626 yeer after the foundation of the citie: for in 56 yeers (which was the meane ſpace betweene the foreſaid ſubduing of Aſia and this feoffment of K. *Attalus*) our citie was well nuzzled and trained not only in the admiration of ſuch puiſſant forrein kings & princes, but alſo in ſome affectionat love to their wealth and riches. About which middle time between, and namely in the 608 yeere, reckoning from the firſt founding of Rome, when Achaia was likewiſe brought under our obedience and ſubjection, this victorie alſo was a mightie means to bring us alſo out of all good order, and to ſet us forward to embrace ſuperfluities and to overthrow all honeſtie & vertue: for now were brought in the ſtately ſtatues & proud painted tables, that we ſhould want no enticing delights, but that all the pride and pleaſure of the world might be found at Rome. Finally, the ruin of Carthage, was the riſing of ſuperfluitie with us, as if the Deſtinies had ſo appointed, that at one and the ſame time we ſhould have both will to embrace vice, and alſo power & libertie withall to perform ſin: ſo that in regard of our times and the enormities therof, we may juſtifie, yea and honour any of our anceſtors who ſeemed before to offend in this behalfe. For, as it is ſaid, *C. Marius* after he had defeited the Cymbrians, contented himſelfe to drinke in a wooden godet and tankerd, after the example of father *Bacchus*: *C. Marius* I ſay, who of a good husbandman in the countrey about Arpinum, and of a common and ordinarie ſoldior, came to be a brave captaine and commaunder in the field.

* *Centum ſeſtertis*: a ſmall matter to the former, and about 15 or 16 *ſh.* of our mony. If you read *Seſtertium centum*, or *Centum ſeſtertijs*, in the neuter gender, it is a thouſād times as much, and that were as monſtrous.

* *Donata*, not *Domata*, according to *Budæus*

Chap. xii.

Of ſtatues and images of ſilver: of the workmanſhip in graving ſilver, and of other things pertinent thereto.

MEn commonly have thought, that the firſt ſtatues of ſilver ſeene in Rome, were made in the honour of the Emperour *Auguſtus*, by way of courting and flatterie to win his grace and

A and savour, as those times did require: but it is altogither untrue; for before his daies, wee find that *Pompey* the Great when he rode in triumph, caused the silver statue of king *Pharnaces* (the first [of that name] that ever reigned in the realme of Pontus) to be carried in a solemne shew: like as the image also of *Mithridates* his father; besides chariots as well of gold as of silver.

Moreover, it falleth out sometimes, that silver is used instead of gold also upon some urgent cause and just occasion: as we may see by our proud and sumptuous dames, that are but commoners and artizans wives, who are forced to make themselves carquans and such ornaments for their shoes, of silver, because the rigour of the statute provided in that case, will not permit them to weare the same of gold. And I my selfe, as I remember, have seene *Aurelius Fuscus* (a gentle-
B man of Rome, who being put beside his place, and having lost the dignitie of a man of arms, by reason of a notable calumniation framed against him, when as young gentlemens sonnes used to accompanie him because he had the name of a brave souldior) weare his rings, of silver. But to what purpose doe I collect these examples, seeing how our souldiours make no reckoning of yvorie, but the hilts of their swords and the hafts of their daggers, bee garnished with silver, damasked, and engraven; their scabberds and sheaths be set out with silver chapes, and their sword girdles, hangers, and bawdricks, gingle againe with thin plates of silver. And doe we not see how our young boyes are * kept in and restrained with silver, during the time that they be under mans age? how our fine dames use to wash and bath in silver, disdaining and setting light by any other bathing-vessels in the bains? insomuch as the same mettall and matter which we are served with at the table, is employed also in shamefull and uncleanly uses. Oh that *Fabricius* were alive now
C againe to behold these things! If hee saw our women bathing togither with men in one and the same bains, and those paved (as it were) under foot with silver so smooth and slipperie that they cannot hold their feet: *Fabricius* I say, who forbad expressely, that any warriours and Generall captains should have in plate more than one drinking boll or goblet, and a saltsellar: If he saw silver (which was woont to be given in presents and rewards to brave men and valiant captains) thus to be melted and broken to serve for these purposes, what would he say? but, What a world is this! wee passe not for *Fabricius*, nay we are ashamed of him and his frugalitie.

But to leave these abuses and complaints: one thing I woonder much at, that among so manie excellent artizans as have beene, there is not one who tooke any pleasure to grave in gold, nor became renowmed thereby; whereas many are famous for their workemanship in
D silver: howbeit *Mentor* (of whome I spake erewhile) excelled them all in this kind: and yet I doe not find, that ever he made in all, above eight peeces that were curiously and exquisitly wrought, and those (as it is said) bee all lost. And no marveile; for why? the temple of *Diana* at Ephesus lieth along: the Capitoll of Rome likewise, and all within it, hath perished by fire. Howbeit, *Varro* hath left in writing, That among his antiquities, one brasen image he had of *Mentors* handworke. Next to him, the world had *Acragas*, *Boethus*, and *Mys*, in great admiration for their excellent skill: and at this day there be extant, peeces of all their workmanship, to be seen in the Isle of the Rhodians: for in the temple of *Minerva* which is at Lindus a citie in that Island, there is one statue of the said goddesse, of *Boethus* his making: within the temple of god *Bacchus* in the verie citie it selfe of Rhodes, there are certaine cups wrought by *Acragas*, wherein bee engraven
E the religious Priestesses called Bacchæ, and the Centaurs. Within the same Church, are the pourtraicts of *Silenus*, and the prettie *Cupids*, expressed lively in imagerie, by *Mys*. Moreover, *Acragas* pourtraied the resemblance of chaces or hunting, in certaine pots, most artificially; for which he became verie famous. After these, there are to bee raunged in another degree, *Calamis* and *Antipater*; togither with *Stratonicus*, who wrought within a broad-mouthed cup, one of the Satyres sound asleepe; but with such dexteritie and so lively, that hee is judged and said to have couched and fitted him to the cup, rather than barely engraven him. Then followeth *Tauriscus* of Cyzicum: semblably *Aristus* and *Eunicus*, both Mityleneans, are highly commended: as also *Hecatæus* and *Praxiteles*, who flourished about the time of *Pompey* the Great. *Posidonius* also of Ephesus, and *Ledus* the Stratiat, who was in great name for engraving of battails and ar-
F med men at the point to joyne skirmish. Likewise *Zopirus*, who made two singular cups; in the one, hee represented the honourable court of the Areopagites; in the other, the triall and judgement of *Orestes*: which were esteemed woorth twelve talents. In another age lived *Pytheas*, a singular artificer, whose workemanship was so rare and exquisit, that everie two ounces of his silver plate, was sold commonly for twentie thousand Sesterces: and verely a broad goblet or stan-

* I could set this downe more plainly: but in some respect of chast minds & ears I am willing enough to leave it as obscure in English, as I found it in Latine.

ding peece there was of his making, with a deuiſe appendant to it, for to be ſet too and taken off by a vice, and the ſame reſembled *Vlixes* and *Diomedes*, ſtealing the Palladium out of the temple of *Minerua* in Troy. The ſame workeman deuiſed to ſet into little cups, prettie images or mannikins reſembling cookes, which he tearmed Magiriſcia, but ſo finely and delicatly wrought they were, that the patterns of them could not be taken out in any mould, without hurting and ſpoiling; ſo ſubiect were they to any outward injuries in the handling. Furthermore, *Teucer* was famous in his time, for his dexteritie and light hand in ſhallow embоſſing. Well, in as great requeſt as theſe artificers were in times paſt, yet this cunning decaied all on a ſodaine, and grew ſo farre out of uſe, that nothing now commendeth ſuch peeces of worke, but onely antiquitie: in which regard, how neare ſoever they bee worne with continuall handling, in ſo much as the ſhapes and proportions of the imagerie engraven cannot be diſcerned, yet great ſtore is ſet by any ſuch antique plate whereſoever it is to be had. G H

Over and beſides, it is to be noted, that ſilver will ruſt in medicinable waters, ſuch as ſtand upon ſome eſpeciall mine; yea the ſalt aire breathing from them, is able to infect it: as we may ſee in the mediterranean parts of Spaine far remote from the ſea.

Alſo, in mines of gold and ſilver, there are ingendred certaine minerall colours ſerving for painters; to wit, * Sil and Azur. As for Sil, to ſpeake properly, it is a kind of muddie ſlime: the beſt of this kind is called Atticum: and everie pound of it is woorth two and thirtie deniers. The next in goodneſſe, is hard as ſtone or marble, and carrieth hardly halfe the price of the other named Atticum. There is a third ſort, of a faſt and compact ſubſtance, which becauſe it is brought out of the Iſland Scyros, ſome call Scyricum: and yet of late verely, wee have it out of Achaia alſo, and this is the Sil that painters uſe for their ſhadows: this is ſold after two ſeſterces the pound. As for the Sil which commeth out of Fraunce, called the Bright Sil, it is ſold in everie pound two aſſes leſſe than that of Achaia. This Sil, and the firſt called Atticum, painters uſe to give a luſtre and light withall: but the ſecond kind, which ſtandeth upon marble, is not emploied but in tablements and chapters of pillers, for that the marble grit within it, doth withſtand the bitterneſſe of the lime. This Sil is digged likewiſe out of certaine hills not paſt twentie miles from the cittie of Rome: afterwards, they burne it, and by that means doe ſophiſticat and ſell it for the faſt or flat kind named Preſſum: but that it is not true & naturall, but calcined, appeareth evidently by the bitterneſſe that it hath, and for that it is reſolved into powder. I K

* i. Ochre.

Chap. xiii.

* i. Ochre.
* Azur.

Of * Sil, * Cæruleum, Neſtorianum, and Cælum. Alſo, that all theſe kinds keepe not the ſame price everie yeere.

Polygnotus and *Mycon* were the firſt painters who wrought with Sil or Ochre, but they uſed onely that of Athens in their pictures. The age enſuing, emploied it much in giving light unto their colours, but that of Scyros and Lydia for ſhadowes. As for the Lydian ochre, it was commonly bought at Sardis, the capitall cittie of Lydia, but now it is growne out of all remembrance.

As touching Cæruleum or Azur, it is a certaine ſandie grit or powder: of which, in old time there were knowne three kinds: to wit, the Ægyptian, moſt commended above the reſt: the Scythian, which is eaſie to bee diſſolved and tempered, and in the grinding turneth into foure colours; namely, the Azure, which is of a pallet colour, called therefore the whiter; the blacker Azur, of a deeper blew; there is the Azur alſo of a groſſer ſubſtance; and the fourth of a finer. The Cyprian Azur is preferred before that of Scythia. Over and above theſe Azurs beforenamed, we have ſome from Puteoli and Spaine, where they bee artificiall, and they have taken to making it, of a kind of ſand. All the ſorts of theſe Azurs, receive firſt a dye, and are boiled with a certaine hearbe appropriat to it, called Oad, the colour and juice whereof Azur is apt to drinke in and receive. As for all the preparation and making of it otherwiſe, it is the ſame that belongeth to Chryſocolla or Borax. Of Azur there is made that powder which we call in Latine Lomentum, for which purpoſe it muſt bee firſt punned, pulverized, and waſhed; and this is whiter indeed than the Azur it ſelfe: ſold it is after three and twentie deniers the pound, whereas Azur may be bought for eighteene. Herewith they uſe to paint walls that bee overcaſt with plaſtres, for line it will not abide. Of late daies there is a kind of Azur growne into requeſt, called Neſtoria- L M

num,

A num, taking that name of him who first devised it: made it is of the lightest part of the Ægyptian Azur, and it costeth fortie deniers the pound. Of the same use also is that Azur of Purcoli, save onely in windows; and this some call Cœlon. It is not long, since another kind of Azur or blew named Indico, began to be brought over unto us out of India, which is prized at seventeen deniers the pound. It serveth painters well for the lines called Incisuræ, that is to say, for to devide shadows from lights in their works. To conclude, there is another kind of Lomentum or blew powder of the baseſt account of all other; some call it Tritum, and it is not esteemed worth above five asses the pound.

But to trie the right and perfect Azur indeed, the best experiment is to see whether it will flame upon a burning cole. As for the false and sophisticat Azur, it is thus made: They take the
B floures of violets dried, and boile them in water: the juice they presse foorth through a linnen cloth, and mix the same with the chaulkie earth called Eretria, untill such time as it bee well incorporat with it.

To proceed unto the medicinable vertues of Azur: It is holden to be a great cleanser, and therefore it mundifieth ulcers: in which regard, it entreth into plastres: as also into potentiall cauteries. As touching Ochre or Sil, it is exceeding hard to bee reduced into powder: and this also serveth in physicke; for it hath a mild kind of mordacitie: astringent it is besides and incarnative; in which respect, soveraigne to heale ulcers: but before that it will doe any good, it ought to be burnt and calcined upon an earthen pan.

To conclude with the prices of all those things named heretofore: howsoever hitherto I have
C set them downe, yet I am not ignorant, how they varie according to the place; yea and alter in manner everie yeere: And well I wot, that as shipping and navigation speeds well or ill, as the merchant buyeth cheape or deare, the price may rise and fall. Againe, it falleth out, that sometime one rich munger or other, buying up a commoditie, and bringing it wholly into his owne hands for to have the monopolie of it, raiseth the market, and enhaunceth the price: for I remember well, how in the daies of *Nero* late Emperour, all the spicers, druggers, and apothecaries, preferred a bill of complaint unto the Consuls, against one *Demetrius* a regrater. Yet notwithstanding, I thought it necessarie to put downe the prices of things as they are ordinarie valued at Rome one yeere with another, to shew in some sort (by a generall æstimat) the worth of such wares and commmodities
D whereof I have written.

¶ The Proëme.

CHAP. I.

❧ The Mines of Brasse.

IT is now time to goe in hand with mines of Brasse, a mettall esteemed most of all other next to Gold and Silver, in regard of the uses about which it is emploied: nay, if I should say truly, preferred it is (especially that which is called the laton of Corinth) in divers respects before silver, yea & gold it selfe: for brasse (I may tell you) is of great authoritie in the campe, and carrieth no small stroke among souldiors in regard of their pay, which (as I have said before) was weighed them out in brasse: and hereupon their wages-money is usually called by the name of Æra militum. From this mettall likewise, the generall Receivers and Treasurers take their title of credit and place: for at Rome they be called Tribuni ærarij, as a man would say, the Tribunes or officers to the chamber of Brasse coine, that is indeed, of the Treasurie: hereof also is the Chamber of the citie or Treasurie it selfe, called Ærarium: finally, those that be deeply indebted to any man, are in Latine named Obærati, as it were charged and pressed with the heavie burden of brasse, *i.* debt. Moreover, I have shewed alreadie (for the greater credit and authoritie of this mettall) for how many yeers togither the people of Rome used no other money but brasen coine. And otherwise, as may appeare by ancient records and histories, the credit of brasse tooke root at the beginning, and hath been in authoritie ever since Rome was Rome: an evident proofe whereof wee have from K. *Numa*, who founded and erected a third societie or confraternitie of brasie-founders. As touching the ore or veine of brasse, digged it is out of the mine in manner aforesaid, but it is tried and brought to perfection by fire. Made also it is of the Chalamine stone, named otherwise Cadmia. The best mines of brasse that yeeld the excellent mettall, are now in Asia; howsoever in old time Campaine in Italie caried the name. And even at this day, the brasse digged out of the mines within the territorie of the Bergomats in the fartheſt part of Italie, is in great request: and as it is said, there are good mines thereof discovered lately in Germanie, a province under the Romane Empire.

CHAP. II.

❧ Divers kinds of Brasse: and namely, the Brasse of Corinth, of the Isles of Delos and Aegina.

IN the Island of Cyprus, where first were found mines of brasse, the same is made of another stone also besides Cadmia, which they name Chalcitis: but this * Cyprian brasie fell soon to beare a low price, by reason of a better kind which other countries did yeeld; and principally the laton called Orichalcum, which for a long time was counted the best and held in greatest admiration. Howbeit, this kind of brasse hath not been gotten for these many yeers, as if the earth were

* *i.* Copper.

A were not in heart, and had given over bearing of it. Next to this Aurichalcum, the moſt reckoning was made of the braſſe Salluſtianum, within the tract or quarter of the Centrones among the Alpes: neither held theſe mines out any long time; but after it, ſucceeded the Livian braſſe, diſcovered in Fraunce. Theſe two kinds laſt mentioned, take name both of the lords and maſters of the mines wherein they were digged: the former of one *Salluſtius*, a great friend and fovant of *Auguſtus Cæſar* the Emperour: the other of the Empreſſe *Livia* his wife: and this mine alſo quickly failed. And verely of this Livian braſſe very little or none there is to be had. But now adaies all the name goes of the Marian braſſe, which alſo is called Cordubenſe. And to ſay a truth ſetting aſide the abovenamed Livian braſſe, there is not any will take the yellow tincture of the Cadmia or Calamine ſtone better, or commeth ſo near in goodneſſe to the latton Orichalcum;
B as if a man would ſay that a peece of coine ſtamped of it, were a ſeſterce, or at leaſtwiſe a double As, to the Cyprian peece, which is but a ſingle As. And thus much concerning the degrees in goodneſſe and credit, of thoſe kinds of braſſe which be naturall.

* As if he would ſay, this mettal is ſo much better thã the Cyprian braſſe and copper, as the Seſterce and Dupondius, is of more value than As: i. duple, or duple and halfe.

There be other ſorts of braſſe mettall, which ſtand upon an artificiall mixture and temperature, whereof I purpoſe to write in more ample manner in place convenient, after I have ſhewed above all other things the excellencie of this mettall in generalitie, thus tempered. In old time there was a mixt mettall made of braſſe, gold, and ſilver, melted and confuſed all together, wherof were made ſingular peeces of worke: and albeit the mettall was rich and precious, yet evermore the workmanſhip was the dearer and went beyond it. But now, it is hard to ſay, whether is worſe of the twain, the matter, or the art that is ſeene in it? But certes, I cannot but marvell much
C how it commeth to paſſe, That theſe braſen workes, having alwaies beene from time to time ſo deare, and growing ſo infinitly as they doe ſtill in price to be bought & ſold, yet the magnificence and credit of this art is ſo much decaied and utterly gone? But I take this verely to bee the cauſe, that in times paſt artificers wrought for to win glory and fame; and now, as all things els, for gain and lucre onely. Certes, in old time the feat of caſting mettall was counted ſo magnificent, that the Poëts aſcribed it to ſome of the principall gods, as a myſterie beſeeming their divine workemanſhip; inſomuch, as the great lords and noble princes of the world ſought to win an immortall name by this meanes: and yet I ſay for all that, the manner of tempering and caſting this precious Maſcellin, this compound mettall I meane of gold, ſilver, and braſſe, is ſo farre growne out of practiſe and knowledge, that for theſe many yeares paſt Fortune her ſelfe hath had no power
D either to retaine or to reſtore the auncient art belonging thereto. But ſetting aſide the glorious Maſcellin of old time, the Corinthian braſſe mettall was moſt highly commended: And the ſame mixture happened even by meere chaunce and fortune, when the cittie Corinth was woon, ſacked and burnt to the ground: and wonderfull it is how the minds of many great men was affected to this compound mettall, and how they ſtood upon the having therof, inſomuch as (by report) there was no other cauſe in the world why *Verres*, whom *Cicero* had cauſed to bee condemned, was together with him proſcribed, outlawed, and baniſhed by *Antonie*, but onely this, For that he vaunted that he had as goodly veſſels and peeces of Corinth mettall as himſelfe, and would not part with any of them to *Antonie*. Howbeit in my conceit, the moſt part of theſe men who delight thus in this Corinth Maſcellin, in a certaine ſingularitie by themſelves, becauſe they would ſeem
E to know more than their fellowes, make ſemblance rather of a ſpeciall inſight and skill that they have therein, than know indeed any thing by it of ſuch exquiſit ſtuffe. And this will I ſhew and declare unto you in few words: The citie of Corinth was woon and deſtroied in the 156 Olympias, and the third yeare thereof, which fell out to be in the 608 yeare by our computation at Rome: now long before this time, thoſe great maſters and imageurs, ſo famous for mettall-founding and caſting of images, were dead & gone; and yet all the peeces of their making, theſe men forſooth at this day will needs have to be of the Corinthian medley, and ſo they call them. And therefore to diſprove this erronious opinion of theirs, I purpoſe as I proceed in this my diſcourſe, to range all the notable artificers that antiquitie hath knowne in this kind, according to the ſeverall ages wherein they lived and flouriſhed in the world. For eaſie it will be to calculat and collect the years
F from the foundation of our citie, by the former compariſon of them with the Olympiads. All the veſſels then which our delicats have, thoſe I meane that would ſeeme to be more fine in their houſes than their neighbours, are onely of the Corinth mettall and no better, which they caſt partly into pots and pans and ſuch like kitchin veſſell for to ſeeth meat in: partly into candleſticks, chafers, chamber pots, and ſuch like homely and baſe veſſels, without any regard of cleaneneſſe

and

and neat ſervice. But this Corinthian mettall may be reduced well into three principall kinds, to G
wit, the white, which commeth neareſt in brightneſſe to ſilver, as ſtanding moſt indeed upon the
mixture of ſilver: the ſecond yellowiſh, according to the nature and colour of gold, which bea-
reth the cheefe ſtroke in it: and a third of an equall medley and temperature, wherein a man ſhall
not perceive any one mettall predominant. Over and beſides, theſe three ſorts of Corinthian
braſſe, there is another kind of Maſcellin; as touching the mixture whereof preciſely, we are not
able to yeeld any reaſon: for although there be found images and ſtatues thereof made, wherein
we may ſee the handie worke of man, yet it ſhould ſeeme that fortune in ſome ſort hath given the
temperature thereto: and that precious and daintie colour that it hath, is a deepe red, much re-
ſembling that of the liver, and therefore they call it commonly Hepatizon. Short it commeth far
off the Corinthian mettall, but out-goeth a great way the braſſe either of Ægina or Delos; which H
two mettals for a long time were thought to be the cheefe. And in very truth, for auncient glorie
and name the Deliake braſſe may challenge the firſt place: for thither, as to a mart or faire, there
was great reſort of chapmen from all parts of the world, & eſpecially of thoſe artificers who were
curious in making of table feet, treſtles, and bedſteeds: And indeed the fineſt workmanſhip at firſt
was ſeene herein, and thereby artificers came to be ennobled. But in proceſſe of time they went
farther, even to caſt the images of gods, the perſonages alſo of men for ſtatues, yea, and the ſolid
formes and pourtraits of beaſts and other ſuch living creatures. After this braſſe of Delos, the
moſt account was made of that which came from Ægina: An Iſland this is without any mine at
all of braſſe in it, howbeit, much renowned for the excellent mettall-founders therein, in regard
of the ſingular temperature that they gave unto their braſſe. The braſen Ox which ſtandeth in I
the beaſt market at Rome was brought from thence. And this may ſerve for a paterne of the Æ-
gineticke braſſe: but the image of *Iupiter*, erected within the chappell of *Iupiter*, ſurnamed Thun-
dring, in the Capitoll, is the true patterne, teſtifying what kind of braſſe that of Delos was. And,
as *Myron* was wont to caſt the mettall of Ægina in all his workes, ſo *Polycletus* uſed ordinarily
that of Delos for his purpoſe; and theſe two were rare Imageurs, living at one time, and prenti-
ſes at the art together: but they endevoured to ſurpaſſe one the other, in diverſe mettals which
they occupied.

Chap. iii.

Of candleſtickes and ornaments belonging to temples, made of Braſſe. K

IN old time the Iſland Ægina was in eſpeciall name for the workmanſhip only of the branches,
ſockets, and heads of candleſtickes; like as Tarentum, for the ſhanke, ſhaft, & bodie ſupporting
the ſame: and therefore that candleſtick was counted rich indeed, when both theſe places ſee-
med to concurre unto the making & workmanſhip therof. For ſuch a candleſticke ſome have not
been aſhamed to give as much money as the ſalarie and yearely penſion of a Tribune militarie or
Which was a talét, or 50000 ſeſterces. Colonell, commeth unto: and yet you ſee, an implement or moveable it is, that hath but a vile
and baſe name, for called it is in Latine Candelabrum, of ſticking a candle in it. But will you know
who was ſo fooliſh as to beſtow ſo much upon a candleſticke, and what a tale belongeth there-
unto, for to amend the hard bargain? thus ſtood the caſe: It was a jollie dame in Rome, named *Ge-* L
gania, who made this wiſe match. And when ſhee had ſo done, ſhee muſt needs forſooth make a
feaſt for to ſhew this candleſticke to her gueſts, which coſt her fiftie thouſand ſeſterces. Now the
founder or braſier that ſold it her, was miſhapen and bunch-backt. And order was taken by the
* *Cleſippus fuſor, gibber, &c.* not *Fullo.* commaundement of **Cleſippus*, a publick crier of Rome, that he ſhould in the middeſt of ſupper
be brought into the place ſtarke naked as ever he was borne (and as foule and illfavoured a fellow
Who as it ſhould ſeeme, was one of her gueſts, & knew how to play his part well ynough. he was otherwiſe as a man ſhould lightly ſee) under a colour to make ſport and to ſet the compa-
nie a laughing, but indeed to mocke *Gegania* the miſtreſſe of the houſe. But what followed ther-
upon? The woman caſt a fanſie to him by and by, and in that heat of love, or luſt rather, admitted
him anon to her bed, and after ſet him into her will, and made him her heire. This crookebackt
ſquire ſeeing himſelfe exceedingly enriched by this double bargain, adored the ſaid candleſticke M
no leſſe than a god, as the onely cauſe of his riſing and all the wealth he had: And thus by his oc-
caſion, one tale more goeth currant abroad in the world, of Corinthian veſſels. And yet after-
wards (as it were to puniſh his miſtreſſe for that light behaviour of hers) hee cauſed a ſtately and
magnificent ſepulchre to be made for her, whereby the infamie and ſhame of *Gegania* might bee

eter-

A eternized and continue freſh in remembrance with all poſteritie. But to return againe unto Corinthian braſſe and the veſſels made thereof, although it bee well knowne, that there are no candleſtickes indeed made of that Maſcellin, yet there goeth a great name of them, as if they above all other things were certainely caſt of that mettall: and the reaſon is, becauſe that *Mummius* as in the heat of his victorie he ſacked and deſtroied Corinth, ſo withall he diſperſed the braſſe by parcels and peecemeale, and ſent it away into many other townes and cities of Greece.

Moreover, this is to be noted, That in old time it was an ordinarie thing to make of braſſe, the ſides, lintels, ſils, and leaves of great dores belonging unto temples. I read alſo in Chronicles, That *Cn. Octavius*, who defeated king *Perſeus* in fight at ſea, and rode in triumph for that navall victorie, cauſed the double gallerie, which ſtandeth neare unto the cirque of *Flaminius*, to be ere-
B cted; which was called the Corinthian gallerie, for that the chapters of the pillers were of braſſe. Furthermore, the Annales do teſtifie, that it was thought good, That the rouſe of the chappell of *Veſta* ſhould be alwaies covered over with braſſe, after the manner of Saracoſſian worke. Likewiſe *M. Agrippa* made all the chapters of the pillars, ſtanding in the temple *Pantheon*, of Syracuſian braſſe, which remaine at this day to be ſeene. And not onely publicke places and buildings were thus beautified and adorned, but great mens privat houſes alſo were enriched with this mettall: For it appeareth upon record, That *Sp. Carvilius*, one of the treaſurers of Rome, among other criminall imputations that he objected unto *Camillus*, challenged him for this, That the dores of his dwelling houſe were plated and garniſhed with braſſe and copper. Moreover, as *L. Piſo* reporteth in his Chronicle, *Cneus Manlius* after his conqueſt of Aſia, was the firſt that in the triumph
C wherein hee rode in the yeare after the foundation of Rome 568, hee made ſhew of three-ſided tables, cup-bourds, and bourds, ſupported by one foot all of braſſe. And *Valerius Antias* verely doth write, That *L. Craſſus*, heire to that great Oratour *L. Craſſus*, made ſale of many ſuch braſen tables, which fell unto him by right of inheritance. Semblably, I find in the hiſtories, That in old time they were wont to make many large baſons, ſupported with a frame of three feet, knowne by the name of Delphicke baſons, for that they were commonly dedicated unto *Apollo*, the patrone or god of Delphos, for to receive the gifts and oblations offered unto him. In thoſe daies alſo the lampe branches hanging aloft in churches, ſpreading out their armes abroad and carying lights like trees bearing fruit, were uſually made of braſſe: and ſuch a one is to be ſeene in the temple of *Apollo* within the Palatine hill at Rome: which being found by *Alexander* the great in the ſaccage
D of Thebes, the ſaid prince dedicated to the god *Apollo* at Cyme, a towne in Æolia. To conclude, this art of founding and caſting braſſe proceeded farther and paſſed on, untill it was commonly practiſed in making the idols and images of the gods.

Chap. iiii.

At what time the firſt braſen image was caſt at Rome. The firſt originall and beginning of ſtatues, and the honour that belonged to ſtatues. Alſo the divers kinds and faſhions of them.

E THe firſt image of braſſe that ever was made at Rome, I find to bee conſecrated unto *Ceres*: and raiſed it was out of the goods of *Sp. Caſſius*, who aſpiring to bee a king, was therefore ſlaine by his owne father. But this honour continued not long proper unto the gods, but paſſed from them unto the ſtatues of men alſo and their portraitures, and that after ſundry ſorts. In auncient time the manner was to verniſh their images and ſtatues of braſſe, with * Bitumen: more mervaile it is therfore, that afterwards men ſhould take ſuch pleaſure to guild them as they did. This invention, whether it came from Rome or no, I know not: but if it did, ſurely it was no auncient deviſe, nor of any long continuance there. Certes, the manner was not in old time to expreſſe the lively ſimilitude of men in braſſe, unleſſe they were ſuch worthy perſons as by ſome notable and famous acts deſerved to be immortalized, as namely, for winning the prizes at any of
F the foure ſacred and ſolemn games holden in Greece, & principally at thoſe of Olympia, where it was an ordinary thing to ſee the ſtatues of thoſe erected & dedicated, who had atcheeved any victory there. But in any caſe any one were ſo happie as to obtain victory at thoſe ſolemnities three ſeverall times, his ſtatue in braſſe was ſo lively & perfitly caſt, that it reſembled his perſon full and whole, according to the proportion of every member, joint, and muskle of the bodie, yea even to the

*or as ſome ſay, with a kind of Amber.

the haire of head and beard. And ſuch kind of complete images, the Greekes uſe to call Iconi- G
cæ, *i.* perſonages. The manner of the Athenians was to honour men of ſingular vertue and valor, by repreſenting their perſonages in braſſe: but I am not ſure whether thoſe Athenians were the firſt that brought up that manner, or no: true it is, that long ago they cauſed the ſtatues of *Harmodius* and *Ariſtogiton*, to be made of braſſe at the charges of the ſtate, and to be erected in publicke place, for that they had the courage and heart to kill *Piſiſtratus*, who tyrannized over them: and this fell out juſt in that very yeare wherein the kings alſo were depoſed at Rome, and expelled the citie for ever. And in proceſſe of time this manner was taken up in all parts of the world: ſo plauſible unto the nature of man, is the ambitious deſire to perpetuat their memorie by ſuch monuments, inſomuch as there is not a good town within our provinces, but they have begun al- H
readie to beautifie their market places with many ſuch ornaments of braſen ſtatues and images; together with titles, honours, and dignities engraven at the baſes or pied-ſtall thereof, for the better continuance of mens memoriall, that the poſteritie might be enformed by ſuch inſcriptions, as well as by their tombes and ſepulchres. And at length the ambition of men proceeded ſo far, that as well their privat houſes within as the baſe courts and porches without, were ſo beſet with images, that a man would take them for ſome publicke places within a cittie: and all this aroſe from the devote courteſie of vaſſales, in token of homage and honour done to thoſe their patrones and lords, whom they acknowledged to be the protectours and maintainers of their life and libertie.

Chap. v. I

Of braſen ſtatues in long robes, and divers other ſorts of Images. Whoſe ſtatues were firſt erected upon pillars. When they were ſet up firſt in publicke, and at the common charges. Finally, which were the firſt in Rome.

IN auncient time all the Images and Statues erected to the honour of any men, were in their gownes and robes. Men delighted alſo to have them otherwhiles all naked, reſting upon their ſpeares which they held in their hands. This patterne came from the Greekes, reſembling the manner of their young men, which in that ſort did exerciſe naked in their publick wreſtling places, thereupon called Gymaſia: and ſuch images are named Achilleæ. And verely, the Greekiſh K
faſhion it is, To hide no part of the bodie, but to ſhew all: wheras the Romans contrariwiſe (like ſouldiors and militarie men) uſed to make their ſtatues armed with a cuirace or breaſt-plate onely, leaving the reſt of the bodie diſcovered and bare. And *Iulius Cæſar* verely the Dictatour, was well content that his image ſhould bee ſet up in the Forum or common place at Rome, armed with an habargeon or coat of maile. As for ſuch ſtatues which repreſented in habit the prieſts of *Pan*, called *Luperci* (that is to ſay, all diſcovered but their privities) it is an invention new come up, and as lately deviſed as thoſe which be pourtraied in clokes or mantles. *Mancinus* appointed that his image ſhould be erected in that habit and manner, that is to ſay, bound and unarmed, as hee was delivered priſoner to the Numantines his enemies. As touching the ſtatue of *L. Actius*, a famous Poet, I will report unto you what writers have recorded; namely, That being himſelf a very L
little man and low of ſtature, he cauſed his image to be made exceeding big and tall, and ſo to be ſet up within the temple of the Muſes at Rome. As for the ſtatues repreſented on horſebacke; in great name and requeſt they were among the Romanes: but no doubt they had their precedent from the Greeks. At firſt they honoured ſuch horſemen only in this ſort, who had woon the price in the race at thoſe ſolemn and ſacred games which were held in Greece, and thoſe horſerunners they called Celeres: howbeit, afterwards the like honor obtained they, who had born themſelves beſt at the running of chariots, whether they were drawn with two horſes or four. And from hence came the manner with us of our valiant captaines and victorious generals, to have their ſtatues made riding triumphant in their chariots. Howbeit, long it was firſt ere this faſhion came to bee taken up: and before the daies of *Auguſtus Cæſar*, late Emperour of famous memorie, there had M
not beene knowne any ſuch Images at Rome riding in chariots either drawne with ſix ſteeds, or Elephants, as now there be. The manner alſo of riding in coches with two horſes about the cirque or ſhew place (which uſually they did who had been lords Pretors of Rome) repreſented in their portraitures, is not auncient.

Con-

A Concerning statues erected upon columns or pillars, they bee of greater antiquitie, as may appeare by that of *C. Menius*, who vanquished the auncient Latines that invaded the territorie of Rome; unto which nation, the people of Rome was wont by vertue of the league, to allow the third part of the bootie and pillage gotten in the wars: during the Consulship of which *C. Menius*, upon the victorie atchieved of the Antiats, the citie of Rome ordained, That the beake-heads with their brasen tines, which were taken from them in a conflict at sea, should be fastened unto the pulpit of publicke pleas and Orations, which thereupon was ever after called Rostra: and this fortuned in the foure hundred and sixteenth yeare after the foundation of Rome. The like statue upon a columne was set up for the honour of *C. Duillius*, who first defeated the Carthaginians by sea, and for that navall victorie entred Rome in triumph: The same remaineth at
B this day to be seene in the Forum or grand-place of the citie. Semblably, *P. Minutius* obtained the same honour, who being purveior generall of corne for the citie in time of a dearth, behaved himselfe so well in that office, that his statue of brasse was erected upon a piller without the gate of Rome called Trigemina: and that by an universall contribution of the people, who gave voluntarily toward the charges thereof, every man to the value of an *ounce of brasse coin. And I wot not whether I may boldly say that he was the first man who received that honor at the peoples hands: for beforetime I am well assured that the Senat only graunted such rewards for mens good service. Certes, these were brave and honourable memorials, had they not begun upon occasion of some trifling matters to speak of. For such a statue was that of *Actius Navius* the Augur or Soothsayer, which stood before the entrie of the Curia or Councell-chamber of Rome:
C the base or foot of which pillar was burnt, at what time as the said Curia or Senat-house caught a light fire, at the funerals of *P. Clodius*. The like image was set up (by authoritie from the State) in the publicke place of elections at Rome, called Comitium, to the honour of *Hermodorus* the Ephesian; who translated out of Greeke into Latine the lawes of the twelve tables, which the ten Decemvirs had gathered and set downe for the publicke benefit of the citie. As for the statue of *Horatius Cocles*, which remaineth to this day, there was another reason of it, & the same of greater credit and importance: for that he alone sustaining the whole charge and brunt of king *Porsenaes* armie, made good the woodden bridge over Tybre at Rome, and caused the enemies perforce to abandon the place. As touching the statues of the propheteesses *Sibyllæ*, three there bee of them neare unto the Rostra beforesaid, but of a lesse making, whereat I nothing marvell: the
D one was repaired by *Sex. Pacuvius Taurus*, one of the Ædiles of the Commons; the other two by *M. Messala*. And I assure you, I would have taken these images and that of *Actius Navius* to have been the most antique of all others, as beeing set up in the daies of king *Tarquinius Priscus*; but that I see the statues of the former kings within the Capitoll.

*i. The twelfth part of their As.

Chap. VI.

Statues without gowne or robe at all. Of other Statues. Which was the first statue on horsebacke. When and whereupon al the images, as well publicke as privat, were demolished and put down. What women they were at Rome who were honoured with brasen statues: and which
E *were the first statues erected publickly at Rome by straungers.*

AMong the said statues of Romane kings, that of *Romulus* is without any coat or cassocke at all; like as that also of *Camillus*, which standeth at the pulpit Rostra. As for the image of *Q. Marcius Tremellius*, which was erected before the temple of *Castor* and *Pollux*, the same was in a gowne, and sitting upon horsebacke: This noble knight had vanquished the Samnites twice: and by the winning of Anagnia, a citie not far from Rome, procured therby an easement unto the people, from paying tribute unto the state for the maintenance of the wars. In the ranke of the most antique monuments of Rome, I may range the statues of *Tullius Clœlius*, *L. Roscius*,
F *Sp. Nautius*, and *C. Fulcinius*, which stand about the pulpit Rostra: And these were the foure Romane Embassadours, who against all law of nations, were during their embassage murdered by the Fidenatians. For this was an ordinarie custome with the Romanes, to honour those in this manner, who in the service of the Commonwealth were unjustly killed: as may appeare likewise by *P. Iunius* and *T. Coruncanus*, who by *Teuca* the queene of the Illyrians were put to death, notwithstanding

withstanding they came in embassade unto her. And here I cannot overpasse one point noted in the Annales, That the measure of these statues erected in the common place at Rome, was set downe precisely to be three foot in height: Whereby it may appeare, that this proportion and scantling in those daies was thought to be honourable. Neither will I conceale from you & omit the memorable example of *C.* Octavius*, who for one word speaking, lost his life: This man being sent as Embassadour unto king *Antiochus*, and having delivered his message unto him according to his charge and commission, when he saw that the king made no hast to give him his dispatch presently, but said he would make him an answere another day; made no more adoe, but with a wand or rod that he had in his hand, drew a circle about the king, and compelled him perforce to give him his answere before he stirred his foot without that compasse. But this cost him his life: and for that he was killed thus in his embassage, the Senat of Rome ordained, That his statue should be erected in the most conspicuous place of the citie, and that was in the publicke pulpit for pleas and Orations, the Rostra beforenamed. I read in the Chronicles, that the Senat made a decree, That *Taracia Caia*, or, as some say, *Suffetia*, a Votarie or Vestall Nun, should have her image made of brasse, with this speciall prerogative besides, that she might set it up in what place she would her selfe: which addition or braunch of the decree emplieth no lesse honor than the graunt it selfe of a Statue to a woman. What her desert might bee, in consideration whereof she was thus honored, I will set down word for word, as I find it written in the Chronicles, namely, *For that she had conferred frankely upon the people of Rome, a peece of meddow ground lying under the river Tybre, which was her owne free land.* I find moreover upon record, That the statues of *Pythagoras* and *Alcibiades* were set up in the cornered nouke of the Comitium at Rome, & that by direction from the Oracle of *Apollo Pythius*; unto which the Senat sent of purpose to know the issue of the Samnites warre, which was then in hand: From whence they had this answere, That if they looked to speed well in their affaires, they should take order to erect two statues of brasse in the most frequented place of the citie of Rome, the one in the honour of the most valiant man, and the other in the honour of the wisest person of all the Greekish nation: which images remained there untill such time as *Sylla* the Dictatour built his stately hall or pallace in the same place. But I marvaile verie much, that those sage fathers (the Senatours of Rome at that time beeing) preferred either for wisdome *Pythagoras* before *Socrates* (considering that the said *Socrates* by the verie same Oracle of *Apollo*, was judged the wisest man, not of Greekes onely, but of all others in the world;) or, in regard of valour, *Alcibiades*, before so many hardie captaines in Greece: but most of all I muse, that in both respects, as well of wisedome as vertue, they set anie one before *Themistocles*. Now, if a man bee desirous to know the reason of these columnes and pillars, which supported those statues aforesaid, it was to signifie, That such persons were now advaunced and lifted up above all other mortall men: which also is meant by the triumphant arches, a new invention, and devised but of late dayes: yet both it, and all other such honourable testimonies, began first with the Greekes. But among manie and sundrie statues which they graunted and allowed unto such as they affected and liked of, I suppose, there was never man had more than *Phalerius Demetrius* at Athens: for the Athenians honoured him with three hundred and threescore: and yet soone after they * brake them all to peeces, even before one full yeare went over their heads, that is to say, a few daies more than there were images. Moreover, all the tribes or wards of Rome set up a statue in every street of the citie (as I have said before) in the honor of *Marius Gratidianus*, and those they overthrew everie one, against the comming in of *Scylla*.

*others say *Pompilius*.

**Strabo* saith, that they defaced & melted them, yea, and flung them into draughts and privies.

As touching Statues and Images on foot, I doubt not but they have been for a long time greatly esteemed at Rome. Howbeit, those on horseback were verie auncient: and that which more is, this honour they did communicat also unto women as well as men; as may appeare yet at this day by the statue of *Clœlia* sitting on horsebacke, as if she could not have beene honoured sufficiently by making her statue in the habit of a damosell or ladie of Rome in a side gowne. And yet neither the chast dame *Lucretia*, nor the valiant *Brutus* (who chased the kings and all their race out of Rome, and for whose sake and in whose quarrell the said *Clœlia* was delivered as an hostage among others) never attained unto that honour. And I doe verely beleeve, that this statue of hers, and that of *Horatius Cocles*, were the first that publicke authoritie ordained: for beforetime king *Tarquinius Priscus* caused both his owne statue and also *Sibyllaes* to be made, like as the other kings before him and after, as may be presumed by all likelyhood

A lihood and probabilitie. And yet *Piſo* ſaith, that the other damoſels and young gentlewomen her fellow hoſtages, after they were ſet free and ſent home ſafe againe by king *Porſena* (for the honour that he meant unto *Clælia* in conſideration onely of her rare and ſingular vertue) cauſed the ſaid ſtatue or image of hers to bee caſt in braſſe, and erected. But *Annius Fæcialis* (another antiquarie or heralt at arms of Rome) reporteth this ſtorie otherwiſe; for hee writeth, That the ſtatue of a woman ſitting on horſebacke (which ſtandeth over-againſt the temple of *Iupiter Stator*, and hard at the gate or entrie of king *Tarquinius* the Proud his pallace) was of ladie *Valeria*, daughter unto *Valerius* the Conſull, ſurnamed *Publicola*: who ſaith moreover, that ſhee it was alone who eſcaped from her fellows, and ſwam over the river Tiberis; whereas the reſt of the virgins which had been ſent as pledges unto king *Porſena*, were murdred all, by the ſecret trains and
B indirect means of *Tarquin* the Proud.

L. Piſo moreover hath left in writing, that in the yeere when *M. Æmilius* and *C. Popilius* the ſecond time were Conſuls, the Cenſors for the time being (*P. Cornelius Scipio* and *M. Popilius*) cauſed all the images and ſtatues of thoſe who had been head magiſtrats, that ſtood about the Forum of Rome, to bee taken downe; permitting thoſe onely to ſtand which had been erected and ſet up either by graunt from the people or warrant and decree of the Senat. As for that ſtatue which *Sp. Caſſius* (him I meane who ambitiouſly ſought to be a king) cauſed to be erected for his owne ſelfe before the church of the goddeſſe *Tellus*, the Cenſors not only pulled it down, but alſo tooke order that it ſhould be melted. And this (no doubt) did thoſe wiſe and provident fathers, to cut off all means even in ſuch things as theſe, that might feed the ambitious ſpirit of
C men. There be yet extant certaine declamations of *Cato*, who being Cenſour, cried out againſt the vaineglorie and pride of certaine Romane ladies who ſuffered their owne images to be ſet up in the provinces abroad: yet with all his exclamations, he could not repreſſe their ambition, but that their ſtatues muſt be erected even in Rome alſo: as for example, *Cornelia*, the daughter of the former *Scipio Africanus*, and mother to the two *Gracchi*, whoſe ſtatue was made ſitting: and this ſingularitie it had beſides from all others, That her ſhoes were pourtraied open and looſe without any ſtrings or latchets at all. This image of hers was ſet up in the great gallerie or publick walking-place of *Metellus*, but now it is to bee ſeene among the ſtately workes and buildings of *Octavia*.

Moreover, (by allowance and permiſſion of the ſtate) there have been ſtatues ſet up in Rome
D in publicke place, by ſtraungers: as namely, for *C. Ælius* a Tribune or Provoſt of the commons, for that he publiſhed and enacted a law, That *Stennius Statilius* a Lucan, who twice had invaded and over-run in hoſtile manner, the territorie of Thurium, ſhould be reputed as an enemie unto the Romans: In regard of which demerit, the Thurines honoured the ſaid *Ælius* with a ſtatue of braſſe, and preſented unto him a coronet of gold. The ſame Thurins alſo cauſed another ſtatue to bee made in the honour of *Fabricius*, for raiſing the ſiege that inveſted and beleaguerd their citie. By occaſion of which ſuccour and reliefe given unto ſtrangers and aliens, it came to paſſe in proceſſe of time, that forrein ſtates and cities ſhrowded themſelves ordinarily under the protection of ſome great men at Rome; and in devotion unto them, honoured ſuch as their lords and maſters, by ſtatues and all other means, even as their bounden vaſſals. At length, there grew
E ſuch diſorder and confuſion of theſe ſtatues, that wee had them pell mell at Rome without any choiſe or regard at all: inſomuch, as at this day, there are no fewer than three ſtatues of *Anniball* to be ſeene at Rome, in three ſeverall places of that citie, within the walls whereof he was the only enemie ever knowne to have launced his javelin.

Chap. VII.

Of the Braſſe-founders in old time. The ineſtimable prices of molten Images. Of the moſt renowmed coloſſes and gyantlike Images in Rome.

F THat the Art of Founderie or caſting mettals for Images hath been verie antique, practiſed alſo and profeſſed in Italie as well as in other countries time out of mind, may be evidently prooved by the ſtatue of *Hercules*, which K. *Evander* conſecrated to the honour of him, in that verie place (by folks ſaying) which now is the beaſt-market in Rome. This image is called at this day, *Hercules triumphalis*, and at everie triumph is richly clad in triumphant habit. The image likewiſe of *Ianus* with two faces, dedicated by K. *Numa*, teſtifieth no leſſe; and honoured

he is no leſſe than a god, as by whome the times of warre and peace be diſtinctly knowne. Moreover, the fingers of his hand are in that ſort faſhioned and formed, as they repreſent the number of 365, which are the daies of the whole yeere; by which notification of the yeare, hee ſheweth ſufficiently, that he is the god and patron of times and ages. The images alſo which are knowne commonly by the name of Thuſcanica, which are ſo diſpearſed abroad in all parts of the world, who will ever doubt but that they were commonly made in Tuſcan? I would have thought verely, that theſe Thuſcanica had been the images of the gods, and no other, but that *Metrodorus Scepſius* who for the immortall hatred that he bare againſt the Romans had his * ſurname given him, reprocheth the Romanes among other imputations, That they had forced and ſacked the towne Volſinij, for the love of two thouſand pettie images of braſſe which were therein. Conſidering then, that the invention of making ſuch molten images hath been ſo antique in Italie, I cannot chuſe but much marveile, that the idols and images of the gods in times paſt dedicated in churches and chappels, were either of wood and potters earth, rather than of braſſe, untill the conqueſt of Aſia; from whence, to ſay a truth, firſt aroſe and proceeded all our exceſſe and ſuperfluitie. As touching the firſt deviſe and originall of caſting by moulds and forming the lively ſimilitudes of any thing expreſſely to the patterne, I ſhall have fitter and better occaſion to write thereof in my treatiſe of the art of Potterie, which the Greeks call Plaſtice; for of more antiquitie I take it to be than this feat of Founderie: and yet this craft and cunning ſo flouriſhed in times paſt, and brought for art ſuch excellent peeces of worke, and for number ſo infinit, that if I ſhould put downe the greater part of them, it would require many volumes; for, to comprehend them all, what man is able? During the time that *M. Scaurus* was Ædile, there were three thouſand molten images ſhewed upon the ſtage when he exhibited his plaies, notwithſtanding this theatre of his was made not to continue any time, but to ſerve for the preſent. *Mummius*, after the conqueſt of Achaia, brought in with him ſo many of theſe images, that hee filled the cittie therewith, and no corner was free: and yet when he departed this life and died, he left not behind him a competent portion for to beſtow his daughter in marriage. And this I write not to accuſe and condemne ſo brave a man, but rather to excuſe and commend him: for how can I otherwiſe doe? The two *Luculli* ſtored Rome with a number of theſe images. *Mutianus* (a man who of late daies had been twice Conſull) reporteth, That there bee yet within Rhodes three thouſand ſuch images: and verely it is thought, that in Athens, Olympia, and Delphi, there remaine no fewer to be ſeen. What man living is able to particularize of them all? and ſay a man ſhould come to the perfit knowledge of them, what good can he reape thereby, or what uſe may he make therof? Howbeit, one would take ſome delight and pleaſure lightly to touch the principall peeces of workmanſhip in this kind, and namely thoſe that be of marke and note for ſome eſpeciall ſingularitie above the reſt; as alſo to name therewith the renowmed artificers in times paſt, who wrought every one of them a number of peeces, the exquiſit and curious workmanſhip wherof, no man is able to unfold and utter as they deſerve, ſince that *Lyſippus* (by report) made in his time ſix hundred and ten, ſo full of art, ſo excellent and perfect all, as there is not one of them but ſufficient it were to immortalize his name. And how was it knowne that he made ſuch a number juſt? It appeared plaine after his deceaſe by a coffer that he had, wherein he treaſured up his gold, and which was then broken open by his heire: for the manner of *Lyſippus* was, whenſoever he tooke money for the workemanſhip of any peece that went out of his hands, to lay by in the ſaid coffer one * denier of gold; and ſo by the number of thoſe deniers it was knowne, how many peeces of worke he made. Incredible it is to what heigth of perfection this art grew unto, firſt by the ſucceſſe of the art, which was ſo vendible and high prized; afterwards, by the audaciouſneſſe of the artificer, who ventured to make ſo huge and monſtrous works.

What good ſpeed this art had, may appeare by an example which I will ſet downe, of an image, deviſed to expreſſe the likeneſſe neither of god nor man: and a dogg it was in braſſe, which many a man hath ſeene in our time in a chappell of *Iuno* within the Capitoll temple, before it was burnt now laſt by the * *Vitellians*: This dog was made licking his owne wound; but how artificially it was wrought, and how lively it expreſſed the proportion and feature of a dogg indeed, to the woonder of all thoſe that beholding it could not diſcerne the ſame from a living creature, is apparent not onely by this, That it was thought worthie to ſtand in that place and to bee dedicated to that goddeſſe, but alſo by the ſtraunge manner of charge laid upon them that had the keeping and cuſtodie thereof: for no reall caution of money was thought ſufficient to

be

* It doth not appeare what it was, but by all likelihood μισοβαρβαρος.

* It ſhould ſeeme that the Greekes had a peece in gold anſwerable in weight unto the Romane *Denarius* in ſilver, which was a dram Attick: and this commeth near unto our French crowne.

* *i.* Thoſe that ſided with *Vitellius*.

A be pledged and pawned for the warrantise, or to countervaile the worth thereof: Order therefore was given by the state, and the same observed from time to time, that the sextons or wardens of the said chappell should perfourme the safetie and forth-comming of it under paine of death.

As touching the bold and venturous peeces of worke that have been perfourmed and finished by this art, we have an infinit number of such examples: for we see what huge and gyantlike images they have devised to make in brasse, resembling high towres more like than personages, and such they called Colossi. Of this kind is the image of *Apollo* within the Capitoll, transported by *M. Lucullus* out of Apollonia, a cittie within the kingdome of Pontus, which in heigth was thirtie cubits, and cost a hundred and fiftie talents the making. Such another is that of *Iupiter* within *Mars* field, dedicated by *Claudius Cæsar* the Emperour, which because it standeth so
B neare unto *Pompeys* theatre, men commonly call *Iupiter Pompeianus*, and full as big he is as *Apollo* abovenamed. Like unto these, is the colosse or stately image [of *Hercules*] at Tarentum, the handiworke of the said *Lysippus*, but he is fortie cubits high: and miraculous is the devise of this colosse, if it be true which is commonly reported thereof, namely, that a man may moove and stirre it easily with his hand, so truly balanced it standeth and equally counterpoised by Geometrie; and yet no wind, no storme or tempest, is able to shake it. Certes it is said, that the workeman himselfe *Lysippus*, provided well for this daunger, in that a prettie way off hee reared a columne or pillar of stone full opposit to the winds mouth, for to breake the force and rage thereof, from that side where it was like to blow and beat most upon the colosse: and verely so huge it was to weld, and so hard to be remooved, that *Fabius* surnamed *Verrucosus*, durst not meddle
C withall, but was forced to let it alone and leave it behind him; notwithstanding he brought with him from thence another *Hercules*, which now standeth within the Capitoll. But the colosse of the Sun which stood at Rhodes, and was wrought by *Chares* of Lyndus, apprentice to the abovenamed *Lysippus*, was above all others most admirable; for it carried seventie cubits in heigth: well, as mightie an image as it was, it stood not on end above threescore yeers and six; for in an earthquake that then happened, it was overthrowne: but lying as it doth along, a woonderfull and prodigious thing it is to view and behold: for first and foremost, the thumbs of the hand and great toes of the foot are so big, as few men are able to fadome one of them about: the fingers and toes are bigger than the most part of other whole statues and images: and looke where any of the members or lims were broken with the fall, a man that saw them would say they were
D broad holes and huge caves in the ground: for within these fractures and breaches, you shall see monstrous big stones, which the workeman at the first rearing and setting of it had couched artificially within, for to strengthen the colosse, that standing firme and upright so ballaised, it might checke the violence of wind and weather. Twelve yeeres (they say) *Chares* was in making of it before hee could fully finish it, and the bare workmanship cost three hundred talents: This mony was raised out of K. *Demetrius* his provision which he had set by for that purpose, and paid from time to time by his officers, for that hee would not himselfe endure to stay so long for the workemanship thereof. Other images there are besides of the nature of colosses in the same cittie of Rhodes to the number of one hundred, lesser indeed than the foresaid colosse of the Sun; yet there is not one of them, but for the bignesse were sufficient to give a name to the place and
E ennoble it, whersoever it should stand. Over and above, there bee in the said cittie five other gyantlike images or colosses representing some gods, and those of an huge bignesse, which were of *Bryaxes* his making. Thus much of workemen straungers.

And to come somewhat nearer home: wee Italians also have practised to make such colosses, for surely we may see (and goe no farther than to the librarie belonging to the temple of *Augustus Cæsar* here in Rome) a Tuscan colosse made for *Apollo*, and the same is fiftie foot high from the great toe upward: but the bignesse thereof is not so much as the matter and workemanship: for hard it is to say, whether is more admirable, the beautifull feature of the bodie, or the exquisit temperature of the mettall. Moreover, *Sp. Carvilius* long agoe made the great image of *Iupiter* which standeth in the Capitoll hill, after the Samnites were vanquished in that daungerous
F warre, wherein they bound themselves by a sacred law and oth to fight it out to the last man, under paine of death to as many as seemed to turne backe or once recule; to the making whereof, hee tooke the brasen cuiraces, greives, and morions of the enemies that lay dead and slaine upon the ground: which is so exceeding bigg and large, that hee may verie plainely and evidently bee discovered and seene from the other *Iupiter* in Latium, called therefore *Latiarius*.

* *Festus* saith 105 foot: wherby it appeareth that a cubit was one foot & a halfe.

Chares the workeman engraved under it this Hypogram in Iambicke verse: Τὸν ἐν ῥόδῳ κολοσσὸν ἑπτήκοντα πήχεων ὑψηλὸν Χάρης ἐποίησε Λίνδιος.

The powder and duſt which the file made in the workmanſhip and poliſhing of this coloſſe, *Carvilius* himſelfe caſt againe, and thereof made his own image and pourtraiture, and the ſame ſtandeth (as you may ſee) at the foot of the other. Within the ſaid Capitoll, there bee two braſen heads worthie of admiration, which *P. Lentulus* when he was Conſull thought good to dedicat to that place. The one was made by *Chares* the foreſaid founder; the other wrought by *Decius*: but this of *Decius* his making compared with the other, commeth ſo farre ſhort, that one would not take it to be the doing of an artificer that was his crafts-maſter, but rather of ſome bungler, prentice, or learner. But to ſpeake indeed of a great image, and that which ſurpaſſeth in bigneſſe all the reſt of that kind, looke but upon the huge and prodigious coloſſe of *Mercurie*, which *Zenodorus* in our age and within our remembrance, made in Fraunce at Auvergne: ten yeeres he was about it, and the workmanſhip came to foure hundred thouſand ſeſterces. Now when he had made ſufficient proofe of his Art there, *Nero* the Emperour ſent for him to come to Rome, where hee caſt indeed and finiſhed a coloſſe a hundred and ten foot long, to the ſimilitude and likeneſſe of the ſaid Emperor, according as it was firſt appointed and as he began it: but the ſaid prince being dead and his head laid, dedicated it was to the honour and worſhip of the Sun, in deteſtation of that moſt wicked monſter, whoſe ungratious acts the citie condemned and abhorred. Certes, I my ſelfe have been in that workehouſe of *Zenodorus*, where I beheld and conſidered not onely that great maſter-patterne in cley of the ſaid coloſſe, but alſo another conſiſting of verie ſmall peeces, as braunches, which ſerved as it were for moulds, and the firſt induction to the worke, as the aſſay and proofe thereof. Surely the workemanſhip of this one ſtatue or coloſſe, ſhewed plainly, that the true ſcience and skill of founderie or caſting braſſe into forms, was clean decaied and gone; conſidering that *Nero* was readie and willing to give ſilver and gold enough for the doing thereof artificially and with expedition. *Zenodorus* alſo himſelfe was not thought inferiour to any workman in old time, either for counterfeiting a ſimilitude, or graving the ſame: for during the time that hee made the ſtatue beforeſaid in Auvergne, hee counterfeited two drinking cups graven and chaſed by the hand of *Calamis*, but belonging to *Vibius Avitus* (the preſident and governour at the ſame time, of that province) which he had received of *Caſſius Syllanus* his uncle by the mothers ſide, tutor and ſchoolemaſter ſometime to *Cæſar Germanicus*; which prince notwithſtanding that he loved them well, yet hee beſtowed them freely upon his ſaid inſtructer *Caſſius*, whome he loved better: and *Zenodorus* did it ſo well, that hardly there could be diſcerned any difference in the workemanſhip. But to conclude, the more conſummat and accompliſhed that *Zenodorus* was for his skill and cunning, the more evidently it appeareth, that the true Art of founderie was in his time cleane loſt, and out of knowledge and practiſe.

Chap. VIII.

Of 366 excellent peeces of worke in Braſſe, and as many cunning artificers in that kind.

THe images and wrought peeces of Braſſe, commonly called Corinthian works, many men take ſuch pleaſure and delight in, that they love to carrie the ſame with them whitherſoever they goe; as *Hortenſius* the famous orator, who would never be without the counterfeit of *Sphinx*, which hee had from *Verres* his client, at what time as hee was in trouble and called into queſtion, for his extortions and oppreſſions in Sicilie: in which triall of *Verres*, wherein *Cicero* was his adverſarie and accuſer, upon occaſion that *Hortenſius* who pleaded at the barre againſt him in the behalfe of *Verres*, among other croſſe words that paſſed betweene, happened to ſay, That he underſtood no parables and riddles, and therefore willed him to ſpeake more plainely; *Cicero* made anſwer readily againe, That by good reaſon he ſhould be well acquainted with riddles, ſeeing he had a *Sphinx* at home in his houſe. Likewiſe, *Nero* the Emperour had a great fancie to a peece or counterfeit of an Amazon, (whereof I meane to write more hereafter) which by his good will he would never bee without. And *C. Ceſtius*, ſomewhat before *Nero*, a man that in his time had been Conſull, was ſo addicted to a little image that he had, that it went with him into the campe, yea and he would have it about him in the verie conflict and battaile with his enemies. Moreover, K. *Alexander* the Great had four ſtatues or images (by report) which ordinarily were woont and none but they, to ſupport his tent when he lay abroad and kept the field: wherof, twain ſtand now before the temple of *Mars* called the Revenger, & othet two before the Palatium.

L M

As

A As touching images, ſtatues, and counterfeits of a ſmaller ſize, there are an infinit number of artificers who are ennobled & renowmed by them: yet to begin with the image of *Iupiter* made at Olympia, *Phidias* the Athenian (above all other) was in great name therefore, and wrought it was of yvorie and gold togither: howbeit, many other peeces of braſſe there were of his making, which greatly commended the workeman. Hee flouriſhed in the 83 Olympias, and about the yeere (after our computation at Rome) 300. And at the ſame time, there lived thoſe concurrents of his who endeavoured to match him, to wit, *Alcamenes*, *Critias*, *Neſtocles*, and *Hegias*. After theſe, and namely in th 87 Olympias, there ſucceeded and had their time, *Agelades*, *Callon*, *Polycletus*, *Phragmon*, *Gorgias*, *Lacon*, *Myron*, *Pythagoras*, *Scopas*, and *Perelius*: of which, *Polycletus* brought up divers brave and worthie apprentices, and by name, *Argius*, *Aſopodorus*, *Alexis*, *Ariſtides*, *Phrynon*, *Pynon*, *Athenodorus*, *Dameas* of Clitore, & *Myron* the Lycian. In the 95 Olympias, B there flouriſhed *Naucides*, *Dinomedes*, *Canochus*, and *Patrocles*. In the 102 Olympias, there came in place, *Polycles*, *Cephiſodorus*, *Leochares*, and *Hypatodorus*. In the 104 lived *Lyſippus*, at what time alſo K. *Alexander* the Great flouriſhed: likewiſe *Lyſiſtratus*, and his brother *Sthenis*, *Euphronides*, *Soſtratus*, *Iön*, and *Silanion*: of which *Silanion*, this is woonderfull, that having no maſter at all to teach and inſtruct him in the art, yet he became himſelfe ſo excellent, that hee brought up under him, *Zeuxis* and *Iädes*. In the 120 Olympias, *Eutychides*, *Euthycrates*, *Lahippus*, *Cephiſodorus*, *Tymarchus*, and *Pyromachus*, were famous artificers for the time. Then lay the Art aſleep and as it were dead for a while, untill ſuch time as about the 155 Olympias, it ſeemed to revive and awaken againe: and then there aroſe *Antheus*, *Calliſtratus*, *Polycles*, *Athenæus*, *Callixenus*, *Pytho-* C *cles*, *Pythias*, and *Timocles*, indifferent good workmen, but nothing comparable to the other beforenamed. Thus having raunged the moſt famous artificers diſtinctly according to their ſeverall ages, I will run over them againe; as many I meane as excell the reſt: and yet howſoever I make haſt, I will not overpaſſe the multitude of others, but interlard (as it were) and diſperſe them among, as occaſion ſhall be offered.

In the firſt place, this is to be underſtood, that the principall and ſingular of all theſe founders came in queſtion (notwithſtanding they lived in ſundrie ages) which of them ſhould be eſteemed chiefe, by reaſon of divers Amazons wrought by their hands: for when theſe images ſhould be dedicated in the temple of *Diana* in Epheſus, it was thought good to make choiſe of one which ſhould be deemed and approoved beſt, by the judgement of thoſe workmen who then lived and D were preſent: for plain it was, that the image which they all judged to be next and ſecond to their owne, the ſame was ſimply beſt, and ſo to be reputed. This principall Amazon hapned to be of *Polycletus* his making: in a ſecond degree, was the Amazon made by *Phidias*: that of *Cteſilas* was counted the third; of *Cydon* the fourth: and in a fifth place was reckoned the workemanſhip of *Phragmon*. As for *Phidias*, beſides the *Iuppiter Olympius* of his making (wherein no man ſeeketh to come neare unto him) he made likewiſe *Minerva* of yvorie at Athens, which ſtandeth there in the temple Parthenon. But over and above the foreſaid Amazon, there was of his workmanſhip, *Minerva* in braſſe, ſo faire and beautifull, that of her beautie ſhee tooke the ſurname [of χαλλίμορφος.] Of his doing was the image called *Cliduchos*, and another *Minerva*, which *Æmilius Paulus* dedicated at Rome in the temple of *Fortuna hujuſce diei*, *i.* Of this daies *Fortune*. Alſo, E two other ſtatues or images portraied in clokes or mantels, were his handiworke, which *Catulus* ſet up in the ſame temple: likewiſe another after the manner of a coloſſus or gyant all naked. In ſum, he was deemed and that juſtly, to have been the firſt that deviſed and taught the skill of chaſing and emboſſing. As for *Polycletus* the Sicyonian, who learned his cunning under *Agelades*, he it was that made in braſſe, *Diadumenus*, an effeminat yong man looking wantonly, with a diadem or wreath about his head; a peece of worke of great account and much ſpoken of, for that it coſt 100 talents: and of his making was *Doryphorus*, a young boy with a manly countenance, bearing a ſpeare in his hand. Moreover, he made that which workmen doe call Canon, that is to ſay, one abſolute peece of worke, from whence artificers doe fetch their draughts, ſymetries, and proportions, as from a perfect pattern or rule which guideth and directeth them in their worke: ſo as we F may well and truely judge, that *Polycletus* alone reduced the skill of founderie and imagerie into an art and method, as may appeare both by that Canon, and by other workes which paſſed his hands. Of his workemanſhip was the braſen image, repreſenting one ſcraping and rubbing himſelfe in the bath or hotehouſe: as alſo another all naked, and *challenging to the dice: *Item*, two boyes both naked playing at dice, which thereupon be called Aſtragalizontes.

* κλειδοῦχος, *i.* *Claviger*, the key-bearer.

* *Talo inceſſentē*, ſome read, *talo inſedentem*.

And theſe remaine to be ſeene in the court or portall belonging to the houſe of *Titus* the Em- G
perour, which is ſuch an exquiſit peece of worke, that many doe judge, there cannot bee ſet another to it more abſolute and perfect: alſo, he it was that wrought the image of *Mercurie* which is at Lyſimachia; of *Hercules* at Rome, and namely, how hee heaved and held up *Anteus* from the ground betweene heaven and earth: and the counterfeit of *Artemon*, that effeminat and wanton perſon, who becauſe he was ordinarily carried in a litter, men called Periphoretos. This *Polycletus* was judged to have brought this art of Imagerie to a conſummat perfection: the feat alſo of engraving and embоſſing, hee was thought to practiſe and promote; like as *Phidias* before him opened the way to it, and gave inſtructions. This proper and ſpeciall gift he had beſides above all other, To deviſe how images might ſtand upon one leg: and yet *Varro* ſaith, that all the images of his making, be foure ſquare, and all in manner after one patterne.

To come unto *Myro*; borne he was at Eleutheræ, and an apprentice likewiſe to *Agelades*: the H
peece of worke that brought him into name and made him famous, was an heifer of braſſe; by reaſon that divers Poëts have in their verſes highly praiſed it, and ſpread the ſingularitie thereof abroad: for ſo it falleth out otherwhiles, that many men are commended by the wit of others, more than by their owne. Other peeces of worke there were of his beſides; to wit, a dog, a coit-caſter (or one hurling a ſtone or weight of lead) *Perſeus* [killing *Meduſa*,] ſawyers called Priſtæ, a Satyre woondring at a pipe or flute, and the goddeſſe *Minerva*: moreover, the Delphicke Pentathli, and the Pancratiaſtæ: furthermore, that image of *Hercules* which ſtandeth in the temple that *Pompey* erected, neare the greateſt cirque or ſhew-place, is the handyworke of *Myro*: over and beſides, (as it appeareth by the poëſie of *Erinna* the poëtreſſe) he it was that made the tomb I
or monument in braſſe, of a poore graſhopper and a locuſt: the image likewiſe of *Apollo* (which after that *Antonius* the Triumvir had wrongfully taken from the Epheſians, *Auguſtus Cæſar* reſtored againe unto them, being warned ſo to doe by a viſion appearing unto him in his ſleepe) was of *Myro* his making. This workeman ſeemeth to have been the firſt that wrought not his images after one ſort, but altered his worke after many faſhions, as being fuller of invention and given more to deviſe in his art, more curious alſo and preciſe in his ſymentries and proportions, than *Polycletus*: And yet as exquiſit as hee was, hee went no farther than to the outward lineaments of the bodie and members thereof; as for the inward affections of the mind, he did not expreſſe in any of his worke: the haire alſo as well of head, beard, as ſhare, he left after a groſſe manner, and wrought them no finer than the rude and unexpert workemen in old time, had either done or K
taught. No marveile therefore if *Pythagoras* (the imageur of Rhegium in Italie) went behind him in this feat, and namely in that peece of worke of his which reſembled a wreſtler or Pancratiaſtes, which was dedicated in the temple of *Apollo* at Delphos. He came ſhort alſo of *Leontius*, who expreſſed lively in braſſe, *Aſtylos*, the famous runner in a race; which image is ſhewed for a rare peece of worke in Olympia: alſo the boy *Libys*, which is to be ſeene in the ſame place, holding in his hand a little table, and withall carrying apples, ſtarke naked. Hee made alſo the pourtraiture of one that ſeemed lame and to halt, upon ſome ulcer; but the ſame was ſo lively and naturally done, that as many as behold the ſame, ſeeme to have a compaſſion and fellow-feeling with him of ſome paine and grievance of his ſore; and this peece of worke a man may ſee at Syracuſa. Furthermore, the ſaid *Leontius* caſt in braſſe one *Apollo* playing upon his harpe; as alſo L
another *Apollo*, and the ſerpent killed with his arrows, which image he ſurnamed *Dicæus*, *i.* Iuſt; for that when the citie of Thebes was woon by *Alexander* the Great, the gold which he hid in the boſome thereof when hee fled, was found there ſafe and not diminiſhed, when the enemie was gone and he returned againe. He was the firſt, that in his images expreſſed the ſinews and veines lying under the skin: he it was alſo that couched and laid the haire of the head more handſomly, yea and wrought the ſame far more finely than any before him.

* rather, *Parius* of Paros.

Now beſides *Pythagoras* before mentioned, there was another a * Samian borne, who by occupation, was at the beginning a painter: of his handiworke are thoſe ſeven images halfe naked, which are to be ſeene in the temple of * This daies *Fortune* at Rome; and one reſembling an old man: all highly commended for ſingular art. This *Pythagoras* was ſo like unto the other above- M
named, eſpecially in face and countenance, that hardly (by report) one of them could be known from the other. As touching *Soſtratus*, it is ſaid, hee was apprentice to *Pythagoras* of Rhegium, and his ſiſters ſon beſides. As for *Lyſippus* of Sicyone, *Duris* ſaith, that he learned the art by himſelfe, and never was taught by other: but *Tullius* affirmeth, that hee was apprentice unto it, and

* *Huiuſce diei.*

having

A having beene at first by occupation but a poore tinker or a plaine brasier and coppersmith at the most, he began to take heart unto him, and to proceed further, by a speech or answere that *Eupompus* the painter gave him: for when he seemed to aske this painters counsell, What patterne, and whom hee were best to follow of all those workemen that were gone before him? hee shewed unto him a multitude of people, and said withall, That he should doe best to imitate Nature her selfe, and no one artificer: and that was it (quoth he) which I meant by the former demonstration of so many men. And verely, so excellent a workeman hee prooved in the end, that he left behind him the most peeces of any man, as I have said before, and those of all sorts, and fullest of art & good workmanship: and among the rest, an image of a man, currying, rubbing, and scraping the sweat and filth off his owne bodie; which *M. Agrippa* caused to be set before his owne baines: and the
B Emperour *Tiberius Cæsar* tooke so great pleasure in it, that notwithstanding at his first comming to the crowne, he knew well ynough how to commaund and temper his owne affections, yet he could not now rule himselfe, but would needs have the said image to be removed from thence into his owne bed-chamber, and another to bee set in the place of it: whereat the common people (see their contumacie and frowardnesse!) were so much offended and displeased at it, that they rested not with open mouth to exclaime upon him in all their Theatres, when they met there together, and cried for to have their Apoxyomenos set againe in the owne place: Insomuch, as the Emperour was content so to doe, notwithstanding he loved it so well. This *Lysippus* also woon greater credit and commendation by another image that hee made, representing a woman piping or playing upon the flute, and drunken withall: also by a kenell of hounds,
C together with the huntsman & all belonging to the game. But above all, he gat the greatest name for making in brasse a chariot drawne with foure steeds, together with the image of the Sunne, so much honoured among the Rhodians. The personage of king *Alexander* the Great hee likewise expressed in brasse, and many images he made of him, beginning at the very childhood of the said prince. And verely the Emperour *Nero* was so greatly enamoured upon one image of *Alexander*, that hee commaunded it to be guilded all over: but afterwards, seeing that the more cost was bestowed upon it by laying on gold, the lesse was the art seene of the first workman, so that it lost all the beautie and grace that it had by that means, he caused the gold to be taken off againe: and verely, the said image thus unguilded as it was, seemed farre more precious than it was whiles it stood so enriched with gold, notwithstanding all the hackes, cuts, gashes, and rases
D all over the bodie wherein the gold did sticke, remained still, which in some sort might disfigure it. Of this mans making was the statue of *Hephæstion*, a great favorit and minion of *Alexander* the Great; and yet some ascribed this peece of worke unto *Polycletus*: whereas in truth hee lived almost a hundred years before the said *Hephæstion*. He counterfeited also *Alexander* the Great how he rid a hunting, with his hounds and all things belonging to the chase: and this worke of his resembling hunting, was thought worthie to be consecrated in the temple of *Apollo* at Delphi. At Athens he made a troupe of Satyres. As for *Alexander* himselfe, with all his principall courtiers and friends about him, he resembled in brasse most lively. All these peeces of his workemanship before rehearsed, were transported to Rome by *Metellus*, after the subduing and conquest of Macedonie. Finally, coaches drawne with foure horses, he made of many sorts and fashions, all in
E brasse. And in one word, the art of founderie and imagerie was brought to farre greater perfection by this artificer, as it was thought: for he expressed the very haires of the head, as fine & small as Nature made them: the heads to the images of his making, were nothing so big in proportion to the rest of the bodie, as they were in old time: his images shewed not so grosse and corpulent, but more lanke, slender, and leane; as well to expresse the knitting of joints, the ribs, veines, and sinewes the better, as to cause them also to seeme the taller. The Symmetrie, which above all things he observed most precisely in all his workes, is a tearme that cannot properly be expressed by a Latine word. A new devise he had that never before him any practised, and that was, to make his images of a quarrie and square stature, as the auncients before his time did: for an ordinarie speech it was of his, That in times past men were made plaine, such as they were: but hee made
F them as they would seeme to be. Finally, it seemeth, that this singular gift he had above all others in all his workes, to shew fineneſse and subtiltie, which he observed most curiously in the smallest things that passed under his hand. When he died, he left behind him three sonnes, who also were his apprentises: of whom, *Lahippus* and *Bedas* were passing good workmen, and very well regarded; but *Euthycrates* his third sonne, overwent his brethren: although I must needs say, that hee

loved

loved rather to follow his father in ſuch workes as caried ſome conſtancie & majeſtie with them, G
than any daintie geſture or curious elegancie, wherein his father excelled: and hee choſe rather
to employ his wit in expreſſing ſad, auſtere, and grave perſonages, than to beat his braine about
pleaſant and beautifull workes to pleaſe and content the eye. And therefore the portrait of *Her-*
cules, which is to be ſeene at Delphos within the temple of *Apollo*, he expreſſed moſt excellently:
the ſtatue alſo of king *Alexander* the Great was of his making, and is thought to be a rare peece
of worke: the hunter *Theſpis* was of his making, a worke highly eſteemed: like as the nine Muſes
alſo, knowne by the name of *Theſpiades*. He repreſented alſo in braſſe a skirmiſh on horſeback, re-
ſembling that Turnois which was performed at the Oracle of *Iupiter Trophonius*: likewiſe the co-
ches of queene *Medea*, drawne with foure horſes, of which kind he made many: as alſo a horſe
with panniers: and hunters hounds, as if there were a crie of them. H

Hee brought up under him one *Tiſicrates*, who alſo was a Sicyonian, but hee rather ſeemed to
imitate *Lyſippus* than his maiſter *Euthycrates*, inſomuch as many peeces of his making could bee
hardly diſcerned from thoſe in the ſame kind, which came out of *Lyſippus* his hand: as for exam-
ple, the image of an old man reſembling the habit of a Thebane; the pourtrait of king *Demetrius*,
and of one *Peuceſtes* who ſaved the life of *Alexander* the Great; in which regard, hee deſerved well
to be immortalized by ſo good a hand.

Moreover, divers artificers there be who have written great volumes of ſingular workmen in
imageurie, & they commend wonderfully one *Telephanes* a Phocean, whoſe name otherwiſe had
been unknown, for that in Theſſalie where he dwelt, his works lay hidden and never came to light:
for in regard of his skill and ſufficiencie, by all their voices equall hee was to *Polycletus*, *Myron*, I
and *Pythagoras*. And to come unto particulars, they write much in the praiſe of his *Lariſſa*, his
Apollo, and one *Spinarius*, a notable wreſtler, and who had woon ſeverall prices in all the five
kinds of maiſteries and feats of activitie. And yet I am not ignorant, that ſome alledge another
cauſe of his obſcureneſſe, and why he is no more talked of, becauſe he was a freed workeman unto
Xerxes and *Darius*, and devoted himſelfe wholly to their ſervice, and had the worke of thoſe two
kings onely.

As for *Praxiteles*, his workmanſhip was more ſeene in cutting of marble, and making images
thereof, wherein he had a ſingular grace and rare felicitie, and in which regard, his name was the
greater. Yet he ſhewed good proofe of his skill in founderie alſo. For there be moſt beautifull caſt
images of braſſe which hee made, to wit, the raviſhing of *Proſerpina* by *Pluto*, a Spinſter ſpinning, K
which hee called *Cataguſa*: the image of drunkenneſſe: god *Bacchus* attended with one of the
Satyres; a noble peece of work, and which, for the great voice and bruit that went of it, the Greeks
ſurnamed *Periboetos*. The braſen images likewiſe which ſtood ſometimes in the forefront of the
temple at Rome dedicated to *Felicity*, were of his making: as alſo the goddeſſe *Venus*, which when
the chappell wherein ſhe ſtood erected, was burnt (during the reigne of *Claudius Cæſar* the Em-
peror) was melted; an exquiſit peece of worke, and comparable to that *Venus* of his cutting in
marble, which all the world ſpeaketh ſo much of. He portraied alſo in braſſe a woman making co-
ronets and chaplets of flowers, which goeth under the name of *Stephuſa*: a foule old trot and a
naſtie, bearing the title of *Spilumene*: a carrier alſo of flaggons or wine-pots, knowne by the ad-
dition of *Oenophorus*. He expreſſed moreover in braſſe and that moſt lively, *Harmodius* and *Ari-*
ſtogiton, maſſacring the tyrant *Piſiſtratus*: which images being with other pillage taken and cari- L
ed away by *Xerxes* king of the Perſians, and recovered by king *Alexander* the Great when he had
conquered the kingdome of Perſis, the ſaid prince and conqueror reſtored to the Athenians, and
ſent them home to them againe. Furthermore, hee caſt in braſſe a * youth lying in wait with an
arrow to kill a Lizard, which was readie to creepe cloſe unto him and to ſting; which peece of
worke he tearmed *Sauroctonus*. Two images there are beſides of his making, which people take
much pleaſure to behold, and thoſe in countenance ſhew divers affections; to wit, a ſobre matron
weeping, and a light courtiſan ſmirking: It is thought that this courtiſan was his own ſweet heart
Phryne, for men do note both (in the curious workmanſhip of the artificer) the love of him which
fancied her, and alſo (in the pleaſant countenance of the harlot) the contentment that ſhe took by M
receiving her hire. There is an image alſo of his making, which doth expreſſe his own benignitie
and bountifull mind; for to a coach of *Calamis* his doing, drawn with foure horſes, he ſet a coach-
man of his owne handyworke: and why? becauſe the poſteritie another day ſhould not thinke,
that *Calamis* having done ſo wel in portraying the horſes, failed of the like cunning in expreſſing

* Some thinke he meaneth this of *Apollo*.

the

A the man: and to say a truth, *Calamis* was not altogether so perfect & readie in personages of men and women, as in the portraiture of horses. This *Calamis* was he who made many other coaches and chariots, as well with two steeds as foure; and verely, for absolute workemanship about horses wherein hee never missed, he had not his fellow againe in the world: and yet because hee would not be thought unlike himselfe, but be taken for as good an imageur in expressing men and women, as in representing horses, one statue he made in resemblance of ladie *Alcmena*, which is so exquisitly wrought as no man could ever set a better peece of worke by it.

To come now to *Alcamenes*, trained up under *Phidias*. A singular workman he was, & wrought many peeces in marble, as also in brasse, and namely a brasen *Pentathlus*, knowne also by the name of *Encrinomenos*.

B But *Aristides*, who learned his skill under *Polycletus*, is famous for the chariots that he made as well with foure as two horses. *Iphicrates* likewise cast in brasse a Lioneſſe, which is much praised, and goeth under the name of *Leæna*, and that upon this occasion; There was a certaine strumpet named *Leæna*, who beeing familiarly acquainted with *Harmodius* and *Aristogiton* abovenamed, (for that she could play upon the harpe, and withall sing so sweetly to it) and privie to their plots and projects as touching the murder of the tyrant *Pisistratus*, would never, to die for it, discover and reveal this intention and purpose of theirs unto the tyrant and his favorits, notwithstanding she was put to most exquisit and dolourous torments about it. The Athenians therefore desirous to honour this woman for her resolute constancie accordingly; and yet loth to be thought for to make so much of such an harlot as she was, devised to represent the memoriall of her and her act
C by a beast of her name, and that was a Lioneſſe: yet for to expresse the particular motive and reason of this honor done unto this Lioueſſe, they gave order unto *Iphicrates* the workman, to leave out the *tongue in the head of this Lioneſſe.

*For this harlot *Leæna* fearing least she might for pain and torment let passe some word, & bewray the thing, she bit out hir own tongue, & spit it in the face of the tyrant and the tormẽtors.

Touching *Bryaxis*, there be two excellent peeces of his making, to wit, *Æsculapius* and *Seleucus*. As for *Bedas*, he resembled in brasse old *Battus* adoring *Apollo* and *Iuno*: And all three by him curiously wrought, are now standing in Rome within the temple of *Concord*. *Ctesilas* expressed in brasse a man greevously wounded, fainting and readie to die thereupon; which hee did so lively, that one might perceive therein how little life and breath was left within his bodie. He made likewise the image of *Pericles* *Olympius*, who for his divine eloquence and holinesse was worthie of that heavenly name. And here by the way, a wonderfull gift this art hath, that it alwaies hath made
D noble and worthie persons more noble and famous.

As for *Cephissodorus*, the admirable image of *Minerva* which is to be seen in the haven or harbor of the Athenians, was his workmanship: The altar also before the temple of *Iupiter*, surnamed *Savior*, neare the said haven, was of his doing, and few peeces of worke there be comparable unto it.

Canachus made one excellent image of *Apollo* all naked, which by the title and surname of *Philesius*, standeth in the temple called *Didymæum*. And this *Apollo* was cast of the brasse of Æginetticke temperature. There is with the said *Apollo* another most exquisit and curious peece of worke by him devised and wrought, to wit, a stag standing so lightly upon his feet, that a man may draw a thred under them; and the same takes hold of the floore underneath, so daintily, that he seemeth to touch it with one foot by the clea, with another by the heele; and the same after
E such a winding manner twining and turning, as well with the one as the other, that a man would thinke one while he were about to bounce and spring forward, and another while to start and cast himselfe backward by turnes. The same workman invented a devise of yong lads and youths vaulting and mounting on horseback. *Chæreas* expressed in brasse the lively portraitures of king *Alexander* the Great, and king *Philip* his father. *Ctesilaus* represented in the same mettall, one of these Doryphori, which were of king *Darius* his guard, bearing a speare or pertuisane: also one of those warlick women, Amazones, wounded. And *Demetrius* woon great credit by making *Lysimache* in brasse, who had beene the Priestresse of *Minerva*, and exercised that ministerie threescore and foure yeares. And this artisane made also the image of *Minerva*, surnamed *Musica*, upon this devise, For that the dragons or serpents which serve in stead of haires upon her *Gorgon* or *Medusaes*
F head, wrought in her targuet, would ring and resound againe, if one strucke the strings of an Harpe or Citron neare unto them. And the same imageur made the lively portraiture of *Sarmenes* riding on horseback, for that he was the first that wrote of horsemanship. *Dædalus* moreover, who is ranged among the excellent founders and imageurs of old time, devised in brasse two boies, rubbing, scraping, and currying the sweat from their bodies in the baine. And *Dinomenes*

* For he never made speech to the people, but with iointhãds lifted up to heaven, he praied first.

was

was the workman,who caſt in braſſe the full proportion and ſimilitude of *Proteſilaus*, and of *Pythodemus* the famous wreſtler. *Alexander*, otherwiſe called *Paris*, was of *Euphranor* his making: The excellent art and workmanſhip whereof was ſeene in this,that it repreſented unto the eye all at once,a judge between the goddeſſes,the lover of *Helena*,and yet the murderer of *Achilles*.The image of that *Minerva* at Rome,which is called *Catuliana*,came out of this mans ſhop: and it is the ſame which was dedicated and ſet up beneath the Capitoll by *Quintus Luctatius Catulus*, whereupon it tooke that name. Moreover, the image that ſignifieth good lucke or happie ſucceſſe,carying in the right hand a boule or drinking cup, in the left an eare of corne and a Poppie head,was his handie worke. Like as the princeſſe or ladie *Latona*, newly delivered of *Apollo* and *Diana*,holding theſe her two babes in her arms:& this is that *Latona* which you ſee in the church of *Concordia* in Rome.He made beſides many chariots, drawne as well with foure as two horſes:as alſo a key-bearer or *Cliduchus*, of incomparable beautie. Semblably, two other ſtatues, reſembling Vertue and Greece,both which were of an extraordinarie ſtature and bigneſſe, gyant-like, in manner of Coloſſes.He made beſides a woman miniſtring,and yet worſhipping withall. *Item*, King *Alexander* the Great,and king *Philip* his father, riding both in chariots drawne with foure horſes. *Eutychides* a renowned imageur, repreſented the river Eurotas in braſſe: and many men that ſaw this worke,were wont to ſay,That the water ran not ſo cleare in that river,as art and cunning did appeare in this workemanſhip. *Hegias* the imageur made *Minerva* and king *Pyrrhus*, which be much praiſed for the art of the maker: likewiſe boies practiſing to ride on horſeback: the images alſo of *Caſtor* and *Pollux*, which ſtand before the temple of thundering *Iupiter* in Rome.In the colonie or citie Parium,there is an excellent ſtatue of *Hercules*,the handie worke of *Iſidorus*. *Buthyreus* the Lycian was taught his cunning by *Myron*, who among many other peeces,beſeeming the apprentiſe of ſuch a maiſter, deviſed in braſſe to repreſent a boy blowing at a fire halfe out: and hee it was that caſt in the ſame mettall the famous Argonautes,in that voyage to Colchos. G H I

Leocras made the Ægle that raviſhed *Ganymedes* and flew away with him;but ſo artificially,as if ſhe knowing what a fine and daintie boy ſhe had in charge,and to whom ſhee caried him, claſped the child ſo tenderly,that ſhe forbare with her tallons to pierce through his very cloths. The boy *Autolicos* alſo, winning the prize in all games and feats of activitie, was of his making; for whoſe ſake *Xenophon* wrote his booke entituled *Sympoſion*: likewiſe that noble image of *Iupiter* in the Capitoll of Rome, ſurnamed Thundering, which is commended above all others: as alſo *Apollo*,with a crowne or diademe. K

Lyciſcus counterfeited *Lago* a boy,who in maner of a page or lacquey,ſeemed to be double diligent,and after a flattering and deceitfull ſort performed nothing but eie-ſervice. *Lycus* alſo made another boy blowing the coales for to maintain fire. *Menechmus* deviſed to caſt in braſſe a Calfe, turning up the necke and head at the man that ſetteth his knee upon his ſides,& keepeth his body down. This *Menechmus* was a ſingular imageur,and himſelfe wrote a book as concerning his own art. *Naucides* was judged to be an excellent workman by the making of *Mercurie*,& of a Diſcobole or coiter: as alſo for counterfeiting in braſſe one that was a ſacrificing or killing a Ram. *Naucerus* woon credit by making of a wreſtler, puffing & blowing for wind. *Nicerates* had the name for the curious workmanſhip of *Aeſculapius* and **Hygia*,which are to be ſeen at Rome within the temple of *Concord*. *Pyromachus* got great reputation by a coach drawn with four ſteads,&ruled by *Alcibiades* the coachman,all of his making. *Policles* was the maker of that noble peece of work that goeth under the name of *Hermaphroditus*. *Pyrrhus* counterfeited in braſſe another *Hygia* & *Minerva*. And *Phœnix* who learned his art of *Lyſippus*,lively counterfeited the famous wreſtler *Epitherſes*. *Stipax* the Cyprian got himſelf a name by an image reſembling one *Splanchnoptes*: This was a pretie boy or page belonging to *Pericles*,ſurnamed *Olympius*,whom *Stipax* made frying & roſting the inwards of a beaſt at the fire, puffing and blowing thereat with his mouth full of breath and wind,for to make it burne. *Silanion* did caſt the ſimilitude of *Apollodorus* in braſſe: who likewiſe was himſelfe a founder and imageur, but of all others moſt curious and preciſe in his art,he never thought a thing of his owne making well done, and no man cenſured his workes ſo hardly as himſelfe: many a time when he had finiſhed an excellent peece of worke,he would in a miſlike unto it,paſh it in peeces, and never ſtood contented and ſatisfied with any thing when it was all done,how full of art ſoever it was,and therefore he was ſurnamed Mad: Which furious paſſion of his,when *Silanion* aforeſaid would expreſſe, hee made not the man himſelfe alone of braſſe, but L M

* *i.* Good health.

the

A the very image of Anger and Wrath also with him, in habit of a woman. Over and besides, the noble *Achilles* was of his making, a peece of worke well accepted and much talked of. Of his doing is *Epistates*, teaching men how to wrestle and exercise other feats of activitie. As for *Strongylion*, he made one of the Amazones, which for an excellent fine and proper leg that shee had, they call *Eucnemos*; and in that regard *Nero* the Emperour set so great store by this image, that it was caried ordinarily whersoever hee went. This artificer made likewise another brasen image resembling a faire and sweet boy, which for the singular beautie *Brutus* of Philippi so loved, that it was commonly called by his surname *Philippensis*.

Theodorus, who made the Maze or Labyrinth at Samos, caused his owne image to bee cast in brasse, which besides the wonderfull neare resemblance and likenesse to himselfe, was contrived
B so artificially besides, and set out with other fine devises, that he was much renowned for the workmanship, and in the sight of all men it was admirable: he carieth yet in his right hand a file, and in his left he bare sometime (with three fingers) a little prety coach, and the same with four horses at it; which was afterwards taken from the rest, and had away to Prænestę: but both the coach, the teeme of horses, and the coachman were couched in so small a roume, that a little flie (which also he devised to be made to the rest) covered all with her pretie wings.

Xenocrates was apprentice to *Tisicrates*, or as some say, to *Euthycrates*; but whether of the twain was his master, he outwent them both in the number of statues & images that he wrought, and besides compiled bookes of his owne art and workmanship.

Many artificers there were, that by Imagerie delighted to counterfeit in brasse the battailes
C that king *Attalus* and *Eumenes* both, fought against the Galatians or Gallogreekes; and namely, *Isigonus*, *Pyromachus*, *Stratonicus*, and *Antigonus*, and this artisane last named, composed bookes also of his owne art. *Boethius*, although he was a better workman in silver, yet one peece of work hee made in brasse, which had an excellent grace, and that was a child throtling a Goose by the necke.

Of all these peeces of antique worke which I have reckoned up, the most choise and singulat above the rest *Nero* beforetime had by his violent edicts and commaundements caused to bee brought from all parts to Rome, and hee disposed them in diverse roumes of his golden house for to adorne and beautifie the same; but now they be consecrated by *Vespasian* the Emperor, in the temple of Peace, and in other stately buildings and edifices of his.

D Many other excellent artificers there are besides these above rehearsed: but they may bee all raunged in one ranke, and counted for their skill and cunning equall, for a man shall not find one peece of worke of their making, that carieth any singularitie above the rest, and namely *Ariston*, who also was wont to grave and chase in silver, *Callias*, *Clesias*, *Cantharus* of Sicyone, *Dionysodorus* who was an apprentice trained up under *Critias*, *Deliades*, *Euphorion*, *Eunicus*, and *Hecatæus*. As touching famous engravers in silver, I read of *Lesbocles*, *Prodorus*, *Pithodicus*, and *Polygnotus*, who also were most excellent and renowned painters. Likewise, of silversmiths or gravers in silver, wee have *Stratonicus*, and *Scymnus*, who had for his maister *Critias*.

Now will I reckon up those worthie and famous Imageurs, who employed themselves in one and the same kind of workes. In the first place, *Apollodorus*, *Androbulus*, *Asclepiodorus*, and *Aleuas*
E tooke pleasure to expresse the similitudes of learned men and Philosophers. As for *Apelles*, he delighted besides to represent women at their devotions, adoring the gods, and offering sacrifices. *Antigonus* had a grace likewise to represent one *currying and scraping his skin all over the body in a stouve, as also the murderers of the Tyrants abovenamed. *Antimachus* and *Athenodorus* loved to have in their shops the statues of great ladies and noblewomen. *Aristodemus* tooke much pleasure to busie himselfe about the portraying of wrestlers, coaches with two horses set thereto, and a coachman, Philosophers and great clearkes, old matrones, and king *Seleucus*: There is also of his making a *Doryphorus*, resembling one of *Darius* his guard, which is a proper peece of work and a lovely. As touching the *Cephisodori* (for two of them there were) the elder had a great dexteritie in making *Mercurie* fostering prince *Bacchus* in his infancie: He made one also, preaching
F to the people, and casting forth his armes; but what person of qualitie he should be, it is not certainely knowne: the younger was wont to represent the Philosopher. *Colothas*, who joined with *Phidias* in the making of *Iupiter Olympius*: He delighted also to be doing with the images of Philosophers. So did *Cleon* and *Cenchramis*, *Callicles*, and *Cephis*. As for *Calcosthenes*, hee busied and amused himselfe in the counterfeits of Comœdians, players of Enterludes, and champions. *Dahippus*

*Perixuomenon the same that Apoxuomenon.

hippus had a very good hand, in making one ſcraping and rubbing his bodie in an hotehouſe. G
Daiphron, *Democritus*, and *Dæmon*, were as cunning and perfit in the perſonages of Philoſophers and Sages. *Epigonus* would have his hand in all thoſe workes in manner which I have rehearſed, and laboured to imitate thoſe artificers: but hee ſurpaſſed them all in a Trumpetter of his owne deviſing; and a little infant, who ſeeing the mother ſlaine, made toward the dead corps, and hung about it as if it would play and be plaied withall, full pittiouſly to behold. *Eubolides* made one, as if he were counting upon his fingers. *Mycon* his cunning was moſt ſeene in the counterfeiting of wreſtlers and ſuch as practiſe feats of activitie: and *Menogenes*, in making chariots with foure horſes. *Niceratus* likewiſe enterpriſed all manner of workes wherein others were beſt ſeen: and beſides repreſented the perſonage of *Alcibiades*, together with his mother *Demarete*, as ſhee ſacrificed with lampe light burning by her. *Piſicrates* ſhewed much skill in a chariot with two horſes, H
wherein he beſtowed **Pitho* ſitting in the habit of a woman: The images of *Mars* and *Mercurie* alſo, which ſtand at Rome in the temple of *Concordia*, be of this mans making. As for *Perillus*, there is no man commendeth him for his workmanſhip, but holdeth him more cruell than *Phalaris* the Tyrant, who ſet him a worke, for that he deviſed a braſen Bull, to roſt and frie condemned perſons in; aſſuring the Tyrant, that after the fire was made under it, they would when they cried ſeeme to bellow as a Bull, and ſo rather make ſport than move compaſſion: but this *Perillus* was the firſt himſelfe that gave the hanſell to the engine of his owne invention, and although this was crueltie in the Tyrant, yet ſurely ſuch a workman deſerved no better a reward, & juſtly he felt the ſmart of it: For why? The art and cunning of founderie, which of all others is moſt civile & agreeable to our nature, and which had beene emploied ordinarily in repreſenting the perſonages of I
men and gods, this monſter of man abuſed, and debaſed to this vile and unnaturall miniſterie of tormenting man. Would one have ever thought, that after ſo many wittie and worthy men who had travelled in this ſcience to bring it to ſome perfection, all their labours ſhould turne in the end to this proofe, for to make inſtruments thereby of torture? And certes, there beeing many peeces of his workemanſhip, they bee kept and ſaved for this cauſe onely, that as many as ſee the ſame, may deteſt and abhorre the wicked hand that made them. But to proceed forward to other workmen in this kind. Of *Sthenis* making are the images of *Ceres*, *Iupiter*, and *Minerva*, which at Rome are within the temple of *Concord*. The ſame man tooke pleaſure in counterfeiting ancient dames and matrons, weeping, praying, and offering ſacrifice. *Simon* [of Ægina] was very good at the making of a dog and an archer. *Stratonicus* that famous cutter and engraver, was never well K
but when he pourtraied ſome Philoſopher or other: no more than *Scopas*, both the one and the other. As for wreſtlers and champions, armed men, hunters, and ſacrificers, they were the onely workes that theſe artificers following delighted moſt in, to wit, *Batton*, *Euchir*, *Glaucides*, *Heliodorus*, *Hicanus*, *Leophon*, *Lyſon*, *Leon*, *Menodorus*, *Myagrius*, *Polycrates*, *Polydorus*, *Pythocritus*, & *Protogenes* (who alſo was a moſt excellent & renowned painter, as I will hereafter ſhew more at large) alſo *Patrocles*, *Polis*, *Poſidonius* born at Epheſus, who likewiſe chaſed and engraved in ſilver moſt finely, *Periclimenus*, *Philon*, *Simenus*, *Timotheus*, *Theomneſtus*, *Timarchides*, *Timon*, *Triſias*, & *Thraſon*. But above all other, *Callimachus* is the workman of greateſt note, in regard of a by-name given unto him, and that was *Cacizotechnos:* and well he might be ſo called, for he would alwaies be finding fault with his owne workmanſhip, and never could ſee when to make an end, thinking ſtill L
that he had not beſtowed art ynough upon that he had under his hand. And ſo he brought forth little or nothing perfect in the end: A notable and memorable example to teach all men not to be over curious and exquiſit in any thing, but to hold a meaſure in all. And there is a daunce of Lacedemonian women of his making: a peece of worke which he went about alſo to amend, and when he thought to make it better, he marred it cleane, ſo that it loſt all the grace it had before. Some ſay, that this *Callimachus* had been in former time a painter. And ſince I have entred ſo far into this Treatiſe of ſtatues and images, I may not paſſe over in ſilence, but note (as it were) by the way one thing of *Cato*, although haply it may be thought but a meere vanitie: In that expedition or voyage wherein Cyprus was conquered and reduced under the dominion of Rome, hee made port-ſale of all the pillage taken there, ſave only one ſtatue of *Zeno*, not for the excellencie of the M
matter, for it was but braſſe, nor yet for the art and curious workmanſhip thereof, but for that it was the image of a Philoſopher. In this diſcourſe of ſtatues and images, I muſt not paſſe by one, although it is not certainely knowne who was the maker of it; and this is *Hercules* in his ſhirt and other habit that he wore upon the mount Oete: ſtanding now at Rome neare unto the publicke

pulpit

**Suada*, *i.* Perſuaſiõ, or *Diana* as ſome think. Some read *Piſto*, *i.* the goddeſſe of Credulitie.

A pulpit called Rostra: Made he is (whosoever did it) with a grim, sterne, and sower countenance, and such indeed as doth bewray and feele those intollerable torments which the bodie sustained by that poisoned shirt [sent unto him from *Deianira*.] Vpon this statue there stand three titles or inscriptions: the first is this; *L. Luculli Imperatoris de Manubijs*, *i. L. Lucullus* lord Generall, erected this statue out of the spoile of the enemies: the second, *Pupillus Luculli filius ex S. C. dedicavit*, *i.* The sonne of *L. Lucullus*, being orphan or ward, dedicated this, by an order or act from the Senat: the third, *T. Septimius Sabinus Ædilis Curulis, ex privato in publicum restituit*, *i. T. Septimius Sabinus*, Ædile Curule for the time being, hath from a privat house caused it to stand againe in publicke place. This is the image of that worthie *Hercules* that fought so many battails, endured such hard conflicts and labours, and was so highly honoured.

B Now is it time to return to the different kinds and sundry temperatures of brasse, from which I have digressed: first and foremost therefore this is to bee noted, That in Cyprian brasse or copper there is to be considered, one sort which is named Coronarium, and the other that they call Regulare; and both the one and the other will abide the hammer & be brought into thin plates. As for the Coronarium or Laton, when it is reduced into thin leaves or plates, and then coloured or rubbed over with the gall of an oxe, it looketh like gold and maketh a faire shew in those coronets that players weare; whereupon it tooke the name Coronarium: the same, after that to everie ounce of it there be put six scrupuls of gold, and be reduced into a verie thin foile, resembleth the colour of fire, like a rubie or carbuncle stone. As touching this brasse, it is found also in other mines of mettall, like as the pot-brasse Caldarium: this onely is the difference, that this
C Caldarium will melt only, for under the hammer it will breake; whereas the other sort of copper named Regulare, yeeldeth to the hammer and will be drawne out, whereupon some there be who call it Ductile, *i.* battable; and such is all the kind of copper or Cyprian brasse. That also which is found in the mines of other mettals, by art refined, differeth from the foresaid pot-mettall, for out of what mine soever it commeth, after that the drosse and imperfections therof be throughly purged by the fire, being thus (I say) cleansed, it becommeth Regulare and will abide the hammer. As for all other sorts besides the Cyprian brasse abovenamed, the Campane brasse is counted best: like unto which, there is much in other parts also of Italie, and in the provinces: but to everie [hundred pound of brasse] they put eight pound of lead: then they boile it as it were and melt it againe with a soft fire, for want and scarsitie of wood and fuell. And what difference there
D may be in that regard, it is most of all seene in the heart of Fraunce, where it is commonly melted (for lacke of other fuell) among stones made red hot: for by reason that this is a swift & scorching fire, it becommeth blacke and brittle withall: besides, they melt it but once: but surely to doe so oftener, maketh verie much for the goodnesse thereof.

Chap. IX.

The difference in Brasse: the divers mixtures thereof: and how Brasse should be kept.

E MOreover, it were not amisse to note thus much also, that all kind of brasse melteth best in coldest weather. Now there is another temperature of brasse which serveth for founders, imageurs, and brasen tables, called thereupon in Latine, Statuaria and Tabularis, which is made in this manner following: First, the masse, ore, or stone as it commeth out of the mine, is melted in the bloome-smithie; and so soone as it is melted, they put thereto a third part of the brasse Collectaneum, that is to say, broken peeces or old vessels that have been used, and bought up here and there. In the choice whereof, this care would bee had, that for to give unto this temperature the kind seasoning as it were, which peculiarly it requireth, there would be gotten such pottain or old mettall which is overworne, and by ordinarie occupying and using to the hand; bright-shining, and as one would say tamed, made gentle, and pliable. It would not be forgotten also, to everie hundred pound weight of the said melted ore, to mix twelve pound and a
F halfe of tin. But to have a kind of brasse mettall that is most tender and soft, there must be given unto it that mixture or temperature which is called Formall, namely, by putting thereto of ordinarie lead a tenth part, and of tin a twentith part; and by that means especially it taketh that colour which they call Grecanicke. The last temperature is that, which in Latine they call Ollaria, as one would say, the pot-brasse, for it taketh the name of that vessell wherto it is most emploied;

and this is by tempering with every hundred pound weight of braſſe, three or four pound weight of argentine lead or tin. To Cyprian braſſe or copper, if you put lead, you ſhall have that deepe red or purple colour which giveth the tincture to the robes that ſtatues are pourtraied with. Moreover, this is to be noted, that the more you doe ſcoure any veſſels of braſſe, the more are they ſubject to ruſt and ſooner will they gather it, than if they were neglected and not medled withall; unleſſe they be well annointed with oile. It is ſaid, that a verniſh made of tarre, is ſingular for to preſerve and ſave any braſſe from ruſt. To conclude, braſſe hath ſerved many a yeere agoe, for the perpetuitie of memorials and regiſters, as we may ſee by thoſe braſen tables here in Rome, wherein be cut and engraven all our publicke laws and conſtitutions. G

Chap. x. H

Of Cadmia or Braſſe ore, and the medicines wherein it is uſually employed.

THe mines and veins of braſſe ore do many waies furniſh us with medecines: a good prooſe whereof this may be, that any ulcers be ſooneſt healed there: but the moſt medicinable of all minerals that belong to braſſe-mettall, is Cadmia [artificiall.] And verely there is a kind of Cadmia made in the furnaces where ſilver is fined, of a whiter colour and leſſe ponderous, but nothing comparable to that which commeth from the braſſe furnaces. And ſundrie ſorts there be of Cadmia: for the verie ſtone of which they make braſſe, is called Cadmia, and as it is neceſſarie for founders, ſo it is of no uſe at all in phyſick. Now is there a Cadmia beſides which I is made in the furnaces, and ſo called, but the reaſon thereof is farre different: and this kind of Cadmia commeth of the fineſt and thinneſt part of the ore or matter in the furnace, caſt up aloft by the flame and blaſt, ſticking to the rouſe or ſides of the furnace, higher or lower according to the proportion of the lightneſſe that it carrieth, more or leſſe. The fineſt and the floure as it were of Cadmia, is found in the verie mouth of the furnace, whereas the flames * doe ſtrive to get forth: The Greeks call it Capnitis, for that it is ſmokie and burnt, and for the exceeding levitie thereof reſemble flying cinders. That which is more inward and hangeth downe from the coping and vauted rouſe of the furnace, is the beſt: and in that reſpect, becauſe it hangeth ſo as it were by cluſters, they give it the name Botryitis: heavier this is than the former, but lighter than thoſe that follow after. As for the colour thereof, it is in two ſorts: that which you ſee of a dead hew like aſhes, is the woorſe, whereas the red is the better; the ſame alſo is brittle and will ſoone crumble ſmall: for eyeſalves and collyries reputed ſoveraigne. A third kind of Cadmia ſticketh by the way, to the ſides and walls of the furnace; for by reaſon of the heavineſſe and profunditie, it was not able to mount up to the bending rouſe of the furnace: this the Greeks call Placitis: and well it may bee ſo named; for a cruſt rather it is than a skalie ſubſtance: breake it, you ſhall find many colours in it: and this Cadmia for to heale ſcabs and ſcurfe, as alſo to cicatrice or skin a ſore, is better than the former. Out of this kind, there proceed other twaine; to wit, Onychitis, which in the outſide is after a ſort blewiſh, but within, it reſembleth the flecks or ſpots of the onyx ſtone; and Oſtracitis, blacke throughout, of all the reſt moſt foule and groſſe, howbeit fitteſt for wounds. K L

* *Eluctantur*, or rather, *Eructantur*, *i.* are breathed and ſent forth.

Generally, that Cadmia, of what kind ſoever, is beſt, which is found within the furnaces of Cypros: this the Phyſicians doe burne a ſecond time with pure coles; and when it is calcined and turned to aſhes, they quench it with Amminean wine, if they meane to prepare it for plaſtres; but with vinegre, for ſcabs and ſcurfe. Some there be, who after it is ſtamped groſſe, burne or calcine it in an earthen pot, then waſh it well in a mortar, and afterwards drie it. *Nymphodorus* taketh the verie ſtone or the ore as it lyeth in the mine, the heavieſt and moſt compact that may be found, which he burneth among coles; and after it is ſufficiently burnt, quencheth it in wine of Chios: he beateth and punneth it then againe, anon he driveth or boulteth it through a linnen cloth, and grindeth it finer in a morter: this done, ſoone after he ſteepeth and ſoketh it well in raine water, and that which ſettleth in the bottome he ſtampeth: and this hee doth, untill M ſuch time as it be like ceruſe or white lead, and will not craſh betweene the teeth. The ſame manner of preparing uſeth *Tollas*, but he choſeth the pureſt and brighteſt ſtone that he can get.

The medicinable operations of Cadmia, bee, to drie, to heale throughly, to ſtay fluxes, to cleanſe the filthineſſe in the eyes, and to ſcoure the pin and web, to extenuat any roughneſſe;

A and in one word, to worke all thoſe effects which I ſhall attribute hereafter to lead.

Furthermore, braſſe it ſelfe may be burnt; and being ſo prepared, it ſerveth for all thoſe purpoſes beforenamed: over and above, it cureth the pearls, filmes, and skarres in the eyes: if it be incorporat with milke, it healeth the ulcers in the eyes: the ſame likewiſe they uſe to grind upon hard ſtones, after the manner of the Ægyptian collyrie: taken as a lohoch inwardly with honey, it cauſeth vomit. Now as touching copper, the manner is to burne it in unbaked earthen pans, with the like weight of brimſtone; but all the breathing holes of the furnace ought to bee well cloſed and luted up where they muſt ſtand, untill ſuch time as the ſaid pans be throughly baked hard: ſome put ſalt thereto: others in ſtead of brimſtone take alume: and there be againe, who uſe neither the one nor the other, but ſprinkle it well with vinegre onely: when it is thus calcined,
B they pun it in a morter of Thebaïcke marble, and then waſh it in raine water. Howbeit, this firſt lotion of it maketh it but weake and of ſmall effect: and therefore it had need of a ſecond waſhing, in a greater quantitie of water, and to be braied againe therein, and left ſo ſtanding untill it be ſetled. This would be reiterated often, untill ſuch time as it be brought to looke like unto Minium: after that, it ought to be dried in the Sun, and ſaved in a braſen box.

Chap. xl.

Of the droſſe or refuſe of braſſe: of the skales of braſſe: of Verdegreace or Spaniſh greene: of Stomoma: of Verdegreace which is the ruſt of Braſſe, and of Hieracium.

C THe droſſe of Braſſe is waſhed after the ſame manner, but of leſſe effect it is than Braſſe it ſelfe: howbeit the floure of braſſe or verdegreace, is much uſed in phyſicke: and engendred it is, when braſſe is melted by much blowing, and then transferred out of the furnace into other receptacles; and there, are ſhaken out certaine skales of millet, and this they call Flos æris, *i.* Verdegreace. Now theſe skales uſe to fall off, when as the maſſes of braſſe be cooled with water and be red. Likewiſe of the ſame maſſes, there is made that which they call Lepis; and thus the verdegreace may be ſophiſticated, ſo as the ſaid Lepis or skales bee ſold for it. Now theſe skales come, by being driven and ſmitten off from thoſe nails which they uſe to forge of the ſaid maſſes and lumps of braſſe, and all theſe moſt commonly are found in the Cyprian forges: herein on-
D ly is the difference; that the foreſaid skales are driven forcibly and ſmitten from the ſaid pains or maſſes of braſſe, whereas the floure of verdegreace falleth off by it ſelfe. And yet there is a ſecond kind of theſe skales more fine and ſubtile than the other, to wit, driven and ſmitten from the verie outſide and uppermoſt part of the braſſe, and this they call * Stomoma.

Howbeit, Phyſicians in theſe daies (with reverence to their profeſſion and with their good leave be it ſpoken) are ignorant wholly of all theſe things; yea and the greater part of them bee not ſo much as acquainted with the tearms and bare names, (ſo farre be they from the true compoſition of medecines:) and yet in times paſt, it belonged properly unto Phyſicians, for to be acquainted with the tearms of all ſimples, and to be perfect in the knowledge of them. But our Phyſicians in this age, when they are to make any compoſition of ſimples, they have recourſe
E ſtraightwaies to their books to be directed by them, that is to ſay, they trie experiments by the hazard of their poore patients; and there finding the names of this and that, they ſet downe a receit, and for the making therof truſt the Apothecaries, as alſo for the ingredients; which commonly they doe ſophiſticat and corrupt by all deceitfull means that poſſibly they can deviſe; ſelling their emplaſtres and collyries that are old made, and ſuch drugs as are paſt all goodneſſe, ſerving the bills of the Phyſicians with the verie refuſe of their ſhop. And thus the deceitfull wares that they have, they rid their hands of, to the diſcredit of the Phyſician, and daunger of the ſicke.

But to come againe unto our skales, and floure of braſſe or verdegreace; the manner is, firſt to calcine both the one and the other, either upon earthen veſſels or braſſe pans; then, to waſh the ſame, as is beforeſaid, and for the ſame uſes. But over and above, theſe being prepared thus
F accordingly, are ſingular for the carnoſities and excreſcences within the noſthrils, or the fundament: for hardneſſe alſo of hearing, if they be blowne into thoſe parts by meanes of a pipe: and the ſores or cankers of the mouth they doe heale, by application of their powder: this powder alſo taketh away the inflammations and accidents of the tonſils or almonds about the throat, if it be tempered and incorporat with honey, and uſed in a collution or gargariſme. There is be-

* *Stomoma* is nothing elſe but ſteele, and therfore *Plin.* here doth err, like as in moſt of this chapt.

ſide, a ſcale that commeth of laton or white braſſe, farre better than that which the red braſſe or copper doth yeeld. G

Moreover, there is a deviſe that ſome uſe, namely, to let firſt the nails and panes of braſſe to lie wet in the urine of a boy: others, ſo ſoone as the skales bee driven off, bray them, and afterwards waſh them in raine water; which they uſe to give for the dropſie, to the weight of two drams in one hemine of honeyed wine; and beſides they make a liniment with it and floure, for to uſe outwardly to the belly.

*Which ſome take to bee verdegreace. * *Æruginis raſilis.*

As touching the ruſt * of braſſe, great uſe there is of it in phyſicke: but it commeth after many ſorts; for firſt and foremoſt, it is found ſticking (in manner of the floure aforeſaid) unto the ſtone or ore out of which braſſe is tried, in ſuch ſort, as it muſt be * ſcraped from it before a man can have it. Alſo it is made after an artificiall manner, by hanging certaine plates of laton driven H full of holes, and hung in a pipe or bartell over vinegre; but the ſame ought to bee cloſe covered and ſtopped with a lid of braſſe, ſo as the ſaid plates doe not touch the vinegre: and verely, verdegreace thus made, is farre better than of skales in the ſame wiſe uſed. Some there bee that take veſſels of white braſſe or laton, and put them in earthen pans, where they ſuffer them to lye in vinegre for ten daies togither, and then ſcrape off the verdegreace or ruſt that is gathered upon the ſaid laton. Others there are who cover the ſaid veſſels of laton in the refuſe of grapes after they be preſſed, (skins I meane and ſtones;) and after ten daies, as is aforeſaid, ſcrape off the verdegreace which they find upon the braſſe. There be againe, who take the fine duſt which the file fetcheth from braſſe, and ſtrew the ſame in a veſſell of vinegre, ſtirring it with ſpattules or ladles oftentimes in a day, untill it be reſolved into the vinegre & conſumed: and yet many thinke I it better to worke and ſtampe the ſaid file-duſt with ſtrong vinegre in a braſen mortar, for to gather verdegreace. But the ſpeedieſt way of engendring the ſaid ruſt of braſſe or verdegreace, is to take the cuttings, parings, or ſmall peeces of laton plates, ſuch as be emploied about coronets, and to put them in vinegre: and you ſhall have divers, who will not ſticke to ſophiſticat verdegris, (ſuch eſpecially as is brought out of Rhodes) by mixing it and the powder of marble togither; others, with the pumiſh ſtone pulverized, or elſe with gum. But the cunningeſt device that they have to falſifie it and deceive chapmen by, is to mingle vitrioll among: for all the other deceitfull tricks bee ſoone found out by the teeth, becauſe a man ſhall feele the verdegreace to craſh and grate betweene them like grit, which he ſhall not perceive if it be ſophiſticat with vitrioll: howbeit, this ſophiſtication alſo and fraudulent caſt, may be ſoone detected and found out by an K experiment made with a ſlice or fire-pan of yron made red hote in the fire: for caſt upon it the right and true verdegreace indeed, it will hold and keepe the owne colour ſtill; but if it bee corrupted with vitrioll, you ſhall ſee it turne red. You may diſcover likewiſe the fraud aboveſaid with

* Of the reed *Papyrus.*

* paper, tempered beforehand and ſoked in gall-nuts; for beſmeare therewith the verdegreace that is falſified, it will quickely become blacke. The eye alſo will ſoone bewray the falſhood that is uſed therein, for if it bee naught, a man ſhall perceive it to looke with a weake greene colour, nothing full nor freſh. But be the verdegreace true or falſe, the beſt way is, before it be emploied in phyſicke, after it bee dried, to calcine it upon a new earthen pan that never was occupied, and in the burning to turne it often with a ſlice or ſpattule, untill ſuch time as it be reduced into light cinders; and then after it is finely pulverized, to lay it up for uſe. Others prepare it after ano- L ther ſort; they put it in an earthen pot unbaked, and ſet the ſame into an oven, where they let it ſtand to bee calcined ſo long untill the ſaid pot of clay bee well and throughly baked. Finally, there be, that before they uſe verdegreace, put thereto the * male frankincenſe, the beſt that can poſſibly be had.

* *Olibanum.*

The manner alſo is to waſh verdegreace before it be occupied, after the ſame order as Cadmia is uſed. Beeing thus made and prepared as is aboveſaid, it is excellent to bee put into eye-ſalves or collyries, for by a * mordicative qualitie it helpeth weeping and watering eyes: in which regard, neceſſarie it is that it be waſhed firſt with pencils well bathed in hot water, ſo long untill it have loſt that corroſive qualitie.

* *Græce* Δακρυικὸν, which *Plinie* tranſlateth *delachrymationibus mordendo proficiens:* which alſo may be turned thus, It helpeth watering eyes proceeding of ſome fretting humors.

As touching Hieracium, a compoſition it is or collyrie ſo called, and made in this manner: M Take foure ounces of Sal Ammoniacke, of Cyprian verdegreace two ounces, of ſhoemakers blacke, or that copperaſſe which the Greekes name Chalcanthum as much, that is to ſay, two ounces; of Myſy or yellow vitrioll one ounce, and of ſaffron ſix: Let all theſe bee ſtamped togeather and tempered in the vinegre of Thaſos untill they bee concorporat, and then reduce them

into

A into trochiques. A ſingular collyrie or eyeſalve this is to withſtand the beginning of pearls, cataracts, and ſuch accidents of the eyes; to diſcuſſe alſo the webs that come over the ſight, to levigat the roughneſſe of the tunicles, to diſpatch the white skars, and in one word to cure all the infirmities of the eyelids. As for verdegreace that is not calcined at all, it is excellent good to be put into vulnerarie or healing plaſtres: the ſame alſo is of a wonderfull operation to cure the exulcerations of the mouth or the gumbs; the lips alſo exulcerat it healeth, being reduced into a liniment with oile: but if you put wax thereto, it doth mundifie, and withall skin and heale perfitly. Verdegreace is proper to eat away and conſume the calloſitie growing in a fiſtula, and in thoſe infirmities which are incident to the ſeat or fundament, whether it be brought into a liniment with gum Hammoniacke and ſo applied, or elſe in forme of a collyrie, that is to ſay, a tent
B thruſt into the hollow fiſtula. The ſame verdegreace incorporat with a third part of the true roſin called Terpentine, is ſoveraigne for foule leproſies and wild-fires.

Chap. XII.

Of [1] *Scolecia*, and [2] *Chalcitis*, of [3] *Myſy*, [4] *Sory*, and [5] *Chacanthum*.

[1] A kind of verdegris or ruſt of braſſe in manner of a worme, as *Pliny* taketh it.
[2] The floure of coppereſſe, whereof is made vitrioll, as ſome think.
[3] *Braſavolus* holdeth it to be vitriol Romane: others take it for yellow coppreſſe.
[4] Duskiſh or aſh-colour coppreſſe.
[5] Vitrioll.

ANother ſort there is of Braſſe-ruſt or Verdegreace, which commonly is called Scolecia: this is made of alume, ſalt or ſalnitre, of each a like weight, ſtamped well togither with the ſtrongeſt white wine vinegre that can be gotten, in a mortar of Cyprian braſſe or copper: and this muſt not be done but in the hoteſt daies of the yeere, to wit, about the riſing of the Dog-
C ſtarre. Now muſt all the ingredients aforeſaid bee punned and incorporat togither, untill ſuch time as the maſſe become green, and that it gather and draw togither in manner of * crawling wormes, whereupon it taketh the name Scolecia. But if ſo bee, that this manner of working and making it, chaunce to faile and doe not well, for to amend the ſame, the two parts of vinegre which entred into the mixture, ought to be tempered with as much urine of a boy under foureteene yeers of age. Now if you would know the medicinable effects and vertues of this kind of verdegreace, both it and the artificiall Borax beforeſaid (which I named Santerna) be of the ve-
E rie ſame operation that the ordinarie ruſt of braſſe or verdegreace, called in Latin Ærugo. There is a kind of Scolecia naturall or minerall of it ſelfe, without addition of any thing elſe whatſoever; whereof I purpoſe to ſpeake in this place, and the ſame is ſcraped from the ſtone or ore of
D which commeth braſſe. There is a ſtone lying in the mine which they name Chalcitis, out of which alſo (with burning) they excoct braſſe: differ it doth from Cadmia; for Chalcitis is hewed out of mines that lye above, verie ebb and expoſed to the aire, whereas the other is digged from under the ground in thoſe mines that lie hidden. *Item*, Chalcitis (as beeing of a tender and ſoft nature) preſently will crumble into peeces, ſo as it ſeemeth to bee a certaine fine moſſe concreat and gathered togither. Alſo, there is another difference betweene theſe two Marcaſſins; for that, Chalcitis containeth in it three ſeverall kinds of matter, to wit, Braſſe, Myſy, and Sory; of which I purpoſe to ſpeake ſeverally by themſelves in their due place. Now this Chalcitis lyeth within the braſſe mine in long veines: that which is of a yellowiſh colour like honey, full of ſmall veins running here and there, brittle and apt to crumble, and not of a ſtonie hardneſſe, is coun-
E ted the beſt: the freſher alſo and more newly gathered that it is, the more effectuall and wholeſome men take it to be; for that beeing long kept, it will grow into the nature of Sory. Beeing thus in the right nature, it hath a faculti (if it bee pulverized) to conſume the excreſcenſe of proud or dead fleſh in ulcers, to ſtaunch bloud, to repreſſe alſo the accidents befalling to the gumbs, uvula, and tonſils: the ſame put up into the naturall parts of a woman within a locke of wooll in manner of a peſſarie, helpeth the infirmities of thoſe places: but if it be tempered and incorporat with the juice of porret, it ſerveth to be put into thoſe plaſtres which are appropriat to the ulcers and ſores of the privities or members of generation. Now if you ſteepe it in vinegre, and let it lie ſo infuſed within an earthen pot well luted with beaſts dung, for the ſpace of fortie daies, it will come to the colour of ſaffron: put then unto it of Cadmia ſtone the like quanti-
F tie in weight, you ſhall have that medecine which is called Pſoricum. Alſo, if in this compoſition you put two parts of Chalcitis to one third part of Cadmia, and ſo temper them togither, this foreſaid medecine will be more quick and ægre: but in caſe you would have it yet more mordicant and ſtronger in operation, let the ſaid ingredients be tempered rather with vinegre than wine. Calcine the ſame or torrifie it, you ſhall find it more effectuall in all operations aforeſaid.

* It ſeemeth that *Plinie* doth here err, by readiag in *Dioſc.* σκωλήκια, for κόλικες; & for ἰος κολικίας, σκωλικία: for the ſaid mixture is to be reduced into certaine trochiſques or thin cakes called κολικες, & not into the form of worms σκωλήκες.

* i. The veine or minerall, whereof commeth the duskish vitrioll.

As for * Sory, that which is brought out of Ægypt is counted best, and farre better than the Cyprian, Spanish, or African: nevertheless, some hold that which commeth from Cypresse to be more appropriat to the cure of the eyes. But of what countrey soever it be, the principall is that which to smell unto is of the rankest and most stinking savour: the same also in the bruising will grow blacke and be uncteous or fattie, and such lightly is hollow in manner of a spunge. A minerall this is altogither hurtfull to the stomacke, and so contrarie unto the nature of it, that to some the verie smell thereof is enough to overturne it and to cause vomit: and especially the Ægyptian Sory is of this operation. That which commeth from other nations, when it is broken or braied, shineth againe. G

Touching Mysy, it is of a more hard and stonie nature than Sory; but good it is for the toothach, if either it bee held in the mouth, or a collution bee made therewith to wash the teeth and gumbs: also it healeth the grievous and irkesome sores of the mouth, yea though they grow to be cancerous and corrosive. The manner is to burne and calcine it upon coles of fire as Chalcitis. Some nevertheless have written, that Mysy is engendred by the means of a fire made with pine wood, in the hollow veines or mines of brasse ore: and they hold, that the cinders or ashes of this pine fewell, beeing mingled with the yellow greins or floure of the said mettall, is that which begetteth Mysy. But the truth is, of the foresaid stone or ore it is engendred naturally: howbeit, a thing it is by it selfe gathered, distinct and separat from it apart: and the best is that which is found in the mines and forges of Cypresse. You shall know it by these signes: breake it (for crumble it will) there appeare within it certaine sparkes shining like gold: and in the braying or stamping, it runneth into the nature of a sand or earth, like unto Chalcitis. This Mysy is the minerall that they put to gold ore, when it is to be tried and purified. H I

To come unto the medicinable vertues thereof: beeing infused or powred into the eares with oile of roses, it cureth their running with matter: the same beeing applied in a frontall within wooll to the head, easeth the ach thereof: it doth extenuat also and subtiliat the asperities of the eyes, such especially as bee inveterat and have continued long: but soveraigne it is found to be for the inflammation or swelling of the tonsils, for the squinancie, and all impostumat sores growne to suppuration. For which purposes, prepared it would be in this wise, and after this proportion: Take of it sixteene drams, seeth the same in one hemine of vinegre with some addition of honey, untill it begin to yeeld and relent; and in this manner ordred, it serveth in cases aforesaid: but whensoever need requireth to mollifie the violence thereof, and make it more mild, it were good to wet it with some sprinckling of honey. If there be a lotion or fomentation made with it in vinegre, it doth consume and eat away the hard callositie in fistuloes, & fortifieth greatly the collyries or tents to be made thereof, and put into the concavitie of the sore: it serveth also for the collyries that be eyesalves: it stauncheth bloud, represseth the malice of fretting humors in corrosive ulcers and such as doe putrifie: the excrescense of proud or ranke flesh it taketh downe and consumeth: a peculiar propertie it hath to cure the accidents of the members of generation in men; and withall stoppeth the immoderat flux of the moneths in women. K

As concerning Vitrioll, which we call in Latine Atramentum Sutorium, that is to say, shoemakers blacke, the Greeks have fitted it with a name respective unto brasse, and by a neere affinitie thereunto call it Chalcanthum: and verely there is not a minerall throughout all the mines, of so admirable a nature as it is. There have been found in Spaine certaine pits or standing pooles, containing a water of the nature of vitrioll: they used to seeth the same, putting thereto of other fresh water a like quantitie, and poure it into certaine troughs or broad keelers of wood: over these vessels, there be certaine barrs [of yron] or transoms overthwart, lying fast that they cannot stirre, at which there hang downe cords or ropes with stones at the end stretching them outright, that they reach to the bottome of the said decoction within those keelers, to the end that the viscous substance of the water may gather about those cords, which you shall see sticking fast thereto in drops, congealed in manner of glasse, and it doth represent as it were the forme of grapes; and that is Vitrioll. Beeing taken foorth and separated from the cords aforesaid, they let it drie for the space of thirtie daies. In colour it is blew, & carieth with it a most pleasant and lively lustre, so cleare, as a man would take it to be transparent glasse. Of this beeing infused in water, is made that blacke tincture which curriers and corviners occupie in colouring of their leather. This Vitrioll is engendred many waies of the copperesse veine within the mine, being hollowed into certaine trenches: out of the sides whereof you shall see in the middest of L M

A Winter when it is a froſt, certaine yſickles depending, as the drops deſtilled and grew one to another: whereupon this kind of Vitrioll they call Stalagmias, and a purer or clearer thing there is not. But looke what part thereof is whitiſh of colour, but not tranſparent, and the ſame enclining to the wall flower or *white Violet, the ſame they call Leucoion. There is a Vitrioll likewiſe made artificially in certaine receits and concavities (digged of purpoſe in the ſtonie mines of Coperoſe) by occaſion of raine water there congealed, which had been conveighed into them, and gathered a viſcous ſlime or mud in the paſſage. Alſo there is a caſt to make it in manner of ſalt by letting freſh water into ſuch hollow receptacles, and permitting the ſame to ferment in the ſunne when he is at the height and full ſtrength of his heat in the Summer, untill it be gathered & hardened as ſalt. And therefore ſome there be who make two ſorts of Vitrioll, to wit, the Naturall or
B Minerall, and the Artificiall: This that is made by the induſtrie and art of man is paler than the other; and looke how much the colour is abated, ſo much inferior it is in goodneſſe. The Cyprian Vitrioll is thought beſt for to be employed in Phyſicke. For, to expell the wormes out of the bellie, it is given unto the patient to the weight of one dram in honey, after the manner of an electuarie. If the ſame be diſſolved and conveighed up into the noſthrils, it purgeth the head. In like manner it cleanſeth the ſtomacke, in caſe it be taken with honey or honied water. The aſperitie of the eyes, their paine, and the dimneſſe or miſts overgrowing the ſight, it diſpatcheth: and healeth the ſores in the mouth. It ſtaieth bleeding at noſe, and the immoderat running of the hæmorrhoids. It draweth forth ſpels of broken bones: and tempered with the ſeed of Henbane, it ſtoppeth the courſe of a rheume running to the eyes, if it be laid in a cloth to the forehead in
C manner of a frontale. Of great effect is it in plaſtres, both for to mundifie wounds and to conſume the excreſcence of fleſh in ulcers. If the Vvula be fallen, it putteth it up againe, by touching it only with the decoction thereof. Moreover, being incorporat with line ſeed, it is ſingular good to be applied aloft upon plaſtres, for to mitigat paine. Of this kind, that which is white is preferred before any that are of a yellowiſh colour like *wall-flowers aforeſaid. Moreover, if it be blown into the eares by the meanes of a pipe, it doth remedie the hardneſſe of hearing. A liniment made of Vitrioll alone, healeth up wounds, but it draweth the skar too neare together: in regard of which aſtringencie of Vitrioll, there hath been an invention deviſed of late, to caſt the pouder of Vitrioll into the mouths of Beares and Lions when they are to be baited: for ſo great a knitter & binder it is, that it will draw their chawes together in manner of a muzzle, that they ſhall not bee
D able to bite.

*Viola alba.

*Violareis. He meaneth thoſe that reſemble *Leucoion*, and which he called before by that name.

Chap. XIII.

Of Pompholyx. Of Spodos, Antiſpodos, and of Diphryges. Of the Trient of Servilius.

THere be found over and beſides in braſſe ſmithies or furnaces, thoſe matters which they call Pompholyx and Spodos: and the difference of the one from the other, conſiſteth in this, that Pompholyx requireth waſhing for to be prepared; Spodos never commeth into water or liquour. And yet ſome diſtinguiſh them otherwiſe, calling the whiteſt and lighteſt part, Pom-
E pholyx: holding opinion, that it is nothing elſe but the very cinders of braſſe, or the Calamine ſtone Cadmia, whereof braſſe commeth: whereas Spodos (ſay they) is blacker and more weightie than Pompholyx, as being ſcraped from the wals and ſides of the furnaces; among which you ſhall ſee many times groſſe ſparkes, yea, and otherwhiles coales entermingled. Well, this Pompholyx beeing tempered or ſoaked in vinegre, ſmelleth of braſſe: and if a man touch it at the tongues end, hath a horrible taſt that goeth againſt ones ſtomack. Proper it is to enter into thoſe compoſitions which be ordained for the eyes, for it helpeth all the infirmities incident thereto: and in one word, ſerveth for the ſame purpoſes that Spodos dooth: herein onely lieth the difference, that Spodos is thought to be more mundificative, by reaſon that the ſtrength of Pompholyx is delaied by the waſhing aforeſaid. It is one of the ingredients alſo to thoſe emplaſtres
F which are deviſed for gentle refrigeratives and exiccatives. And for whatſoever it ſhall bee employed, better it is found to be, in caſe it were waſhed firſt with wine.

As touching Spodos, the Cyprian is moſt eſteemed: and engendered it is, whiles Cadmia and the braſſe ore or ſtone be melted together in the furnace. Exceeding light it is, and apt to mount aloft with the ſmoake of the bloume ſmithie, very ſpeedily, yea, and ready to flie out of the fur-

furnace: and much of it ſticketh to the rouſe and uppermoſt part thereof, differing onely from G
ſoot in whiteneſſe. That which is not ſo white as the reſt, ſignifieth that the furnace was not quick ynough, and that it is not yet come to the full perfection and concoction: and this, ſome there be who call Pompholyx. But looke how much thereof is found of a redder colour, the ſame hath much acrimonie in it, and is of a more biting nature: yea, ſo fretting and corroſive it is, that in the waſhing, if it chaunce to touch a mans eyes, it will put out their light and make him blind. There is a kind of Spodos beſides that looketh yellowiſh like honey, wherin a man may perceive that it ſtandeth very much upon braſſe: but of what ſort ſoever it is, waſhing mendeth it much. Firſt, before it be waſhed, they uſe to cleanſe it lightly with a wing or a briſtle bruſh: and then afterwards to waſh it in a groſſer manner, untill the water be thick and muddie, rubbing it well with the fingers, untill it have loſt all the roughneſſe that it had. That which is waſhed in wine, is H
thought to be of a middle and indifferent operation. And when I ſay wine, you muſt thinke there is ſome difference therein alſo. For being waſhed in a ſmall and mild wine, it is thought to be very good for thoſe collyries which ſerve to comfort and fortifie the eyes that have beene wearied and weakened with long watching: the ſame alſo thus prepared, is more effectual to heale ulcers that be matterie and run: the ſores likewiſe in the mouth that are moiſt and rheumaticke: and generally it ſerveth well to goe into thoſe ſalves and plaſtres which are deviſed againſt gangrenes, tending to mortification. Another kind there is beſides of Spodos called Lauriotis, found in the furnaces where ſilver is tried. But commonly it is held, and for certaine affirmed, That the beſt
*Spodos is called *Nil*, wherof commeth the pretie ambiguous ſpeech, *Nil prodeſt oculis.*
*Spodos for the eyes, is that which commeth in the furnaces where gold is fined. Neither in any thing belonging to our life, is the wit and invention of man more admirable than in this. For, be- I
cauſe we ſhould not take the paines to ſearch into mines and furnaces for ſuch matters, they have deviſed meanes to helpe themſelves withall in the ſame caſes, even by the baſeſt things that be in ſtead of Spodos, which thereupon they tearme by the name of Antiſpodos; for ſo they call the aſhes of the Figtree, whether it bee the gentle or the wild; the aſhes likewiſe of the Myrtle tree leaves, and the tendereſt parts of the branches; as alſo of the wild Olive, the Quince, & the Lentiske trees. They have a kind of Antiſpodos beſides made of the unripe Mulberries, that is to ſay, whiles they be white, dried in the Sunne: like as, of the tops of the Box tree or the baſtard Cyperus, of brier crops, the leaves of the Terebinth or the wild vine Oenanthe flowers. Finally, they uſe in ſteed of Spodos, the aſhes of ſtrong Buls glew, or of linnen rags: which is found to be as effectuall as the right Spodos. Now for to have the ſaid aſhes for this purpoſe, the manner is to K
burne and calcine all theſe matters abovenamed within ſome veſſell of cley, and to ſet it into the oven or furnace, where they are to be torrified untill the ſaid veſſell be throughly baked.

In the ſmithies where braſſe is made and wrought, there commeth a certaine refuſe or offall therof, called Pſegma: to wit, when after the braſſe ore is ſufficiently melted and concocted, there be new coales put thereto, and the ſame ſet on fire and kept burning with the blaſt of bellowes: for then of a ſuddaine (as it were by ſome extraordinarie ſtrong puffe) there are rejected and caſt forth from it certaine huls or chaffe (if I may ſo ſay) of braſſe. Now the ground or floor to receive this refuſe as it falleth, ought to be well paved.

There is another ſtuffe found in the ſaid forges or bloome-ſmithies, eaſily diſcerned from this Pſegma, which the Greeks (for that it is, as it were, twiſe burnt or concocted) call Diphryges. And L
this is made three manner of waies: For firſt they ſay it commeth of the Marqueſit ſtone burnt in a furnace untill it be calcined and reduced in the red chalke Rubrica. It is engendered alſo of the earth or cley within a certaine cave in Cyprus, firſt dried and ſoon after gently burnt in a fire round about it, maintained with ſmall ſtickes put thereto by little and little. There is a third way of making it, to wit, of the groſſe dregs or droſſe of braſſe ſettling downe to the bottome of the furnace: in which furnace a man ſhall perceive theſe different matters, to wit, the braſſe it ſelfe, which being melted, runneth into pans and veſſels readie for to receive it; the refuſe, called Scoria, which flieth out of the furnace; the florey that floteth aloft; & the Diphryges or droſſe which remaineth behind. Some yeeld another reaſon and making of Diphryges in this manner, namely, That there be certaine round bals or pellets (as it were) of hard ſtones found within the mines M
of braſſe, which together with the Marqueſit or braſſe ore doth not melt in the furnace, & a man ſhall ſee the braſſe it ſelfe boile about the ſame: which round hard ſtones are united and ſoudered onely, one to another by this meanes; but themſelves reſolve not nor melt perfitely, unleſſe they be tranſlated into other furnaces: for they be the very heart (as it were) of the whole matter.

But

A But in the ſecond triall and boiling, that which remaineth behind, is called Diphryges. Well, be it what it will, the ſame reaſon there is of it in Phyſicke, as of the reſt of this kind found in furnaces: for by nature it is deſiccative: it conſumeth beſides all excreſſences, and doth cleanſe mightily. The triall of it is by the tongue, for if it be good Diphryges, no ſooner toucheth it the toung, but it drieth it, and withall taſteth of braſſe.

But before I depart from theſe braſſe mines and furnaces, I cannot conceale from you one miraculous thing as touching this mettall. There is (you know) a noble familie in Rome of the *Servilij*, well renowmed, as may appeare by the Romane kalender and acts of record: and theſe have among them a certaine peece of braſſe coine called a Triens (i. the third part *of a Romane Aſſe) which they doe keepe and feed with ſilver and gold. For eat and conſume it dooth both the
B one and the other: from whence it came firſt, and what the reaſon in nature of this propertie is, I know not yet. But for my warrant, I will ſet downe as touching this matter the verie words of old *Meſſala*: The houſe (quoth he) of the *Servilij* hath a certaine ſacred Triens, in the honour of which peece they doe ſacrifice yearely with great devotion and ſolemnitie, omitting no magnificence nor ceremonies therto belonging. And this Triens the common ſpeech is of them all, that it ſeemeth one while to grow bigger, and another while to deminiſh and bee ſmaller: according to which encreaſe or decreaſe, the ſaid *Servilij* take preſage, That their familie ſhall either riſe to more honour, or decay in credit and reputation.

* Which is a farthing.

Chap. xiiii.

C

Of yron, and yron mines, and the different kinds of yron.

IT remaineth now in the next place to diſcourſe of the mines of yron, a mettall which wee may well ſay is both the beſt and the worſt implement uſed now in the world: For with the helpe of yron we breake up and ear the ground, we plant and plot our groves, we ſet our hortyards and range our fruitfull trees in rewes: we prune our Vines, and by cutting off the ſuperfluous branches and dead wood, we make them every yeare to looke freſh and young againe: by meanes of yron and ſteele we build houſes, hew quarries, and cut in ſtone, yea and in one word, we uſe it to all other neceſſarie uſes of this life. Contrariwiſe, the ſame yron ſerveth for warres, murders, and robberies, not onely to offend and ſtrike therewith in hand, but alſo to reach and kill afarre off, with
D divers ſorts of darts and ſhot; one whiles diſcharged and ſent out of engins, another while launced and flung by force of the arme; yea and ſometime let flie with wings: and this I take to bee the wickedſt invention that ever was deviſed by the head of man: for to the end that death may ſpeed away the faſter to a man, and ſurpriſe him more ſodainly, we make it to flie as a bird in the aire, and to the arrow headed at one end with deadly yron, we ſet feathers at the other: whereby it is evident, that the miſcheefe proceeding from yron, is not to bee imputed to the nature of it, but to the unhappie wit of man. For good proofe we had alreadie by many experiments otherwiſe, that yron might be employed and occupied, without any hurt or harme at all to mankind. And verely in thoſe capitulations of peace, which after the expulſion of the kings, *Porſena*, king of the Tuſcanes tendered unto the people of Rome, I find this expreſſe article & impoſition, That
E they ſhould not uſe yron, but onely about tillage of the ground. And as our Chronicles of greateſt antiquitie have left recorded, it was not thought ſafe to permit writing and engraving letters with a ſtyle of yron. Certes, in the third Conſulſhip of *Pompey* the great, by occaſion of a tumult and commotion raiſed within the citie of Rome for the murder committed upon the perſon of *P. Clodius*, there was an edict came foorth (which now is extant upon record) after the manner of an inhibition in this forme: *Ne ullum telum in urbe eſſet*, i. That no man throughout all Rome ſhould be ſeene to weare a weapon. Nevertheleſſe men did not forbear and give over to do ſome honour unto yron alſo in ſome other occaſions of this life, tending to the entertaining of civilitie and humanitie: for *Ariſtonidas* the cunning artificer, minding to repreſent in an image the furious rage of *Athamas*, beginning now to coole and bee allaied, together with his repentance
F for the cruell murdering of his owne ſonne *Learchus*, whom he flung headlong againſt the hard ſtones, and thereby daſht out his braines; made a temperature of braſſe and yron together, to the end, that the ruſtie yron appearing through the bright luſtre of the braſſe, might lively expreſſe a bluſhing red in the countenance, beſeeming a man confuſed and diſmaied for ſo unnaturall a fact. This ſtatue is at this day to beſeene at Thebes. Within the ſame cittie there is another

* O *Plinie*, what wouldeſt thou ſay, if thou didſt ſee and heare the Piſtols, Muskets, Culverines, & Canons in theſe dayes.

image

image of *Hercules* all of hard yron or ſteele, which *Alcon* the famous workman made of purpoſe to ſignifie the undaunted heart of that deified *Hercules*, who underwent and endured all labours and perils whatſoever. Here alſo in Rome wee may ſee certaine drinking cups of ſteele dedicated in the temple of *Mars* the Revenger. G

But to come unto the nature of yron, herein appeareth ſtill the ſame goodneſſe of Nature, that this mettall working ſuch miſcheefe as it dooth, ſhould bee revenged of it ſelfe, and receive condigne puniſhment by the own ruſt. See alſo the wonderfull providence of Nature, *who maketh nothing in the world more ſubject to death and corruption, than that which is moſt hurtfull and deadly to mankind.

**Nihil in rebus mortalibus faciente, quam quod infertiſsimum mortalizati:* the grace of this Latine cannot be ſo well expreſſed in Engliſh.

As touching mines of yron ore, they are to be found almoſt in every countrie, for there is not ſo much as the Iſland Ilva here within Italie, but it breedeth yron. And lightly whereſoever anie ſuch be, they are eaſily found, for the very leere of the earth, reſembling the colour of oare, bewrayeth where they lie. And when it is found out, they burne, trie, and fine it, as other veines of mettall. Onely in Cappadocia there is ſome queſtion and doubt made, whether in the making of yron they be more beholden to the earth that yeeldeth the ore, or to the water for the preparing and ordering of it? For this is certaine, that unleſſe the veine of ore be well drenched and ſoked with the water of one river there, it will never yeeld yron out of the furnace. As for the kinds of yron, many they are, and all diſtinct. The firſt difference ariſeth from the diverſitie of the ſoile and climats where the mines be found: For in ſome places, the ground & the poſition of the heavens doe yeeld onely a ſoft ore, and comming nearer to the ſubſtance of lead than yron: in another, the mettall is *brittle and ſhort, ſtanding much upon a veine of braſſe, ſuch as will not ſerve one whit for ſtroke and naile to bind cart-wheeles withall, which tire indeed would be made of the other that is gentle and pliable. Moreover, ſome kind of yron there is that ſerveth onely, if it bee wrought in ſhort and ſmall works, as namely, for nailes, ſtuds, and tackes emploied about greeves and leg-harneis: another againe, that is more apt to take ruſt and canker than the reſt. Howbeit, all the ſorts of yron ore are tearmed in Latine Stricturæ, a word appropriat to this mettall and to no other, * *à ſtringenda acie, i.* of dazeling the eyes, or drawing a naked ſword. But the furnace it ſelfe, where the ore or yron ſtone is tried, maketh the greateſt difference that is: for therein you ſhall have to ariſe by much burning and fining, the pureſt part thereof, which in Latine is called *Nucleus ferri, i.* the kernell or heart of the yron [and it is that which we call ſteele] and the ſame alſo of diverſe ſorts: for the beſt is it that hardeneth the edge of any weapon or toole: there is of it which ſerveth better for ſtithie or anvill heads, the faces of hammers, bits of mattockes, and yron-crowes. But the moſt varietie of yron commeth by the meanes of the water, wherein the yron red hot is eftſoones dipped and quenched for to be hardened. And verely, water only which in ſome place is better, in other worſe, is that which hath ennobled many places for the excellent yron that commeth from them, as namely, Bilbilis in Spaine, and Taraſſio, Comus alſo in Italie; for none of theſe places have any yron mines of their owne, and yet there is no talke but of the yron and ſteele that commeth from thence. Howbeit, as many kinds of yron as there bee, none ſhall match in goodneſſe the ſteele that commeth from the Seres: for this commoditie alſo, as hard ware as it is, they ſend and ſell with their ſoft ſilkes and fine furs: In a ſecond degree of goodneſſe, may be placed the Parthian yron. And ſetting aſide theſe two countries, I know not where there be any bars or gads tempered of fine and pure ſteele indeed, for all the reſt have a mixture of yron, more or leſſe. And generally in this Weſt part of the world wherein we live, all our ſteele is of a more ſoft and gentle temperature than that of the Levant. This goodneſſe of ſteele in ſome countries ariſeth from the nature of the mine, as in Auſtrich: in others from the handling and temperature thereof, like as by quenching, as I ſaid before, and namely at Sulmo, where the water ſerveth eſpecially for that purpoſe: and no marvaile, for wee ſee a great difference in whetting and ſharpening the edge of any inſtrument, betweene oyle whetſtones that barbars uſe, and the common water grindſtones: for ſurely the oyle giveth a more fine and delicat edge. Furthermore, this is ſtraunge, that when the ore or veine is in the furnace, it yeeldeth yron liquid & clear as water: and afterwards, being reduced into bars and gads when it is red hot, it is ſpungeous and brittle, apt to breake or reſolve into flakes. And conſidering the difference that is betweene the nature of oyle and water (as I have ſaid) this is to be obſerved, that the finer any edge-tooles bee, the manner is to quench them in oyle for to harden the edge: for feare leaſt the water ſhould harden them overmuch, and make the edge more readie to breake out into nickes, than to bend H I K L M

and

**Which our ſmiths cal Colſar-yron.*

**Some read à ſtringenda [oculorum acie] i.* of dazeling the eies; which iron red hot, or the bright blade of ſword & other weapons, doth: but neither any copies of the author have the word [*oculorum*] neither have I read *ſtringere*, but *perſtringere*, to ſignifie, To dazle. Others underſtand it of drawing a naked ſword: and yet it is not ſo proper in Latine to ſay in that ſence, *ſtringere aciem*, as *ſtringere ferrum*, or *gladium*: howbeit, I encline rather to this, for that *Plinie* a little after calleth the beſt ſteele *Acies*, which word haply is the primitive, from whence *acies* alſo is uſed for an edge, &c. And yet it may be, that thoſe *ſtricturæ, i.* ſparkling skales flying from yron under the ſmiths hãmer, and from no other mettall, (which do *perſtringere aciem oculorum*, if any thing els) may give occaſion hereof. *Sed hæc viderint Critici.*

A and turne againe. But wonderfull it is above all, that mans bloud ſhould have ſuch a vertue in it; as to be revenged of the yron blade that ſhed it; for being once embrued therein, it is given ever after eftſoones to ruſt and canker.

Concerning the loade-ſtone, and the great concord or amitie betweene yron and it, I meane to write more amplie in the due place. Howbeit, for the preſent thus much I muſt needs ſay, that yron is the onely mettall which receiveth ſtrength from that ſtone, yea, and keeperh the ſame a long time, inſomuch as by vertue thereof, if it bee once well touched and rubbed withall, it is able to take hold of other peeces of yron: and thus otherwhiles wee may ſee a number of rings hanging together in manner of a chaine, notwithſtanding they bee not linked and enclоſed one within another. The ignorant people ſeeing theſe rings thus rubbed with the load ſtone, & cleaving one to another, call it Quick-yron. Certes, any wound made by ſuch a toole, are more eager and angrie than by another. This ſtone is to be found in Biskay, ſcattered here and there in ſmall peeces by way of bubbation (for that is the tearm they uſe;) but it is not that true Magnet or load-ſtone indeed, which groweth in one continued rock. And I wot not whether theſe be ſo good for glaſſemakers, and ſerveth their turne ſo well in melting their glaſſe, as the other: for no man yet hath made any experiment thereof. But ſure I am, that if one doe rub the edge, back, or blade of a knife therewith, it doth impart an attractive vertue of yron thereunto, as well as the right Magnet. And here I cannot chuſe but acquaint you with the ſingular invention of that great architect and maſter deviſer, of Alexandria in Ægypt *Dinocrates*, who began to make the arched rouſe of the temple of *Arſinoe* all of Magnet or this Loadſtone, to the end, that within that temple the ſtatue of the ſaid princeſſe made of yron, might ſeeme to hang in the aire by nothing. But prevented he was by death before hee could finiſh his worke, like as king *Ptolomæe* alſo, who ordained that temple to be built in the honour of the ſaid *Arſinoe* his ſiſter.

But to returne againe to our yron: of all mines that be, the veine of this mettall is largeſt, and ſpreadeth it ſelfe into moſt lengths every way: as we may ſee in that part of Biſcay that coaſteth along the ſea, and upon which the Ocean beateth: where there is a craggie mountaine very ſteep and high, which ſtandeth all upon a mine or veine of yron. A wonderfull thing, and in manner incredible, howbeit, moſt true, according as I have ſhewed already in my Coſmographie, as touching the circuit of the Ocean.

Chap. XV.

The temper of yron. The medicinable vertues thereof, as alſo of the ruſt of braſſe and yron. Of the skales that ſhed and flie from yron: and of the liquid emplaſtre, called by the Greekes Hygremplaſtrum.

IRon made once hot in the fire, unleſſe it be hardened with the hammer, doth ſoone waſt and corrupt. So long as it looketh but red, it is not readie for the hammer, neither would it bee beaten before it begin to looke white in the fire. Beſmeare it with vinegre and allum, it will looke like copper or braſſe. If you be deſirous to keepe any yron-worke from ruſt, give it a verniſh with ceruſſe, plaſtre, and tarre, incorporat all together. And this is that compoſition, which is called by the Greekes * Antipathia. And ſome ſay alſo, that there is a kind of hallowing yron that will preſerve it from ruſt: As alſo that there is at this day to bee ſeene the chaine of yron within the citie called Zeugma, ſeated upon Euphrates, wherewith king *Alexander* the Great ſometime bound and ſtrengthened the bridge over the river there: the linkes whereof, as many as have ben repaired and made new ſince, doe gather ruſt, whereas the reſt of the firſt making, bee all free therefrom.

* *Veli ſtrigilis inimica.*

As touching the uſe of yron and ſteele, in Phyſicke it ſerveth otherwiſe than for to launce cut and diſmember withall: for take a knife or dagger and make an imaginarie circle two or three times with the point thereof, upon a young child, or an elder bodie, and then goe round withall about the partie as often, it is a ſingular preſervative againſt all poyſons, ſorceries, or enchauntments. Alſo to take any yron naile out of the coffin or ſepulchre wherein man or woman lieth buried, and to ſticke the ſame faſt to the lintle or ſide poſt of a dore, leading either into the houſe or bed-chamber where any dooth lie who is haunted with ſpirits in the night, he or ſhe ſhall be delivered and ſecured from ſuch phantaſticall illuſions. Moreover, it is ſaid, That if one be lightly pricked with the point of ſword or dagger which hath been the death of a man, it

is an excellent remedie againſt the paines of ſides or breaſt, which come with ſuddaine prickes and ſtitches. An actuall cauterie of yron red hot, cureth many diſeaſes, and eſpecially the biting of a mad dog; in which caſe it is ſo effectuall, that if the poyſon inflicted by that wound, have prevailed ſo far, that the patient be fallen into an Hydrophobie thereby, and cannot abide drinke or water, let the ſore be ſeared therewith, the partie ſhall find helpe preſently. Gads of ſteele or other yron red hot quenched in water, ſo long untill the ſame water be hot, cauſeth it to be a holeſome drinke in many diſeaſes, but principally in the bloudie flix. G

The very ruſt of yron alſo is counted medicinable: for ſo *Achilles* is ſaid to have healed *Telephus*: but whether the head of his ſpeare were yron or braſſe, of which he uſed the ruſt, I do not certainely know. Certes, hee is painted thus: with his ſword ſcraping and ſhaking off the ruſt into the wound. But if you would fetch off the ruſt from any old nailes, ſcrape it with a knife wet before in water. As touching the vertues thereof, It is cleanſing, exiccative, and aſtringent; it recovereth the haire in places deſpoiled thereof, if they be annointed therewith in the forme of a liniment: being reduced into a ſalve with wax and oyle of Myrtles incorporat together, many uſe it for the roughneſſe about the eye-lids: the pimples alſo breaking forth over all the bodie. For ſhingles and S. *Antonies* fire, it is ſingular good to applie it in an unguent with vinegre: likewiſe it killeth ſcabs, and healeth whitflawes of the fingers, and the excreſcence or turning up of the fleſh about the roots of the nailes, if linnen rags wet therein be applied conveniently. The ſame conveighed up in wooll after the manner of a peſſarie into the naturall parts of women, ſtayeth the immoderat flux both of whites and reds. The ruſt of yron tempered in wine, and wrought together with Myrrhe, is good for a greene wound: put thereto vinegre, and then it helpeth the piles and ſwelling biggs of the fundament. A liniment made with it, mitigateth the paine of the gout. H I

As touching the skales of yron that flie from the edge or point of any weapon, wrought in the ſmiths forge: they ſerve in the ſame caſes, that the ruſt dooth, and have the like effects, ſave onely this, that they have greater acrimonie, and worke more eagerly: in which regard they are employed about repreſſing of the flux that falleth into watering eyes. But marke this one thing: Yron beeing that which woundeth moſt and ſheddeth bloud, yet the skales that come from it, ſtaunch the ſame: a propertie they have beſides to ſtop the flux in women: and being applied to the region of the ſpleene, they doe open the obſtructions thereof, and eaſe other infirmities incident thereto: the running hæmorrhoids they repreſſe, and ſuch ulcers as are given to ſpread farther and corrode as they goe. Reduced into a fine pouder, and gently ſtrowed upon the eye-lids, they are good for the accidents thereto belonging. But the principall uſe of them, and for which they are moſt commended, is in a certaine liquid plaſtre called Hygremplaſtrum; which ſerveth to mundifie wounds, ulcers, and fiſtulaes: to eat away all calloſities, and to incarnat and engender new fleſh about bones that are periſhed. And this is the receit of that compoſition: Take of the ſcouring Tuckers earth the weight of two oboli, of braſſe ſix drams, of the skales of yron as much; and no leſſe of wax, incorporat all theſe according to art in one ſextar of oile. But in caſe there be need to mundifie any ſores, or to incarnat, there would be put therto ſome plaine cerot beſides. K

Chap. xvi. L

Of the mines of lead ore: of *white lead and blacke.

*Which ſome hold to be Tinglaſſe.
*Our ordinary lead.

NOw enſueth the diſcourſe of lead, and the nature of it; of which there be two principall kinds, the blacke, and the white. The richeſt of all, and that which carieth the greateſt price, is that which we in Latine name *Plumbum candidum*, *i.* the white bright lead, and the Greekes *Caſsiteron*. But I hold it a meere fable and vaine tale, that all of it is fetched as farre as from the Iſlands of the Atlanticke ſea, and that the inhabitants of thoſe parts doe conveigh it in little twiggen boats, covered all over with feathers. For the truth is, that there is found of it in theſe dayes within Portugall and Gallæcia, growing ebbe upon the upmoſt face of the earth, being among the ſands, of a blacke colour, and by the weight onely is knowne from the reſt of the foile: and here and there among, a man ſhall meet with ſmall ſtones of the ſame ſtuffe, moſt of all within the brookes that bee drie ſometimes of the yeare. This ſandie and gravellie ſubſtance, the mine maiſters and mettall finers uſe to waſh, and that which ſetleth downeward, they burne M

and

A and melt in the furnace. There is found likewise in the gold mines, a kind of lead ore which they call Elutia; for that, the water that they let into those mines (as I said before) washeth and carrieth downe withall certaine little blacke stones, streaked and marked a little with a kind of white, and as heavie they be in hand as the verie ore of gold: and therefore gathered they bee with the same ore, and remaine in the paniers togither therewith: and afterwards in the furnace when the fire hath made a separation between them and the gold, so soone as they are melted, doe resolve into the substance of the white lead or tinglasse aforesaid.

Moreover, this is strange, that throughout all Gallecia, you shall not find a mine of common blacke lead, and yet in Biskay (which confineth hard upon it) there is abundance of it, and no other; neither out of the veine of this white lead shall you trie any silver, whereas out of the
B blacke, it is an ordinarie thing to extract silver. Againe, this is certein, that two peeces of blacke lead, cannot possibly be sodered togither without this tinglasse; neither can this be united to the other but by the meanes of oile: nay it is unpossible to conjoyne a peece of tin-soder or white lead with another, but with a soder of the blacke. This white lead or tinglasse hath been of long time in estimation, even since the warre of Troy, as witnesseth the Poët *Homer*, who calleth it Cassiteron. As for blacke lead, engendred it is two manner of waies; for either it groweth in a veine of the owne without any other mettall with it, or else it doth participat with silver in the same mine, and beeing intermingled in one peece or lumpe of ore, it is separated from it at the melting and fining onely: for the first liquor that runneth forth from it in the furnace is tin, and the second silver. As for the third part of the veine which remaineth behind in the furnace, it is
C[3] Galæna, that is to say, the verie mettall it selfe of lead; which beeing once againe melted and tried in the fire, after two parts thereof bee deducted, yeeldeth that blacke lead whereof wee now doe treat.

Chap. xvii.

Of Tin: of Argentine-lead: and other points pertinent to these matters.

D TIn hath a proper use to enhuile vessels of brasse, partly to take away the evill tast that they have and to make them sweeter, and partly to preserve them from rust, or to qualifie the malicious nature of brasse: and yet woonderfull it is, that such vessels thus tinned are never a jot the heavier by that means. Also, in times past there were (as I have alreadie said) excellent mirroirs made of tin, and the same were tempered and wrought at Brundise: but those of silver have put them downe since, that everie chamber-maid and such like serving creature, would be at their looking-glasses of silver. But tin is found much counterfeit in these daies, by putting unto white lead aboveſaid a third part of white brasse: yea and there is another devise to sophisticat tin, to wit, by mixing white and blacke lead one with another by even weight and portion: and this maslen some call at this day, *silver-lead or argentine. As for that mixed matter, wherein be two parts of blacke lead and one of the white, they call it Tertiarium: this kind of tin is sold after *thirtie the pound, and it is that wherewith they used to soder conduit pipes: but the leau-
E der disposed pewterers have a cast to put unto this tin called Tertiarium, an equall quantitie of white lead, and then they call it Argentarium; which mettall they employ in vessels for the kitchin to seeth meat or what they list in them: and this kind of pewter wanteth no price, for they set it at an hundred and thirtie the pound, whereas a pound of white lead or tinglasse pure and fine of it selfe, is sold for thirtie, and the blacke for sixteene. As touching the temperature and nature of the white lead, it standeth more upon a drie substance; contrariwise, that of blacke, is wholly moist and liquid: which is the reason that the said white lead or tinglasse will serve to no use or purpose unlesse it bee mixed with some other mettall: neither is it good to lead or soder silver with, for sooner will silver melt in the fire, than it. There is a devise to tin pots, pans, and other peeces of brasse so artificially with white lead or tinglasse, (an invention which came out
F of Fraunce) that hardly a man shall discerne them from vessell of silver: and such leaded vessels are commonly called Incoctilia. After the same manner, they have taken up of late another custome, to silver the trappings especially and caparisons of their horses of service, yea and the harnaise of coach-horses and draught-jades, and namely in the towne Alexia: As for the former invention, those of Bourges have the honour of it. Neither rested they so, but have proceeded to

* *i.* Pewter, as some take it.

* This place seemeth to be corrupt.

adorne and garniſh in that manner their charriots, waggons, and coaches. But our vaine and G
waſtfull wantons not herewith contented, are come now to their ſtirrops and waggon ſeats, not of ſilver onely but alſo of gold. And that which in times paſt was condemned as monſtrous prodigalitie, to be put into drinking veſſels; the ſame to tread upon now with the feet, and to weare and conſume about waggons and charriots, is commended for fineneſſe, neatneſſe, and elegancie. But to returne againe unto our white lead, if you would know whether it be right and good or no, the proofe is to be made in paper: for put it melted into a ſheet of paper, if it be not falſified it will ſeeme to breake and rend the paper with the weight, and not with the ſcalding heat thereof.

Moreover, it is worth the obſervation, that the Indians have no mines among them either of braſſe or lead, but they are content to part with their pearls and pretious ſtones unto merchants H
by way of counterchaunge for theſe mettals.

Blacke lead or common lead is much uſed with us for ſheets to make conduit pipes; alſo it is driven with the hammer into thin plates and leaves. This mettall requireth much labour and toile in Spaine and Fraunce, before it bee gotten out of the mine, ſo deepe it lieth; whereas in Britaine it runneth ebb in the uppermoſt coat of the ground, and that in ſuch abundance, that by an expreſſe act among the Iſlanders themſelves, it is not lawfull to digg and gather ore above ſuch a proportion, ſet downe by ſtint. Furthermore, all the blacke lead which now men have in requeſt, is knowne by theſe names, to wit, Iovetanum, Caprarienſe, and Oleaſtrenſe. As for the droſſe and refuſe that is purged from it, there is no difference at all, ſo that it have the due cleanſing by the fire as it ought. Theſe mines alone of lead have one woonderfull and admirable gift I
above all others, That if they be forlet a time and ſuffered to reſt, they will grow againe and be more fettile of ore by that means. And in truth, this ſeemeth to be the reaſon thereof, For that the aire hath good means and libertie to infuſe it ſelfe, and to enter in at the pores and paſſages which it findeth enlarged and open: much like as we obſerve in certaine women, who upon their ſlips of abortive fruit, proove thereby more fruitfull and apter to conceive. And that this is true that I ſay of lead mines, it was found of late by good experience in the mines of Santaria in the province of Bœtica in Spaine: for whereas in times paſt for two huudred yeeres togither it was woont to be ſet for a rent of ten pound weight, after it had taken repoſe and was opened againe, it yeelded for everie ten, five and fiftie. Likewiſe, the lead mine named Antonianum within the ſaid province, which paid in old time but a cheiſe of ten pound weight, is come now to a yeerely K
revenew of foure hundred pound. To conclude, one marveilous qualitie lead hath beſides, That no veſſell made thereof, will melt over the fire, if there bee water in it: and yet caſt into the ſaid water a little ſtone, or a ſmall peece of braſſe coine, although it be no more than a quadrant, you ſhall ſee it melt, and a hole burnt through it by and by.

Chap. xviii.

The medecines that wee have from Lead, and the refuſe or droſſe of Lead: of the veine of Lead called Molybdæna or Galena: of Ceruſe, white Laad, or Spaniſh white, called Pſimmythium: and of Sandaracha. L

GReat uſe there is in Phyſicke of Lead applied by it ſelfe alone, and namely, to repreſſe and keepe downe the skarres and cicatrices that riſe above the other skin: alſo by the refrigerative qualitie that it hath, to coole the heat of fleſhly luſt, if there be bound unto the loines and region of the reines, a thin plate or leafe thereof. And verely *Calvus* the oratour (who by occaſion of much dreaming in his ſleepe of venereous ſports, fell into mightie pollutions, and ſo farther into the grievous maladie of Gonorrhæa or running of the reins) with wearing ordinarily theſe leaden plates, ſtaied (by report) all ſuch vaine and wanton fantaſies and imaginations: by which means hee preſerved alſo his ſtrength, and had a bodie able to endure the labour M
of much ſtudie and ſitting at his booke. And *Nero* the Emperour (ſince the gods would have it ſo) uſed ordinarily to weare a plate of lead to his breaſt, under which hee would chaunt out luſtily with a wide throat and ſtrong voice, his filthie ſonnets and beaſtly ballads; but hee ſhewed thereby that lead was a ſingular meanes to maintaine a good voice. But to ſerve otherwiſe in Phyſicke,

A Phyſicke, lead ought to bee prepared and baked after this manner: Take an earthen pan of potters worke, and lay one bed therein of brimſtone finely powdered; upon which, beſtow another couch of thin leaves or plates of lead, and a third courſe over them of brimſtone and yron filedust togither, for to cover all: this beeing done, ſet the veſſell in a furnace; but while theſe things are calcining, meet it is and neceſſarie that the veſſell or pan aforeſaid be well luted and ſtopped cloſe, that there bee no venting or breathing hole at all; for otherwiſe the lead within the ſaid pan, would ſend foorth a noiſome vapour and peſtilent, moſt daungerous to all that bee within the ſent thereof, but to doggs eſpecially, whome it killeth out of hand: and verely, as this exhalation of lead is deadly unto them, ſo the aire of all mettals in generall, is adverſe and contrarie unto flies and gnats: which is the reaſon, that a man ſhall never ſee any of theſe inſects in
B mines, forges, and bloome-ſmithies, where mettals bee uſually tried. Now in the calcining of lead, ſome there bee who chuſe rather to take the duſt of lead gotten off with a file, and to mix the ſame with brimſtone: others thinke it better to uſe ceruſſe rather than brimſtone. Furthermore, lead doth yeeld from it ſelfe a certaine ſubſtance by way of loture, which is of right great and manifold uſe in phyſicke: the making whereof is in this manner, They take a leaden mortar, they pun and ſtampe the ſame with a leaden peſtill, caſting in raine water eftſoons; and thus they labour at it continually untill ſuch time as the water grow to ſome conſiſtence and be thicke againe: this they permit to reſt and ſettle: the pure and cleare portion that is aloft, they ſucke and ſoke away with ſpunges: the groſſeſt part that is ſettled in the bottome, after it is dried, they reduce into trochiſques. There be ſome who ſtampe in the ſame order, the filedust which com-
C meth of lead: others put thereto ſome lead ore among: and as there bee many that uſe vinegre or wine in this operation, ſo there are ſome againe who take greace or roſes in lieu thereof. You ſhall have thoſe that for this purpoſe make choice of a ſtone mortar, eſpecially of Thebaïcke marble, but they take a leaden peſtill rather than any other, to bray and pun withall: and by this means the medicinable lead will be the whiter.

Now as touching the lead calcined in manner aforeſaid, it may bee waſhed alſo after the order of Antimonie and Cadmia: and in this manner prepared, it is of power aſtringent, good to ſtop any flux or rheume; proper alſo to skin and make a ſmall skarre. Much uſe there is of lead thus burnt and waſhed, in collyries or eyeſalves, and principally if the eyes either ſtand out too farre, or be ſunke in too deepe: alſo it is ſingular to repreſſe the excreſcenſe of fleſh in ulcers, to
D heale the chaps in the ſeat or fundament, to cure the running hæmorrhoids, and to diſcuſſe or keepe downe the blind and ſwolne piles: and for all theſe accidents in generall, the loture of lead aforeſaid is moſt excellent. But the aſhes of lead burnt and calcined, is more proper for the cure of corroding ulcers and filthie ſores. And in one word, the ſame effects and operations it hath, that the aſhes of paper. Alſo, the manner of burning and calcining lead, is to put into a pan certaine little plates thereof, togither with brimſtone, turning the ſame ever and anon either with ſome yron rod or ſtiffe ſtalke and ſtem of Ferula plants, untill ſuch time as both the one and the other being liquefied, be converted and turned into aſhes: the ſame, after that they be once cooled, ought to bee punned and beaten againe, and reduced into a moſt pure and exquiſit fine powder. Some there bee who take file-duſt of lead, put the ſame in an earthen pot of
E greene potters clay, ſet the ſame into an oven, and ſo let it calcine therein untill ſuch time as the pot be well and througly baked: others againe there are, who mix with lead the like quantitie of ceruſſe, or elſe of barley, and pun the ſame like crude-lead uncalcined in manner aforeſaid, for a loture; and when it is reduced thus into a powder, they make more reckoning of it than of the Cyprian Spodium.

Over and beſides, the droſſe or refuſe of lead is medicinable: and the beſt is that accounted, which commeth neareſt unto a yellow colour, without any reliques at all of the lead among; or elſe enclining to the hew of brimſtone, and cleanſed from all earthly ſubſtance: this alſo being braied and broken into ſmall parcels, may bee waſhed in manner aforeſaid, and ſtamped with water in a mortar, untill ſuch time as the water looke yellow; then muſt it be powred forth into
F a pure and cleane veſſell; and this tranſlavation ought ſo long to be continued out of one veſſell into another, untill ſuch time as it have done caſting any reſidence downward; for the ſediment that reſteth in the bottome is the beſt, working the ſelfeſame effects as lead doth, but with more acrimony. When I conſider all this, me thinks I cannot ſufficiently admire the diligence of men, who have made ſuch experiments of all things in the world, ſparing not ſo much as the verie

ordure, offall, and filthie excrements, but have tried concluſions therein ſo many wayes, and left nothing unattempted. G

There is a kind of Spodium alſo made of lead in the furnace, after the ſame manner as I ſhewed before, of copper or Cyprian braſſe: the order of waſhing whereof, is this; To put it in a courſe linnen cloth, and to lay the ſame in raine water, that the terrene ſubſtance may bee ſeparated from the reſt that is transfuſed or paſſeth through the cloth with the water: and yet the ſame muſt be cribled or ſerced afterwards, and beaten to powder. Some thinke it better to wipe and ſcoure off the duſt from the Calamine with wings, and then to beat it in a mortar with the moſt odoriferous wine they can get.

There is beſides, a minerall named Molybdena, which elſewhere I have called Galæna; by which I meane in this place, the ore or veine that containeth within it, both ſilver and lead: the better this is thought to be, the more that it enclineth to the colour of gold, and the leſſe that it ſtandeth upon lead: the ſame alſo is brittle, apt to crumble, and in proportion of the quantitie not verie weigtie in hand: the ſame, if it be boiled with oile, will in colour reſemble liver. There is a kind of Galæna likewiſe that ſticketh to the furnaces of gold and ſilver: but this (whereof I now ſpeake) they call Metallica, that is to ſay, the Minerall: and verely the beſt of this kind, is that which is found in Zephyrium: the markes whereof are theſe; If it have little or no earth in it, nor be any waies ſtonie: the ſame is burnt, calcined, and waſhed, neither more nor leſſe than the droſſe Scoria. Much uſed this minerall is in thoſe unctuous liniments or ſalves called Liparæ, deviſed as lenitive and refrigerant, for ulcers: alſo it entreth into plaſtres which are * not mordicant: but beeing applied to any ſore in tender or delicat bodies, and in the ſofteſt parts, it doth heale faire, and skin throughly. The compoſition of which plaſtres, is after this manner; Take three pound weight of this minerall lead Molybdæna, put thereto of wax one pound, and of oile three hemines; which done, incorporat all togither (according to art) into the forme of an emplaſtre. Now if it ſo fall out that the patient be an elderly bodie, there would be an addition put thereto of the lees or mother of oile olive. This minerall may be tempered alſo to right good purpoſe, with litharge of ſilver, and the droſſe of lead, and then it is a moſt excellent medecine (to be injected by a clyſtre) for the dyſenterie or bloudie flix; for the tineſme alſo, which is an inordinat deſire to the ſtoole without doing any thing; provided alwaies, that the belly be fomented beſides with hot water. H I

* *Quæ non alligantur*: it is thought that *Plinie* miſtook in *Dioſcorides*, and for *αἱματίτις λίθος*, read *αἱματίτις*, which he hath tranſlated without any ſenſe at all or congruitie to the place.

There is another minerall beſides, called Pſimmythium, which is all one with Ceruſe: and this, the furnace and mine of lead ore doth yeeld: but the beſt of this kind is brought from the Iſland Rhodes. The manner of making it, is this: Take the fineſt peeces that are ſcraped from lead, let the ſame be hung over a veſſell of the ſtrongeſt and ſharpeſt vinegre that poſſibly can be had, that they may diſtill thereinto: and looke what of it is falne into the ſaid vinegre, muſt be dried afterwards, ground into powder, and ſearced; and then a ſecond time it ought to bee tempered with vinegre, and ſo reduced into ſeverall trochiſques, to be dried in the Sun during Summer. There is another way of making Ceruſe beſides this; namely, to put lead into certaine pots or pitchers of vinegre well and throughly ſtopped, that no aire goe out, and therein to let it reſt for ten daies ſpace togither: after which time, to take it forth, and ſcrape from it the mouldineſſe or vinewing that doth furre or gather about it: which done, to caſt it in againe into the ſaid veſſels, continuing ſo untill ſuch time as the lead bee conſumed to nothing. Now that which hath been thus ſcraped from it, they take and beat into powder, they ſerce it alſo verie fine, calcine it over the fire in a pan, ſtirring and mixing it togither with little ſlices or pot-ſtickes, untill ſuch time as it wax red, and be like unto Sandaracha. After all this, they waſh it in freſh water ſo long untill that all the groſſeneſſe be ſcoured off: which when it is drie, in like manner as before, they digeſt it into trochiſques. This Ceruſe ſerveth to the ſame purpoſes that the reſt abovenamed, (onely of all the other it is lighteſt in operation) and beſides ſerveth to make an excellent blanch for women, that deſire a white complexion: but deadly it is, being taken inwardly in drinke; like as litharge alſo. This ceruſe thus made, as white as it is, in caſe it be afterwards burnt againe, turneth to be reddiſh. K L M

As touching Sandaracha, I have alreadie ſhewed in manner all that concerneth the nature of it: howbeit, this would be noted over and above, that it is found in the mines as well of ſilver as of gold: the redder it is, and of a more ſtrong and violent ſmell, the better men take it to be; ſuch alſo is pure, cleare, and brittle withall, or eaſie to crumble: mundificative it is and aſtringent,

heating

A heating alſo and exceeding corroſive: and the principall vertue that it hath, is to fret and putrifie whatſoever it worketh upon: in a liniment with vinegre, it cauſeth the haire to come up thicke againe in places deſpoiled thereof by any diſeaſe. It entreth into collyries or eyeſalves: reduced into a lohoch with honey, it cleanſeth the throat, and maketh a cleare, ſhrill, and lowd voice: eaten by way of a bole with turpentine, it is a gentle and pleaſant medecine for thoſe that bee ſhort-winded and troubled with the cough: a perfume alſo made with it and cedar togither, is good in the ſame caſes, ſo that the ſmoke bee received up at the mouth. As for * Arſenicke, it is of the ſame ſtuffe: that which is beſt of this kind, reſembleth burniſhed gold in colour: the paler kind enclining to the colour of Sandaracha, is thought to be the worſe. A third ſort there is, of a middle and meddled colour, compounded as it were of gold and Sandaracha. Theſe two
B later kinds be skalie aloft: as for the firſt, which is drie and pure, it is full of ſmall veines running here and there, whereby it is apt to cleave as the veine goeth. Of the ſame operation is Arſenicke as the reſt, but that it is more hot and biting; in which regard, it is uſed in potentiall cauteries, and depilatories: it taketh away the carnoſities and apoſtemations about the nailes of the fingers: the ſuperfluous fleſh alſo within the noſthrils: the biggs that hang foorth of the fundament: and in one word, it eateth away any excreſcence whatſoever. To conclude, much better it is and more powerfull in operation, in caſe it bee calcined in a new earthen pan, where it muſt torrifie ſo long untill it chaunge the colour.

* Yellow orpiment.

C

THE XXXV. BOOKE OF THE HISTORIE OF NATVRE,

D

WRITTEN BY C. PLINIVS SECVNDVS.

¶ The Proëme.

E *THe diſcourſe of Mines and Mettals, wherein principally conſiſteth the wealth of the world: of other minerals alſo growing to them, with the natures, operations, and effects of them all, is an argument ſo knit and annexed to Phyſicke, that the handling thereof (which I have alreadie well-neare perfourmed) not onely diſcovereth a world of holeſome medicines profitable for the life and health of man, but alſo inferreth a number of hidden ſecrets, couched within the Apothecaries ſhops; yea and openeth the way unto the curious Art and ſubtile deviſes of Gravers, Painters, and Diers, inducing me withall to take them alſo before me, and to treat thereof accordingly: which when I have done, there remaineth yet for mee a new worke to take in hand; namely, to write of ſundrie kinds of Earth and Stone, and thoſe linked togither and carrying with them a longer traine by farre, than the former minerals. Concerning which, other authors and the Greeke writers eſpecially, have ſo particularized, that of each one of them they have written many volumes. For mine owne part, I meane not*
F *to follow their ſteps, but by way of compendious brevitie, to proceed as I have begun, and yet to omit nothing that is neceſſarie, profitable, and pertinent to nature.*

G

Chap. I.

The honour of flat picture in old time.

TO begin then with that which remaineth as touching Picture and Painting, this would be knowne, That in times past it was reputed a noble and excellent Art: in those daies I meane, when Kings and whole States made account thereof; and when those onely were thought ennobled and immortalized, whom painters vouchsafed to commend by their workmanship to posteritie. But now, the marble and porphyrit stones have put painting cleane downe: the gold also laid upon them hath woon all credit from painters colours: gold I say, wherewith not only plaine and entire walls are richly guilded all over, but also the polished works of marble engraven upon them after the manner of inlaid worke and marquetage of divers peeces, resembling men, beasts, floures, and all things else: for in these daies contented we are not with plaine squares and tables of marble, nor with the riches of mightie mountains, couched under covert and laid within our bed-chambers in that sort as they grew, but come wee are now to paint stones. Devised this was first in the daies of *Claudius Cæsar*: but when *Nero* came to be Emperour, the invention was taken up, to give those colours to stones in their superficiall outside, which they had not of their owne; to make them spotted, which naturally were of one simple colour: that by the helpe of mans hand, the * Numidian red porphyrit should be set out with white spots in *eg-fashion: the * Sinadian grey marble distinguished with marks and strakes of purple: as if our delicat wantons shewed thereby how they could have wished the stones to grow. Thus would they seeme to correct the works of Nature, to supply the want of mountaines and quarries, and to make amends for the hills cloven in sunder for gold, and hewed in peeces for marble. And what is the end of all this prodigious prodigalitie and wastfull superfluitie? but that the fire when it commeth, may consume in one houre a world of wealth.

Chap. II.

The estimation and account that was made of Images in times past, represented by lively pictures.

K

THE manner was in auncient time, to continue and perpetuat the memoriall of men, by drawing their pourtraitures in lively colours, as like to their proportion and shape as possibly could be; but this custome is growne now altogither out of use: in stead thereof wee have shields and scutcheons set up of brasse: wee have faces of silver in them, without any lively distinction of one from another: and as for our statues, the heads upon them otherwhiles bee *chaunged one for another; which hath given occasion long since of many a jest and libell spred abroad in rime and sung in everie street. In so much as all men now adaies are more desirous to have the rich matter seene that goeth to the making of images, than to be known by their owne personage and visage as it is: and yet everie man delighteth to have his cabinet and closet well furnished with antique painted tables: the statues and images of other men they think it enough to honour and adore; whiles they themselves, measuring worship by wealth, and thinking nothing honourable that is not sumptuous and costly, see not how by this means they give occasion to their heires for to breake open their counters and make spoile of all, or else before that day come, entice a theefe to be hooking or twitching them away with gins and snares. Considering then, that no man careth for a lively picture, all the monuments that they leave unto their heirs, are images rather of their monies, than resemblances of themselves. Howbeit, these great men take pleasure to have their owne wrestling places and halls of exercise, yea and the roumes where they are annointed, beautified and adorned with the pourtraitures of noble champions: they delight also to have the face of *Epicurus* in everie chamber of the house, yea and to carrie the same about them upon their rings whersoever they goe: in the remembrance and honour of his nativitie, they doe offer sacrifice everie twentith day of the moon, and these month-minds they keepe as holydaies duly, which thereupon they call Icades: and none so much as they who will not abide to be knowne another day by any lively image drawne whiles they be alive. Thus it is come to passe, that whiles artificers play them and sit still for want of worke, noble arts by the means

L

M

* For they were so made that they mought be taken off & set on againe.

A meanes are decaied and periſhed. But I marvaile nothing hereat: for thus it is verely and no otherwiſe, when we have no reſpect or care in the world to leave good workes behind us, as the images of our minds, wee doe neglect the lively pourtraitures and ſimilitudes alſo of our bodies. In our forefathers dayes ywis it was otherwiſe: their hils and ſtately courts were not ſet out with images and portraitures after this ſort; there were not in them to bee ſeene any ſtatues or images wrought by artiſane ſtrangers, none of braſſe they had, none of marble, their Oratories and Chappels were furniſhed with their own and their aunceſtors *pourtraictures in wax, and thoſe lively and expreſſely repreſenting their viſages; theſe were ſet out and diſpoſed in order, theſe were the images that attended the funerals of any that was to bee enterred out of that ſtocke and linage. Thus alwaies as any Gentleman died, a man ſhould ſee a goodly traine of all thoſe which B were living of that houſe, accompanying the corpes, cauſing alſo the images of their predeceſſours to march ranke by ranke in order, according to their ſeverall deſcents: in which ſolemne ſhew, the whole generation that ever was of that familie, repreſented by theſe images, is there preſent, readie to performe that laſt dutie and honour to their kinſman. Moreover, whereſoever theſe images ſtood within the oratorie or chappell beforeſaid, there were lines drawn from them upon the wall, directing to the ſeverall titles and inſcriptions which contained their ſtile, their dignities, and honours, &c. As for their ſtudies and counting houſes, full they were of books, records, and rolls, teſtifying all acts done & executed by them both at home and abroad, during the time they were in place to beare office of ſtate. Over & beſides thoſe images within houſe, reſembling the bodily ſhape & countenance; there were others alſo without dores, & namely, about the por- C tailes and gates of the houſe, which were the teſtimonies of brave minds & valiant hearts: there hung fixed the ſpoiles conquered and taken from the enemies, which notwithſtanding any ſale or alienation, it was not lawfull for the purchaſer to pluck downe; in ſuch ſort, as the houſe it ſelfe triumphed ſtill and retained the former dignitie, notwithſtanding it had a new lord and maiſter. And verely, this was to the maiſter and owner a great ſpur unto valour and vertue: conſidering, that if he were not in heart and courage anſwereable to his predeceſſour, he could never come in at the gates, but the houſe was readie to reproch and upbraid him daily for entering into the tri- umph of another. Extant there is upon record, an Oration or act of *Meſſala* (a great Oratour in his time) wherein upon a great indignation he expreſſely forbad that there ſhould bee enter- mingled one image that came from another houſe of the *Levini*, among thoſe of his owne name and D linage, for feare of confounding the race of his familie and aunceſtours. The like occaſion mo- ved and enforced old *Meſſala* to put foorth and publiſh thoſe bookes which he had made of the deſcents and pedigrees of the Romane houſes: for that upon a time as hee paſſed through the gallerie belonging to *Scipio Africanus* his houſe, hee beheld therein his ſtile, augmented by the addition of *Salutio*, (for that was one of his ſurnames) which fell wnto him by the laſt will and te- ſtament of a certaine rich man ſo called, who adopted him for his owne ſonne: as being greatly diſcontented in his mind, that ſo baſe a name as that (to the ſhame and diſhonor of the *Africans*) ſhould creepe into the noble familie of the *Scipions*. But if I may ſpeake without offence of theſe two *Meſſalæ*, it ſhould in my conceit be ſome token of a noble ſpirit and good mind that loveth and embraceth vertue, to entitle his owne name, although untruly, to the armes and images of o- E thers, ſo long as they be noble and renowmed: and I hold it a greater credit ſo to doe, than to de- meane our ſelves ſo unworthily, as that no man ſhould deſire any of our armes or images. And ſeeing that I am ſo far entered into this theame, I muſt not paſſe over one new deviſe and inven- tion come up of late, namely, to dedicat and ſet up in libraries the ſtatues in gold or ſilver, or at leaſtwiſe in braſſe, of thoſe devine and heavenly men, whoſe immortall ſpirits doe ſpeake ſtill and ever ſhall, in thoſe places where their bookes are. And although it bee unpoſſible to recover the true and lively pourtraits of many of them, yet we forbear not for all that to deviſe one image or other to repreſent their face and perſonage, though we are ſure it bee nothing like them: and the want thereof dooth breed and kindle in us a great deſire and longing, to know what viſage that might be indeed which was never delivered unto us: as it appeareth by the ſtatue of *Homer*. Cer- F tes, in my opinion there can be no greater argument of the felicitie and happineſſe of any man, than to have all the world evermore deſirous to know, What kind of perſon hee was whiles he li- ved? This invention of erecting libraries, eſpecially here at Rome, came from *Aſinius Pollio*, who by dedicating his Bibliotheque, containing all the books that ever were written, was the firſt that made the wits and workes of learned men, a publicke matter and a benefit to a Commonweale.

*These images were no other than the viſage and head as far as to the ſhoulders.

But

*Ptolomæus Philadelphus.
*Attalus.

But whether the kings of *Alexandria in Ægypt, or of *Pergamus, began this enterprise before (who upon a certain emulation and strife one with another, went in hand to make their stately and sumptuous libraries) I am not able to avouch for certaine. But to returne againe to our flat images and pictures; that men in old time delighted much therin, yea and were caried away with an ardent and extraordinarie affection unto them, may appeare by the testimonie, not onely of *Articus* that great friend of *Ciceroes* (who set forth a booke entituled, A Treatise of painted images) but also of *M. Varro*, who in all his volumes, whereof hee wrate a great number, upon a most thankfull and bountifull mind that he caried, devised to insert not onely the names of seven hundred famous and notable persons, but also in some sort to set downe their physiognomie and resemblance of their visage: not willing as it might seeme that their remembrance should perish, but desirous to preserve the shapes and portraits of so worthie personages against the injurie of time, which weareth and consumeth all things; endevouring by this meanes, & as it were in a kind of emulation striving to do as much for them in this behalfe, as the gods could doe, not onely in giving them immortalitie, but also by dispersing these pourtraits into all parts of the world, to shew them personally in every place to the eyes of men, as if they were present.

Chap. iii.

At what time scutchions and shields, with images engraven in them, were first erected in publicke place. Where they began to be set up in privat houses. The originall of pictures. The first portrait that was of one single colour. Of the first painters. How ancient the art of painting was in Italy.

And this verely which *Varro* did, namely, to insert the names and counterfeits of famous men in his bookes, was to gratifie straungers onely. But of those who were desirous in this kind, to honour Romanes, I find in the Chronicles, that *Appius Claudius* was the first (him I meane, who in the 259 yeare after the foundation of the citie of Rome, bare the Consulship with *Servilius*) and namely by dedicating in temples and publicke places of the citie, the shields of his predecessours by themselves alone. For within the chappell of *Bellona*, he caused to bee set up the scutcheons and shields of his aunce stours; taking great contentment to have the armes of his predecessours seene on high, and the same accompanied with the titles of their honourable dignities to be read. A goodly shew, no doubt, and a magnificent, in case there could be shewed withall a long descent of petie images representing a number of children, as it were the neast of a faire brood and off-spring: for who would not take great joy and pleasure to see such a sight, who would not favourably behold the armes of such a race and linage? After that *Appius Claudius* had given this precedent at Rome, there followed *M. Æmilius*, companion in the same Consulship with *Q. Luctatius*, who not contented to have the Armoires and coats of his progenitors, to be advaunced aloft in the stately hall and pallace Æmilia onely, tooke order, that they should stand also at home in his owne house: and this also was a matter of right great consequence, beeing done according to the patterne and example of the martiall worthies in *Homer*: For within these shields and scutcheons, resembling those which were used in old time in the battailes before Troy, were represented the images of such as served with them, engraven therein: for thereupon such shields tooke the name *Clypei, i. chased and engraven, not of the old word in Latine *Cluere*, which signifieth to fight, or to bee well reputed, as our thwarting Grammarians would with their subtile sophistrie seeme to etymologize and derive it. Certes, this originall of shields and coats of armours, emplied a brave mind and noble spirit full of vertue and valour, when every mans shield shewed the lively pourtrait of him that bare it in the wars. The Carthaginians were wont to make their targuets of beaten gold, and those likewise they caused to be engraven with their own pourtraits, and caried the same with them to the wars. And verely, *Q. Martius* that worthy warrior, and revenger of the two *Scipioes* in Spaine, having defeated the Carthaginians & taken many of them prisoners, found among other spoiles and pillage, the shield of *Asdrubal*, made in maner aforesaid: Which shield was erected & hung up over the porch of *Iupiters* temple upon Capitoll hill, and remained there unto the first fire that consumed the temple. And seeing I am fallen upon this point, namely, of erecting the armours woon from enemies, in publicke place; I may not passe over in silence the securitie and careless regard that our forefathers had in this behalfe;

*Quasi glypei. ἀπὸ τῦ γλύπτειν, i. à cælando.

A behalfe: which was ſo great, that *M. Aufidius*, who farmed and undertooke the cuſtodie or keeping of the Capitoll, the temple, and all therein, the ſame yeare wherein *L. Manlius* and *Q. Fulvius* were Conſuls, and which was from the foundation of the citie of Rome 575 yeares, advertiſed the Senat, That thoſe ſhields there, which for ſo long together were appointed and aſſigned thither by the Cenſors, were not of braſſe, as they had beene taken for, but of ſilver.

Concerning pictures, and the firſt originall of painters art, I am not able to reſolve and ſet downe any thing for certaine: neither is it a queſtion pertinent to my deſſigne and purpoſe, I am not ignorant, that the Ægyptians doe vaunt thereof, avouching that it was deviſed among them, and practiſed ſixe hundred yeares, before there was any talke or knowledge thereof in Greece: a vaine brag and oſtentation of theirs, as all the world may ſee. As for the Greeke writers, ſome aſ-
B cribe the invention of painting to the Sicyonians, others, to the Corinthians. But they all doe jointly agree in this, That the firſt pourtrait was nothing els but the bare pourfling and drawing onely the ſhaddow of a perſon unto his juſt proportion and lineaments. This firſt draught or ground, they began afterwards to lay with one ſimple colour, and no more: which kind of picture, after that they fell once to more curious workmanſhip, they called Monochromaton, that is to ſay, a pourtrait of one colour, for diſtinction ſake from other pictures of ſundrie colours: which notwithſtanding, yet this plaine manner of painting continueth at this day, and is much uſed. As for the linearie portraying or drawing ſhapes and proportions by lines alone, it is ſaid, That either *Philocles* the Ægyptian, or elſe *Cleanthes* the Corinthian was the inventor therof. But whoſoever deviſed it, certes *Ardices* the Corinthian, and *Telephanes* the Sicyonian, were the firſt
C that practiſed it. Howbeit colours they uſed none, yet they proceeded thus far as to diſperſe their lines within, as well as to draw the pourfle, and all with a coale and nothing elſe. And therefore their manner and order was to write alſo the names of ſuch as they thus painted, and alwaies to ſet them cloſe to the pictures. But the firſt that tooke upon him to paint with colour, was *Cleophantus* the Corinthian, who (as they ſay) tooke no more but a peece of a red potſherd, which he ground into pouder, and this was all the colour that he uſed. This *Cleophantus*, or ſome other of that name, was he, who by the teſtimonie of *Cornelius Nepos*, as I will anon ſhew more at large, accompanied *Demetrius* the father of *Tarquinius Priſcus* king of Rome, when he fled from Corinth to avoid the wrongs of *Cypſellus* the tyrant, who perſecuted and oppreſſed him. But it cannot bee ſo: for ſurely before this *Tarquines* time, the art of painting was growne to ſome perfection, even
D in Italie: for proofe whereof, extant there be at this day to be ſeene at Ardea within the temples there, antique pictures, and indeed more ancient than the citie of Rome: and I aſſure you, no pictures came ever to my ſight, which I wonder ſo much at, namely, that they ſhould continue ſo long, freſh, and as if they were but newly made, conſidering the places where they be, ſo ruinate and uncovered over head. Semblably, at Lanuvium there remaine yet two pictures of ladie *Atalanta* and queene *Helena*, cloſe one to the other, painted naked, by one and the ſame hand: both of them are for beautie incomparable, and yet a man may diſcerne the *one of them to be a mai- *i. Atalanta.
den by her modeſt and chaſt countenance; which pictures, notwithſtanding the ruins of the temple where they ſtand, are not a whit disfigured or defaced. Of late daies, *Pontius*, lieutenant under *C. Caligula* the Emperour, did what he could to have removed them out of the place, and caried
E them away whole and entier, upon a wanton affection and luſtfull fancie that he caſt unto them: but the plaſtre or porget of the wall whereupon they were painted, was of that temper that would not abide to be ſtirred. At Cære alſo there continue certaine pictures of greater antiquitie than thoſe which I have named. And verely, whoſoever ſhall well view & peruſe the rare workmanſhip therein, will confeſſe, that no art in the world grew ſooner to the height of abſolute perfection than it, conſidering that during the ſtate of Troy no man knew what painting was.

Chap. iiii.

Of Romanes that were excellent painters. When the art of painting came firſt into credit and eſtimation at Rome. What Romans they were that exhibited the pourtraits of their owne
F *victories in pictures. And about what time painted tables made by ſtrangers in forrain parts, were accepted and in great requeſt at Rome.*

AMong the Romanes alſo this Art grew betimes into reputation; as may appeare by the *Fabij*, a moſt noble and honourable houſe in Rome, who of this ſcience were ſurnamed *Pictores*,

Pictores, *i.* Painters. And the first who was entituled with that addition painted with his own hand G
the temple of *Salus*; and this was in the foure hundreth and fiftieth yeare after the foundation of
our citie: which painting continued to our age, even unto the time of *Claudius Cæsar* the Em-
perour, in whose daies the temple it selfe with the painting, was consumed with fire. Next after
this, the workmanship of *Pacuvius* the Poët (who likewise painted the chappell of *Hercules* in the
beast-market at Rome) was highly esteemed and gave much credit to the art. This *Pacuvius* was
Ennius the Poëts sisters sonne: and being as hee was a famous Tragædian besides, and of great
name upon the stage, the excellencie of his spirit that way, much commended at Rome his han-
dyworke and painting aforesaid. After him, I doe not find that any person of worth and qualitie
tooke pensill in hand and practised painting, unlesse haply a man would nominat *Turpilius* a gen-
tleman of Rome in our time, and a Venetian borne, of whose workmanship there bee many faire H
parcels of painting extant at this day in Verona: and yet this *Turpilius* was altogether left han-
ded, and painted therewith, a thing that I doe not heare any man did before him. As for *Aterius*
Labeo, a noble man of Rome, late lord Pretour, and who otherwise had been vice-Consull in
Gallia, Narbonensis or Languedoc, who lived to a very great age & died not long since, he pra-
ctised painting; and all his delight and glorie that he tooke, was in fine and small workes of a lit-
tle compasse: howbeit, hee was but laughed at and scorned for that qualitie, and in his time the
handicraft grew to be base and contemptible. Yet I thinke it not amisse to put downe for the bet-
ter credit of painters, a notable consultation held by certaine right honourable personages as
touching the art, and their resolution in the end. And this was the case: *Q. Pædius*, the little ne-
phew of *Q. Pædius* who had been Consull in his time and entred Rome in triumph, him I mean I
whom *C. Cæsar* Dictatour, made co-heire with *Augustus*, happened to be borne dumbe: and *Mes-*
sala the great Oratour, out of whose house the grandmother of this child was descended, beeing
carefull how the boy should be brought up; after mature advise and deliberation, thought good
that he should by signes and imitation be trained up in the art of painting, which counsell of his
was approoved also by *Augustus Cæsar*. And in truth, this young gentlemen beeing apt thereto,
profited marvellous much therein, and died in his youth. But the principall credit that painters
attained unto at Rome, was, as I take it, by the meanes of *M. Valerius Maximus*, first surnamed
Messala, who being one of the grand-seigneurs of Rome, was the first that proposed to the view
of all the world, and set up at a side of the stately hall or court Hostilia, one picture in a table,
wherein hee caused to be painted that battaile in Sicilie wherein himselfe had defeated the Car- K
thaginians and king *Hiero*: which happened in the yeare from the foundation of Rome 490. The
like also, I must needs say, did *L. Scipio*, and hung up a painted table in the Capitoll temple, con-
taining his victorie and conquest of Asia, whereupon he was surnamed *Asiaticus*. But (as it is said)
Africanus although he were his owne brother, was highly displeased therewith: and good cause
he had to be angrie and offended, because in that battaile his owne sonne was taken prisoner by
the enemie. The like offence was taken also by *Scipio Aemilianus*, against *Lucius Hostilius Man-*
cinus, who was the first that entered perforce the cittie of Carthage; for that hee had caused to
bee set up in the market place of Rome a faire painted table, wherein was lively drawne the
strong situation of Carthage, and the warlicke meanes used to the assaulting and winning of
it, together with all the particulars and circumstances thereof: which *Mancinus* himselfe in L
person sitting by the said picture, desciphered from point to point unto the people that came to
behold it; by which courtesie of his hee woon the hearts of the people, insomuch, as at the next
election of magistrates, his popularitie gained him a Consulship. In the publicke plaies which
Claudius Pulcher exhibited at Rome, the painted clothes about the stage and Theatre (which re-
presented building) brought this art into great admiration: for the workmanship was so artificiall
and lively, that the very ravens in the air, deceived with the likenesse of houses, flew thither apace
for to settle thereupon, supposing verely there had been tiles and crests indeed. And thus much
concerning painters craft, exercised in Rome.

To come now unto forraine pictures, *Lu. Mummius*, surnamed *Achaicus* (for his conqueft of
Asia) was the first man at Rome, who made open shew of painted tables wrought by straungers, M
and caused them to be of price and estimation: for when as in the port-sale of all the bootie and
pillage gotten in that victorie, king *Attalus* had bought one of them, wrought by the hand of
Aristides, containing the picture onely of god *Bacchus*, which was to cost him * six thousand Se-
sterces, *Mummius* wondering at the price, and supposing that this table had some speciall and se-

**VI. M. Sesterti-*
um.

cret

A cret propertie in it more than himselfe knew of, brake the bargaine, called for the picture againe, and would not suffer it to be caried away, notwithstanding *Attalus* complained much at the hard measure offered unto him; and so he brought it with him to Rome, and dedicated it in the chappell of *Ceres*. And verely, this I take to be the first painted table of a forrainers making, that ever was set up in publicke place at Rome. But after he had once begun, I see it was an ordinary thing to adorn and beautifie even the common place also with such like: for upon this occasion arose that pretie scoffe, which was given by *Crassus* the Oratour, as hee pleaded upon a time under the *old Rostra: for when there was a witnesse produced to depose against him, whom he would seem to challenge and reproved, whereupon the partie replied again, and urged him instantly in these tearmes: Speake out *Crassus*, & in the face of all this court say, What kind of person you would B make me to be? Marie (quoth hee) againe I take thee to bee such an one (pointing directly to a table hanging thereby, wherein was painted a certaine Frenchman yawning and lelling out his tongue full illfavoredly.) In the same Forum or Grand-place at Rome there stood sometime the picture of an old sheepeheard leaning upon his crooke, as touching which (for that as it should seeme, it was very workmanlike made) when a certaine Dutch Embassador who beheld it, was demaunded, At what price he esteemed it, answered short and quicke, What a question is that? I would not have such an one (were he alive, as I see he is but painted) though he were given mee for nothing. But if I should speake at once who it was that gave the greatest countenance unto such tables in open view, I must needs say it was *Cæsar* Dictatour, who shrined the pictures of *Ajax* and *Medea*, in no meaner place than before the temple of *Venus Genetrix*. Next after him C came *M. Agrippa*, a man by nature enclined rather to rusticitie than to delights, and more like a rude peasant than a civile gentleman: But surely there is extant a worthie Oration of his, and beseeming the principall person of a whole cittie, as touching the open sale of all painted tables, statues, and images, that were in the hands of privat men, and the setting of them up in publicke places for to adorne the citie: which no doubt had ben farre better, than to have them banished (as it were) and sent as they be into the countrey, for to beautifie manors and retiring houses of pleasure: howbeit, as sterne and grim a sir as hee was, hee could find in his heart to bestow upon two tables with the pictures of *Venus* and *Ajax*, twelve thousand sesterces, which hee paied unto the Cyzicenes for them. Also he had caused to be set in marble stone enchased, within the hotest part of his bathes, many rich pictures of a small making, and couched in small tables, the which D were taken away but a little before the said bathes were repaired. But above all that ever were, *Cæsar Augustus* the Emperour of famous memorie, did set up in the most frequented or conspicuous place of his Forum or stately hall, two excellent painted tables: the one containing the lively pourtrait of Warre, the other of Triumph. Hee also dedicated the pictures of *Castor* and *Pollux*, besides others, whereof I will write in my catalogue of Painters: which hee hung up all within the temple of *Iulius Cæsar* his father. The same *Augustus Cæsar* enclosed within the wall of that Curia, which he erected and consecrated in the common place named Comitium, two tables painted; the one resembling the forrest Nemea, in habit of a woman sitting upon a Lion, she carieth in her hand a Date tree, and there standeth by her an old man resting upon his staffe, over whose head there was a prettie tablet hanging downe as a labell, from a charriot drawne by E two horses, with this inscription, *Nicias me inusit*, *i. Nicias* ennamelled or wrought me with fire: for that verbe [*inusit*] it pleased him to use. As for the other table, the admirable workemanship therein was this, An old grey-beard accompanied with his sonne, a youth exceeding like unto his father, save onely for the difference in age which appeared in the young downe that sprung upon his cheekes and chin. A devise there was besides, of an Ægle flying over their heads, clasping a dragon within her tallons. And as it appeared by the superscription, *Philochares* was the workeman. By which one table (if there were no more but it in the whole world) a man may make an estimate of the infinite power that is in this art, which could cause the Senat and people of Rome to take such pleasure so many yeares together to looke upon *Glaucion* and his sonne *Aristippus*, persons otherwise most base and contemptible, onely in respect of *Philochares*, who F painted them. As for *Tiberius Cæsar* the Emperour, albeit he was a prince, of all other least courteous and affable, yet he delighted to hang up those painted tables within the temple of *Augustus Cæsar*, whereof I meane to write hereafter.

* *Sub veteribus*, which some interpret *Tabernis*.

Quintilianus reporteth this otherwise.

CHAP.

Chap. v.

The art and manner of painting. The colours that painters use.

THus farre forth may suffice to bee spoken of the auncient dignitie of that art, which beginneth alreadie to decay and die. What were the colours also that the first painters used in old time, when they drew their portraicts with one simple colour, I have written alreadie in my Treatise of Mines and Minerals, where I discoursed likewise of painters colours. Touching those that named certaine kinds of pictures Monochromatea, as also who enriched them with more colours, who invented this or that for the bettering and perfecting of them, and at what time each of these additions accrewed thereto, I meane to reserve unto my catalogue of painters: for the order and consequence of my worke requireth, that I should first set downe the nature of every colour.

First and formost therefore this is to bee noted, That in processe of time the artificer who began with one bare colour, found out the difference himselfe betweene * light and shaddow, and devised by this distinction, to set up and debase the one and the other alternatively, and the same more or lesse, according to his severall intentions. After these lights and shaddows, there was invented a kind of lustre or glosse, different from the light aforesaid; which because it is of a meane nature betweene the shade and the light, and doth participat of them both, they called by a Greek word Tonos. As for the apt coherence of one colour with another, the joint as it were betweene, and the passage from one to another, they named it Harmoge.

*i. White and blacke.

Chap. vi.

Of Painters colours, Naturall and Artificiall.

ALl colours be either sad or lively; and those be so, either naturally, or by artificiall mixture. Lively or gay colours be such, as the [1] maister delivereth unto the painter by weight and measure. As namely, [2] Vermillion, [3] Verd d'Azur, [4] Sang dragon, [5] Verd-de terre or Borras, [6] Indico, and [7] Rosett. The rest be sad or duskish: and as well the one as the other, bee all either naturall or artificiall. Among the naturall of this sort (to wit, the sad colours) I reckon the [8] common bole Armin, [9] Ruddell or red-stone, [10] Paræ tonium, [11] Melinum, [12] Eretria, and [13] Orpin. The rest of this kind be artificiall, and principally those which I have alreadie spoken of in the treatise of Mines. Moreover, of the baser sort are burnt Ochre, and Ruddell, Cerusse or Spanish white, Sandix minerall, and Scyricum, Sandaracha, Vitrioll or blacke. As for Sinopis or common bole Armin, found out first it was at Sinope, a maritime towne in the kingdome of Pontus, whereof it tooke that name: it groweth also in Ægypt, the Baleare Islands, and Affricke: but the best is found in the Island Lemnos, and in Cappadocia, digged out of certaine holes and caves. That which stucke fast unto the rockes, excelleth all the rest. The peeces of this earth, if a man doe breake, shew the own naturall colour which is not mixt: without-forth they be spotted. And this earth in old time was used for to give a lustre unto other colours. Of this Sinopis or bole Armin common, there be three kinds, the deepe red, the pale or weake red, and the mean between both. The best Sinopis is esteemed worth * thirteene denarij Roman by the pound; this may serve the painters pensill, yea or in grosser worke, if a man list to colour posts, beames, or wood: as for that which commeth out of Affricke, it is worth eight Asses every pound; and this they call Cicereulum: that which is redder than the rest, serveth better for painting of Tablements: as for that which is most browne and duskish, called in Latine Pressior, it is of the same price that the other, and employed in the bases and feet of such Tablements. And thus much for the use in painting. Touching Physicke and the medicinable properties thereof, mild it is of nature, and in that regard of gentle operation, whether it enter into hard emplaistres of a drie composition, or into emollitive plastres that are more liquid, and principally such as are devised for ulcers in any moist part, as the mouth or fundament. This earth, if it bee injected by a clystre, stoppeth a laske: and being given to women in drinke to the weight of one denarius, a dram, it staieth their immoderat fluxes of the matrice. The same burnt or calcined, drieth up the fretting roughnes of the eyes, principally if it be applied with vinegre. This kind of red earth some would have to bee counted in a second degree of Rubrica for goodnesse, for they alwaies reckoned that of Lemnos to be the cheefe;

[1] Because they be rich and costly.
[2] *Minium.*
[3] *Armenium.*
[4] *Cinnabaris.*
[5] *Chrysocolla.*
[6] *Indicum.*
Lacca mixta cum cerulco.
[7] *Purpurissum.*
[8] *Sinopis.*
[9] *Rubrica.*
[10] A white kind of fattie earth like plastre.
[11] A white earth like chalke.
[12] A whitish earth or ash-colour white.
[13] *Auripigmentum.*
* Or rather three denarij, for otherwise there were no proportion betweene it and the other of that kind.

A chiefe and simply best, as comming next in price to Minium, *i.* Vermillon. And in truth, this Terra Sigillata or Lemnia, was highly accounted of in old time, like as the Island Lemnos from whence it commeth: neither was it lawfull to sell any of it before it was * marked or sealed, and thereupon they used to call it Sphragis. The painters ordinarily lay a ground of this under their vermillon, and sophisticat it many waies. In physicke it is holden to be a soveraigne thing: for if the eyes be annointed round about therewith in manner of a liniment, it represseth the flux of rheumaticke humors and doth mitigat the paines incident unto them: the fistulous sores likewise about the angles or corners of the eyes, it drieth up that they shall not run as they use to doe. Inwardly also it is commonly given in vinegre, to such as cast up bloud at the mouth. It is taken also in drinke, for the opilations and other accidents as well of the spleene as kidnies: and besides,

B to stop the excessive fluxes that be incident unto women. Singular it is against any poison or venomous sting of serpents, either upon land or sea; and therefore is a familiar ingredient into all antidots or countrepoisons. Of all other sorts of red earth, the ruddle of Ægypt and Affricke is fittest for carpenters; for if they strike their line upon timber with it, they shall bee sure that it will take colour and be marked verie well. Moreover, another sort there is of this red earth mineral, found with yron ore, and the same is good also for painters. There is a kind of ruddle also made of ochre burnt and calcined in new earthen pots well luted all over: and the greater fire that it meeteth withall in the furnace, the better it is. In generall, any ruddle whatsoever is exiccative, in which regard it agreeth well with salves and healing plastres, and is verie proper for to represse shingles & such cutanean wildfires that will stand in drops. Take of Sinopis or Bolearmin com-

C mon that commeth out of Pontus *halfe a pound, of bright Sil or ochre ten pound, of the Greek white earth Melinum two pound; pun them all togither, and mix them well, so as they may ferment twelve daies togither: and hereof is made Leucophorum, that is to say, a kind of gum or size to lay under goldfoile for to guild timber.

Touching the white earth Parætonium, it carieth the name of a place in Ægypt from whence it commeth: and many say, that it is nothing but the fome of the sea, incorporat and hardned togither with the slime and mud of the shore: and therefore there bee winkles and such shell-fishes found therwith. It is engendred also in the Island Candie, and the country of Cyrenæ. At Rome they have a devise to sophisticat it, namely by boiling fullers earth untill it be of a fast and massie consistence: the price of the best is after six deniers the pound. Of all white colours it is the fatti-

D est, & for that it runneth out smooth in the working, it is the fastest parget to overcast wals withall.

As for the earth Melinum, white it is likewise; but the best is that which the Isle Melos doth yeeld, whereupon it tooke that name. In Samos also it is to be found, but painters use it not, because it is over clammie and unctuous. The Islanders are woont to creepe on all foure and to lie along at their worke when they dig it forth of the rocks, for search it they must among the veins that run therein. The same * operation it hath in physicke that the earth Eretria: also, if a man touch it with the tongue, he shall find it astringent and drying: howbeit, a depilatorie it is in some sort, and fetcheth away haire, or else causeth it to grow thin. A pound of it is worth a Sesterce.

There is of white colours a third kind, and that is Cerussa or white lead, the reason and making whereof, I have shewed in my discourse of Minerals: and yet there was found of it in the nature

E of a verie earth by it selfe at Smyrna, within the land belonging to one *Theodotus*, wherewith in old time they used to colour & paint ships. But in these daies we have no other ceruse or Spanish white but that which is artificiall, made of lead and vinegre, in manner aforesaid. As touching ceruse burnt, the invention thereof came by meere chaunce, upon occasion of a skare fire happning in the harbour of Piræum, which caught the pots and boxes wherein the Athenian dames that dwelt by the said harbor kept their blaunch of ceruse for complexion: and this ceruse thus calcined, the first that used in picture was *Nicias*, of whome I have alreadie spoken. The best that we have in these daies commeth out of Asia, and for that it enclineth to a purple colour, they call it Purpurea: a pound of it is sold for 16 deniers Romane. This also is made in Rome, namely by calcining Sil or ochre minerall, which standeth much upon marble, and then quenching it with

F vinegre. Such use the painters make therof thus burnt, that no shadows will doe well without it.

Concerning Eretria, another kind of white earth, it taketh the name of the place from whence it commeth. *Nicomachus* & *Parasius* used this colour much. In physick, it is found to be cooling and emollitive. Being burnt or calcined, it is an excellent incarnative: singular good for to drie any sore: proper also to be applied to the forhead for the headach: like as, to discover any festring

* With the image of a goat, as *Dioscorides* saith: or of *Diana*, according to *Galen*.

Thus *Dalechampius* readeth this place, according to *Philander*, out of *Dioscor.* and *Theophrast.* * *Selibra*, others read *Sex libræ*.

* *i.* To staunch bloud.

or rankling matter that lieth ſecret within: for if a place be anointed therewith, when it is reduced G
into a liniment with water, in caſe it wax not drie, be ſure there is ſome ſuppuration underneath.

As touching Sandaracha and Ochra, K. *Iuba* writeth, that they are to be found in Tapazus, an Iſland within the red ſea; but that which we have, was never brought from thence. How Sandaracha is engendred, I have ſaid alreadie in the diſcourſe of Mines. There is an artificiall and ſophiſticat Sandaracha, made of ceruſſe burnt in a furnace. The colour of Sandaracha ought to be fierie like a flame: a pound thereof is bought for five aſſes, *i.* halfe a denier. Calcine this and Ruddle togither, and of both, being concorporat in equall quantitie, you ſhall have the colour called Sandyx. Howbeit, I doe obſerve in *Virgil* that he tooke Sandyx for an hearb, as may appeare by this verſe:

Sponte ſua Sandyx paſcentes veſtiet agros. H
A ruddie fleece ſhall Sandyx yeeld,
To lambs, as they doe graze in field.

This Sandyx to bee bought and ſold, carrieth but halfe the price of Sandaracha: neither bee there any colours more weightie than theſe in the ballance.

Among the artificiall and made colours, I reckon Scyticum, which as I have alreadie ſaid, ſerveth for a good ground to take vermillon. The manner of making it, is to mix the beſt ruddle Sinopis and this Sandyx togither.

Painters blacke [called in Latine Atramentum] I count an artificiall colour, although I know there is a vitrioll or coperoſe going under that name, which is minerall, and is engendred two manner of waies: for either it iſſueth and ooſeth out of the mine in manner of a ſalt humor or liquor; or els there groweth an earth it ſelfe of a brimſtone colour, which ſerveth for it, that it may be drawne out thereof. Some painters have been knowne, who for to get black, have ſearched into ſepulchres for the coles there, among the reliques and aſhes of the dead. But in mine opinion, all theſe be but new deviſes, and fooliſh irregular toies without any reaſon: for a man need ſeeke no farther but to ſoot, and that made many waies, by burning either of roſin or pitch: in which regard, many have built places and forges of purpoſe to burne them in; without any emiſſaries, tunnels, or holes, that the ſaid ſmoke or ſoot may not get forth. But the beſt black in that manner made, commeth of the ſmoke of torchwood. This fine ſoot is ſophiſticat with the groſſe ſoot that doth gather and engender in forges, furnaces, and ſtouphs: and this is that inke wherewith we uſe to write our books. Some there be who take the lees or dregs of wine, and when it is dried, boile it throughly: and they affirme, that if the wine were good whereof thoſe lees came, the ſaid inke or black will make a colour like Indico. And in truth, *Polygnotus* and *Mycon* (two as renowmed painters as ever were) uſed no other blacke at all, but that which they made of the marre or refuſe of grapes after they be preſſed, & this they call Tryginon. *Apelles* deviſed a way by himſelfe, to make it of yvorie or the elephants tooth burnt, and this they named therupon Elephantinum. As touching the blacke called Indicum, it is brought out of India: but as yet I know not the manner either of the making or the engendring of it. A kind thereof I ſee the diers doe make, of that black flotey which ſticketh to their coppers. Alſo, there is a black made of torchwood burnt, and the coles that come of it punned to powder in a mortar. And heere commeth to my mind the wonderfull nature of the Cuttle fiſhes, which do yeeld a black humor from them like unto inke: howbeit, I do not find that painters or writers make any uſe thereof. But all blackes whatſoever take their perfection by ſunning: if it bee writing inke, with gum (Arabick;) if to colour pargetting or walls, with glew among: and looke what blacke is diſſolved and liquefied in vinegre, the ſame will hold well & hardly be waſhed off. And thus much of the ordinarie colours low prized.

Of all the colours beſides, which (as I ſaid once before) for their high price the poore painters be ſerved with from their maſters hands who ſet them on worke, the rich roſet or purple red that is made of Tripolie or goldſmiths earth, is ſimply the beſt: for this Tripolie is commonly died togither with purples; and no ſilke, wooll, or cloth, will ſo ſoone take that tincture, as it. The principall is that, which having had the floure of a fatt, hath drunk the fill as it were, whiles the liquor is yet boiling, and the drugs within the caudron be in their verdure and have not loſt the heart. M
When this firſt Tripolie thus deeply died, is caſt up and taken forth, that which is put in next into the ſaid liquor, is counted the ſecond in goodneſſe; and ſo conſequently by degrees: for the former evermore taketh the higher die, and the oftener you dip therein, the weaker will the tincture be: which is the reaſon that the roſet or purple red of Puteoli, is more commended, than either

A the Tyrian, Gætulian, or Lacedæmonian, notwithſtanding from thence ther come the moſt rich and pretious purples. The reaſon is, becauſe the Tripoli in Puteoli is died moſt with the juice of the Magaleb berries among, which yeeldeth the gallant red; and beſides, is forced to drink the tincture of Madder. That roſet which is made at Canuſium, is the worſt of all other, and carieth the loweſt price: a pound of roſet coſteth ordinarily * 30 deniers Roman. Painters or complexioners, when they would counterfeit a luſtre or gloſſe of vermillon, lay a ground firſt with Sandyx, and then charge roſet upon it with the white of an egg: but if they be deſirous to make a purple colour, the firſt courſe or ground is azur, and ſtraightwaies they come upon it with* roſet and the white of an egg aboveſaid. After this rich and lively roſat or purple-red, Indico is a colour moſt eſteemed: out of India it commeth; whereupon it tooke the name: and it is nothing els * but a

B ſlimie mud cleaving to the foame that gathereth about canes and reeds: whiles it is punned or ground, it looketh blacke; but being diſſolved, it yeeldeth a woonderfull lovely mixture of purple and azur. There is a ſecond ſort of it found ſwimming upon the coppers or vats in purple diers worke-houſes; and in truth, nothing els but the verie ſome or ſcum that the purple caſteth up as it boileth, in manner of a florey. Some there be that doe counterfeit and ſophiſticat Indico, ſelling in ſtead thereof pigeons dung, Selinuſian earth, or Tripoli, died and deeply coloured with the true Indico: but the proofe thereof is by fire; for caſt the right Indico upon live coles, it yeeldeth a flame of moſt excellent purple, and while it ſmoketh, the fume ſenteth of the ſea; which is the reaſon that ſome doe imagine it is gathered out of the rocks ſtanding in the ſea. Indico is valued at 20 denarij the pound. In phyſicke there is uſe of this Indico; for it doth aſſuage ſwellings

C that doe ſtretch the skin: it repreſſeth violent rheums and inflammations, and drieth ulcers.

The land of Armenia doth furniſh us with the colour of Verd d'azur, and of that countrey it is named Armenicus: a ſtone it is that is likewiſe died before it can die, in manner of Borras or verd de terre: the beſt is the greeneſt, & yet withall it doth participat the colour of azur; in which regard, it may properly be called verd d'azur. In times paſt a pound of it was held at 300 ſeſterces: but ſince time that there was found in Spaine a kind of ſand that would take the like tincture and doe as well, the price hath been well abated, and is come downe to ſix deniers. All the difference betweene this colour & azur, is this, For that it ſtandeth more upon the white, which cauſeth this colour to be lighter and and weaker. The only uſe that it hath in phyſicke, is to nouriſh hairs, and eſpecially thoſe of the eielids. Over and beſides all theſe colours abovenamed, there be two more

D newly come up, and thoſe beare but a verie low price; to wit, the green called Appianum, and oftentimes it is taken for Borras or verd de terre, as if there were not other things enough that did counterfeit and reſemble it: made it is of a certaine green chaulkie earth; and is worth but everie pound a ſeſterce. The ſecond new colour is a white, called Anulare, & it is that which in womens pictures giveth a lightſome carnation white: this alſo is made of a kind of chaulk, & certain glaſſie gems or bugles which the common fort uſe to weare in rings, & therupon it is called Anulare.

* *In ſingulas libras ad denarios triginta.*

* our painters in ſtead thereof uſe *Lac.*

* They ſay it is made of Oad: and in thoſe countries frō whēce it commeth, Gali of Nil.

Chap. vii.

What colours refuſe to be laid upon ſome grounds: with what colours they painted in old time: and when the fight of Sword-fencers were firſt propoſed to be ſeen at Rome.

E

OF all colours, Roſet, Indico, Azur, Tripoli or Melinum, Orpiment, white Lead or Ceruſſe; love not to be laid upon plaſtre-worke, or any ground, while it is moiſt: & yet wax will take any of theſe colours aboveſaid, to be emploied in thoſe kind of workes which are wrought by fire (ſo it be not upon plaſtre, parget, and wals, for that is impoſſible) whether they be enameld or damaskd; yea and in their painting of ſhips at ſea, as well hulks and hoies of burden, as gallies and ſhips of war: for now are we come (forſooth) to enamell & paint thoſe things that are in danger to periſh and be caſt away everie houre; ſo as we need not marveile any longer, that the coffin going with a dead corps to a funerall fire, is richly painted: and we take a delight when we mind to fight at ſea, to ſaile with our fleet gallantly dight & enriched with colours, which muſt cary us into

F daungers, either to our owne death, or els to the carnage of others. And when I conſider ſo many colours, and thoſe ſo variable, as be now adaies in uſe, I muſt needs enter into the admiration of thoſe artificers in old time; and namely, of *Apelles*, *Echion*, *Melanthius*, and *Nicomachus*, moſt excellent painters, and whoſe tables were ſold for as much apeece, as a good town was worth; & yet none of theſe uſed above four colors in all thoſe rich & durable works: And what might thoſe be?

Of all whites, they had the white Tripoli of Melos: for yellow ochres, they tooke that of Athens: G
for reds, they ſought no farther than to the red ochre or Sinopie ruddle in Pontus: & their black
was no other than ordinarie vitrioll or ſhoemakers blacke. And now adaies when wee have ſuch
plentie of purples that the very wals of our houſes pe painted all over therewith, when there com-
meth from India ſtore enough not onely of Indico, which the mud of their rivers doth yeeld, but
alſo of cinnambre, which is the mixed bloud of their fell dragons and mightie elephants, yet a-
mong all our moderne pictures we cannot ſhew one faire peece of worke: inſomuch as we may
conclude, All things were done better then, notwithſtanding the ſcarſitie that was of ſtuffe and
matter. But to ſay a truth, the reaſon is, Given we are now (as I have oftentimes ſaid) to eſteeme
of things that be rich and coſtly, never regarding the art that is emploied about them. And here
I thinke it not amiſſe to ſet downe the outrageous exceſſe of this age, as touching pictures: *Nero* H
the Emperour commaunded, that the pourtraict of himſelfe ſhould bee painted in linnen cloth,
after the manner of a gyantlike coloſſe, 120 foot high; a thing that never had been heard or
ſeene before. But ſee what became of it? when this monſtrous picture (which was drawne and
made in the garden of *Marius*) was done and finiſhed, the lightning and fire from heaven caught
it, and not onely conſumed it, but alſo burnt withall the beſt part of the building about the gar-
den. A ſlave of his enfranchiſing (as it is well knowne) when he was to exhibit at Antium certain
ſolemnities, and namely a ſpectacle of ſword-fencers fighting at ſharpe, cauſed all the ſcaffolds,
publicke galleries, and walking-places of that cittie, to be hung and tapiſſed with painted cloths,
wherein were repreſented the lively pictures of the ſword-plaiers themſelves, togither with all the
wifflers and ſervitors to them belonging. But to conclude, the beſt men and moſt magnanimous I
that for many a hundred yeers our countrey hath bred, have taken delight (I muſt needs ſay) in
this art, and ſet their minds upon good pictures. But to pourtraie in imagerie tables, and pain-
ted cloth, the publicke ſhews of fencers and ſword-players, and to ſet them up to be ſeen in open
place to the view of the world, began by *C. Terentius* a Lucan: for this man, to doe honour unto
his grandfather who had made him his owne ſonne by adoption, exhibited a ſhew for three daies
togither of thirtie paire of ſuch fencers fighting with unrebated ſwords: and a faire painted ta-
ble which carried the lively reſemblance of this ſpectacle, he ſet up and dedicated within the ſa-
cred grove of *Diana*.

Chap. VIII. K

This argumét or title reacheth to many chapters following.

The antiquitie of Painting, and the ſeverall ages wherein the famous Painters lived. A ſurvey of excellent Pictures, and the artificers that made them, togither with the prices that their workmanſhip was valued at: and notable pictures to the number of 305.

NOw will I after a curſorie ſort, run through all the famous profeſſours and artizans in this kind, and that with as great brevitie as poſſibly I can; for the ſcope that I have propoſed to my ſelfe, tendeth rather another way: and therefore let not the reader thinke much if I doe but touch the names of ſome, as it were paſſing by, and by occaſion of others whoſe cata- L
logue I meane to deliver. Howbeit, in making this haſt, my purpoſe is not to omit any excellent peece of worke which is worth the remembrance and relation, whether the ſame be extant at this day, or loſt and periſhed. Where I muſt advertiſe the readers, that in this argument my mea-
ning is not to ſtand much upon the authoritie of Greeke writers, who indeed deliver no certi-
tude, nor agree in their records as touching this point (notwithſtanding that they would ſeeme
diligent in that behalfe) and namely, in that they have written, That the excellent painters flouri-
ſhed ſo many Olympiads after the famous Imageurs; and have nominated for the firſt & chiefe
to have lived in name, about the time of the 90 Olympiad: whereas this is for certaine reported,
that *Phidias* himſelfe was a painter at the beginning, and that the noble ſhield of *Minerva* in A-
thens was by him painted: beſides, this is confeſſed and reſolved upon for a truth, that *Panæus* his M
brother lived in the 83 Olympias, and painted the inſide of the ſaid ſhield; who alſo in another
ſcutcheon of *Minerva*, which *Colores* the apprentice of *Phidias* had made; as alſo in making the
ſtatue of *Iupiter Olympius*, wrought with the ſaid *Colores* and helped him. But what ſhould I dwell
long in this matter? Is there any doubt made, that *Candaules* K. of Lydia, the laſt of the race and

familie

familie of the *Heraclidæ*, who also was commonly called *Myrsilus*, bought the painted table which contained the battaile of the Magnetes, and paid for it unto *Bularchus* (the painter or workman thereof) as much gold as it came to in weight. See of what price and estimation pictures were even in those daies! And needs it must be that this happened about that age wherein K. *Romulus* lived: for the said K. *Candaules* died in the 18 Olympias; or as some write, in that verie yeere that *Romulus* departed this life: at what time this skill of painting (if I be not much deceived) was in great request everie where, and growne alreadie to an absolute perfection. Which being graunted, as of necessitie it cannot be denied, evident and apparent it is, that the originall and beginning of this art, was much more auncient: and that those painters who used one colour and no more in their plain draughts called Monocromata, (to wit, *Hygiænon*, *Dinias*, and *Charmas*) lived a good while before, although it be not recorded in any writer in what age precisely they flourished: as also that *Eumarus* the Athenian painter, who devised first to distinguish male & female in painting; and besides, undertooke to draw with his pencill the proportion and shape of any thing that he saw; togither with *Cimon* the Cleonæan, who followed his steps, and practised his inventions, could not chuse but by all congruitie and consequence bee of more antiquitie than *Bularchus* aforesaid, or the reigne of *Romulus* and *Candaules*. This *Cimon* devised the works called Catagrapha, that is to say, pourtraicts and images standing byas and sidelong: the sundrie habits also of the visage and cast of the eye, making them to looke, some backeward over their shoulders, others aloft, and some againe downeward: his cunning it was to shew in a picture, the knitting of the members in everie joynt: to make the veines appeare how they braunched and spread: and besides, the first he was that counterfeited in flat pictures, the plaits, folds, wrinkles, and hollow lappets of a garment. As touching *Phanæus* the brother of *Phidias*, hee painted also the battaile betweene the Athenians and the Persians, upon the plains of Marathon: for now by this time were painters furnished in some sort with colours to their purpose; and the art was growne to such perfection, that in the picture resembling the said battaile, the full personages were pourtraied most lively, of the captains on both sides, to wit, *Miltiades*, *Callimachus*, and *Cynegyrus*, for the Athenians; *Datis* also and *Artaphenes*, for the Barbarians or Persians.

Chap. IX.

The Painters that first entred into contention for to win the prize by their Art: and who devised to paint with the pencill.

Moreover, during the time that the above-named *Panæus* flourished, there were prises proposed at Corinth and Delphos, for those painters that could win them: and the first that strived for the best game, was the said *Panæus*, who challenged *Timagoras* the Chalcidian upon this occasion, That the same *Timagoras* had given him the foil before at the Pythian games: which also doth appeare by certain verses composed by *Timagoras* himselfe as touching that argument, which savour of great antiquitie. Whereby the errour of Chronielers beforesaid is manifestly convinced, who have failed much in the calculation of the times. Furthermore, besides these painters above rehearsed, others there were of great name, and yet all of them before that nintith Olympiad whereof they write; as namely, *Polygnotus* the Thasian, who was the first that painted women in gay and light apparell, with their hoods and other head attire of sundrie colours: and in one word, passed all others before him in devises, for the bettering of this art. His invention it was to paint images with their mouths open, to make them shew their teeth; and in one word, represented much varietie of countenance, farre different from the rigorous and heavie looke of the visage beforetime. Of this *Polygnotus* workmanship, is that picture in a table which now standeth in the stately gallerie of *Pompeius*, and hung sometime before the Curia or Hall that beareth his name, in which table he painted one upon a scaling ladder, with a targuet in his hand; but so artificially it is done and with such dexteritie, that whosoever looketh upon him, cannot tell whether he is climbing up or comming downe. All the painting of *Apollo* his temple at Delphos, was of this mans doing: who also beautified with pictures, the great gallerie or walking place at Athens, which thereupon was called Pœcile: and this he did *gratis*, & would not take one penie for it: whereas *Mycon* afore him, painted one part thereof, and was well paid for his workemanship: which liberall mind of his, wan him the greater credit and honour besides: for by a decree from the Amphyctions (who are the lords of the publicke counsell of state

in Greece) it was granted, that in all cities and towns of Greece whereſoever he came, he ſhould G
be lodged and entertained of free-coſt. Beſides that *Mycon* before mentioned, there was another of the name, diſtinguiſhed onely by this, That the former was called *Mycon* the elder, and this, *Mycon* the younger, who had a daughter named *Timarete*, and ſhee could paint likewiſe excellently. But to come now unto that nintith Olympias, there flouriſhed in that time *Aglaophon*, *Cephiſſodorus*, *Phrylus*, and *Euenor* who was both father and maſter unto *Paraſius* that moſt renowmed painter, of whome I purpoſe to ſpeake in his ranke when the time comes; all theſe were reputed verie good artizans in their time, howbeit not ſo excellent that I ſhould need ſtand long upon them or their workemanſhip, making haſt as I doe unto thoſe glorious and glittering painters indeed, who ſhine as bright ſtars above all their fellows: among whome, *Apollodorus* the Athenian was the firſt that gave light, and hee lived in the 93 Olympias: This man led the way to H
others, and taught them to expreſſe the favour and beautie of any thing, which he obſerved eſpecially: of whome I may well and truly ſay, that he and none before him brought the pencill into a glorious name and eſpeciall credit. Of his making there is one picture, of a prieſt at his devotions, praying and worſhipping: as alſo another repreſenting *Ajax*, all on a flaming fire with a flaſh of lightning, which at this day is to bee ſeene at Pergamus, as an excellent peece of worke. And verely before his dais there cannot be ſhewed a table of any ones painting worth the ſight, and which a man would take pleaſure to behold and looke upon any long time.

When this man had opened the dore once, and ſhewed the way to this art, *Zeuxis* of Heraclea entred in, and that was in the fourth yeere of the 95 * Olympias: and now that the pencill I
was taken in hand (for now I ſpeake thereof) hee ſeeing that it made good worke, followed on therewith, and by continuall practiſe brought the ſame to great perfection, wherby he wan much credit to the art, and reputation to himſelfe. Some writers there be, who raunge him wrong in the 89 Olympias; at which time it muſt needs bee, that *Demophilus* the Himeræan and *Neſeas* the Thracian lived; for to one of them apprentice hee was, but whether of the two was his maſter, there is ſome doubt made: and verely ſo excellent hee prooved in his art, that the abovenamed *Apollodorus* made verſes of him: in which he ſignifieth, that *Zeuxes* had ſtolne the cunning from them all, and he alone went away with the art. He grew in proceſſe of time to ſuch wealth by the means onely of his excellent hand, that for to make ſhew how rich he was, when hee went to the ſolemnitie of the games at Olympia, he cauſed his owne name to be embrodered in golden letters, within the lozenge-worke of his clokes, whereof hee had chaunge, and which hee brought K
thither to be ſeene. In the end, hee reſolved with himſelfe to worke no longer for money, but to give away all his pictures, ſaying, That he valued them above any price. Thus he beſtowed upon the Agrigentines, one picture of queene *Alcmena*: and to king *Archelaus* hee gave another of the ruſticall god *Pan*: there was alſo the pourtraict of ladie *Penelope*, which he drew in colours; wherein hee ſeemeth not onely to have depainted the outward perſonage and feature of the bodie, but alſo to have expreſſed moſt lively the inward affections and qualities of her mind: and much ſpeech there is of a wreſtler or champion of his peinting, in which picture he pleaſed himſelfe ſo well, that hee ſubſcribed this verſe under it, * *Inviſurus aliquis facilius quam imitaturus: i.* Sooner will a man envie me, than ſet ſuch another by me. Which thereupon grew to be a by-word in everie mans mouth. One ſtately picture there is of his workemanſhip, *Iupiter* ſitting upon a throne in his majeſtie, with all the other gods ſtanding by and making court unto him. Hee pourtraied *Hercules* alſo as a babe lying in the cradle, and ſtrangling two fell ſerpents with his hand, togither with his mother *Alcmena*, and her husband K. *Amphytrion* in place, affrighted both at the ſight thereof. Howbeit, this *Zeuxis* as excellent a painter as he was, is noted for one fault and imperfection; namely, that the head and joynts of his pourtraicts, were in proportion to the reſt ſomewhat with the biggeſt: for otherwiſe ſo curious and exquiſit he was, that when hee ſhould make a table with a picture for the Agrigentines, to be ſet up in the temple of *Iuno Lacinia*, at the charges of the citie, according to a vow that they had made, hee would needs ſee all the maidens of the citie, naked; and from all that companie hee choſe five of the faireſt to take out as from ſeverall patterns, whatſoever hee liked beſt in any of them; and of all the lovely parts of M
thoſe five, to make one bodie of incomparable beautie. Many draughts he made of one colour, in white. There lived in his time *Timanthes*, *Androcydes*, *Eupompus*, and *Paraſius*, who were his concurrents and thought as well of themſelves as he did.

* For *Olympias* was counted the ſpace of five yeers.

* *Græcè melius,* μιμήσεται τίς μᾶλλον, ἢ μιμήσεται: which Iambick verſe ſome attribute to *Apollodorus.*

CHAP.

A

Chap. x.

Of birds deceived by pictures. What is the hardeſt point in the art of painting?

Of thoſe foure beforenamed, *Paraſius* by report was ſo bold as to challenge *Zeuxis* openly and to enter the liſts with him for the victorie: in which contention and triall, *Zeuxis* for proofe of his cunning, brought upon the ſcaffold a table, wherein were cluſtres of grapes ſo lively painted, that the very birds of the aire flew flocking thither for to bee pecking at the grapes. *Paraſius* againe for his part to ſhew his workmanſhip, came with another picture, where-
B in he had painted a linnen ſheet, ſo like unto a ſheet indeed, that *Zeuxis* in a glorious bravery and pride of his heart, becauſe the birds had approoved of his handyworke, came unto *Paraſius* with theſe words by way of a ſcorne and frumpe, Come on ſir, away with your ſheet once, that we may ſee your goodly picture: But taking himſelfe with the manner, and perceiving his owne error, hee was mightily abaſhed, & like an honeſt minded man yeelded the victory unto his adverſary, ſaying withall, *Zeuxis* hath beguiled poore birds, but *Parrhaſius* hath deceived *Zeuxis*, a profeſſed artiſane. This *Zeuxis*, as it is reported, painted afterwards another table, wherein hee had made a boy carying certaine bunches of grapes in a flasket, and ſeeing againe that the birds flew to the grapes, he ſhooke the head, and comming to his picture, with the like ingenuous mind as before, brake out into theſe words, and ſayd, Ah, I ſee well ynough where I have failed, I have painted the
C grapes better than the boy, for if I had done him as naturally, the birds would have beene afraid and never approched the grapes. He pourtraied alſo diverſe peeces of earthen veſſels in potterie, which onely were left behind in Ambracia, at what time as *Fulvius* ſurnamed *Nobilior*, remooved the Muſes from thence of his pourtraying, and brought them to Rome. Moreover, there remaineth yet at Rome within the galleries of *Philippus*, the picture of *Helena*, wrought by the hand of *Zeuxis*: and in the temple of *Concord* another, reſembling *Marſyas* the Muſician bound to a tree.

As for *Paraſius* beforenamed, borne he was at Epheſus, and invented alſo diverſe things of himſelfe to the advancement of this art: for the firſt he was that gave the true ſymmetrie to a portraiture, and obſerved the juſt proportions: hee firſt exactly kept the ſundrie habits and geſtures
D of the countenance: hee it was, that firſt ſtood upon the curious workmanſhip of couching and laying the haires of the head in order: the lovely grace and beautie about the mouth and lips, he firſt exactly expreſſed: and by the confeſſion of all painters that ſaw his worke, hee woon the priſe and praiſe from them all in making up the pourfils and extenuities of his lineaments, which is the principall point and hardeſt matter belonging to the whole art: For to draw forth the bodily proportion of things, to hach alſo, yea and to fill within, requireth (I confeſſe) much labour and good workemanſhip; but many have been excellent in that behalfe: marie to pourfill well, that is to ſay, to make the extremities of any part, to marke duly the deviſions of parcels, and to give every one their juſt compaſſe and meaſure, is exceeding difficult, and few when they come to the
E doing of it, have beene found to attaine unto that felicitie. For the utmoſt edge of a worke muſt fall round upon it ſelfe, and ſo knit up in the end, as if it ſhaddowed ſomwhat behind, and yet ſhewed that which it ſeemeth to hide. In this ſo curious and inexplicable a point, *Antigonus* and *Xenocrates* both, who wrote as touching this art, have given him the honour of the beſt: not onely confeſſing his ſingular gift herein, but alſo commending him for it. Many other plots and projects there doe remaine of his drawing, pourtraied as well in tables as upon parchment, which ſerve as patternes (they ſay) for painters to learne much cunning by. And yet for inward workes, and to expreſſe the middle parts of a pourtraiture, he ſeemeth not ſo perfect, nor anſwereable to himſelfe otherwiſe. There is a notable picture of his making, which he called **Demon Athenienſium*, that is to ſay, the common people of the Athenians: the deviſe whereof was paſſing full of wit and very inventive: for his intention was in one and the ſame pourtraict, and under one ob-
F ject of the eye to expreſſe the nature of the people, variable, wrathfull, unjuſt, and unconſtant; the ſame alſo he would have to appeare exorable, mild, and pitifull; haughtie, glorious & proud, and yet humble, lowly, and ſubmiſſe; fierce and furious, and the ſame coward, and ready to runne away: all theſe properties, I ſay, he repreſented under one caſt of the eye. This workman painted alſo *Theſeus*, which ſtood ſometimes in the Capitoll of Rome: a certaine Admirall likewiſe of a navie,

* τὸν δῆμον.

navie, armed with a corselet. In one table also which is at Rhodes, he depainted *Meleager*, *Hercules*, and *Perseus*. This table was thrice blasted with lightening; howbeit, the pictures were not defaced, but remained whole and entire as at the first: a miraculous thing, and that which maketh much for the credit of the picture. *Archigallus* was of his painting; a picture that *Tiberius* the Emperour tooke great pleasure in; and as *Eculeo* mine author doth testifie, he esteemed it worth sixtie thousand sesterces, and enclosed it within his bed-chamber. Moreover, hee counterfeited one *Cressa* a nource, with her infant in her armes: he pourtraied *Philiscus*, and god *Bacchus*, with the goddesse *Vertue* standing by him: also two boyes; on whom a man might see most lively resembled, the carelesnesse and simplicitie of that age: likewise, a priest, attended upon with a prettie boy, holding a censar in his hand, and a coronet. Over and besides, two pictures there be of his handiworke, going under the name of *Hoplitides*, *i.* armed: the one running in his armour in battaile-wise, so as hee seemeth all in a sweat: the other disarming himselfe, all wearied, so as a man would thinke his wind were gone, or that hee drew it very short. Great praise there is of one table of his, wherein are painted, *Aeneas*, *Castor*, and *Pollux*: also of another, which contained *Telephus*, *Achilles*, *Agamemnon*, and *Ulysses*. An artisane full of worke, and who evermore would bee doing one thing or other; but so arrogant withall, as no man ever shewed more insolencie than he, in regard that he was cunning and well thought of: which hee knew well ynough, and no man needed to tell him. In this prowd spirit of his, hee would take upon him divers titles and additions to his name: among others, he would call himselfe* *Abrodiætus*: and other words he used, whereby he would make himselfe knowne that he was the prince of Painters, and the art by him made perfect and accomplished. But it exceedeth how vaine-glorious he shewed himselfe, in that he gave out, he was in right line descended from *Apollo*: also that the pourtrait of *Hercules*, which is in a table at Lindos, he drew from the very person of *Hercules* himselfe, answerable in all points to the proportion and lineaments of his bodie; who (by his saying) had appeared unto him oftentimes in his sleepe of purpose, that he might paint him lively as he was. In this veine of vanitie, beeing upon a time put downe by *Timanthes* the painter at Samos, where, by the judgement of all that were present, his picture representing *Ajax*, and the awarding of the armor of *Achilles* from him to *Ulyxes*, was not thought comparable to another of *Timanthes* his making: I am ill apaied (quoth he) and sorie at the heart, for this noble knight and brave warrior *Ajax*, whose evill hap it is thus to be foiled once againe by so unworthie a wight, and a farre meaner person than himselfe. Hee delighted also to paint small pictures in pretie tables, and those representing wantonnesse & letcherie: and this he did (as he was wont to say) for his recreation, and as it were to breath himselfe when he had laboured hard at greater workes.

*That is to say, fine, delicat, & sumptuous: for he would be in his purple, or his goldé chaplets, his staffe tipt with gold, and his shoe-buckles of the same.

As for *Timanthes*, an excellent fine wit he had of his own, & full he was of rare inventions. He it was that made the famous picture of *Iphigenia*, so highly commended by eloquent Orators. And to say a truth, his conceit therein was admirable: for when he had devised that the poor innocent ladie should stand hard at the altar readie to be slain for sacrifice, and had painted those that were present about her, with heavie and sad countenance, weeping and wailing all for the instant death of this young princesse, and her unckle *Menelaus* above the rest, full of sorrow and lamentation, and shewing the same as much as possibly might bee: having by this time spent in them all the signes that might testifie the hearts greefe, and that he was come to pourtray her own father *Agamemnon*, hee represented his visage covered with a vaile, for that hee was not able to expresse sufficiently the extraordinarie sorrow above the rest which he had to see his owne daughter sacrificed, and her guiltlesse bloud spilt. Other peeces of worke there be, patternes all of singular wit: among the rest, he devised within a very small table, a Cyclops lying asleepe: and yet because hee would seeme even in that little compasse to shew his giant-like bignesse, hee devised withall to paint little elvish Satyres hard by, and those taking measure of one of his thumbs with long perches. In summe, so inventive he was, that in the works which passed through his hands, a man shall ever conceive & understand some hidden thing within more than is painted without: for albeit a man shall see in his pictures as much art as may be, yet his wit went alwaies beyond his art. Moreover, his picture of a prince was thought to bee most absolute; the majestie whereof is such, that all the art of painting a man, seemeth to be comprised in that one pourtrait. This peece of worke remaineth at this day within the temple of *Peace* in Rome.

In this age flourished *Euxenidas*, and taught *Aristides* his cunning, who proved afterwards a singular workman. *Eupompus* also trained up *Pamphilus* the painter under him, whose apprentise

was

A was *Apelles*. There is a fine picture of *Eupompus* his making, to wit, one who had obtained the victorie at the publicke Gymnicke exercises of activitie, painted naked as hee performed his devoire, holding in his hand the braunch of a Date tree. This *Eupompus* was of such authority, that whereas before his time there were but two kinds of Pictures, to wit, Helladicum, *i.* the Greekish; and Asiaticum, *i.* Asiaticke, he brought in a new devision, and made three distinct members thereof: for in love of him, because he was a Sicyonian born, the foresaid Helladicum being parted in twaine, there arose these three severall sorts, the Ionicke, Sicyonian, and the Atticke.

As for *Pamphilus*, renowned he was for painting a confraternitie or kinred: the battell fought before Phlius, and the victorie of the Athenians: semblably, of his making is the picture of *Vlixes* in a punt or small bottome. Himselfe was a Macedonian borne, but of all painters, the first
B that gave his mind to other good literature, and especially to Arithmetick and Geometrie: without the insight of which two Sciences, hee was of opinion, that unpossible it was to bee a perfect painter. He taught none his cunning under a *talent of silver for tenne yeares together: and thus much paied *Apelles* and *Melanthus* unto him, for to learn his art. His authority brought to passe, that ordained it was first at Sicyone, and so consequently throughout all Greece, that gentlemens sonnes and free borne should goe to painting schoole, and there bee taught first above all other things the art Diagraphice, that is to say, the skill to draw and paint in box tables: and for the credit of painters, he brought to passe, that the art should be raunged in the first degree of liberall Sciences. And verely, this craft of painting hath been alwaies of that good respect and so honoured, that none but gentlemen and free borne at the first beginning medled therwith, yea, and
C afterwards honourable personages gave themselves to the practise therof, with this charge, from time to time, To teach no slave the mysterie of painting, who by a strict and perpetuall edict were excluded from the benefit thereof. Neither shall you ever heare of any peece either of picture or graverie and embossing that came out of a servile hand.

*Minoris talento annis decem: yet *Budæus* readeth, *annuis talentis decē*, *i.* ten talents by the yeare.

Furthermore, about the hundred and seventh Olympias, there flourished *Echion* and *Therimachus*, two renowmed painters: As for *Echion*, ennobled he is for these pictures, god *Bacchus*, a Tragœdie & a Comœdie, represented by painting; also *Semiramis*, who of a bond-maiden came to be a queene; an auncient woman carrying a torch or lampe going before a yong wife new wedded, and leading her to the bride bed, who followeth with a modest, shamefast, and bashfull countenance, most apparent to the eye.

D But what should I speake of these painters, when as *Apelles* surmounted all that either were before or came after. This *Apelles* flourished about the hundred and twelfth Olympias, by which time hee became so consummat and accomplished in the art, that hee alone did illustrat and enrich it as much, if not more, than all his predecessours besides: who compiled also divers books, wherein the rules and principles, yea, and the very secrets of the art are comprised. The speciall gift that he had, was this, that he was able to give his pictures a certaine lovely grace inimitable: and yet there were in his time most famous and worthie painters whome hee advaunced, whose workes when he beheld, hee would praise them all, howbeit, not without a but: for his ordinarie phrase was this: Here is an excellent picture, but that it wanteth one thing, and that is the *Venus* which it should have: which *Venus* the Greekes call *Charis*, as one would say, the grace: And in
E truth, hee would confesse, that other mens pictures had all things els that they should have, this onely excepted; wherein he was persuaded, that he had not his peere or second. Moreover, he attributed unto himselfe another propertie, wherein hee gloried not a little, and that was this, that hee could see to make an end when a thing was well done. For beholding wistly upon a time a peece of worke of *Protogenes* his doing, wherein hee saw there was infinit paines taken, admiring also the exceeding curiositie of the man in each point beyond all measure, hee confessed & said, That *Protogenes* in every thing els had done as well as himselfe could have done, yea, and better too. But in one thing he surpassed *Protogenes*, for that he could not skill of laying worke out of his hand, when it was finished well ynough: a memorable admonition, teaching us all, That double diligence and overmuch curiositie, doth hurt otherwhiles. This painter was not more renowmed
F for his skill and excellencie in art, than he was commended for his simplicitie and singlenesse of heart: for as he gave place to *Amphion* in disposition, so he yeelded to *Asclepiodorus* in measures and proportion, that is to say, in the just knowledge how farre distant one thing ought to be from another. And to this purpose, impertinent it is not to report a pretie occurrent that fell between *Protogenes* and him: for being very desirous to be acquainted with *Protogenes*, a man whom hee had

had never ſeene, and of his workes, whereof there went ſo great a name, he embarked and ſailed G
to Rhodes, where *Protogenes* dwelt: and no ſooner was he landed, but he enquired where his ſhop
was, and foorthwith went directly thither: *Protogenes* himſelfe was not at home, onely there was
an old woman in the houſe who had the keeping of a mightie large table ſet in a frame, and fitted
readie for a picture. And when hee enquired for *Protogenes*, ſhee made anſwere, that hee was not
within; and ſeeing him therupon readie to depart, demaunded what his name was, and who ſhe
ſhould tell her maiſter asked for him. *Apelles* then, ſeeing the foreſaid table ſtanding before him,
tooke a penſill in hand and drew in colour a paſſing fine and ſmall line through the ſaid table, ſay-
ing to the woman, Tell thy maiſter, that he who made this line, enquired for him, and ſo he went
his waies. Now when *Protogenes* was returned home, the old woman made relation unto him of
this that happened in his abſence. And, as it is reported, the artificer had no ſooner ſeene and be- H
held the draught of this ſmall line, but he knew who had beene there, and ſaid withall, Surely *A-*
pelles is come to towne: for unpoſſible it is, that any but hee ſhould make in colour ſo fine worke-
manſhip. With that he takes me the penſill, and with another colour drew within the ſame line a
ſmaller than it: willing the woman when he went foorth of dores, that if the partie came againe,
ſhe ſhould ſhew him what he had done, and ſay withall, that there was the man whom hee enqui-
red after. And ſo it fell out indeed, for *Apelles* made an errand againe to the ſhop, and ſeeing the
ſecond line, was diſmaied at firſt and bluſhed withall to ſee himſelfe thus overcome: but taking
his penſill, cut the foreſaid lines throughout the length, with a third colour diſtinct from the reſt,
and left no roume at all for a fourth to be drawne within it: Which when *Protogenes* ſaw, hee con-
feſſed that he had met with his match and his maiſter both, and made all the haſt he could to the I
haven to ſeeke for *Apelles* to bid him welcome and give him friendly entertainement. In memo-
riall whereof it was thought good both by the one and the other, to leave unto poſteritie this ta-
ble thus naked, without any more worke in it, to the wonder of all men that ever ſaw it, but of cun-
ning artiſanes and painters eſpecially: for this table was kept a long time, and as it is well known,
conſumed to aſhes in that firſt fire that caught *Cæſars* houſe within the Palatine hill. And verely,
wee tooke great pleaſure before that, to ſee it many times, containing in that large and extra-
ordinarie capacitie which it had, nothing in the world than certaine lines, which were ſo fine and
ſmall, that unneath or hardly they could be diſcerned by the eye. And in truth, when it ſtood a-
mong the excellent painted tables of many other workemen, it ſeemed a verie blanke, having
nothing in it: howbeit, as void and naked as it was, it drew many a one unto it even in that reſpect, K
being more looked upon and eſteemed better than any other rich and curious work whatſoever.
But to come againe unto *Apelles*, this was his manner and cuſtome beſides, which he perpetual-
ly obſerved, that no day went over his head, but what buſineſſe ſoever hee had otherwiſe to call
him away, hee would make one draught or other, (and never miſſe) for to exerciſe his hand and
keepe it in ure, inſomuch, as from him grew the proverb, *Nulla dies ſine Linea*, *i.* Be alwaies doing
ſomewhat, though you doe but draw a line. His order was when he had finiſhed a peece of worke
or painted table, and laid it out of his hand, to ſet it forth in ſome open gallerie or thorow-fare to
be ſeene of folke that paſſed by, and himſelfe would lie cloſe behind it to hearken what faults were
found therewith; preferring the judgement of the common people before his owne, and imagi-
ning they would ſpie more narrowly and cenſure his doings ſooner than himſelfe: and as the L
tale is told, it fell out upon a time, that a ſhoemaker as he went by ſeemed to controule his worke-
manſhip about the ſhoe or pantophle that he had made to a picture, and namely, that there was
one latchet fewer than there ſhould bee: *Apelles* acknowledging that the man ſaid true indeed,
mended that fault by the next morning, and ſet forth his table as his manner was. The ſame ſho-
maker comming again the morrow after, and finding the want ſupplied which he noted the day
before, tooke ſome pride unto himſelfe, that his former admonition had ſped ſo well, and was ſo
bold as to cavill at ſomewhat about the leg: *Apelles* could not endure that, but putting forth his
head from behind the painted table, and ſcorning thus to be checked & reprooved, Sirrha (quoth
he) remember you are but a ſhoemaker, and therefore meddle no higher I adviſe you, than with
ſhoes: which word alſo of his came afterwards to bee a common proverbe, *Ne ſutor ſupra crepi-* M
dam. Over and beſides, very courteous he was and faire ſpoken, in which regard king *Alexander*
the Great accepted the better of him, and much frequented his ſhop in his owne perſon: for, as
I have beforeſaid, he gave ſtreight commaundement, That no painter ſhould be ſo hardie as to
make his picture but onely *Apelles*. Now when the king beeing in his ſhop, would ſeeme to talke

much

much and reaſon about his art, and many times let fall ſome words to little purpoſe, bewraying his ignorance; *Apelles* after his mild manner, would deſire his grace to hold his peace, and ſay, Sir, no more words, for feare the prentiſe boies there that are grinding of colours, doe laugh you to ſcorne: So reverently thought the king of him, that being otherwiſe a chollericke prince, yet hee would take any word at his hands in that familiar ſort ſpoken in the beſt part, and bee never offended. And verely, what good reckoning *Alexander* made of him, he ſhewed by one notable argument; for having among his concubines one named *Campaſpe*, whom hee fancied eſpecially above the reſt, in regard as well of that affection of his as her incomparable beautie, he gave commaundement to *Apelles* for to draw her picture all naked: but perceiving *Apelles* at the ſame time to be wounded with the like dart of love as well as himſelf, he beſtowed her upon him moſt frankly: By which example hee ſhewed moreover, that how great a commaunder and high minded a prince he was otherwiſe, yet in this maiſtering and commaunding of his affections, his magnanimitie was more ſeene: and in this act of his he wan as much honour and glorie as by any victory over his enemies, for now hee had conquered himſelfe, and not onely made *Apelles* partner with him of his love, but alſo gave his affection cleane away from her unto him, nothing moved with the reſpect of her whom before he ſo dearly loved, that being the concubine of a king, ſhe ſhould now become the bedfellow of a painter. Some are of opinion, That by the patterne of this *Campaſpe*, *Apelles* made the picture of *Venus** *Anadyomene*. Moreover, *Apelles* was of a kind bountifull diſpoſition even to other painters of his time, who commonly as concurrents, do envie one another. And the firſt hee was that brought *Protogenes* into credit and eſtimation at Rhodes; for at the firſt, his owne countreyman made no account at all of him (a thing ordinarily ſeen, that in our owne countrey we are leaſt regarded) but *Apelles*, for to countenance and credit the man, demanded of him what price he would ſet of all the pictures that he had readie made; *Protogenes* asked ſome ſmall matter and trifle to ſpeake of: howbeit, *Apelles* eſteemed them at fiftie talents, & promiſed to give ſo much for them: raiſing a bruit by this meanes abroad in the world, that hee bought them for to ſell againe as his owne. The Rhodians hereat were moved and ſtirred up to take better knowledge of *Protogenes*, what an excellent workman they had of him: neither would *Protogenes* part with any of his pictures unto them, unleſſe they would come off roundly and riſe to a better price than beforetime. As for *Apelles*, he had ſuch a dexteritie in drawing pourtraits ſo lively, and ſo neare reſembling thoſe for whom they were made, that hardly one could be knowne from the other; inſomuch, as *Appion* the Grammarian hath left in writing (a thing incredible to be ſpoken) that a certaine Phyſiognomiſt or teller of Fortune, by looking onely upon the face men and women, ſuch as the Greekes call Metopoſcopos, judged truly by the pourtraits that *Apelles* had drawne, how many yeares they either had lived or were to live, for whom thoſe pi[c]t were made. But as gracious as he was otherwiſe with *Alexander* and his traine, yet he could win the love and favor of prince *Ptolomæus*, who at that time followed the court of K. *Al[e]* and was afterwards king of Ægypt. It fortuned, that after the deceaſe of *Alexander*, an the reigne of king *Ptolomæ* aforeſaid, this *Apelles* was by a tempeſt at ſea caſt upon t Ægypt, and forced to land at Alexandria: where, other painters that wer practiſed with a jugler or jeaſter of the kings, and ſuborned him in the ki *les* to take his ſupper with the king. To the court came *Apelles* accordi in the preſence. *Ptolomæ* having eſpied him, with a ſterne and angri him what he made there, and who had ſent for him? and with that tours who ordinarily had the inviting of gueſts to the kings table, of all them had bidden him: whereat *Apelles*, not knowing t brought him thither, and beeing thus put to his ſhifts, caught hearth there by, and began therewith to delineat and draw upon couſiner beforeſaid. Hee had no ſooner pourfiled a little about ly tooke knowledge thereby of the partie that had played this p this diſpleaſure. This *Apelles* drew the face of king *Antiochus* withall: for to hide which deformitie and imperfection, hee d ſage a little away, and ſo he ſhewed but the one ſide of his fac wanting in the picture, might be imputed rather to the pain traied. And in truth, from him came this invention firſt to c the viſage, and to make one halfe face onely, when it might

* *i.* Ortam maci, *i.* riſing out of the ſea.

pleased the painter. Among other principall peeces of worke, some pictures there be of his ma- G
king, resembling men and women lying at the point of death, and even readie to gaspe and yeeld up the ghost. But of all the pictures and pourtraitures that he made; to say precisely which be the most excellent, it were a very hard matter. As for the painted table of *Venus*, arising out of the sea (which is commonly knowne by the name of *Anadyomene*) *Augustus Cæsar*, late Emperour of famous memorie, dedicated it in the temple of *Iulius Cæsar*, his father; which he enriched with an Epigram of certaine Greeke verses, in commendation as well of the picture, as the painter. And albeit the artificiall contriving of the said verses went beyond the worke, which they seemed to praise, yet they beautified and set out the table not a little. The nether part of this picture had caught some hurt by a mischance: but there never could bee found that painter yet, who would take in hand to repaire the same and make it up againe as it was at first: so as, this wrong & harm H
done unto the worke, and continuing still upon the same, turned to the glorie of the workeman. This table remained a long time to be seene, untill in the end for age it was worm-eaten and rotten: in such sort, as *Nero* beeing Emperour was faine to set another in the place, wrought by the hand of *Dorotheus*. But to come againe unto *Apelles*: he had begun another picture of *Venus Anadyomene*, for the inhabitants of the Iland Cos for Lango, which he minded should have surpassed the former: howbeit, before hee could finish it, surprised he was with death, which seemed to envie so perfect workmanship: and never was that painter knowne to this day, who would turne his hand to that piece of worke, and seeme to goe forward where *Apelles* left, or to follow on in those traicts and lineaments, which he had pourfiled and begun. One picture he drew of * king *Alexander* the Great, holding a *thunderbolt and lightening in his hand, which cost twentie ta- I
lents of gold, and was hung in the temple of *Diana* at Ephesus. And verely, this devise was so finely contrived, that as *Alexanders* fingers seemed to beare out higher than the rest of the worke, so the lightening appeared to be cleane without the ground of the table, and not once to touch it. [But before I proceed any farther, let the readers take this with them, and alwaies remember, that these rich and costly pictures were wrought with foure colours and no more.] And for the workmanship of this picture, the price thereof was paied him in good gold coine by weight and measure, and never told and counted by tale. Of his handyworke was the picture of a Megabyzus or guelded priest of *Diana* in Ephesus, sacrificing in his pontificall habits and vestiments accordingly. Also the counterfeit of prince *Clytus*, armed at all peeces save his head, mounted on horsebacke and hasting to a battell, calling unto his squire or henxman for his helmet, who was K
urtraied also reaching it unto him. To reckon how many pictures *Apelles* made of king *Alex-*
er and his father *Philip*, were but losse of time, and a needlesse discourse: But I cannot omit the
ed table, containing the pourtrait of *Abron* that wanton and effeminat person; which peece
ke the Samians so highly extoll and magnifie: ne yet another picture of *Menander* the
Caria, that he made for the Rhodians, and which they so much admire. Neither must I
e counterfeit of *Ancæus*: of *Gorgosthenes* the Tragœdian, which he made at Alexandria:
was at Rome, one table containing *Castor* and *Pollux*, with the image of *Victorie*, and
ikewise, another representing the counterfeit of Warre in person, bound
the backe, and *Alexander* the king mounted in a charriot triumphant:
ius late Emperour of immortall memorie, had dedicated modestly, L
used them to be hung up in the most conspicuous places of his Fo-
when *Claudius Cæsar* came to weare the diademe, hee thought it
, to scrape out the face of *Alexander*, as well in the one as in the
lively image of the said *Augustus* to be seene. It is thought like-
rcules, painted in a table, standing now in the temple of *Antonia*,
ce of worke no doubt, for notwithstanding that the backe part
on it, yet it sheweth the entier visage, which is an exceeding hard
is *Hercules*, would thinke that the picture it selfe turned the face
ned by the rest of the worke to hide from the eye. Of his pain-
night all naked, in which picture he seemed to challenge Na- M
part so well, as shee her selfe could not have framed the same
horse of his painting: which hee pourtraied, to set against o-
men, with whom he was entred into contention for the victo-
the sentence of men to the judgement of fourfooted beasts,

even

*Of this picture *Apelles* was wont to say, That there were two *Alexanders*: the one begotten by *Philip*, who was ἀνίκητος: & the other painted by *Apelles*, & he was ἀμίμητος, inimitable.

* The manner was to expresse lightening, by three shafts

A even living horses indeed: for perceiving that his concurrents were in favor too mightie for him, and that they were like to carrie away the prize by corrupting the judges and umpiers, he caused living horses to be brought into the place; and when he had presented before them the pictures of his concurrents horses one by one, they seemed not to joy nor make toward them: but no sooner had he shewed * that of his owne pourtraying, but they fell all to neigh, as taking it for one of their fellows; which experiment served ever after for a rule, to know indeed a good peece of workmanship in that kind. Moreover, hee made a picture representing *Neoptolemus* the sonne of *Achilles*, in habit of a man of armes, sitting on horsebacke and riding against the Persians: likewise another, resembling *Archelaus* with his wife and little daughter: also king *Antigonus* armed before with a cuirace, and marching on foot with his horse of service led by him. Howbeit

* *Valer. Max.* reporteth, that he painted a mare.

B those painters that are counted more skilfull and cunning than others, preferre before all other peeces of his workemanship, one picture of the same king sitting upon his horse; and another which doth represent the goddesse *Diana*, among a consort or companie of other virgins at sacrifice; whome he depainted so artificially in this table, that he seemeth to have surmounted *Homer* the Poët, who eftsoons in his poëms describeth the said maiden *Diana* with her traine of young damosels. What would you have more? hee would seeme to pourtray those things which indeed cannot bee pourtraied, cracks of thunder, leames or flashes of lightning, and thunderbolts; all which pictures goe under the name of *Brontes*, *Astrape*, and *Ceraunobolos*: his inventions served as precedents and patterns for others in that art to follow. One secret hee had himselfe, which no man was ever able to attaine and reach unto, and that was a certaine blacke vernish which he used to lay upon his painted tables when he had finished them; which was so finely

C tempered, and withall driven upon the worke so thin, that by the repercussion thereof it gave an excellent glosse and pleasant lustre to the colours: the same also preserved the picture from dust and filthinesse: and yet a man could not perceive any such thing at all, unlesse hee held the table close at hand, and looked verie neare. And great reason hee had besides to use this vernish, namely, least the brightnesse of the colours without it, might offend and dazle the eyes, which now beheld them as it were afarre off through a glasse-stone; and withall, the same gave a secret deeping and sadnesse to those colours which were too gay and gallant. And thus much may suffice for *Apelles*.

In his time lived *Aristides* the Thebane, a famous painter. This *Aristides* was the first that

D would seeme to paint the conceptions of the mind, and to expresse all the inward dispositions and actions thereof, which the Greeks call Ethe: yea the verie perturbations and passions of the soule he represented in picture: howbeit, his colours were unpleasant and somwhat too harsh. He represented in a table the winning of a towne by force, wherein was pourtraied most lively a little infant winding it selfe and making prettie means to creepe unto the mothers pap, who lay a dying upon a mortall wound received in her breast: but it passed, how naturally the poore womans affection was expressed in this picture; for a man might perceive in her, verie sensibly, a certaine sympathie and tender affection yet, unto her babe, albeit shee were now in her deadly pangs and going out of the world, fearing even then, least the child should meet with no milke when shee was dead, but in stead of sucking it fall to licke her bloud, and doe it selfe hurt and injurie: This

E painted table K. *Alexander* the Great translated from Thebes to Pella, the cittie where himselfe was borne. The same *Aristides* painted the counterfeit of a battaile betweene the Greeks and the Persians: in which table, hee compriſed an hundred fighting men: his bargaine was to have of *Mnason* the tyrant or K. of Elate, for everie personage that he made * ten pounds of silver. Hee pourtraied the running in a race of charriots drawne with foure steeds, so lively, that a man would have thought he saw the wheels turning about. And as for an humble suter or suppliant, hee depainted him so naturally, making his petition and following it with such earnestnesse, that he seemed in maner to crie with an audible voice from the verie picture. He counterfeited in a painted table, hunters with their venison that they had taken: *Leontion* also the painter: and a woman under the name of *Anapauomene*, dying for kind heart and the love of her brother: likewise prince

* *Mnas.*

F *Bacchus*, and ladie *Ariadne* his wife, which be pictures much looked upon at Rome in these daies within the temple of *Ceres*: a plaier besides in a tragœdie, accompanied with a boy (and these are to be seen in the chappell of *Apollo*) howbeit, this table hath lost all the beautie which it first had, through the follie of an unskilfull painter, unto whom it was put forth to be scoured and refreshed, by *M. Iunius* the Pretor, against the solemnitie of the Apollinar games. Moreover, there was

to beſeen in the chappell of *Faith* within the Capitoll, the picture of an old man with an harpe, G
teaching a boy to play; which was of *Ariſtides* his making: but there is a man lying ſicke in his
bed, of his painting, that cannot be praiſed ſufficiently. And verely to conclude with this owne
word, ſo accompliſhed he was in this art, that K. *Attalus* (by report) gave unto him for one table
with the picture, one hundred talents of ſilver.

About the ſame time, there flouriſhed (as I have ſaid before) *Protogenes*: borne hee was at
Caunos a citie in Cilicia, and ſubject to the Rhodians: hee was ſo exceeding poore at the begin-
ning, and withall ſo ſtudious, intentive, and curious in his worke without all end, that fewer pi-
ctures by that means came out of his hands, and himſelfe never riſe to any great wealth. Who it
was that taught him his art, it is not known for certain: but ſome ſay that he painted ſhips untill
he was fiftie yeers of age: which they collect by this argument, That when at Athens in the moſt H
conſpicuous and frequented place of the cittie, he was to adorne with pictures the porch before
* Names of gallies. the temple of *Minerva*; wherein he depainted that famous * Paralus and * Hemionis, which
ſome call Nauſicaa, he deviſed certaine borders without: wherein hee painted among thoſe by-
works (which painters call Parerga) certaine ſmall gallies and little long barkes, to ſhew thereby
the ſmall beginnings of his art, and to what heigth of perfection hee was come to in the end,
when his workmanſhip was thought worthie to be ſeene in the moſt eminent place of that citie.
* A worthie knight, ſonne of *Ochimus*. But of all the painted tables that ever hee wrought, that of * *Ialyſus* is accounted the principall,
which is now dedicated at Rome within the temple of *Peace*: whiles he was in painting this *Ialy-*
ſus, it is ſaid, that he lived onely upon ſteeped lupines, which might ſerve him in ſtead of meat
and drinke both, to ſatisfie his hunger and quench his thirſt: and this hee did, for feare leaſt too I
much ſweetneſſe of other viands ſhould cauſe him to feed over-liberally, & ſo dull his ſpirit and
ſenſes. And to the end that this picture ſhould bee leſſe ſubject to outward injuries, and laſt the
longer, he charged it with foure grounds of colours, which he laid one upon another; that ever
as the upper coat went, that underneath might ſucceed in the place and ſhew freſh againe. In
this table, the pourtraiture of a dog is admirable and miraculous; for not onely art, but fortune
alſo met togither in the painting thereof: for when hee had done the dog in all parts to the con-
tentment of his owne mind (and that ywis was a verie hard and rare matter with him) hee could
not ſatisfie and pleaſe himſelfe in expreſſing the froth which fell from his mouth as hee panted
and blowed almoſt windleſſe with running; diſpleaſed he was with the very art it ſelfe: and albeit
he thought that hee had been long enough alreadie about the ſaid froth, and ſpent therein but K
too much art and curioſitie, yet ſomewhat (he wiſt not what) was to be diminiſhed or altered ther-
in: the more workemanſhip and skill that went thereto, the farther off it was from the truth in-
deed and the nature of froth, (the onely marke that he ſhot at:) for when hee had done all that
he could, it ſeemed ſtill but painted froth, and not that which came out of the doggs mouth;
whereas it ſhould have been the verie ſame and no other, which had ben there before. Hereat he
was troubled and vexed in his mind, as one who would not have any thing ſeene in a picture of
his, that might be ſaid like, but the very ſame indeed. Many a time he had changed his penſill and
colours; as often, he had wiped out that which was done, and all to ſee if he could hit upon it: but
it would not be, for yet it was not to his fanſie. At the laſt, falling cleane out with his own work-
manſhip, becauſe the art might be perceived in it, in a pelting chafe he flings me the ſpunge-full L
of colors that he had wiped out, full againſt that unhappie place of the table which had put him
to all this trouble: But ſee what came of it! The ſpunge left the colours behind, in better order
than hee could have laid them, and in truth, as well as his heart could wiſh. Thus was the froth
made to his full mind, and naturally indeed by meere chaunce, which all the wit and cunning in
his head could not reach unto. [After whoſe example, *Nealces* another painter did the like, and
ſped as well, in making the froth falling naturally from a horſes mouth; namely, by throwing his
ſpunge againſt the table before him, at what time as he painted a horſe-rider cheering and chir-
king up his horſe, yet reining him hard as he champed upon his bit.] Thus (I ſay) Fortune taught
Protogenes to finiſh his dog. This picture of *Ialyſus* and his dog, was of ſuch name and ſo highly
eſteemed, that K. *Demetrius* when he might have forced the cittie of Rhodes, on that ſide onely M
where *Protogenes* dwelt, forbare to ſet it on fire, becauſe he would not burne it among other pain-
ted tables: and thus for to ſpare a picture, he loſt the opportunitie of winning a towne. During
this ſtreight ſiege and hot aſſault of Rhodes, it chaunced that *Protogenes* himſelfe was at worke in
a little garden that hee had by the townes ſide, even as a man would ſay within the compaſſe of

Demetrius

A *Demetrius* his campe. And for all the furie of warre and the daily skirmishes within his sight and hearing, yet hee went on still with his workes that hee had in hand, and never discontinued one houre. But being sent for by the king, and demaunded, How he durst so confidently abide without the walls of the citie in that daungerous time? he answered, That he knew full well that *Demetrius* warred against the Rhodians, and had no quarrell to good arts and sciences. The king then (glad in his heart that it lay now in his hand to save those things, which hee had spared before, and whereof he had so good respect) bestowed a verie strong guard about *Protogenes* for his better safetie and securitie: and as great an enemie as he was to the Rhodians, yet he used otherwhiles to visit *Protogenes* of his owne accord in proper person, because hee would not eftsoons call him out of his shop from worke: and setting aside the maine point and occasion of lying
B before Rhodes, which was the winning thereof, the thing that hee so much desired; even amid the assaults, skirmishes, and battailes, hee would find times to come unto *Protogenes*, and tooke great pleasure to see his worke. By occasion of this siege and hostilitie, arose this tale moreover of one table of his making, That all the whiles he painted it, the dagger (forsooth) was set to his heart, and a sword readie to cut his throat: and it was the picture of a Satyre playing upon a paire of bagpipes, which he called * *Anapauomenos:* by which name, as well as by the thing it selfe, he would seeme to signifie, that he tooke but little thought and care during those daungerous troubles. Moreover, he made the picture of ladie *Cydippe*, and of * *Tlepolemus:* he painted also *Philiscus* a writer of Tragœdies, sitting close at his studie meditating and musing. Also, there be of his making, a wrestler or champion, *Antigonus* the king, and the * mother of *Aristotle* the Phi-
C losopher, who also was in hand with *Protogenes*, persuading him to busie himselfe in painting all the noble acts, victories, and whole life of king *Alexander* the Great, for everlasting memoriall and perpetuitie: but the vehement affection and inclination of his mind stood another way, and a certaine itching desire to search into the secrets of the art, tickled him and drew him rather to these kinds of curious works whereof I have alreadie spoken. Yet in the latter end of his daies, he painted king *Alexander* himselfe, and god *Pan*. Over and besides this flat painting, he gave himselfe greatly to the practise of founderie, and to cast certaine images in brasse, according as I have alreadie said.

* One at rest, or reposing himselfe.

* Some read, *Triptolemus.*

* *Phæstias.*

At the verie same time lived *Asclepiodorus*, whome for his singular skill in observing symetries and just proportions, *Apelles* himselfe was woont to admire. This painter pourtraied for *Mnason*
D the foresaid king of the Elateans, the twelve principall gods, and received for everie one of them three huudred pound of silver. The said *Mnason* gave unto *Theomnastus* for painting certaine Princes or Worthies, one hundred pounds apeece.

In this ranke is to bee raunged *Nicomachus*, sonne and apprentice both unto *Aristodemus*. This *Nicomachus* pourtraied the ravishing of *Proserpina* by *Dis* or *Pluto*: which picture standeth in a table within the chappell of *Minerva* in the Capitoll, above the little cell or shrine of *Iuventus*. In the same Capitoll, another table there is likewise of his making, which *Plancus* (lord Generall of an armie for the time beeing) had there dedicated and set up: the same doth represent *Victorie* catching up a triumphant charriot drawn with foure horses aloft into heaven. Hee was the first that pourtraied prince *Vlixes* in a picture, with a * cap upon his head. Hee pain-
E ted also *Apollo* and *Diana: Cybele* likewise the mother of the gods, sitting upon a lyon: of his workemanship is the table, representing the religious priestresses of *Bartus* in their habit, together with the wanton Satyres creeping and making toward them. Semblably, the monstrous meermaid *Scylla*, which at this day is to bee seene at Rome within the temple of *Peace*. A readie workeman hee was, and you shall not heare of a painter that had a quicker hand than hee, at his worke: for proofe whereof, this voice goeth of him, That having undertaken for a certaine sum of money unto *Aristratus* the tyrant of Sicyone, to paint a monument or tombe which he caused to be made for *Telestes* the Poët, and to finish it by such a day appointed and set downe in the covenants of the bargaine, hee made no great haste to goe about it, but came some few daies before the expiation of the prescript terme, for to begin the same worke: whereat the tyrant was
F wroth, and menaced to punish him for example: howbeit, hee quit himselfe so well, and followed his worke with such woonderfull celeritie, that in few daies space hee brought it to an end: and yet the art and workemanship thereof was admirable. Vnder him were brought up as apprentices, his brother *Aristides*, his owne sonne *Aristocles*, and *Philoxenus* the Eretrian.

* In token of nobilitie, as *Pierius* noteth in his Hieroglyphicks, *lib.* 11.

This *Philoxenus* made one painted table for *Cassander* the king, containing the battell between

Alexander the Great and K. *Darius*, which for exquisit art commeth not behind any other what- G
soever. One picture there is of his doing, wherein he would seeme to depaint Lascivious wantonnesse, which he pourtraied by three drunken Sylenes making merrie and banketting togither. He gave himselfe also to the speedie workemanship of his master before him, and for that purpose invented other compendious means of greater brevitie to make riddance and quicke dispatch with his pencill.

With these may be sorted *Nicophanes* also, a proper, feat, and fine workeman, whose manner was to take out old pictures and paint them new againe, thereby as it were to immortalize the memorie of things: a running hand he had of his owne, and besides was by nature hastie and furious: howbeit, for skill and cunning there were but few comparable unto him. In all his workes he aimed at loftinesse and gravitie: so that a man may attribute the stately port that is in this art, H
unto him and no other.

As touching *Perseus* (apprentice to *Apelles*, & wrote a book unto him of the very Art) he came far short both of his master & also of *Zeuxis*. As for *Aristides* the Theban, who also lived in this age, he brought up under him his two sonnes, *Niceros* and *Aristippus*. This *Aristippus* pourtraied a Satyre crowned with a chaplet, and carying a goblet or drinking cup: he taught *Antonides* and *Euphranor* his cunning; of whome I will write anon: for meet it is to annex unto the rest, such as have been famous with the pencill in smaller works and lesser pictures: among whome I may reckon *Pyreicus*, who for art and skill had not many that went before him: and verely of this man, I wot not well, whether hee debased himselfe and bare a low saile, of purpose or no? for surely his mind was wholly set upon painting of simple and base things: howbeit, in that humble and lowly I
carriage of himselfe, hee attained to a name of glorie in the highest degree: his delight was to paint shops, of barbers, shomakers, coblers, taylers, and semsters: hee had a good hand in pourtraying of poore asses, with the victuals that they bring to market, and such homely stuffe: wherby hee gat himselfe a by-name, and was called *Rhyparographus*. Howbeit, such rude and simple toies as these were so artificially wrought, that they pleased & contented the beholders, no thing so much. Many chapmen he had for these trifling peeces, and a greater price they yeelded unto him, than the fairest and largest tables of many others. Whereas contrariwise, *Serapion* used to make such great and goodly pictures, that (as *M. Varro* writeth) they were able to take up and fill all the stalls, bulks, and shops, jutting forth into the street under the old market-place Rostra. This *Serapion* had an excellent grace in pourtraying tents, booths, stages, and theatres; but to paint a K
man or a woman, he knew not which way to begin. On the other side, *Dionysius* was good at nothing else, and therefore hee was commonly called *Anthropographus*. Moreover, *Callicles* also occupied himselfe in small works: and *Calaces* set his mind especially upon little tables & pictures which were to set out comœdies and enterludes: but *Antiphilus* practised both the one and the other; for hee pictured the noble ladie *Hesione*, K. *Alexander* the Great, and *Philip* the king his father, with the goddesse *Minerva*: which tables hang in the Philosophers schoole or walking-place within the stately galleries of *Octavia*, where the learned clerks and gentlemen favourers of learning, were woont to meet and converse. Within the galleries also of *Philippus* there are to be seen, the picture of prince *Bacchus*, the pourtrait of *Alexander* in his childhood, and of *Hyppolitus* the young gentleman, affrighted and astonied at the sight of a monstrous bull let loose L
and readie to encounter him. Likewise in the gallerie of *Pompey*, the counterfeits of *Cadmus* and *Europa*; all, pictures of *Antiphilus* his making. Of his handyworke, there is a foole, with his bell, cockscombe, bable, and in other ridiculous habit, going under the name of *Gryllus*, devised for the nones to make sport and pastime: wherupon all such foolish pictures be called Grylly. Himselfe was borne in Ægypt, howbeit hee learned all his cunning of *Ctesidemus*. In this bedroll of painters, I should not doe well to passe over in silence, the workeman that painted the temple of *Iuno* at Ardea, especially seeing that he was enfranchised free burgeois of that cittie, and honoured besides with an Epigram or Tetrastichon, remaining yet to be read in the mids of his pictures in these foure Hexameter verses following:

M

Dignis digna loca picturis concolebravit,
Reginæ Iunonis supremi conjugis templum
Marcus Ludius Elotas Ætolia oriundus;
Quem nunc, & post semper ob artem hanc Ardea laudat.

This

A This ſtately Church of *Iuno* queene, with pictures richly dight,
Whome wife to mightie *Iupiter*, and ſiſter, men doe call;
Commends the hand of *Marke Ludie*, *Elotas* alſo hight,
Ætolian borne: whome Ardea doth praiſe, and ever ſhall.

Theſe verſes are written in antique Latine letters. By occaſion of whoſe name, I muſt not defraud another *Ludius* of his due praiſe and commendation, who lived in the daies of *Auguſtus Cæſar* Emperour of happie memorie: for this *Ludius* was hee who firſt deviſed to beautifie the walls of an houſe with the pleaſanteſt painting that is in all varietie; to wit, with the reſemblance of manours, farms, and houſes of pleaſure in the countrey, havens, vinets, floure-worke in knots, groves, woods, forreſts, hills, fiſhpools, conduits, and drains, rivers, riverets, with their banks, and
B whatſoever a man would wiſh for to ſee: wherein alſo hee would repreſent ſundrie other ſhews of people, ſome walking and going too and fro on foot; others, ſailing and rowing up and downe the ſtream upon the water; or els riding by land to their farms, either mounted upon their mules and aſſes, or els in waggons and coaches: there a man ſhould ſee folke, in this place fiſhing and angling, in that place hawking and fouling: ſome hunting here, the hare, the fox, or deere both red and fallow; others, buſie there, in harveſt or vintage. In this manner of painting a man ſhould behold of his workemanſhip, faire houſes ſtanding among marſhes, unto which all the wayes that lead, be tickliſh and full of bogs; where you ſhould ſee the paths ſo ſlipperie, that women as they goe are afraid to ſet one foot afore another; ſome at everie ſtep readie to ſlide, others bending forward with their heads, as though they carried ſome burdens upon their neck and ſhoul-
C ders, and all for feare leaſt (their feet failing under them) they ſhould catch a fall: and a thouſand more deviſes and prettie conceits as theſe, full of pleaſure and delight. The ſame *Ludius* deviſed walls without-dores & abroad in the open aire, to paint cities ſtanding by the ſea ſide. All which kind of painting pleaſeth the eye exceeding well, and is beſides of little or no coſt. Howbeit, neither he nor any artificers in this kind (howſoever otherwiſe reſpected) grew ever to be famous and of great name; that felicitie attained they only unto, who uſed to paint in tables: and therefore in this regard, venerable antiquitie we have in greater admiration: for painters in old time loved not to garniſh walls for to pleaſure the maſter only of the houſe, ne yet to bedeck houſes in that manner, which cannot ſtir out of the place nor ſhift and ſave themſelves when fire commeth; as painted tables may, that are to be remooved with eaſe. *Protogenes*, as excellent a painter as hee was,
D contented himſelfe to live within a little garden in a ſmall cottage, and I warrant you no part thereof was painted. *Apelles* himſelfe might well have the walls of his houſe rough-caſt or finely plaſtered, but never a patch therof had any painting. They tooke no pleaſure, nay they had no luſt at all to paint upon the whole walls, and to work upon them from one end to another: all their skill and cunning attended upon the publick ſervice of ſtates and cities: and a painter was not for this or that place only, but emploied for the good & benefit indifferently of all countries & nations.

But to returne again to our particular painters: there flouriſhed at Rome a little before *Auguſtus Cæſars* daies, one *Arellius*, a renowmed painter, but that he had one notable foule fault which marred all and diſcredited his art; given he was exceedingly to wenching, and ſure hee would be to have one woman or other all times in chace: which was the reaſon that hee loved a-life to bee
E painting of goddeſſes, and thoſe were ever drawne by the patterne of his ſweet-hearts whom he courted: A man might know by his pictures how many queanes he kept, and which were the miſtreſſes or goddeſſes rather, whom hee ſerved. Of late daies we had among us here at Rome, one *Amulius* a painter: he caried with him in his countenance and habit, gravitie and ſeveritie; howbeit, he loved to make gay & gallant pictures, neither ſcorned he to paint the moſt trifling toies and meaneſt things that were: The picture of *Minerva* was of his making, which ſeemeth to have her eye full directly upon you, looke which way ſoever you will upon her. Hee wrought but ſome few hours of the day, and then would he ſeeme verie grave & ancient; for you ſhould never find him out of his gowne and long robe, but verie formall, though he were cloſe ſet at worke & even locked as it were to his frame. The golden houſe or pallace of *Nero* caught up all the workes that
F he could make, where they remained as it were in priſon & never came abroad: which is the reaſon that none of his pictures els be extant. After him, ſucceeded *Cornelius Pinus*, & *Actius Priſcus*, two painters of good reputation, who painted the temples of *Honour* and *Vertue* for *Veſpaſianus Auguſtus* the Emperour, when he cauſed them to be reedified: but of the twaine, *Priſcus* in his workmanſhip came nearer to the painters in auncient time.

G

Chap. xi.

The manner how to make birds silent, and to leave their chattering and singing. Who first devised with fire and pencill to enamell and paint the arched roufes and embowed seelings of houses. The admirable prices of pictures, inserted here and there among other matters.

SInce I have proceeded so farre in the discourse of Painters and their Art, I must not forget to set downe a pretie jest, which hath been reported by many as touching *Lepidus*: It happened during the time of his Triumvirat, that in a certaine place where he was, the magistrats attended him to his lodging, environed as it were with woods on everie side: the next morrow *Lepidus* took them up for it, and in bitter tearms and minatorie words chid them, for that they had laid him where hee could not sleepe a wincke all night long, for the noise and singing that the birds made about him. They being thus checked and rebuked, devised against the next night, to paint in a peece of parchment of exceeding length, a long dragon or serpent, wherewith they compassed the place where *Lepidus* should take his repose: the sight of which serpent thus painted, so terrified the birds, that they had no mind to sing, but were altogither silent: by which experiment at that time, it was knowne afterwards that birds by this means might be stilled.

H

* *Encaustice.*

As touching the feat of setting colours with wax, and * enamelling with fire, who first began and devised the same, it is not known. Some are of opinion, that the invention therof came from *Aristides*: and that *Praxiteles* practised the same, and brought the art of it to an absolute perfection. But surely there were pictures wrought by fire a good while before *Aristides* daies; and namely, by *Polygnotus*, *Nicanor*, and *Arcesilaus* of Paros. *Lysippus* also in his painted tables that he made at Ægina, used to entitle them with this inscription, Λύσιππος ἐνέκαυσεν, *i. Lysippus* painted this with fire: which verely he would never have done, if the art of painting so with fire (called Encaustice) had not been before devised. Moreover, *Pamphilus*, master to *Apelles*, is reported not onely to have himselfe practised this painting with vernish, and to enamell by the means of fire, but also to have taught it unto *Pausias* the Sicyonian, who was the first that excelled in this kind, and caried away the name from all others in his time. This *Pausias* was the sonne of *Brietes*, & apprentice also to his father at the beginning: he used also the plaine pencill, wherwith he wrought upon the walls at Thespiæ; which having been in times past painted by *Polygnotus*, were now to be refreshed and painted new againe by his hand: howbeit, in comparison of the former worke, he was thought to come a great way short of *Polygnotus*: and the reason was, because he dealt in that kind of worke which was not indeed his proper profession. He it was that brought up first the devise of painting vaulted roufs; for never was it the manner to adorne and garnish embowed seeling over head with colours, before his time. His delight naturally was to be painting of little tables, and therein he loved to pourtray little boies. Other painters his concurrents, and no well-willers of his, gave it out, That he made choice of this kind of worke, because such painting went but slowly away, and required no quicke and nimble hand. Whereupon *Pausias*, to disproove his adversaries, and withall to get himselfe a name as well for celeritie and expedition, as for his art and skill otherwise in these small peeces, began and finished in a table the picture of a boy, within one day; and thereupon it was called *Hemereſios*. In his youthfull daies he fell in fancie with a woman in the same towne where he dwelt, named *Glycera*: a fine wit shee had of her owne; and especially in making chaplets and guirlands of flours, shee was full of invention. *Pausias* by his acquaintance with her, and striving to imitat with his pencill her handy-worke, and to expresse that varietie of flours which she gathered and couched togither full artificially in her coronets, enriched his owne pictures also with a number of colours, and brought the art to wonderfull perfection in that point. In the end, he painted *Glycera* also his love sitting, with a chaplet of floures in her hand: and certes, this is the most excellent peece of worke that ever went out of his shop: this table with the picture was thereupon called by some, Stephanoploros, *i.* [A woman] plaiting and twisting a guirland: by others, Stephanopolis, *i.* Selling guirlands: for that this *Glycera* got a poore living by making chaplets, and had no other good means to maintaine her selfe. The counterfeit taken from this table and made by it (which kind of patterne the Greeks call Apographon) *L. Lucullus* bought of *Dionysius* a painter of Athens, and it cost him * two talents of silver. Furthermore, this *Pausias* made faire and great pictures also; and

namely,

A namely,one of his making,which doth represent a solemne sacrifice of oxen,is to be seen at this day within the stately galleries of *Pompeius:* and verely, this manner of painting the solemnitie of a sacrifice,hee first invented: but no man ever after could attaine to his dexteritie in that kind: and notwithstanding many gave the attempt,and seemed to imitate him,yet they came all short of him. Above all,he had a singular gift to work by perspective: for when he was minded to paint a bœufe or oxe,to shew the full length,he would not portray him sidelong or a flanke,but afront: by which meanes the beast is best represented,not onely how long,but also how large and big he is every way. Againe, whereas all other painters,whensoever they would raise their worke, and make any thing seeme eminent and high,use to colour the same white and bright,and the better to make them perspective,doe shaddow or deepe the same with blacke; this man in lieu thereof,
B would paint the oxe all of a blacke colour,and cause the bodie as it were of the shaddow to arise out of it selfe. And verely,so excellent he was in this perspective,that a man would say, his even, plaine, and flat picture, were embossed and raised worke, yea and imagine where fractures were, that all was sound and entire. This man lived also at Sicyone: and verely,for a long time this citie was reputed the native countrey that bred painters, and the onely place stored with excellent pictures. But during that time wherein *Scaurus* was Ædile at Rome,all the rich tables which were in the publicke places of that cittie, whether in the market steads,temples, or common hals, were seized upon and brought to Rome,for to satisfie great summes of mony wherein the Sicyonians stood endebted.

After *Pausias*,there arose one *Euphranor* the Isthmian,who flourished about the hundred and
C fourth Olympias,far surpassing all other painters of his time. This *Euphranor* is he whom I have named among the famous imageurs and founders. Of his workemanship there bee colosses of brasse,statues of marble stone,yea,and faire drinking cups chased and engraven. Of an excellent capacitie he was,and apt to learne any thing,studious withall,and painefull above all others: and whatsoever he gave his mind unto,therein he excelled: and in one word,a generall man he was, like himselfe still,that is to say,his craftsmaister in all,and as good in one thing as another. This is he who seemeth to have expressed first the port and majestie that is in princes and great states, and to have observed symmetrie and proportion: and yet he was not without his imperfection, for commonly,as he made the bulke of the bodie too slender,so the joints and heads were somewhat with the biggest: howbeit,he wrote bookes as touching symmetrie and proportion, as also
D of colours. Among other workes of his, there are reckoned these, to wit, the pourtraiture of a battaile or skirmish of horsemen,the twelve cheefe gods and goddesses, also the lively picture of *Theseus*,of whom he was wont to say, That the *Theseus* of *Parasius* his painting was fed with roses, but this *Theseus* of his with good flesh. There be excellent tables of his making at Ephesus, to wit, *Vlyxes* faining himselfe mad, and in that fit coupling an oxe and a horse in one and the same yoke: also divers personages in their clokes and mantles,after the Greekish fashion, musing, and in their deepe studie: likewise,a captaine,putting up his sword into his scabbard.

At the same time lived *Cydias*, hee who in a table represented the * Argonautes, for which *Hortensius* the Oratour, was content to pay 144000 sesterces. This picture hee shrined in an Oratorie or Chappell, built of purpose for it, in a house of pleasure that he had at Thusculum.

* i. Divers valiant knights, who accompanied prince *Iason* in his voiage to Colchos for the golden fleece.

E As for *Antidotus*,apprentice he was unto *Euphranor:* of his handyworke there is a picture at Athens,resembling one with a shield readie to enter into combat and fight, also a wrestler, and a player upon the fife or haut-bois(which is a peece of worke highly commended,and few comparable unto it)more curious and precise he was in the secrets of the art,than observant of symmetrie and proportion; beeing otherwise given to use sad and duskish colours. The greatest name that he had,was for bringing up *Nicias* the Athenian,who of all others painted women most excellently. For lights and shaddowes in perspective,he was exquisit: also a passing great care and regard he had so to raise his worke,as that it seemed to bee embossed and higher than the bourd of his table: The pictures of *Nemea*,which out of Asia was transported to Rome by *Syllanus*, and hung up in the Senate-house as I have shewed heretofore; of prince *Bacchus* within the temple
F of *Concord*; of *Hyacinthus*, which *Augustus Cæsar* upon a speciall liking to it brought with him to Rome, after he had forced and sacked Alexandria, in which regard, *Tiberius Cæsar* his successour, (seeing what affection *Augustus Cæsar* had to it in his life time) dedicated it in the temple of the said *Augustus*; and lastly, of the goddesse *Diana*; were all proofes of his skill and workemanship. Moreover,at Ephesus,the sepulchre of a *Megabyzus*,one of the priests of the order

der of *Diana* of Epheſus, was of his painting: like as at Athens, the Necromancie of the Poët *Homer*. This picture *Nicias* held at ſo high a price, that he would not let it goe unto K. *Attalus* for 60 talents, but choſe rather to beſtow it freely upon his native countrey, being otherwiſe a man for his owne privat eſtate very wealthie. Over and above theſe before rehearſed, he made others of a larger ſize, among which are reckoned *Calypſo*, *Iö*, and the lady *Andromeda*. The excellent picture alſo of king *Alexander*, which is in the gallerie of *Pompeius*, together with *Calypſo* painted ſitting, came out of his ſhop. The perfect pourtraying of foure-footed beaſts, is aſcribed unto him; and in truth, a ſingular grace he had and felicitie in painting dogs. This is that *Nicias*, of whom *Praxiteles* gave ſo good teſtimonie: for being asked the queſtion upon a time, What peeces hee eſteemed beſt of all thoſe which himſelfe had cut in marble? he anſwered, Even thoſe, wherein *Nicias* hath had a hand: ſo much did he attribute unto his *verniſh and poliſhing. Another *Nicias* there was, who lived in the 112 Olympias: but whether this man were hee or no, it is not for certaine knowne: howbeit, ſome there be that would have him to bee the ſame. Certes, *Atheman* of Marona, was taken for as good a workeman every way as *Nicias*, and in ſome reſpects better. He learned the art of *Glaucion* the Corinthian: In choiſe of his colours, he ſtood not ſo much upon gallantneſſe, but uſed thoſe that were with the ſaddeſt: howbeit, thoſe darke and ſhaddowed works of his, ſhewed more pleaſant & delectable than his maiſters: whereby appeared his profound knowledge and deepe skill, in the very laying and couching of his colours. The picture of *Philarchus* hee drew, which is in the temple of *Ceres Eleuſine*: the frequent aſſemblie alſo of the dames of Athens, which they called *Polygynæcon*, was of his pourtraying: likewiſe, he repreſented *Achilles* in his youth, hidden under the habit of a young damoſell, and how the craftie fox *Vlixes* diſcovered and found him out, notwithſtanding he was ſo diſguiſed. But one table above the reſt woon him the greateſt credit, and that was, wherein hee painted a horſekeeper, training and nurturing his palfrey. Certes, but that hee died in his youth, there had not been a painter in all the world comparable unto him.

*Circumlitioni: others read *circumductioni*, *i.* the firſt draught or pourſiling.

As touching *Heraclides* the Macedonian, he alſo may run in the raunge of famous painters. At the beginning, he employed himſelfe in painting ſhips: after that king *Perſeus* was taken priſoner, he left his native countrey and went to Athens, where lived at that time *Metrodorus*, a Painter and Philoſopher both, a man of great name and authoritie as well in the one profeſſion as the other: and therefore, when *L. Paulus*, after the defeature of the ſaid *Perſeus*, ſent unto the Athenians, and requeſted them to ſend unto him an excellent Philoſopher to teach & inſtruct his children, together with a ſingular painter for to ſet out his triumph with curious pictures, the Athenians made choice of *Metrodorus* onely, and commended him alone unto *Lucius Paulus*, for the beſt approoved and moſt conſummat to ſerve his turne and ſatisfie both his deſires: which by good proofe and experience, *Paulus* found true, and gave judgement of him accordingly.

Timomachus the Bizantine flouriſhed in the dayes of *Cæſar* Dictatour, for whom hee painted *Ajax* and *Medea*: which pictures when he bought of him for eightie talents, he cauſed to bee hung up in the temple of *Venus* *Genetrix*. Now when I ſpeake of a talent, you muſt underſtand the Atticke talent, which *M. Varro* dooth value at ſixe thouſand deniers Romane. There goeth as great praiſe and commendation likewiſe of other peeces that paſſed from under the hands of *Timomachus*, to wit, the pictures of *Oreſtes*; of *Iphigenia* in Tauris; and of one *Lecythion*, who taught youths dauncing, vaulting, and other feats of activitie: hee pourtraied alſo in a table, a goodly race, deſcent, and kinred of gentlemen: two perſons beſides in thir clokes or mantles, after the Greekiſh faſhion, readie to make a ſpeech unto the people; the one ſet, the other ſtanding upon the feet: but it ſeemed that art favoured and graced him moſt, in painting *Minervaes* ſhield, where he pourtraied *Gorgon* or *Meduſaes* head moſt lively.

*This Saint *Iulius Cæſar* honoured moſt: for that hee would ſeeme to be deſcended from *Julus* or *Aſcanius*, ſon of *Æneas*, and nephew to *Venus* by *Anchiſes*

Ariſtolaus was the ſonne of *Pauſias*, and under his father he learned the myſterie of painting: who is counted one of the graveſt painters that ever were: Of his workmanſhip are the tables containing the pictures of *Epaminondas*, *Pericles*, *Medea*, *Vertue*, & *Theſeus*: He drew alſo with his penſill in colours, the common people of Athens, and a ſolemne ſacrifice of oxen.

There was alſo one *Mechopanes*, apprentiſe likewiſe unto the ſame *Pauſias*, who is highly commended by ſome for his curious and exquiſit workemanſhip: but ſuch it is, as none but cunning artificers can conceive, for otherwiſe I aſſure you, his colours are unpleaſant, and he loved to lay on too much of one thing, and that was Sil.

As

A As for *Socrates* the painter, his pictures were liked very well of all that saw them, and in truth, they deserved no lesse: for of his doing are these and such like, to wit, *Aesculapius*, with his daughters, *Hygia*, *Aegle*, *Panacea*, and [1] *Iaso*: and an idle lazie lubber, knowne by a devised name *Ocnos*, whom he pourtraied twisting a cord of Spart, and ever as he did it, an asse behind him gnawed it asunder. Thus much may serve, concerning the principall painters that have been known to excell in both kinds, to wit, with the pensill, and with fire: it remaineth now that I should discourse of those who were next unto the principall, and so reputed.

In this second course of Painters I must raunge *Aristoclides*, who beautified with his pictures the temple of *Apollo* in Delphos. As for *Antiphilus*, he is much praised for painting a boy blowing hard at the coales; in which table, it is a pretie sight to see how all the house (which was faire
B ynough besides) shineth by the fire that he maketh, as also what a mouth the boy makes: likewise for the picture of a companie of Spinsters, so lively, that one would imagine he saw every woman making hast to spin off her distaffe, striving avie who shall have done her taske first. He devised also to pourtray *Ptolomæ* hunting, and this they call [2] *Aposcopon*; for which he is much commended: but principally for a brave Satyr of his workemanship, clad in a Panthers skin. *Aristophon* woon much credit by painting *Ancæus* wounded to death by a wild Bore, and his wife *Astypale* standing hard by, who seemeth to lament for his sake, and (as it were) to feele part of his paine: Hee made likewise one faire table, enriched with a number of personages, to wit, king *Priamus*, faire *Helena*, dame *Credulitie*, *Ylixes*, *Deiphobus*, and *Dolori*. *Androbius* got himselfe a great name by a picture, representing one [3] *Scyllis* [a cunning dyver] cutting in twaine the anker cables of the Persian fleet,
C riding at sea. *Artemon* likewise was renowned for the counterfeit of ladie *Danaë*, found floting in the sea by [4] rovers or men of warre, who seemed to wonder at her beautie, and to behold her with much contentment: also for picturing queene *Statonice*: *Hercules* and *Deianira* his wife: But the most excellent peeces of his workmanship, be those which are to be seene in the galleries of *Octavia*, among other of her stately buildings; to wit, *Hercules* ascending up into heaven from the mountaine Oeta within the region of Doris, where he chaunged this mortall life, and by the generall consent of all the gods, was received into their societie: the whole hystorie also of *Laomedon*, as touching his falshood to *Hercules* and *Neptune*. *Alcimachus* the painter was renowned for the picture of hardie *Diox ppus*, who [5] carried away the prise in all feats of activitie, at the solemne games of Olympia, and never sweat nor touched [6] dust for it; which easie victory the Greeks
D call Aconiti. As for *Cænus*, he was excellent at painting Coronets & Guirlands: also at drawing coats of armes in scutcheons, of gentlemen and noble persons, with the stile of their titles & dignities. *Ctesilochus*, an apprentice to *Apelles*, became very famous for one picture above the rest, although it were but a wanton one and offensive to chast eyes; wherein forsooth he depainted *Iupiter*, attired in a caule or coife about his head like a woman, groning and crying out also (as women do in travell of childbirth) among the goddesses for their helping hand, who plaid the midwives about him, untill hee was delivered of god *Bacchus*, and brought to bed. *Cleon* was much spoken of, for the picture which he made of king *Admetus*: *Ctesidamus* for pourtraying the winning of Oechalia by *Hercules*. And for drawing the picture of ladie *Laodamia*, the wife of *Protesilaus*. *Clesides* was notorious for one picture which he made in despight of queene *Stratonice*, wife
E to king *Antiochus*, and to be revenged of her for a disgrace that he had received at her hands: For being in the court, and perceiving that the queene did him no honour at all, nor gave him any countenance, he made no more adoe, but painted her in her colours, tumbling and wallowing a-
2 long full unseemely with an odde base fisherman, whome as the voice went, shee was enamoured upon; and when he had done, set it up in the very haven of Ephesus, recovered a barke presently, and away he went under saile as fast as wind and tide would carie him. When the queene heard of it, she made but a jeast and mocke of it; neither would shee suffer the picture to bee taken away, in regard of the wonderfull workmanship, which expressed both her and him so like and lively. *Craterus* was a Comœdian and plaier in Enterludes, howbeit, a fine painter, as may appeare by his handyworke at Athens, within the publicke place Pompeium. *Eutychides* pourtraied a charriot
F drawne with two horses, and *Victorie* to guide and drive the same. *Eudoxus* had the name for his pictures which are seene at stage-plaies, to beautifie the place: who also was a good imageur and cast many faire peeces in brasse. *Iphis* was well thought of for *Neptune* and *Victorie* of his painting: and *Abron* was no lesse esteemed for the pictures resembling *Amitie* and *Concord*, as also for the pourtraitures of the gods. *Leontiscus* pictured *Aratus* the Generall of the Achæans, returning

[1] I am not of *Dalechampius* his opinio, who taketh *Iaso* here for the valiant knight *Jason*. For the termination of the word is meere feminine, as *Iö*, *Ins*, *Sappho*, and such like: besides, who sees not, that *Jaso* is respective unto Physick, for that *Iasis* in Greeke signifieth curing or healing, and it sorteth well with the names of her other sisters, which are likewise significant.

[2] That is to say, [levelling his shot at the Deere or wild beast] as *Dalechampius* doth interpret it: or els according to *Scoliger* [holding his hand over his eies to spie his game, and take his marke the better.]

[3] or *Scyllias*, according to *Herod.*

[4] *Prædonibus*, otherwise *Piscatoribus*, *i.* Fishermen.

[5] For he was the challenger, & none would come forth against him.

[6] For at wrestling especially, they caught up dust in their hands, to take hold the better of one anothers bodie, which were glib with oyle.

turning with victorie, and triumphing with his Trophee. Hee painted also a minstrell wench a G
playing upon a Psaltrie, and seeming to sing to it; which was thought to bee a daintie peece of worke. As for *Leon*, he painted *Sappho* the Poëtresse. And *Nicearchus* was much bruited abroad for a picture, shewing *Venus* accompanied with the Graces and the prettie *Cupids*. And of his workemanship is *Hercules*, sad and pensive: penitent also and repentant for that which hee had done in his furious madnesse. *Nealces* made one picture of *Venus* most curiously: for passing wittie he was, full of invention, and exquisit in his art. When he painted the navall battaile between the Ægyptians and the Persians, which was fought upon the river Nilus, the water whereof is rough and like the sea; because hee would have it knowne, that the fight was upon the said river, he devised another by-worke to expresse the same, which all the art of painting otherwise could not performe: for he painted an Asse upon the banke, drinking at the river, and a Crocodile ly- H
ing in wait to catch him: whereby any man might soone know it was the river Nilus, and no other water. *Oenias* the painter made one picture above the rest, which he called *Syngenicus*. *Philiscus* became renowned by a painters shop of his painting, where hee devised a prentice boy blowing the coales to kindle a fire. *Phalerion* pourtraied *Scylla*, transformed into a monstrous Meremaid. *Simonides* got credit by the picture of *Agatharchus*, who woon the best game at running: and of the goddesse of Memorie, named *Mnemosyne*. *Simus* took pleasure in painting a yong man lying asleepe in a waulke-mill or Fullers worke-house: another sacrificing unto *Minerva* at the feast *Quinquatrus*: & of the same mans doing, there is an excellent picture of *Nemesis*, representing Iustice and Revenge. *Theodorus* drew one snetting his nose: and the same painter represented in a table, how *Orestes* murdered his owne mother *Clytemnestra*, and *Aegysthus* the adulterer I
that kept her. The warre of Troy hee depainted in many severall tables: and these hang in the galleries of *Philip* at Rome. Of his handyworke is ladie *Cassandra* the Propheteesse, which is to bee seene in the chappell of *Concord*. Also, *Leontium* the courtisane belonging to *Epicurus* and his followers, was of his painting; like as king *Demetrius* musing and standing in a deepe studie. As for *Theon* the painter, hee described with his pensill the madnesse of *Orestes*, and pourtraied *Tamyras* the Harper or Musician. *Tauriscus* made one table, representing a man slinging a coit: and another resembling queene *Clytemnestra*. Hee pictured also a little *Pan*, whom hee called *Panniscus*, in manner of an Anticke: *Polynices* also making claime to his kingdome, and marching in warlicke manner to recover the possession thereof againe: and last of all, signieur *Capaneus*, who lost his life in skaling the walls of Thebes. And here commeth to my K
mind one notable example as touching *Erigonus*, which I cannot passe with silence: This *Erigonus*, servant sometime to *Nealces* the Painter, and employed onely in grinding colours, profited so much by seeing his maister worke, that hee became a painter himselfe, and left behind him an excellent workeman of his owne teaching, *Pausias*, brother to *Aegineta* the Imageur. But one thing more there is, of rare admiration and worthie to bee remembred, That the last peeces of excellent Painters, and namely such tables as bee left unperfect, are commonly better esteemed than those that bee fully finished: as wee may see by the Raine-bow or Iris which *Aristides* was entered into; the two brethren *Castor* and *Pollux*, begun by *Nicomachus*; the picture of *Medea*, killing the children that shee had by *Iason*, which *Timomachus* was in hand with; and the *Venus*, that as I said before, *Apelles* lived not to make an end of: for in these and such like L
imperfect tables, a man may (as it were) see what traicts and lineaments remaine to bee done, as also the very desseignes and cogitations of the artificers: and as these beginnings are attractive allurements to moove us for to commend those hands that began such draughts: so the conceit, that they bee now dead and missing, is no small greefe unto us, when wee behold them so raw and fore-let. But to come againe unto our Painters: there bee more yet behind, and those of very good regard in their time, howbeit, I will run them over slightly, and as it were passing and glauncing by them, namely, *Aristonides*, *Anaxander*, *Aristobulus* the Syrian, *Arcesilas* the sonne of *Tisicrates*, *Corybas* apprentice to *Nicomachus*, *Carmanides* to *Euphranor*, *Dionysodorus* the Colophonian, *Diogenes* who followed the court of king *Demetrius*, *Euthymedes*, *Heraclides* the Macedonian, *Mydon* of Solæ brought up under *Pyromachus* the Imageur, *Mnasitheus* of Sicyone, *Mnasithemus* the sonne of *Aristonides*, who was apprentice likewise unto him, and *Nessus* the sonne of *Abron*, *Polemon* of Alexandria, *Theodorus* of Samos, and *Stodius* (all three trained under *Nicosthenes*) and *Xenon* of Sicyone, who learned his craft of *Neocles*. M

Moreo.

A Moreover, women there were alſo, excellent*Paintreſſes, to wit, *Timarete*, the daughter of *Ni-con*, who made that excellent pourtraiture of *Diana* at Epheſus, a moſt antique picture: *Irene* the daughter of *Cratinus* the painter, who learned under her father, & drew the picture of a yong damoſell, which is at Eleuſine: *Calypſo*, of whoſe workemanſhip there is the picture of an old man, and of *Theodorus* the juglar: *Alciſthene* painted a dauncer: and *Ariſtarete*, both daughter and apprentiſe to *Nearchus*, made proofe how well ſhe had profited by the picture of *Aeſculapius*. And *Marcus Varro* ſaith, That when hee was a young man, there was at Rome one *Lala*, a Cyzecene borne, who paſſed her whole life in virginitie; and ſhe was skilfull both in painting with the penſill, and alſo in enamelling with hote ſteele in yvorie: her delight was principally in drawing women; and yet there is a Neapolitane of her pourtraying in a faire long table: laſt of all, ſhe tooke
B out her own counterfeit at a mirroir or looking glaſſe. This one thing is reported of her, That no painter had a quicker hand or went faſter away with his worke than ſhee: and looke what pictures ſoever came out of her hands, they were ſo artificially done, that they did out-ſell a great deale the workes of *Sopylos* and *Dionyſius* (the moſt famous painters in that age) notwithſtanding their pictures and tables were ſo faire, as that they take up whole cabinets; and well was hee (before that her pictures came abroad) who could be furniſhed out of their two ſhops. There was yet one paintreſſe more, to wit, *Olympias*: howbeit I heare no great matter of her, but this onely, that ſhee taught *Autobulus* the art of painting.

To come now unto painting by the meanes of fire: I find this agreed upon by all, that practiſed it was in old time but two waies onely, that is to ſay, with wax, and in yvorie with a little ſteele
C or punching yron; untill ſuch time as they fell to painting ſhips alſo with wax and fire: and in this third ſort the manner is to uſe great penſils or bruſhes dipt in wax molten over the fire. And this kind of painting ſhips is ſo faſt and ſure, that neither ſunne will reſolve, nor ſalt water eat and fret, ne yet wind and weather pierce and chinke it.

Moreover, in Ægypt they have a deviſe to ſtaine cloths after a ſtrange and wonderfull maner: They take white clothes, as ſailes or curtaines when they have beene worne, which they beſmeare not with colours but with certaine drougs that are apt to drinke and take colour: when they have ſo done, there is no apparence in them at all of any die or tincture. Theſe clothes they caſt into a lead or cauldron of ſome colour that is ſeething and ſcalding hote: where, after they have remained a pretie while, they take them forth againe, all ſtained and painted in ſundrie colours. An ad-
D mirable thing, that there being in the ſaid cauldron but onely one kind of tincture, yet out of it the cloth ſhould be ſtained with this and that colour, and the foreſaid boiling liquor chaunge ſo as it doth, according to the qualitie and nature of the drougs which were laid upon the white at firſt. And verely, theſe ſtaines or colours are ſet ſo ſure, as they can never be waſhed off afterwards. Thus the ſcalding liquor, which no doubt if it had diverſe tinctures and colours in it, would have confounded them all into one: now out of one doth diſpenſe and digeſt them accordingly, and in boiling the drougs of the cloths, ſetteth the colour and ſtaineth ſurely. And verely, this good moreover have the clothes by this ſcalding, that they be alwaies more firme and durable, than if they had not come into the boiling cauldron.

E

Chap. XII.

The firſt deviſers of the art of Potterie, and in working in cley. Of Images made of earth. Of earthen veſſels, and their value in old time.

NOw that I have diſcourſed of painting ynough, if not too much, it were good to annex and joine thereto the craft of Potterie, and working out of cley. And to begin with the originall and invention of making the image or likeneſſe of any thing in cley, it is ſaid, That *Dibutades*, a Sicyonian borne and a Potter, was the firſt that deviſed at Corinth to form an image in the ſame cley whereof he made his pots, by the occaſion and meanes of a daughter which hee had: who being in love with a certaine young man, whenſoever hee was to take a long journey far
F from home, uſed ordinarily to marke upon the wall the ſhaddow of her lovers face by candle light and to pourfill the ſame afterwards deeper, that ſo ſhee might enjoy his viſage yet in his abſence. This her father perceiving, followed thoſe tracts, and by clapping cley thereupon, perceived that it tooke a print, and made a ſenſible forme of a face: which when hee ſaw, hee put it into the furnace to bake among other veſſels, and when it was hardened, ſhewed it abroad. And it is ſaid, that

this

*i. that knew how to handle the penſill.

this very peece remained in the baines of Corinth safe, untill *Mummius* destroied the citie. How- G
beit, writers there bee who affirme, That *Rhœcus* and *Theodorus*, both of the Isle Samos, were the
first inventors of this feat of forming shapes in cley, long before the expulsion of the **Bacchia-* **i.* The race of *Bacchis*, who for a time reigned at Corinth.
dæ out of Corinth. And by their saying, when *Demaratus* was faine to flie out of that cittie, and
to retire himselfe into Tuscan (where he begat *Tarquinius*, afterwards surnamed *Priscus*, and king
of Rome) there accompanied him from Corinth *Eucheir* and *Eugrammus*, two Imageurs in cley,
and they taught in Italie the art of Potterie and imagerie in that kind. As for *Dibutades* before-
said, the inventor he was not of this craft, but indeed he devised to use with other cley and earth,
a ruddle, or else to colour the white cley with madder: His invention it was to set up Gargils or
Antiques at the top of a Gavill end, as a finiall to the crest tiles, which in the beginning he called
**Protypa*. The same man afterwards devised other counterfeits, and those he tearmed *Ectypa*: And H
hence came the louvers and lanternes reared over the roofes of temples, which are so curiously
wrought in earth. In summe, this man gave the originall name *Plastica* to the craft, and *Plastæ* to
the craftsmen in this kind. But *Lysistratus* of Sicyone, and brother to *Lysippus*, of whom I have
written before, was the first that in plastre or Alabaster represented the shape of a mans visage in
a mould from the lively face indeed; and when he had taken the image in wax, which the foresaid
mould of plastre had given, used to forme and fashion the same more exactly. This man staid not
there, but began to make images to the likenesse and resemblance of the person: for before him
every man studied onely to make the faitest faces, and never regarded whether they were like or
no. *Lysistratus* also invented to make counterfeits in cley, according to the images and statues in
brasse, already made. And in the end, this feat of working in cley grew to such height, that no ima- I
ges or statues were made without moulds of cley: Whereby it may appeare, that the skill and
knowledge of Potterie is more auncient than founderie or casting brasse. To come now to Ima-
geurs in cley, *Damophilus* and *Gorgasus* were counted most excellent & principall of all others,
and they were good painters besides: as may appear by the temple of *Ceres* in Rome, which stan-
deth at the greatest shew-place, called Circus Maximus, which these two workemen enriched
both with pictures, and also with earthen images: for in the said temple there be certain Greeke
verses set up, which testifie, That all the worke on the right hand was wrought by *Damophilus*, and
on the left hand by *Gorgasus*. Before this temple was built, *M. Varro* saith, That all Rome was
furnished with images, of Tuscane worke, and no other: but out of this church, when it was ree-
dified, the pictures upon the walls were esteemed so rich, that people thought them worthie to K
be cut out in great crusts and flakes out of the said walls; and for to save them, they bestowed cost
to set them in frames faire crested about the edges: also (by his report) the images wherewith the
festeries and lovers of the said church stood adorned, were dispersed into diverse parts of the citie,
as singular peeces of worke, and well was he that could have one of them. Moreover, I read, that
Chalcosthenes made diverse peeces of worke in raw cley at Athens, and the place called Cerami-
cos tooke the name of his worke-house. And *M. Varro* doth write, That himselfe knew at Rome a
certaine man named *Posis*, who was wont to make of cley, clustres of grapes, and fishes, so lively,
that whosoever looked upon them, could hardly have discerned them by the eye from grapes and
fishes indeed. The same author doth highly extoll and magnifie one *Arcesilaus*, a very familiar
Hee meaneth those whereby images of brasse were cast. friend of *Lu. Lucullus*, and whome hee loved very well, whose *moulds were commonly sold L
dearer even to workemen themselves, than the workes of others after they were finished. And
he saith, That the image of *Venus Genetrix*, which standeth in the Forum of *Cæsar*, was of his
making: but before he had fully finished the same, for hast of dedication, it was set up unperfect.
After which time (as he affirmeth) *Lu. Lucullus* bargained with him to make the image of *Felici-
tie*, for which hee was to have threescore thousand sesterces, howbeit, the death both of the one
and the other, was the cause that the worke was never finished. As for *Octavius*, a knight of Rome
being minded to make a fair standing cup, he paied unto him for the mould in plastre one whole
talent. The same *Varro* praiseth also *Praxiteles*, who was wont to say, that the craft of Potterie and
working in cley, was the mother of Founderie, and of all workes that are cut, engraven, chased,
and embossed: who, albeit he were an excellent founder and imageur in brasse, and knew how to M
carve, grave, and chase passing well, yet would hee never goe in hand to make any peece of worke,
but he would forme it first in cley, in a mould of his owne making. Moreover, this art (by his say-
ing) was much practised in times past, in Italie and Tuscane especially: from whence, and namely
out of the citie Fregellæ, king *Tarquinius Priscus* sent for one *Turianus*, to no other purpose in

the

A the world, but to agree with him for to make the image of *Iupiter* in earth to be ſet up in the Capitoll: for ſurely, no better hee was than made of clay, and that by the hand of a potter; which was the reaſon, that they uſed to colour him over with vermillon: yea and the charriots with foure horſes which ſtood upon the lanterne of the ſaid temple, were of no other ſtuffe; concerning which, I have ſpoken in many places. The ſame *Turianus* alſo made the image of *Hercules*, which at this day retaineth ſtill in the cittie that name, which teſtifieth what matter he is made of. Loe, what kind of images there were in thoſe daies made in the honour of the gods by our auncеſtors, for the moſt excellent! neither have we cauſe to bee aſhamed of thoſe our noble progenitours, who worſhipped ſuch and no other. As for ſilver and gold, they made no reckning thereof, either about themſelves or the verie gods whome they worſhipped. And verely, even at this
B day there continue ſtill in moſt places, ſuch images of earth. As for the feſtiers and lanterns of temples, there bee many of them both within the cittie of Rome, and alſo in divers burrough towns under the Empire, which for curious workemanſhip (as it were chaſed and engraven) are admirable; and for continuance of time more laſting and durable, than our louvers of gold; and for any harme they doe, leſſe ſubject I am ſure to injurie. Certes in theſe daies, notwithſtanding the infinit wealth and riches that wee are growne unto, yet in all our divine ſervice and ſolemne ſacrifices, there is no aſſay given or taſt made to the gods out of Caſſidoine or criſtall bolls, but onely in earthen cups. If a man conſider theſe things aright, and weigh them duly in particular, he ſhall find the bounty and goodneſſe of the Earth to be inenarrable, though he ſhould not reckon her benefits that ſhee hath beſtowed upon mankind, in yeelding us ſo many ſorts of corne,
C wine, apples, and ſuch like fruits, hearbs, ſhrubs, buſhes, trees, medicinable drugs, mettals, and minerals, which I have alreadie treated of: for even in theſe works of earth and potterie, which we are glutted with (they be ſo uſuall and ordinarie) how beneficiall is the Earth unto us, in yeelding us conduit-pipes for to conveigh water into our bains, tyles flat yet hooked and made with crochets at one end to hang upon the ſides of the roofe, chamfered for to lie in gutters to ſhoot off water, curbed for creſts to claſpe the ridge on both ſides; bricks to lie in walls afront for building, and thoſe otherwhiles to ſerve as binders in parpine-worke with a face on both ſides; to ſay nothing of the veſſels that be turned with the wheele and wrought round; yea and great tuns and pipes of earth deviſed to containe wine and water alſo? In regard of which ſtone and earthen veſſels, K. *Numa* ordained at Rome a ſeventh confraternitie of potters. Over and beſides, many
D men there have been of good works and reputation, who would not bee burnt to aſhes in a funerall fire after they were dead, but choſe rather to have their bodies beſtowed entire within coffins of earth, lying among leaves of myrtle, olive, and blacke poplar, after the Pythagorean faſhion: in which manner, *M. Varro* tooke order for to be interred. And if we looke abroad into the world, moſt nations under heaven doe uſe theſe earthen veſſels: and even ſtill, thoſe that bee made of Samian earth and come from that Iſle, are much commended for to eat our meats out of, and to be ſerved to the bourd: and Eretum here in Italie, retaineth yet the name for ſuch veſſell: but for drinking-cups onely, Surrentum, Aſia, and Pollentia, within Italie; Saguntum in Spaine, and Pergamus in Aſia, be in credit: at Tralleis alſo a citie in Sclavonia, and Modenna (to go no farther than Lombardie in Italie) there is made much faire veſſell of earth, appropriat unto thoſe
E places: for even in this reſpect, ſome nations are ennobled and growne into name. This earthen ware is of that price beſides, that it is thought a commoditie worth the tranſporting too and fro over land and ſea, by way of merchandiſe. But if we ſpeake of that kind that is wrought by turners craft with the wheele, the daintieſt veſſels come from Erythræ. And in verie truth, ſuch may the earth be, that much art and fine workmanſhip is ſhewed therein: in teſtimonie whereof, there be two ſtone veſſels or earthen (call them whether you will) within the principall temple of that citie to be ſeene at this day, thought worthie to be conſecrated there, in regard of their cleane worke and their thinneſſe beſides; which a maſter and his prentice wrought in a ſtrife and contention, whether of them could drive his earth thinneſt: however it bee, they of the Iſland Cos are moſt commended for the faireſt veſſels of earth; and yet thoſe of Hadria beare the name to be more
F durable, and of a more faſt and firme conſtitution. And ſince I am entred thus far, I will obſerve unto you ſome examples of ſeveritie not impertinent to this diſcourſe: I find upon record, that *Q. Ceponius* was condemned and fined for an ambitious man, onely for this, becauſe hee had ſent an earthen * amphor [of wine] as a preſent unto one who was to give him his voice when hee ſtood for an office. And that you may certainly know that veſſels of earth have in ſome ſort been

* *Vini amphoram*: I ſuppoſe that he meaneth the veſſell it ſelfe for wine, and not full of wine.

been in request among roiotous gluttons and wastfull spendthrifts, listen what *Fenestella* saith as touching this point, The greatest exceeding (quoth hee) and gaudiest fare at a feast, was served up in three platters, and was called Tripatinum: the one was of Lampreys, the second of Pikes, the third of the fish Myxon: whereby it may appeare, that even in those daies men began at Rome to grow out of order, and to give themselves to roiot and superfluitie: yet were not they so bad, but wee may preferre them even before the Philosophers of Greece: for it is written, that in the sale of *Aristotles* goods, which his heirs made after his decease, there were sold threescore platters, which were woont ordinarily to goe about the house. As for that one platter of *Æsope* the plaier in tragœdies, which cost six hundred thousand sesterces, I doubt not but their stomackes rise thereat when they read thereof in my treatise as touching birds. But this is nothing (I assure you) to that charger of *Vitellius*, who whiles hee was Emperour caused one to be made and finished that cost a * million of sesterces, for the * making whereof there was a furnace built of purpose in the field: the which I rather note, because you should see the monstrous excesse in these daies, that vessels of earth should be more costly than of Cassidonie. Alluding to this monstrous platter, *Mutianus* in his second Consulship (when hee ripped up in a publicke speech, the whole life of *Vitellius*, now dead) upbraided the verie memoriall of him in these very tearms, calling his excesse that way, Patinarum paludes, *i.* Platters as broad as pools. And verely (saith hee) that platter of *Vitellius* came nothing behind another, which *Cassius Severus* reproched *Asprenas* withall, whome hee accused bitterly and said, that the poison of that one platter, had killed a hundred and thirtie persons who had tasted thereof.

* *Decies sestertium*, according to *Budæus*: but if you read according to *Hotomanus*, *ducenties*, it is twentie times as much more.

* This platter he called, the targuet of *Minerva*, and hee gat himselfe therby a name to be called *Patinarius*. See *Sueton.*

Furthermore, there be certaine townes that are in good account by reason onely of this vessell made therein, and namely Rhegium and Cumæ.

The priests of *Cybele* the mother of the gods, who are called Galli, use to gueld themselves with a sheard of Samian earth; and they be of opinion, that if it be done with any thing else, they shall die thereof, if wee may beleeve *M. Cælius*, who whetted that tongue of his (which shortly after was in that sort to bee cut out) against *Vitellius*: which turned to his great reproach and infamie, for that himselfe even then railed upon *Vitellius* in so bad tearms, and lost his tongue for his labour.

But to conclude, what is it, that Art and the wit of man hath not devised? for there is means found to make a strong kind of mortar or cement by the broken sheards of potters vessell, if the same bee ground into powder and tempered with lime; and the ordering of it in this manner, causeth it to be more firme and last the longer; and such they call Signina. And hereby also men have found out certaine durable pavements of that kind.

Chap. xiii.

The varietie of sundrie kinds of earth: of the dust or sand of Puteoli: and of other sorts of earth which will harden as a stone.

OVer and besides the cement above-named, there bee other parcels that the earth it selfe doth affourd, fit to be laid in paving-worke: for who can sufficiently wonder at this, namely, That the woorst part of it (which thereupon is called dust and sand, as it were the verie excrement thereof) should be of that nature upon the side of the hills of Puteoli, as being opposed against the waves of the sea, and continually drenched and drowned therewith, should become a stone so compact and united togither as it were into a worke, that it scorneth all the violence of the surging billows; which are not able to undermine and pearce the same, but hardeneth every day more than other; even as if it were tempered with the strong cement of Cumes. Of the same propertie is the earth within the countrey about Cyzicum: onely this is the difference, that not the dust or sand there, but the earth it selfe cut out into what parcels you will, in case it be drenched in the sea water a certaine time, is taken forth againe a verie hard stone. The same (by report) happeneth about the cittie Cassandria: as also about Gnidos in a fountaine of fresh water, wherein if earth doe lye, within the space of eight moneths it will turne to be a stone. Certes, all the way as a man goeth from Oropus as farre as to Aulis, what ground soever is beaten upon by the water, chaungeth into rocks and stones. There is found also in Nilus a certaine sand, whereof the finest part differeth not much from that of Puteoli beforesaid; not in regard

that

A that it is so strong as to breake the force of the sea water and to beat backe the waves, but to subdue and crush the bodies of our young gentlemen, and therefore serveth well in the publicke place of wrestling for those that bee given to such exercises: And for this purpose verely was it brought from thence by sea unto *Patrobius*, a slave lately enfranchised by *Nero* the Emperour. I read also, that *Leonatus*, *Cratus*, & *Meleager*, who were great captains under *Alexander* the Great and followed his court, were woont ro have this sand carried with them, with other baggage belonging to the campe. But I meane not to write any more of this argument, no more verely than of the use of earth in those places where our youth annoint their bodies against they should wrestle; wherein our youths addict themselves so much to the exercise of the bodie, that they have spoiled themselves otherwise, and lost the vigor of the mind.

B

Chap. xiiii.

Of mud walls: of Bricke walls, and the order and manner of making them.

WHat shall wee say? See wee not in Affricke and Spaine both, certaine walls of earth, which they call * Fornacei, of the forme and frame that is made of planks and bourds of each side, betweene which a man may say they are rather infarced and stuffed up, than otherwise laid and reared orderly: but I assure you, the earth thus infarced, continueth a world of yeers and perisheth not, checking the violence of raine, wind, and fire, no mortar and C cement so stiffe and strong. There are yet to be seene in divers parts of Spaine, the watch-towers of *Anniball*, the high turrets and skonces also reared upon the tops of hills, made all of earth: and hereof wee have our turfs, which naturally are so proper not onely for the rampiers and fortifications of a campe, but also for wharfs, bankes, and buttresses, to breake the violence and inundation of rivers. As for the manner of making walls, by dawbing windings and hurdles with mud and clay, also of rearing them otherwhiles with unbaked bricke; who is so ignorant that he knoweth it not? Howbeit, for to make good bricks, they ought not to be made of any soile that is full of sand and gravell, much lesse then of that which standeth much upon grit and stones, but of a greyish marle or whitish chalkie clay, or at leastwise a reddish earth: but in case wee be forced to use that which is given to bee sandie, yet wee must chuse that kind of sand which is tough and D strong. The best season to make these brickes or tyles, is in the Spring time; for in the mids of Summer they will cleave and be full of chinks: but if you would have good bricks for building, they ought to bee two yeers old at the least. Now the batter or lome that goeth to the making of them, ought to bee well steeped and soked in water, before it bee fashioned into bricke or tyle. Bricks are made of three sizes: The ordinarie bricke that wee use, is called Didoron, which carrieth in length one foot and a halfe, and in breadth a foot: a second sort is named Tetradoron, *id est*, three foot long: and the third, Pentadoron, of three foot and nine inches in length: for the Greeks in old time, called the span or space of the hand from the thumbe to the little fingers end stretched out, Doron; which is the reason that gifts and rewards be called in their language, Doræ, for that they were presented by the hand. You see therefore, how according to the length E that they carrie, either of foure or five spans, they have their denomination of Tetradora, or Pentadora; for the breadth is one and the same in them all, to wit, one foot over. Now there being this difference in the size, in Greece the manner is to employ the smaller sort in their privat buildings, but the bigger serveth for greater publicke workes. At Pitana in Asia, and in Massia and Calentum, citties of low Spaine, the bricks that be made, after they are once dried, will not sinke in the water, but flote aloft; for of a spungeous and hollow earth they be made, resembling the nature of the pumish stone, which is very good for this purpose, when it may be wrought. The Greeks have alwaies preferred the walls of bricke, before any others, unlesse it be in those places where they had flint at hand to build withall: for surely such bricke walls, if they be made plumbe upright & wrought by line and levell, so as they neither hang nor be battred, be everlasting: and I therfore such bricks serve for walls of cities & publick works; their roiall pallaces likewise be built therewith. After this sort, was that part of the wall at Athens laid and reared, which regardeth the mount Hymettus: so they built also at Patræ, the temples of *Iupiter* and *Hercules*, although all the columns, pillars, and architraves round about them, were of ashler stone: thus was the pallace of K. *Attalus* built at Tralleis; likewise that of K. *Cræsus* at Sardis, which afterward was converted

* Some read *fornacei*, i. arched walls.

to their Senate-houſe, named Geruſia: likewiſe the ſumptuous and ſtately houſe of K. *Mauſolus* at Halicarnaſſus: which goodly ædifices continue at this day. Wee read in the Chronicles, that *Muræna* and *Varro* when they were the high Ædiles at Rome, cauſed the outmoſt coat which was overcaſt of the brick-walls of Lacedæmon, to be cut out whole and entire, and to be ſet and encloſed within certaine frames or caſes of wood, and ſo to be tranſlated from thence to Rome, for to adorne and beautifie the publicke hall for elections of magiſtrates, called Comitium; and all for the excellent painting upon that parget. The workmanſhip therein although it were excellent & wonderfull in it ſelfe, yet being thus removed and brought ſo far aſide, it was eſteemed more admirable. Moreouer, here within Italie the walls of Aretine and Mevania be made all of bricke: marie at Rome they dare not build their houſes with this kind of brick, becauſe a wall bearing in thickneſſe but one foot and an halfe, will not ſuſtain above one *ſingle ſtorie: for the order of the citie permitted not the common wals and thoſe which were outmoſt, to be thicker than a foot and an halfe: neither will the partition wals within abide that thickneſſe, but are made after another ſort.

* For by reaſō that Rome was ſo populous, they made many lofts over head, ſo that the building was raiſed to 60 and 70 foot in upright walls: & theſe ſerved as tenements, & were called *Cœnacula*, & one paire of ſtaires leading into the ſtreet, ſerved them al: whereas the lord and maſter of the houſe kept beneath with his houſhold, and was not troubled with theſe tenants or in-mates.

Chap. xv.

Of Brimſtone and Alume, with their ſeverall kinds: alſo their medicinable properties.

HAving ſpoken ſufficiently of Brickes, it remaineth that I ſhould proceed to other kinds of earth: wherein the nature of ſulphur or brimſtone is moſt woonderfull, beeing able as it is to tame and conſume the moſt things that be in the world. It is ingendred within the Iſlands Æoliæ, which lie betweene Italie and Sicilie; thoſe I meane which (as I have ſaid before) doe alwaies burne by reaſon thereof. Howbeit, the beſt ſulphur is that which commeth from the Iſle Melos. There is found thereof likewiſe in Italie, within the territorie about Naples and Capua, and namely in the hils called Leucogæi: that which is digged out of the mines, is fined and brought to perfection by fire. Of brimſtone there be foure kindes: to wit, Sulphur-vif or Quick-brimſtone, which the Greeks call Apyron, becauſe it never came into the fire: the ſame is found ſolid of it ſelfe, that is to ſay, by whole pieces and in maſſe, which their Phiſicians doe uſe, and none but it: for all the other kinds conſiſt of a certaine liquid ſubſtance, and beeing boyled in oyle are made up and confected to their conſiſtence: whereas the ſulphur-vif is digged out of the mine ſuch as we ſee, that is to ſay, tranſparent cleere, and greeniſh. The ſecond kind is named Gleba, good onely for Tuckers and Fullers. The third ſort alſo yeeldeth but one uſe and no more, and that is, for tincture of wooll, by reaſon that the ſmoke and perfume thereof will bring it to be white and ſoft; and this brimſtone they call Egula. As for the fourth kind, it ſerveth moſt of all for matches and wieks.

As touching the nature of Brimſtone, ſo forcible it is, that if it bee caſt into the fire, the verie ſmell and ſteeme thereof will drive thoſe in the place into a fit of the falling ſickneſſe, if they bee ſubject thereunto. As for *Anaxilaus*, he would commonly make ſport withall at a feaſt, and ſet all the gueſts into a merriment: for his manner was to ſet it a burning within a cup of new earth over a chafing-diſh of coales, and to carrie it about the table where they were at ſupper: and in verie truth the reverberation of the flame would make all that were neere it to looke pale and wan after a moſt fearfull manner, like as if there were as many griſly ghoſts or dead mens faces. And to come more neere to the properties that it hath reſpective unto Phyſicke, It heateth mightily, and is a maturative: it doth reſolve withall and diſcuſſe any gathering of impoſtumes; in which regard it entreth ordinarily into ſuch plaſtres that be diſcuſſive and emollitive. A cataplaſme made with it incorporat with greaſe or ſewet, and ſo applied unto the loynes and region of the kidneies, doth woonderfully aſſuage the paine and griefe in thoſe places: beeing tempered with turpentine, it riddeth away the foule tetters called Lichenes that ariſe in the face; yea and cleanſeth the leproſie. The Greekes have a prettie name for it and call it Harpacticon, for the ſpeedie remooving and ſnatching it from the place where it is applied; for eftſoons it ought to bee taken away. The ſame reduced into a lohoch or liquid electuarie, is good to be licked and let downe ſoftly towards the lungs, in caſe of ſhortneſſe and difficultie of wind: in which ſort it ſerveth for them that ſpit and reach out of the breaſt by coughing, filthie matter: and ſoveraigne it is for thoſe that be ſtung with ſcorpions. Take ſulphur-vif,

mix

A mix it with ſal-nitre, grind the ſame togither with vinegre, it maketh a ſingular good liniment for to ſcoure the foule morphew: let the ſame be tempered and prepared with vinegre of Sandaracha, it killeth the nitts that breed in the eye-lids. Moreover, brimſtone is emploied ceremoniouſly in hallowing of houſes; for many are of opinion, that the perfume and burning thereof, will keepe out all enchauntments, yea and drive away foule fiends and evill ſprites that do haunt a place. The ſtrength of ſulphur is evidently perceived and felt in the ſprings of hot waters, that boile from a veine of it: neither is there in all the world, a thing that ſooner catcheth fire; wherby it is apparent, that it doth participat much of that element. Thunderbolts and lightnings in like manner doe ſent ſtrongly of brimſtone: the verie flaſhes and leams thereof ſtand much upon the nature of ſulphur, and yeeld the like light. Thus much ſhall ſuffice as touching the na-
B ture of ſulphur.

The nature of Bitumen approcheth neare unto brimſtone: where it is to be noted in the firſt place, that the bitumen whereof I ſpeake, is in ſome places in manner of a muddie ſlime; in others, a verie earth or minerall. The ſlimie bitumen ariſeth (as I have ſaid before) out of a lake in Iurie: as for the minerall bitumen, it is found in Syria, about a maritime town upon the ſeacoaſt, called Sidon: but both the one and the other are of a compact and maſſie ſubſtance, growing together faſt and unite. And yet there is a kind of Bitumen liquid, and namely that of Zacynthus, and the Bitumen which is brought from Babylon, where verely it is white naturally as it groweth. The Bitumen alſo which commeth from Apollonia is liquid: and all theſe the Greeks doe comprehend under one name Piſſaſphalton, a word derived of Pitch and Bitumen. There is
C a fattie kind of Bitumen likewiſe reſembling an unctuous or oleous liquor, within the territorie of Agragentum in Sicilie, ariſing out of a fountaine, and it floteth aloft: The Inhabitants of the countrey uſe to skum and fleete it off by the meanes of certaine chats or catkins which grow upon many reeds and canes, for quickly will it hang and cleave to the downe of ſuch. Great uſe they have of this Bitumen, for it ſerveth their turns to maintaine lamp-light, inſteed of oile: and therewith alſo they kill the farcins, ſcabs, and mange in their jades and labouring garrons. Some writers there be who reckon Naphtha (whereof I haue written in my ſecond booke) to be a kind of Bitumen; but ſo ardent it is, and holdeth ſo much of the fire, that we know not which way to make any uſe thereof. Concerning the markes of good Bitumen, the beſt is knowne by the gloſſe that it carrieth, if it ſhine exceeding much: the ſame alſo is ponderous and weightie:
D whereas the lighter ſort is but indifferent heavie, and argueth ſome ſophiſtication with pitch. In operation it hath the qualities of brimſtone; a bringent it is, and yet reſolutive: it draweth together and ſoldereth withall. A perfume thereof, while it burneth, chaſeth away ſerpents. The Babylonian Bitumen is thought to be verie effectuall for the cataracts, pearles, and filmes that overſpred the eies: ſoveraine likewiſe for the leprie, the filthie tettars of the face called Lichenes, and the itch in any part of the bodie: it ſerveth in a liniment for the gout: and there is no kind thereof, but it cauſeth the haires of the eye-lids, which grow untowardly and fall into the eyes, for to turne up againe. If the teeth bee well rubbed with Bitumen and ſal-nitre together, it doth eaſe and aſſuage their paine: and beeing given in wine, it helpeth an old cough, and the ſhortneſſe of wind. In caſe alſo of the diſſenterie, it is taken in that manner, for it ſtaieth a bloudie flix: but if it bee drunke with vinegre, it doth diſcuſſe and diſſolve *cluttered bloud which
E is within the bodie, and expelleth the ſame downeward by ſeege: it dooth likewiſe aſſuage the paine of the loines or ſmall of the backe, and generally mittigateth any greefe of the joints, if it bee laid too in manner of a cataplaſme with Barley meale. There is a ſpeciall plaſtre or cataplaſme made of Bitumen, which carrieth the name thereof; it ſtaunch eth bloud, it bindeth and draweth together the edges of a wound, alſo it knitteth and uniteth againe ſinewes which bee cut in twaine. There is an ordinarie medicine alſo for the quartane ague, made in this wiſe: Take of Bitumen one dram, of Mints the like weight, of Myrrhe the quantitie of one Obolus, mix and incorporat all theſe together: A perfume or ſmoake thereof will bewray the falling ſickneſſe. The very ſmell of Bitumen alſo diſcuſſeth the fitts of the mother when it riſeth and
F ſtoppeth the womans breath: A ſuffumigation thereof, doth likewiſe reduce the mattice and tiwill into the right place, if they bee ſlipped and fallen downe too low, and readie to hang foorth of the bodie: Being drunke with wine and Caſtoreum, it bringeth the ordinarie courſe of the monethly tearmes in women. It ſerveth alſo for diverſe and ſundrie other uſes than in Phyſicke: for if any braſen pots, chaufers, pans or kettels, and ſuch like veſſels, bee enhuiled there-

* Hereupon is an ordinarie medecine, to give *Mumia* (which is *Piſſaſphaltō*) unto thoſe that are falne from on high and be inwardly bruiſed.

therewith, it hardeneth them againſt the violence of fire. I have ſaid alreadie, that they were wont in old time to verniſh their images with bitumen: it hath ben uſed in mortar alſo in ſtead of lime, and with that kind of cement were the walls of Babylon laid, and the ſtones ſodered togither. Iron-ſmiths alſo have much uſe of bitumen, and namely, in ſanguining or colouring their iron-worke; and nailers eſpecially about their naile heads; many other wayes likewiſe it ſerveth their turne. G

As touching Alume, which we take to be a certaine ſalt ſubſtance or liquor iſſuing out of the earth, there is no leſſe uſe thereof than of bitumen, and the emploiment is not much unlike. Of alume there be many kinds: in the Iſland Cypreſſe there is found alume which they call White, and another named Blacke: and albeit the diſtinction in the colour bee but ſmall, yet it is occupied to farre different uſes; for the cleare alume which they name the white, is proper for to colour wooll with any bright tincture; contrariwiſe, the blacke ſerveth for ſad, darke, and browne colours. The foreſaid blacke alume is occupied much by goldſmiths, to purge and purifie their gold: and yet all theſe alumes the one as well as the other, be engendred of water & ſlimie mud, that is to ſay, of a certaine ſweat that the earth naturally doth yeeld: it is ſuffered to run and gather togither into a place, during winter; and in the heat of the ſummer, it fermenteth and taketh the perfection: that which commeth ſooneſt to concoction and ripeneſſe, the ſame is alwaies the whiteſt and pureſt. As touching the mines of alume, they grow naturally in Spaine, Ægypt, Armenia, Macedonie, Pontus, and Affricke, which be all countries of the continent: in the Iſlands likewiſe it is found, namely in Sardinia, Melos, Lipara, and Strongyle. The beſt ſimply is that which commeth out of Ægypt, and in the next place is that accounted of Melos. In ſum, alume may be reduced into two principall kinds; for either it is pure and cleare, or els thicke and groſſe: As for the former kind, it may be knowne whether it be good and naturall, if it be bright like water, and white as milke, not offenſive to their hands that rub it, & yet participating in ſome ſort of a fierie heat; this they call Phormion: but in caſe it be ſophiſticat, you may ſoon find it by the juice of a pomegranat; for that which is true and in the right kind, is no ſooner mixed therewith, but it waxeth blacke. The ſecond ſort is of a pale colour, and beſides naturally rugged in the hand, and lightly it will ſtaine like gall nuts; which is the reaſon that the Greeks call it Paraphoron. The vertues of the cleare alume, be aſtringent, hardning, and fretting: if it be tempered with honey, it healeth the cankers or ſores in the mouth: wheals and itch it likewiſe cureth in any part of the bodie: but this inunction muſt be uſed in a baine; and regard ought to be had of it in the proportion, namely, that there be two third parts of honey to one of alume. The ranke ſmell of the arme-holes it doth allay, and repreſſeth ſweat and the ſtinke thereof: it is taken in pills, for the obſtructions and ſchirrhoſities of the ſpleene: and in that ſort, it driveth away an itch & ſendeth forth corrupt bloud by urine: made into an unguent with Sal nitre and Nigella Romana, it healeth the bleach or ſcabs. Of alume that is thicke, hard, and maſſive, there is one kind which the Greeks call * Schiſtos, and the nature thereof is to cleave along into certaine filaments or threads like haires, of a greyiſh colour; which is the reaſon that ſome have given it rather the name of Trichitis: howſoever it be named, it commeth of a certaine marqueſit ſtone, wherupon alſo they call it Chalcitis; ſo as it may be counted a verie ſweat of the ſaid ſtone, gathered togither or congealed into a fome. This kind of alume is exiccative; howbeit, not ſo good as the other to repreſſe any offenſive humors in the bodie: but ſurely it is ſingular for the ears, either infuſed, or applied as a liniment: it helpeth alſo the ſores of the mouth, if a man let it melt togither with the ſpittle or moiſture of the mouth: for eyeſalves likewiſe it ſerveth fitly among other ingredients; and is verie appropriat for the accidents befalling to the ſecret parts of either ſex, as well men as women: but before it bee uſed, it would be boiled upon a pan over the fire, untill it give over to melt. There is another ſort of alume, that is weaker in operation, which the Greeks call Strongyle: and this likewiſe is found of two ſorts; the one is hollow and light in maner of muſhroms, eaſie to bee melted in any kind of liquor; and this is altogither rejected as good for nothing: the other is hollow alſo and light in manner of a pumiſh ſtone, full of holes too, but reſembling the pipes rather of ſpunges; the ſame is round in forme, and enclining to a white colour; a certaine unctuoſitie or fattineſſe it carrieth with it, apt to breake and crumble, and yet without ſand, neither will it colour and ſtaine the fingers blacke in the handling: this muſt bee calcined by it ſelfe upon cleare burning coles, untill ſuch time as it bee reduced into aſhes. But would you know the beſt and principall alume of all the ſorts that are? It is that (no doubt) H I K L M

* Some take this for alume de plume: others, for the ſtone *Amiantus*.

which

A which (as I have ſaid before) is brought out of the Iſland Melos, and therefore called Melinum. Certes, there is not an Alume more aſtringent, nor more proper to harden: none more firm and thicke than it. It doth ſubtiliat the roughneſſe of the eyes: and being calcined, it is the better for to repreſſe the fluxion of humors into the eyes: and in the ſame ſort prepared, it killeth the itch in any part of the bodie: generally, whereſoever it is applied outwardly, it ſtaunch eth bloud: being uſed in a liniment with vinegre unto any place where the haire hath been plucked up, it cauſeth that which commeth againe to be but ſoft and in manner of a downe. There is no kind of it, but the ſame is exceeding aſtringent, whereupon it tooke the name in *Greek. In regard of which ſtypticitie, they are all very good for the accidents of the eyes. Alume incorporat with ſome greaſe or fat, is ſingular to repreſſe the flux of bloud: very proper alſo for the red gum incident to
B children: and in the ſame ſort ſtaieth ſuch ulcers as tend to putrifaction, yea, it drieth up the breaking forth of *wheales and puſhes. With the juice of the Pomgranat, it is good for the infirmities of the eares; in which ſort it doth amend the raggedneſſe of the nailes, the hardneſſe and nodoſitie of cicatrices or skars, the excreſſence and turning up of the fleſh about the naile roots, and the kibes of the heeles. With vinegre, or calcined with the like weight of gall nuts, it is excellent for cankers and inflammations of ſuch ulcers as bee corroſive. Tempered with the juice of Beets or Coleworts, it cleanſeth the leproſie. Incorporat with two parts of ſalt, it healeth thoſe ſores which are given to eat and ſpread farther: and mingled with water, it riddeth away nits, lice, and ſuch vermine breeding in the head; in which manner it healeth burnes and ſcalds. But with pitch and the floure of Erviles, it ſcoureth away dandruffe and ſcurfe in any part of the bodie. In a
C clyſtre, Alume is ſoveraigne for the bloudie flix. It ſerveth likewiſe for the uvula in the mouth and the inflammation of the Amygdales. In one word, for all thoſe purpoſes which I have ſaid, other ſorts of Allume are good for, we muſt alwaies thinke, that the Alume brought from Melos, is the beſt and moſt effectuall. As touching other uſes beſides Phyſicke, wherein it is emploied neceſſarily, and namely in dreſſing of skins and colouring wooll, of what reckoning it is, I have ſhewed alreadie. It remaineth now to treat of all other kinds of earth reſpectively, as they ſerve in the uſe of Phyſicke.

*στυπτικὸν

*Papularum.

Chap. xvi.

Of the diverſe ſorts of earth, to wit, of Samia, Eretria, Chia, Selinuſia, Pnigitis, and Ampelitis, together with their medicinable properties.

D

FRom the Iſle Samos there be brought two kinds of earth: whereof the one is called by the Greeke's Syropicon, the other Aſter. As for the former, the commendation of it, is to bee freſh, light, and cleaving to the tongue: The other, is white, and of a more compact conſtitution: but both the one and the other, before they be uſed, ought to bee calcined and waſhed. Some there be who preferre the former: but both bee very good for thoſe that ſpit bloud. They enter into emplaſtres, which are deviſed and made for to exiccate: and they are mingled alſo with eye-ſalves.

Touching the earth Eretria, diſtinguiſhed it is likewiſe by two kinds, for ſome there is of it
E white, others of aſh colour: and this for Phyſicke is held to be the better. It is known to be good, if it be ſoft in hand; and, if upon a peece of braſſe it draw a line of purple colour. What power it hath, and how it is to bee uſed in Phyſicke, I have ſhewed alreadie in my diſcourſe of painters colours. But this is a generall rule in all kinds of earth (for I will put it off no longer) that are to bee waſhed, Firſt to let them lie well ſteeped in water, then ought the ſame to bee dried in the Sunne; which done, it ought once againe to be braied in water, and let to reſt untill they bee ſettled, that they may bee digeſted and reduced into trochiskes. But for the burning and calcining of theſe earths, it ought to bee done in certaine pots, and eftſoones followed and plied with ſhaking and ſtirring.

Among the ſorts of earth that bee medicinable, there is reckoned that which commeth from
F Chios, and the ſame is white, having the ſame effects that the earth of Samos: but our dames uſe it moſt for to embelliſh and beautifie their skin. To which purpoſe, the earth of Selenus likewiſe is employed: White this earth is as milke, and of all others, will ſooneſt reſolve in water; which if it be tempered with milke, ſerveth to whiten and refreſh the pargetting and painting of walls.

The earth called *Pignitis, is very like unto Eretria beforenamed, onely it is found in greater clots

*Some read Pnigitis.

clots or peeces, and otherwise is glutinous. The same effects it hath that Cimolia, howbeit, somwhat weaker in operation. G

There is an earth called Ampelitis, which resembleth Bitumen as neare as may be. The triall of that which is good indeed, is, if in oyle it be gentle to bee wrought as wax; and if when it is torrified, it continue still of a blacke colour. It entereth into medicines and compositions, which are made to mollifie and discusse: but principally it serveth to beautifie the eyebrowes, and to colour the haire of the head blacke.

Chap. xvii.

Sundrie sorts of chaulkes for to scoure clothes, and namely the Tuckers earth Cimolia, Sarda, and Vmbrica. Of the common chaulke: and of Tripolium. H

OF chaulkes there be many kinds: of which, Cimolia doth affourd two sorts, and both pertinent unto Physicke; the one is white, the other enclineth to the colour of Roset. Both the one and the other is of power to discusse tumors, and to stay destillations, if they bee used with vinegre. They doe keepe downe biles in the emunctories and swellings behind the ears: the foule tettars also, and other offensive pimples and pushes they represse, applied in the forme of a liniment: incorporat therewith sal-petre, sal-nitre, and put vinegre thereto, it is an excellent medicine to allay the swellings of the feet; with this charge, that this cure be done in the Sunne, and that after sixe houres, the medicine bee washed off with salt water: Put thereto the cerot Cyprinum, it is singular good for the swelling of the genetoires. This Fullers earth Cimolia is of a cooling nature, and being used in the forme of a liniment, it staieth immoderat sweats. The same taken inwardly with wine in the baine or hote house, restraineth the breaking foorth of pimples. The best of this kind, is that which commeth out of Thessalie. It is to bee found also in Lycia about Bubon. There is over and besides another use of this Cimolia or Tuckers cley, to wit, in scouring clothes. As for the chaulke Sarda, so called because it is brought out of Sardinia, it is employed onely about white clothes, for if they bee motley or pied coloured, it is of no use. Of all kinds of Cimolia it is the cheapest, and of basest account: yet that of Vmbria is of more price, and that which they call Saxum in Latine, and is our ordinarie white chaulke: This propertie it hath, that with lying in water it groweth; this is commonly bought therefore by weight, whereas the other is sold by measure. As for the foresaid earth of Vmbria, it serveth onely for to polish and give a glosse to clothes: for why should I scorne or thinke much to handle this matter also? seeing there is the expresse law or act Metella provided for Fullers, the which, *C. Flaminius* and *Lu. Aemylius*, when they were Censors, proposed unto the people for to be enacted; so carefull were our predecessors, to take order for all things. To come then to the mysterie of Fullers craft: First they wash and scoure a peece of cloth with the earth of Sardinia, then they perfume it with the smoake of brimstone, which done, they fall anone to burling of it with Cimolia; provided alwaies that it bee the right and have the native colour, for if it be sophisticat, it is soone knowne by this, that it waxeth blacke, and will chaune and cleave, if it come after sulphur: and if it be the true Cimolia, it doth refresh and give a chearefull hew to precious and rich colours, yea it setteth a certaine glosse and lustre vpon them, if they were made duskish and sad by the smoake of sulphur. But in case the clothes bē white, then the common chaulke is better to bee used presently after the brimstone: for hurtfull it is to other colours. In Greece, they use in stead of Cimolia, a certaine plastre which they have from Tymphe. Yet is there another kind of chaulke or white cley, named *Argentaria, for that it giveth a glistering silver colour unto clothes. Howbeit, one sort more there is of chaulke, which of all others is most base and least esteemed; this is that chaulke, wherewith our aunce stours in old time ordained to whiten the cirque, in token of victorie: wherewith also they use to marke the feet of those slaves which were brought over from beyond sea, to be bought and sold in the markets: such an one sometime was that *Publius*, the deviser of riming and wanton jestures upon a stage: such another was his cousin germaine, *Manilius Antiochus*, the Astrologer; yea, and *Taberius Erotes* the excellent Grammarian: whom all three, our great grandfathers saw in that manner brought over in one and the same ship. I K L M

Chap.

Chap. xviii.

Who they were in Rome, and of whom enfranchised, that of slaves rise to be mightie, and of exceeding wealth?

BVt what meane I to stand upon those who had learning to commend and bring them into some state of credite and honour? Have not the same forefathers of ours seene in the like plight standing within a cage, with a marke of chaulke upon their feet, and a locke about their heeles, *Chrysogonus* the slave to *Sylla*, *Amphion* to *Qu. Catulus*, *Hero* to *Lu. Lucullus*, *Demetrius* to *Pompey*, *Auge* the bondmaid to *Demetrius* (though she was thought to be the base daugh-
B ter of *Pompey*,) *Hipparchus* the slave of *Antonius*, *Menas* and *Menecrates* of *Sex. Pompeius*, and an infinit sort of others, whom I cannot reckon up? and yet they all beeing by their maisters enfranchised, became wonderfull rich by the bloudshead and goods of Romane citizens, in that licentious time of proscriptions. Well, this was the marke of slaves set out by companies in the market to be sold: and this is the opprobrious & reprochfull note, to twit those by, that in their fortunes are growne insolent. And yet we in our daies have knowne the same persons to climbe unto the place of highest honour and authoritie, insomuch as we have seene with our owne eyes the Senat (by commandement from *Agrippina* the Empresse, wife to *Claudius Cæsar*) to decree unto enfranchised slaves, the robes of Pretours, with the badges and ornaments to that dignitie belonging; yea, and such to bee sent againe as it were with the axes and knitches of rods decked with
C Lawrell, into those countries to governe, from whence they came at first poore slaves with their feet chalked and marked for the market.

Chap. xix.

Of the earth of Galata, and Clupea: Of the Baleare earth, and Ebusitana.

D OVer and above those before rehearsed, there bee other sorts of earth, having a propertie by themselves, which I have named heretofore, but in this place I am to set downe their nature and vertues also. There is a kind of earth comming out of the Isle Galata, and about Clupea in Affricke, which killeth scorpions: like as the Balearike and Ebusitane earth, is the death of other serpents.

THE XXXVI. BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

¶ The Proëme.

CHAP. I.

The natures and properties of Stones: The excessive expence in columnes and buildings of Marble.

IT remaineth now to write of the nature of Stones, that is to say, the principall point of all enormious abuses, and the very height of wastfull superfluities, yea though we should keepe silence, and say nothing either of precious stones and amber, or of Chrystall and Cassidonie. For, all things els which we have handled heretofore even to this booke, may seeme in some sort to have beene made for man; but as for mountaines, Nature had framed them for her owne selfe; partly to strengthen (as it were) certaine joints within the veines and bowels of the earth; partly to tame the violence of great rivers, and to breake the force of surging waves and inundations of the sea: and in one word, by that substance and matter whereof they stand, which of all others is most hard, to restraine and keepe within bounds that unruly element of the Water. And yet notwithstanding, for our wanton pleasures and nothing else, we cut and hew, wee load and carie away those huge hils and inaccessible rockes, which otherwise to passe onely over, was thought a woonder. Our auncestors in times past reputed it a miracle, and in manner prodigious, that first *Annibal*, and afterwards the Cimbrians, surmounted the Alpes: but now, even the same mountains wee pierce through with picke-ax and mattocke, for to get out thereof a thousand sorts of marble; we cleave the capes and promontories; wee lay them open for the sea, to let it in; downe wee goe with their heads, as if wee would lay the whole world even, and make all levell. The mightie mountaines set as limits to bound the frontiers of diverse countries, and to separat one nation from another, those we transport and carrie from their native seat: ships we build of purpose for to fraught with marble: the cliffes and tops of high hils they carrie too and fro, amid the waves and billowes of the sea, and never feare the daunger of that most fell and cruell element: wherein verely we surpasse the madnesse and vanitie of those, who search as high as the clouds for a cup to drinke our water cold; and hollow the rockes that in manner touch the heaven, & all to drinke out of *yce. Now let every man thinke with himselfe what excessive prices of these stones he shall heare anone, and what monstrous peeces and masses hee seeth drawne and carried both by land and sea; let him consider withall, how much more faire and happy a life many a man should have without all this, and how many cannot chuse but die for it, whensoever they goe about to doe, or, if I should speake more truly, to suffer this enterprise: Also, for what use else, or pleasure rather, but onely that they might lie in beds and chambers of stones that forsooth are spotted, as if they never regarded how the darkenesse of the night bereaveth the one halfe of each mans life of these delights and joies. When I ponder and weigh these things in my mind, I must needs thinke great shame, and impute a great fault to our forefathers that lived long since, & blush in their behalfe. Lawes were enacted, and prohibitions published by the Censors, and those remaining upon record,

*Vt bibatur glacie, for they held Crystall to be a kind of yce.

A cord, forbidding expreſſely, That neither the kernellie part of a Bores necke, nor Dormice, and other ſmaller matters than theſe to be ſpoken of, ſhould be ſerved up to the bourd at great feaſts: but as touching the reſtraint of bringing in marble, or of ſailing into forraine parts for the ſame, there was no act or ſtatute ordained.

Chap. ii.

Who was the firſt that ſhewed Marble ſtones in columnes, or any publicke workes at Rome.

B But ſome man haply might replie againe upon mee, and ſay: What need was there of any ſuch ordinance, conſidering there was no marble in thoſe daies brought in from ſtraunge countries? Vnto whom I anſwere, That it is a meere untruth, for even our progenitours, of whom I ſpeake, ſaw well ynough how in that yeare when *M. Scaurus* was Ædile, there were no fewer than three hundred and threeſcore pillars of marble tranſported to Rome, for the front and ſtage of a Theatre, which was to continue a ſmall while, and ſcarcely to be uſed one month to an end: and yet no law there was to checke and controule him for it. But it may be inferred againe, the Lawyers winked hereat, becauſe he did all this for a publicke pleaſure to the whole citie, during the plaies exhibited by him in his Ædileſhip: marie that is it that I would have, What reaſon I pray you had they ſo to doe? By what meanes more doe abuſes and enormities creepe into a citie or ſtate, than by a publicke preſident given? for I aſſure you it was nothing elſe but ſuch ex-
C amples at the firſt that brought thoſe other things, I meane yvorie, gold, jewels, and precious ſtones, to be uſed by privat perſons, ſo commonly as they be, in their houſes, plate, & ornaments. And what have we left and reſerved at all for the very gods to have, ſince that we lay ſo much upon our ſelves? But ſay that in thoſe daies they did tollerat this exceſſe in *Scaurus*, becauſe of the paſtimes that he did exhibit to the whole citie; What, were they ſilent alſo and made no words, when the ſaid *Scaurus* cauſed the biggeſt of all thoſe columnes (yea thoſe that were fortie foot high within twain, and the ſame of Lucullean black marble) to be erected and placed in the court before his owne houſe in mount Palatine? And leaſt any man ſhould ſay, that this was done in ſecret and hucker mucker, know he, That when theſe pillars were to be carried up into the mount Palatine where his houſe ſtood, the Baliſe that had the charge of the publick ſinkes vaulted un-
D der the ground, dealt with *Scaurus* for good ſecuritie, yea, & demanded cautions and ſureties for ſatisfying of all harmes and damages that might be occaſioned by their carriage, ſo huge & heavie they were. Conſidering then this bad example, ſo prejudiciall unto all good manners, and ſo hurtfull to poſteritie, had it not been better for the citie to have cut off theſe ſuperfluities by holeſome lawes and edicts, than thus to permit ſuch huge and prowd pillars to bee carried unto a privat houſe up into the Palatine mount, even under the noſe of the gods, whoſe images were but of earth, and hard by their temples that had for their covers and louvers no better than ſuch as were made of potters cley?

Chap. iii.

E

The firſt man who had at Rome for his owne uſe, pillers of Marble brought from forraine lands.

NEither can it be alleadged for excuſe of this tolleration in *Scaurus*, that he tooke the vantage and ſpied his time when the citie of Rome was not ware of any ſuch matter toward, as having not beene acquainted beforetime with the like, and therefore hee ſtale upon them with theſe ſuperfluous pompes, as doubting nothing leſſe than ſuch new deviſes, and therfore having no time to prevent and ſtay them: for long before this, *L. Craſſus* that great Orator, who was the firſt that enriched his houſe (within the ſame Palatium) with pillers of outlandiſh marble, al-
F though they were but of the Quarrie in Hymettus hill, and neither more in number than ſix, nor carrying in length above twelve foot apeece, was reproved and reproched for this pride and vanitie by *M. Brutus*, who among other hote words and biting tearmes that paſſed enterchaungeably between them, taunted him by the name of *Venus Palatina*. Certes, conſidering how all good orders and cuſtomes otherwiſe were troden under foot, we are to preſume thus of our predeceſſors, That when they ſaw other injunctions and prohibitions as touching diverſe abuſes crept in, take

no

no effect, but daily broken, they thought it better pollicie to make no lawes at all for restraint of G
such columnes, than to have them infringed, or at leastwise, not observed when they were made: yet are we in these daies in better order than so, and I doubt not but the age and generation following will justifie and approve of, as in comparison of them: for where is there one in Rome at this day, who hath in the portaile or entrie of his house any columnes, that for bigneſſe and pride come neare to those of *Scaurus*? But before that I enter farther into this discourse of Marbles and other rich stones, it shall be good to speak somewhat of the men that have excelled in the cutting thereof, and whose workmanship hath caried the greatest price. First therefore I will goe through with the artificers themselves.

Chap. iiii. H

The first Imageurs that were in name for cutting in Marble, and in what ages they flourished.

THe first that we read renowmed for graving and carving in marble, were *Dipœnus* and *Scyllis*, both Candiots borne: who during the Empire and Monarchie of the Medes, and before that *Cyrus* began his reigne in Persia, lived in great fame; and that was in the fiftieth Olympias or thereabout. These men went together unto Sicyone (a citie, which I may truly say was for a long time the very native countrey that brought foorth the excellent workemen in all kinds of mettals and minerals.) It fortuned at the same time, that the magistrats of Sicyone, had bargained with them for certaine images of the gods to be made at the publicke charges of the I
citie; but these artificers, who had undertaken the thing, aggreeved at some wrongs offered unto them, departed in Ætolia before they had finished the said images, and so left them unperfect. Presently upon this, there ensued a great famin among the Sicyonians, by occasion that the earth failed to yeeld encrease: the citizens therefore full of sorrow and heavinesse, fearing utter desolation, had recourse unto the Oracle of *Apollo Pythius*, to know what remedie for this calamitie: and this answere was delivered unto them from the said god, That according to their petition, they should find meanes for to be eased of this plague, in case *Dipœnus* and *Scyllis* had once finished the images of the gods, which they begun. And this was performed accordingly, but with much difficultie, for they were faine to pay whatsoever they would demaund: they were glad also to pray unto them with cap in hand. And what images mought these bee? Even *Apollo*, K
Diana, *Hercules*, and *Minerva*: and this last named, was afterwards smitten and blasted with fire from heaven.

Chap. v.

Of singular peeces of worke, and excellent artificers in cutting and graving Marble, to the number of 126. Of the white Marble of Paros, and of the stately sepulchre called Mausoleum.

LOng time before *Dipœnus* and *Scyllis*, there had beene in the Island Chios one *Melas*, a cutter and graver in marble: after whom, his sonne *Micciades* succeeded, and hee likewise left a L
sonne behind him, named *Anthermus*, of the said Isle, a cunning workeman: whose two sons *Bupalus* and *Anthermus*, proved also most skilfull Imageurs. These flourished in the daies of *Hipponax* the Poët, who (as it is well knowne) lived in the 60 Olympias. Now, if a man will calculate the times, according to the genealogie of these two last named, and count backward in ascent no higher than to their great grandsire, he shall find by the ordinarie course of Nature, that the art of cutting and graving in stone, is equall in antiquitie to the originall and beginning of the Olympiades. But to prove that these two, *Bupalus* and *Anthermus*, lived in the daies of *Hipponax* abovenamed, recorded it is, That the said Poët had a passing foule and illfavored face of his own: and these Imageurs could find no better sport, than to counterfeit both him and his visage, as lively as possible might be in stone; and in a knaverie to set the same up in open place where mer- M
rie youths met in knots together, and so to propose him as a laughing stocke to the whole world. *Hipponax* could not endure this indignitie, but for to be revenged upon these companions, sharpened his style or pen against them, and so coursed them with bitter rimes and biting libels, that as some doe thinke and verely beleeve, being wearie of their lives, they knit their necks in halters,

and

A and ſo hanged themſelves. But ſurely this cannot bee true: for they lived many a faire day after; yea and wrought a number of images in the Iſlands adjacent to Chios, and namely in Delos: under which peeces of their worke, they ſubſcribed certaine arrogant verſes to this effect, That the Iſland Chios was not onely ennobled for the vines there growing which yeelded ſo good wine; but renowmed as well for *Anthermus* his two ſonnes, who made ſo many fine and curious images. The Iſlanders alſo of Iaſus have to ſhew, the image of *Diana*, their handyworke: within the Iſle of Chios, their native country, there was likewiſe another *Diana* of their making, whereof there goeth much talke, and which ſtandeth aloft in a temple there: the viſage of which *Diana* is ſo diſpoſed, that to as many as enter into the place, it ſeemeth ſad and heavie; but to them that goe forth, it appeareth pleaſant and merrie. And in verie truth, there be certain ſtatues at Rome
B of theſe mens doing, to wit, thoſe which ſtand upon the lanterne of *Apollos* temple in the mount Palatine, and almoſt generally in all thoſe chappels which *Auguſtus Cæſar* Emperour of glorious memorie, erected. Moreover, their father *Anthermus* left behind him certaine images both in Delos, and alſo in the Iſland Lesbos. As for *Dipœnus*, his workes were rife in Ambracia, Argos, and Cleone, in which citties a man ſhould not ſee a corner without them. But all the race of theſe, both father, grandſire, ſonnes, and nephewes, wrought onely in white marble digged out of the Iſland Paros: and this ſtone men began to call Lychnites, that is to ſay, the candle marble, not for the lightſome white colour which it carried (for many quarries were found afterwards of whiter and brighter marble, and namely of late daies in thoſe about Luna in Tuſcane) but as *Varro* mine authour ſaith, for that the pioners undermined the ground for that ſtone, and labou-
C red in hewing it continually by candle-light. But here commeth to my remembrance a ſtraunge thing that is recorded of the quarries in the Iſland Paros; namely, That in one quarter thereof there was a veine of marble found, which when it was cloven in twaine with wedges, ſhewed naturally within, the true image and perfect pourtraiture of a Silenus imprinted in it. Neither muſt I forget to note, that this art of graving images in ſtone, is of greater antiquitie by farre than either painters craft or founderie and caſting ſtatues; for both painters and alſo imageurs in mettall, began with *Phidias* about the 83 Olympias, which falleth out to be * three hundred and two and thirtie yeers after *Malas* the firſt graver in ſtone, of name. This *Phidias* [though otherwiſe a painter at the beginning, and a carver in yvorie] was himſelfe alſo a graver in marble; and the image of *Venus*, which now ſtandeth among the ſtately building of *Octavia*, was (as they ſay) of
D his cutting; a brave peece of worke, and in beautie ſurpaſſing. This is knowne for certaine, that *Alcamenes* the Athenian (a moſt excellent graver in ſtone) learned his skill under him; of whoſe workemanſhip there be a number of ſtatues to be ſeene at Athens within the ſacred temples: beſides, one image there is of *Venus*, moſt exquiſitly wrought, ſtanding without the walls of the citie, and is knowne by the name of *Aphrodite* * ἐν κήποις, [*id eſt*, *Venus* in the Gardens:] and as it is ſaid, *Phidias* himſelfe with his owne hands finiſhed this *Venus*: who alſo had another apprentice under him named *Agoracritus* of Paros, whome hee loved alſo for his ſweetly youth: in regard of which affection, it is ſaid, that many brave peece of his owne handyworke, hee was content ſhould paſſe under his name, which hee dedicated to the immortall memorie of *Agoracritus*. Now theſe two apprentices of his ſtrove a-vie, whether of them could make the ſtatue
E of *Venus* better? and ſo it fell out, that *Alcamenes* wan the victorie; not in regard of finer and more cunning workemanſhip, but for that the citie of Athens in favouring of their owne countreyman, gave ſentence on his ſide againſt *Agoracritus*, a ſtranger and Parian borne; who tooke this repulſe and diſgrace in ſuch diſpleaſure and indignation, that (by report) when hee ſold the ſaid *Venus* of his owne making, hee would not by any means paſſe it away, but with this condition, That it ſhould never ſtand in the citie of Athens; and withall, hee named it *Nemeſis*, [*id eſt*, Vengeance:] and therefore ſet up it was at Rhamnus, a village ſo called within the territorie of Attica; which image of *Venus*, *M. Varro* preferred before all other ſtatues whatſoever. With-
F in the foreſaid citie of Athens, and in the chappell dedicated to the honour of *Cybele* the great mother of the gods, there was another moſt excellent ſtatue or image, wrought by the hands of *Agoracritus*.

As touching *Phidias*, no man doubteth but he was the moſt excellent graver that ever was, as all nations will confeſſe who ever have heard of that ſtatue of *Iupiter* * *Olympius*, which his owne hands wrought: but that all others alſo may know (who never ſaw his work nor the ſtatues that he made)

* By this it is evident, that *Olympias* was but the ſpace of foure yeers compleat, although it be taken for five yeere.

* Some read ἐξάπολις, *id eſt*, without the citie.

* Out of yvorie: which when he had finiſhed, being demanded after what patterne hee had made the ſaid image, & how he went up into heavē for to take it forth? anſwered out of *Homer*, ἦ, καὶ κυανέῃσιν ἐπ' ὀφρύσι νεῦσε Κρονίων; Ἀμβρόσιαι δ' ἄρ' ἔχυντο, &c *Iliad. a.* whereby hee ſignified, that he had made him according as *Homer* the poet pourtraied and deſcribed him in his verſes.

made, that hee well deserved the name which went of him: I will lay abroad some small peeces as arguments of his handyworke, and those onely that may testifie his fine head and rare invention: neither will I alledge for proofe hereof, either the beautifull image of *Iupiter Olympius*, which he made at Olympia; or the stately statue of * *Minerva*, that he wrought at Athens, which carried in heigth six and twentie cubits, and was all made of yvorie and gold: but I will take the shield or targuet that the said goddesse is pourtraied with; in the embossed and swelling compasse whereof, he engraved the battaile wherein the Amazons were defeated [by *Theseus*;] within the hollow part and concavitie, hee enchased the conflict betweene the gods and the gyants; upon the shoes or pantofles that shee weareth, hee pourtraied the fight betweene the Lapithæ and the Centaures; so full compact of art was everie thing about her, and so curiously and artificially contrived. Now in the base or piedstall under the statue, the worke that was cut, hee called the Genealogie of *Pandora*: there a man might see the nativitie (as it were) of the gods, to the number of thirtie; and among them the goddesse *Victorie*, of most admirable workemanship. Moreover, artificers that are seene and skilfull in these matters, doe greatly admire the fell serpent; as also the monster *Sphinx* made in brasse, under the verie speare that *Minerva* holdeth in her hand. This may serve by the way in a word or two touching that famous and renowmed artizan *Phidias* (whome no man is able to praise and commend sufficiently) that it may be known likewise that the magnificence of his workemanship was the same still, even in small matters as well as great.

* Surnamed *Lemnia*, because the Lemnians dedicated it.

To come now to *Praxiteles*: what time hee lived, I have declared alreadie in my catalogue of Founders and Imageurs in brasse: who, albeit hee was singular in that kind, yet in marble he went beyond himselfe: his workes are to be seene at Athens, in that conspicuous street called Ceraunicum: but of all the images that ever were made (I say not by *Praxiteles* onely, but by all the workemen that were in the world) his *Venus* passeth, which hee wrought for them of Gnidos: and in truth, so exquisit and singular it was, that many a man hath embarked, taken sea, and sailed to Gnidos for no other businesse, but onely to see and behold it: hee had made two of them, and sold them both togither; the one with a vaile and arraied decently in apparell, which in that regard the men of Cos bought; for beeing put to their choice, they like honest men preferred it before the other which was naked (notwithstanding *Praxiteles* tendred them both at one and the same price) in a good mind that they carried, and having respect and regard unto their gravitie and modest carriage of themselves: that which they refused and rejected, the Gnidians bargained for, and indeed (to speake of workemanship) it was infinitely better, and there was no comparison betweene them, by the generall fame and opinion of all men: and verely king *Nicomedes* afterwards would gladly have bought it again of the Gnidians, and offered them enough; for hee promised in consideration thereof, to discharge all debts that their cittie was engaged in, which were verie great sums; but they would not give eare nor hearken unto him: content they were to live in debt and daunger still, yea and to abide and endure any forfeitures, exegents, executions, and extents whatsoever, than to part with their *Venus*. And to say a truth, good reason they had so to doe; for that one image of *Praxiteles* his making, was their chiefe credit, ennobled their cittie, and drew resort from all parts thither. This *Venus* was shrined in a little chappell by her selfe within a tabernacle; but of purpose so devised, that it might bee set open on all sides for to be seene and viewed all and whole on everie part: wherewith the goddesse her selfe (as men were verely persuaded) was well enough pleased, and shewed her contentment therein to all commers; for looke upon her as one would, amiable shee was and admirable everie way. It is reported, that a wretched fellow was enamoured of this *Venus*, and having lurked one night secretly within the chappell, behaved himselfe so and came so neare unto the image, that hee left behind him a marke of his leaud love and beastly lust; the spot of which pollution, appeared afterwards upon the bodie. In the same Gnidos there bee divers other peeces more, of marble, wrought by excellent workemen; to wit, one god *Bacchus* made by *Brixiades*, and another by *Scopas*, of whose handyworke there was *Minerva* also: yet there goeth no speech nor voice of any but onely of *Venus* abovesaid; than which, there cannot bee a greater argument to proove the excellencie of *Praxiteles* his worke; they seeme all but foils to give a lustre unto his *Venus*. Of his making there is the *Cupid* also, that *Cicero* reproched *Verres* with; the same for whose sake there is such resort and pilgrimage to Thespiæ, and which standeth now shrined within the * schooles

* *Scholis*: certaine galleries where learned mē were wont to meet, & (either walking or sitting) to discourse of learning, and to dispute. And yet there were other *Scholæ* withdrawing places in bains, where those that came gave attendance untill there were roume void by others going forth.

of

A of *Octavia*. Hee made also another *Cupid* all naked, for them of Parium, a cittie within Propontis, howbeit in the nature of a colonie governed by the Romane lawes, and owing service to their high court: comparable it was unto his *Venus* at Tenedos, as well for beautie and excellencie of workemanship, as for the like abuse and villanie done unto it; for one *Alcbidas* a Rhodian loved this *Cupid*, and (a shamefull thing to speake) defiled both himselfe and it, like a most filthie and profane villaine. Moreover, at Rome there be divers peeces of *Praxiteles* his making, to wit, *Flora*, *Triptolemus*, and *Ceres*, within the gardens of *Servilius*; the images of *Good-adventure*, and *Good-fortune* both, which are in the Capitoll; also the religious women of the order of *Bacchus*, to wit, the furious *Mænades* which also they name *Thyades*; also the holy nuns or votaries called *Caryatides*; and *Silenus*, standing among the monuments and bookes within
B the librarie of *Asinius Pollio*, togither with *Apollo* and *Neptune*. Thus much may suffice to have been spoken of *Praxiteles*.

Praxiteles left behind him a sonne named *Cephissodorus*, who was his fathers heire everie way, as well of his excellent and singular cunning as his worldly goods: of his handyworke there is to bee seene at Pergamus, a * couple of little boyes clipping, embracing, and kissing one another; a most daintie and exquisit peece of worke, and much spoken of and highly praised: a man that saw them would verely beleeve and say, they dented with their fingers into a bodie of flesh, rather than a statue of marble. At Rome there bee images that came out of his hand, to wit, *Latona* within the temple upon mount Palatine, *Venus* within the librarie or monuments of *Asinius Pollio*, *Æsculapius* and *Diana* in the temple of *Iuno*, standing within the pourpris or
C quadrant of *Octavias* galleries.

* *Symplegma*: this may be meant of two wrestlers beeing at handy-gripes.

Scopas followeth these in order of narration, but striveth to match them in praise of worthie workemanship: hee engraved and wrought the images of *Venus*, *Pothos*, and *Phaëton*, which three be honoured among the Samothracians in all ceremonious devotion, as right holy saints; likewise of *Apollo*, which standeth within mount Palatine; of the faerie goddesse *Vesta*, sitting in a chaire, accompanied with two * hand-maidens set upon the ground of each hand of her, which are to bee seene within the gardens of *Servilius*: like unto which, there be other such damosels, and ladie *Vesta*, remaining within the monuments or librarie of *Asinius* beforesaid; where also there is one *Canephoros*, to wit, a virgin bearing upon her head a flasket of holy reliques; all of *Scopas* his making. But of all that ever hee wrought, there is most account made of
D those images which are in the chappell of *Cneus Domitius*, within the cirque of *Flaminius*; to wit, *Neptune* himselfe, and dame *Thetis*, and her sonne *Achilles*; the Sea-nymphs or Meermaids also called *Nereïdes*, mounted upon Dolphins, Whales, and mightie Sea-horses called Hippocampi, and sitting upon them: moreover, the Sea-trumpetters *Tritones*, with all the quire and traine attending upon Sir *Phorcus* a Sea-god, and the mightie fishes called Prisles, besides many other monsters of the sea; all wrought by one and the same hand so curiously, that if he had sitten about the making of them all his life time and done nothing at all else, a man would have thought it worke enough, and a great deed. But moreover and besides these above rehearsed, and many more which wee are not come to the knowledge of, we have here with us at Rome the image of *Mars*, made gyant-like after the manner of a colosse, yet sitting within the temple of
E *Brutus Callaicus*, which standeth close unto the said cirque, in the way as men goe from thence to the gate Labicana. In the same place there is moreover another *Venus* naked, and wrought by the hands of *Scopas*, which seemeth to goe beyond that other *Venus* of Gnidos that *Praxiteles* made; which image alone were able (no doubt) to give name to any other cittie where it should stand, and to ennoble the place: But at Rome verely there bee so many peeces besides, and those so stately and sumptuous withall, that they obscure and darken it (as it were) in some sort. Moreover, the exceeding great affaires and the busie negotiations (whereof there is such a multitude and a world as it were in that cittie) withdraw all men from the contemplation and beholding of such things, bee they never so singular: for to say a truth, it belongeth rather to idle persons to looke and gaze upon these matters, and fitter for a place where there is little or
F no stirring, but all quiet and silent: which was the cause that no man knoweth who was the workman that made the images of *Venus*, which *Vespasian* the Emperour dedicated in the rampars and building of his temple of *Peace*: and yet if it stood any where else than at Rome, it might seeme nothing inferiour in name to the auncient works of old time. As little certaintie there is likewise of that image wrought in marble, which representeth dame *Niobe* readie to die, togither

* *Chamæteræ*.

with all her sweet children, and standeth in the temple of *Apollo* surnamed *Sosianus*, whether *Scopas* or *Praxiteles* made it: no more than father *Ianus*, which *Augustus Cæsar* brought out of Ægypt and dedicated in his owne temple, is known out of whose shop it came; notwithstanding now it be guilded all over: semblably, there standeth in the courtly pallace of *Octavia*, the image of *Cupid* holding a thunderbolt or lightning in his hand, readie to shoot; but it is a question who was the maker of him? and yet this is affirmed, That the said *Cupid* was made by the lively patterne of *Alcibiades*, who at that age was held to be the faireſt youth that the earth did beare. In the same place, and namely in the schoole or gallerie of learned men, there be many more images highly commended, and yet no man knoweth who wrought them: As for example, four that resemble Satyres; of which, one seemeth to carrie on his shoulders prince *Bacchus* arraied like a girle in a side coat or gown; another likewise beareth yong *Bacchus* in the same order, clad in the robe of his mother *Semelle*; the third maketh as though he would still the one *Bacchus* crying like a child; the fourth offereth the other a cup of drink to allay his thirst. Furthermore, there be two images in habit and forme fœminine, representing gales of wind, & these seem to make saile with their owne cloaths. As doubtfull also it is, who made the images within the railed enclosure in *Mars* field named Septa, which doe represent *Olympus*, *Pan*, *Chiron*, and *Achilles*; and yet so excellent peeces they be, that men esteeme them worthie to be kept safe, & satisfaction to be made with no lesse than their death, under whose hands and custodie they should miscarrie. But to returne againe unto *Scopas*; he had concurrents in his time, and those that thought themselves as good workemen as himselfe, to wit, *Bryaxis*, *Timotheus*, and *Leochares*, of whome I must write joyntly togither, because they joyned all foure in the graving and cutting of the stately monument Mausoleum.

This Mausoleum was the renowmed tombe or sepulchre of *Mausolus*, a petie king of Caria, which the worthie ladie *Artemisia* (sometime his queene, and now his widow) caused to be erected for the said prince her husband, who died in the second yeere of the hundredth Olympias: and verely so sumptuous a thing it was & so curiously wrought, by these artificers especially, that it is reckoned one of those matchlesse monuments which are called the * seven Wonders of the world: From North to South it carrieth in length, sixtie three foot; the two fronts East & West, make the breadth, which is not all out so large; so as the whole circuit about, may contain foure hundred and eleven foot: it is raised in heigth five and twentie cubits, and environed with six and thirtie columns: one the East side, *Scopas* did cut; *Bryaxes* chose the North end; that side which regardeth the South, fell to *Timotheus*; and *Leochares* engraved at the West end: but Queene *Artemisia* (who caused this rich sepulchre to bee made for the honour and in the memoriall of her husband late deceased) hapned her selfe to depart this life before it was fully finished: howbeit these noble artificers whome shee had set a worke, would not give over when shee was dead and gone, but followed on still and brought it to a finall end, as making this account, that it would be a glorious monument to all posteritie, both of themselves and also of their cunning: and in truth at this day, it is hard to judge by their handyworke, who did best. There was a fifth workeman also came in unto them; for above the side wall or wing of the tombe, there was a Pyramis founded, which from the verie battlements of the said wall was caried to the heigth of the building underneath it: the same grew smaller still as the worke arose higher, & from that heigth at everie degree (which in the whole were foure and twentie) was narrowed and taken in, untill at last it ended in a pointed broch: in the top whereof, there is pitched a coach with foure horses wrought curiously in marble; and this was the worke of *Pythis* for his part. * So that reckoning this charriot with the sharpe spire, the Pyramis under it unto the battlements, and the bodie of the sepulchre founded upon the firme ground, the whole worke arose to an hundred and fortie foot in heigth. But to come unto some particular workes of *Timotheus* beforesaid: his hand wrought that statue of *Diana* in marble which standeth at Rome in the chappell of *Apollo*, situat in mount Palatine: and yet the head belonging thereto, which now this image carrieth, *Aulanius Evander* set unto it in place of the former.

As touching *Menestratus*, men have in high admiration *Hercules* of his making; as also *Hecate*, which standeth in a chappell at Ephesus behind the great temple of *Diana*: the sextons or wardens of which chappell, give warning unto those that come to see it, that they looke not too long upon it for dazling and hurting their eyes, the lustre of the marble is so radiant and resplendent.

I can-

* 1. The temple of *Diana* in Ephesus.
2. The sepulchre of *Mausolus*.
3. The colosse of the Sun at Rhodes.
4. The statue of *Jupiter Olympius*.
5. The wals of Babylon.
6. The Ægyptian Pyramides.
7. The obelisk of *Semiramis*.

See *Cæl. Rhod. antiquar. lect. lib. 23. cap. 6.*

* *Dalechampius* suspecteth this place: but me thinkes a man may conceive, even by the verie wordes of *Pliny*, that upō the first *pyramis* of 25 cubits, ther was raised another spire which lessened by 24 degrees, [like as wee may see in many steeples with us] and that might carie so many foot, as beeing added to the rest, will make up the whole 140 from the ground.

A I cannot raunge in a lower degree unto these, the three Charites or Graces, which are to bee seene in the Basse court before the Citadell of Athens, the which * *Socrates* made; I meane not that *Socrates* whome I reckoned among painters, although some thinke hee was the same man. As for *Myro*, (whome I commended for a singular imageur in brasse) there is in marble of his pourtraying & engraving, an old woman drunken, which he made for them of Smyrna; a peece of worke as much esteemed and spoken of, as any other. And here I cannot but thinke of *Pollio Asinius*, who (as he was a man of a stirring spirit and quicke conceit) delighted to have his librarie and monuments to be enriched with such antiquities as these: for among them, a man shall see the Centaurs cary behind them upon their croupe, the Nymphs, which *Archesitas* wrought; the Muses named Thespiades, of *Cleomenes* his cutting; *Oceanus* and *Iuppiter*, done by the hand
B of *Eutochus*; the statues on horseback resembling women called Hippiades, which *Stephanus* wrought; the joynt-images of *Mercurie* and *Cupid*, called Hermerotes, the workmanship of *Tauriscus* (I meane not the graver, of whome I spake before, but another *Tauriscus* of Tralleis;) *Iupiter* surnamed *Xenius* or *Hospitalis*, which came out of the hands of *Pamphilus* an apprentice to *Praxiteles*: as for the brave peece of worke, to wit, *Zetus*, *Amphion*, *Dirce*, the Bull, and the bond wherewith *Dirce* was tied, all in one entier stone, which was brought from Rhodes to Rome; it was done by *Apollonius* & *Tauriscus*: these men made question of themselves, who should be their fathers? professing in plaine tearms, that *Menocrates* was taken and supposed their father, but indeed *Artemidorus* begat them, and was their father by nature: and in the same place, among other monuments, the statue of father *Bacchus* made by *Eutychides*, is much commended. More-
C over, neare unto the gallerie of *Octavia*, there is the image of *Apollo*, wrought by *Philiscus* the Rhodian; and he standeth in a chappell of his owne. *Item*, *Latona*, *Diana*, the nine Muses, and another *Apollo* naked. As for that *Apollo*, who in the same temple holdeth in his hand a harpe, *Timarchides* was the workman of it: but in the precinct or cloistre of the said galleries, and in the chappell of *Iuno*, there is the goddesse her selfe curiously made in marble; the handyworke of *Dionysius* and *Polycles*; but the image of *Venus* in the same place, *Philiscus* wrought: all other statues there, came out of *Praxiteles* his hands. Moreover, *Polycles* and *Dionysius*, the sonnes of *Timarchides*, made that *Iupiter* which is in the next chappell: the images of *Pan* and *Olympus*, wrestling togither in the same place, were the workemanship of *Heliodorus*; and this is one of the two fairest images coupled togither as wrestlers, that are knowne in the world: as for *Venus* ba-
D thing her selfe, he also made her; but *Dædalus* standing by, *Polycharmus*. As touching one peece of worke that *Lysias* made, it may appeare how highly it was esteemed, by the honourable place wherein it stood; for *Augustus Cæsar* late Emperour of happie memorie, to the honour of *Octavius* his father, dedicated it in mount Palatine over the triumphant arch there, & placed it within a shrine or tabernacle adorned with columnes: but what might this worke be? surely nothing else but a chariot with foure horses set unto it, *Apollo* and *Diana*, all of one entire peece. Within the gardens of *Servilius*, I find there is great praise of *Apollo* made by *Calamis*, that singular graver in mettall: the religious priests and propheteses also of *Phœbus*, called Pytheæ, done by *Dactylis*; and *Callisthenes* the Historiographers statue, wrought by *Amphistratus*.

Moreover, many cunning workemen there were, whose fame notwithstanding is obscured, by
E reason that albeit many singular peeces & those unmatchable, have passed through their hands, yet for that many have joyned in the workmanship togither, the number hath ben a checke and barre to the excellencie of some that went beyond their fellows, for neither is there one among them that goeth away cleare with the honor from the rest, nor many togither can well be named for one thing: and this may bee seene in the image of *Laocoon*, which remaineth within the pallace of Emperour *Titus*, a peece of worke to be preferred (no doubt) before all pictures or cast images whatsoever; and yet we know not what one artificer to praise for it. *Agesander*, *Polydorus*, and *Athenodorus*, Rhodians, most excellent workemen all, agreed by one generall consent to expresse lively in one entire stone, *Laocoon* himselfe, his children, and the woonderfull intricat winding of the serpents, clasping and knitting them about: semblably, the houses Palatine of the *Cæ-*
F *sars*, a man shall see fully furnished with right excellent statues, which *Craterus* and *Pythidorus*, *Polydectes* with *Hermolaus*, another *Pythodorus* also joined with his fellow *Arthemon*, wrought togither; as also those that *Aphrodisius Trallianus* alone himselfe, did cut. As for the temple called Pantheon, which *Agrippa* built, *Diogenes* of Athens enriched it with marble images. The virgins also going under the name of *Caryatides*, erected upon the chapters of the columnes in that

* Some take this for the wise Philosopher so famous.

temple are commended, as few like unto them for workemanſhip: like as the other images which G
be advaunced up to the verie top of the lanterne of the foreſaid temple, are thought to be excellent peeces; howbeit, for that they ſtand ſo high and cannot well bee diſcerned, leſſe ſpeech there is of them. As touching that *Hercules*, in the honour of whome the Carthaginians were woont everie yeere to ſacrifice the fleſh of mankind, as an image not regarded; for hee hath no place in any temple or chappell, neither is hee erected upon pillar, no nor ſo much as upon a baſe, but ſtandeth upon the bare ground, juſt over-againſt the entrie to thoſe galleries in Rome, called * Ad Nationes: howbeit, the workmanſhip of this *Hercules* is not to be deſpiſed. There ſtood alſo beneath, the nine Muſes called *Theſpiades* under the temple of *Felicitie*, and as *Varro* ſaith, one *Iunius Piſciculus* (by place a gentleman of Rome) was enamoured upon one of them, ſo beautifull they were made: and yet to this day, *Paſiteles* cannot looke enough thereupon, but H
hath the ſame in great admiration: who alſo wrote five bookes, compriſing all the famous and principall peeces of worke that are to be found in the world. This *Iunius* was borne in the marches and coaſts of Italie called Græcia, and togither with the townes of that tract, was made a Romane free-denizen; being himſelfe alſo a good cutter in ſtone, hee made that image of *Iupiter* in yvorie which ſtandeth in the chappell of *Metellus*, in the way which leadeth into [*Mars*] field. It happened upon a time, that beeing about the Arſenall, where certaine wild beaſts were, newly brought out of Affrick, he looked in at a grate to behold a lyon and to take out the counterfeit of him; but as hee was engraving in ſtone according to the patterne, behold, out of another cage a panther brake looſe, to no ſmall daunger of that moſt curious and painfull workeman: it is ſaid, that hee made many workes, but in particular which were of his doing, it is not I
preciſely ſet downe. Moreover, *M. Varro* doth highly magnifie *Arceſilaus*, of whoſe handyworke hee ſaith that he had a lioneſſe in marble, and certaine winged *Cupids* playing with her; of which, ſome ſeemed to hold her faſt bound, others forced her to drinke out of a horne, others againe would ſeeme to ſhoe her with their ſocks; and all this prettie anticke-worke was of one entire ſtone. The ſame *Varro* writeth, that *Coponius* made the images of the fourteene nations, which are about the galleries or theatre of *Pompeius*. I find alſo by my reading, that *Canachus* (whome I commended for a good founder or imageur in braſſe, in my catalogue of ſuch artizans) wrought in marble likewiſe and cut many faire ſtatues: neither is it meet, that *Sauros* and *Batrachus* ſhould be forgotten, who wrought the chappels that are within the cloſe or cloiſter belonging to the galleries of *Octavia*, notwithſtanding they were themſelves Lacedæmonians borne. Some alſo K
are of opini[on] that they were exceeding rich men, and that of their owne purſes they defraied the charges of building thoſe chappels, hoping to have had the honour to bee immortalized with the inſcriptions in the forefront thereof: which being denied them, yet in another place and after another ſort, they made means to eternize their name; for they deviſed in the foot or baſe of everie pillar (as it appeareth yet at this day) to cut the forme of a * frog and a lizard, to repreſent thereby their owne names. Moreover, I cannot conceale from you one prettie thing to be obſerved, and which wee all know to bee true, That in one chappell of *Iupiter*, all the pictures therein, as alſo all the ceremoniall ſervice thereto belonging, are reſpective altogither to the fœminine ſex: the which happening at firſt by meere chaunce, continued afterwards: for when the temple of *Iuno* was finiſhed, the porters who had the carriage of the images ordained there L
to ſtand, miſtooke their markes and carried thither thoſe which were appointed for the chappell of *Iupiter*; and contrariwiſe thoſe for *Iuno*, into the chappell of *Iupiter*: which beeing once done, was not altered againe, but taken for a preſage, and religiouſly ever after kept, as if the verie gods themſelves had ſo ordered and appointed it, and made a counterchaunge: which is the reaſon alſo, that in the foreſaid chappell of *Iuno*, there is that kind of ſervice which was meant for *Iupiter*.

To conclude, there have been certaine workemen that have growne to great name, by cutting and graving in ſmall peeces of marble; and namely, *Myrmecides* deviſed to inchaſe in marble, a charriot with foure horſes, and a man to drive the ſame, in ſo ſmall a roume, that a poore flie might cover all with her little wings. As for *Callicrates*, he cut in ſtone the ſimilitude and proportion of piſmiers in ſo narrow a compaſſe, that a man cannot eaſily diſcerne the feet and M
other parts of the bodie.

CHAP.

*So named, by occaſion of the ſtatues of 14 natiõs there erected, as appeareth a little after.

*For in Greek *Batrachos* is a frog, and *Sauros* a lizard.

A

Chap. VI.

When firſt began Marble ſtones to be uſed in building of privat houſes. Who began at Rome to parget and cover walls with thin leaves of Marble. In what ages each kind of Marble came into uſe and requeſt. Who invented cutting of Marble into thin plates: the deviſe and manner thereof. Of ſand proper for building.

THus fatre forth have I diſcourſed of the cutters and engravers in marble, and of thoſe excellent artificers, who have been moſt renowned. In which Treatiſe I remember well, that
B the diapred and ſpotted marble all this while was of no regard: for all the antique peeces which I have rehearſed, were made of the marble of Thaſos, of the Iſlands Cyclades, as alſo of Lesbos: and yet this enclineth to a blackiſh or blewiſh colour ſomewhat more than the reſt. As for marble ſpotted in ſundrie colours, as alſo of the ordering, workmanſhip and uſe of any kinds of marble in building, *Menander*, who in his time was moſt curious of all others in diſcuſſing all ſuch ſuperfluitie, dealt firſt therein, but ſeldome medled hee withall. Howbeit, true it is, that at length pillars of marble were taken up to bee uſed in temples, not upon any pride, braverie, or magnificence (for as yet they knew not what ſuch things meant) but for that it was thought, that they could not bee erected nor beare upon any thing ſtronger: and in that manner was begun the temple at Athens of *Iupiter Olympias*, out of which, *Sylla* brought thoſe columnes which
C ſerved for his houſe and pallace in the Capitoll. Howbeit, even in *Homers* time a difference there was made betweene ordinarie ſtone and marble: For this Poët ſaith plainely, That *Paris* caught a rap upon the mouth with a marble ſtone: And yet whenſoever hee extolleth and ſetteth out in the higheſt degree the moſt ſtately pallaces of kings and princes, hee never maketh mention of any other matter to adorne them withall, but of Braſſe, Gold, Electrum, Silver, and Yvorie, and not one word of Marble. But, as I take it, the firſt time that theſe marbles of ſundrie ſpots and colours were diſcovered, was in the quarries of the Iſlanders of Chios, by occaſion that they digged for ſtone to fortifie their cittie with walls; whereupon *M. Cicero* plaieth merrily upon them with a pleaſant conceit: for when they made ſhew unto all that came, and among the reſt to him, what wals they had built of marble, and ſeemed to take great pride in their ſumptuous and mag-
D nificent building; What adoe is here (quoth *Cicero*) I would have marvelled much more at your wall and thought you had done a greater deed, if you had built it out of the quarie of Tyburtum. Certes, if marble had beene of any name and credit in old time, painters had not beene ſo highly honored as they were, nay, had there been (thinke ye) any reckoning made of them at all?

As touching the manner of ſlitting marble into thin plates, therewith to cover and ſeele as it were the outſides of wals, I wot not well whether the invention came from Caria, or no. The pallace of *Mauſolus* king of Caria, built at Halicarnaſſus, is the auncienteſt building that I can find in any record, garniſhed, ſet out and enriched with marble of Proconneſus, notwithſtanding all the wals were reared of bricke. This prince changed his life in the ſecond yeare of the 100 Olympias, which fell out to be the 302 yeare after the foundation of the citie of Rome. As for our Romans,
E *Cornelius Nepos* writeth, That *Mamurra*, borne at Formiæ, a gentleman of Rome; and ſometime Provoſt over the Pioners, Maſons, Smiths, and Carpenters under *Cæſar* in Fraunce, was the firſt who covered all the wals throughout his houſe which he had upon mount Cœlius, with leaves of marble. Now when I ſpeake of *Mamurra*, you muſt not bee offended, and thinke that I aſcribe the invention hereof to a meane perſon; for I tell you, this is that *Mamurra*, whom the Poet *Catullus*, my countryman of Verona, ſo taunted and reviled in his verſes; this is the man, whoſe houſe beforeſaid, teſtifieth better by proofe and effect, than *Catullus* could by his Poëſie expreſſe, That he had laid upon it and gathered into it all the riches of Gallia Comata: which was as much to ſay as all France, ſave only Provance, Languedoc, Savoy, and Dauphine. And well it might be ſo, for *Cornelius Nepos* beforenamed addeth moreover and ſaith, That he was the firſt man, who cauſed
F the pillars of his houſe to be of marble, and had not one of other matter, neither were thoſe ſlight and ſlender, but ſolide and maſſie, even hewen out of the quarries either of Caryſtus or Luna. But after him, in proceſſe of time, *M. Lepidus* who was joined companion in the Conſulſhip to *Catulus*, was the firſt man known to lay the ſils, lintels & cheeks of his dores throughout his houſe with Numidian marble; & Conſull he was in the *666* yeare, reckoning from the foundation of Rome:

but

but well ſhent and rebuked hee was for his labour. And verely, this was the firſt Numidian marble, as farre as I can find by any mention or token at all, brought over to Rome; not to ſerve in pillars onely and panels in the ſeeling of walls, as *Mamurra* employed his Caryſtian marble, but in *middle workes, and in the baſeſt of all, namely, in dore ſils, lintels, and jambes. After this *Lepidus* ſome foure yeares, ſucceeded Conſull *L. Lucullus*, who, as it ſhould ſeeme by that which fell out, gave the name to Lucullean marble, for that he was ſo much delighted therein: he brought it firſt to Rome, and had a ſpeciall fancie thereto, notwithſtanding it were blacke otherwiſe: whereas all other men eſteemed better of other coloured marble, or elſe ſpotted. This marble groweth in an Iſland lying within the river Nilus, and no marbles (as many kinds as there be) tooke name of him that loved them, but it alone. But among theſe men that were given to build with marble, *M. Scaurus* was the firſt man, as I take it, that for the ſtage and forefront of his Theatre, made the walls of marble: but whether the ſame were of ſlit and ſawne marble, or laid with good ſound ſquare aſhler or no (as the temple of *Iupiter Tonans* in the Capitoll hill, is at this day built) I am not able to ſay for certaine: for as yet I doe not read or find by any ſigne, that Italie knew how to ſlit marble into leaves. But ſurely, whoſoever deviſed that invention, to ſaw marble ſtone and to ſlit it into leaves for to ſerve the turne of roiotous and waſtfull perſons, had a perillous head of his owne, and a ſhrewd. But would you know the caſt of ſlitting marble? it is done with a kind of ſand, and yet a man would thinke that it were the ſaw alone that doth the deed; for when there is an entrie once made by a very ſmall line or trace, they ſtrew the ſaid ſand aloft all the length thereof: then they ſet the ſaw to it, and by drawing it too and fro, the ſand under the teeth thereof, maketh way downwards ſtill, and ſo the ſtone, as hard as it is, they cut through in a trice: Now for this purpoſe the Æthyopian ſand hath no fellow. And to this paſſe forſooth we are come, that wee cannot have marble to ſerve our turnes, unleſſe we ſend as farre as into Æthyopia: nay, we muſt bee provided of ſand to ſlit our marble with, out of India; from whence in times paſt, during the auncient diſcipline of Rome, it was thought too much and a ſhamefull thing, to fetch rich pearles. And yet this Indian ſand is commended in a ſecond degree: but the Æthyopian is the ſofter and better ſimply; for that ſand cutteth ſmooth and cleane as it goeth, and leaves no race at all in the work; the Indian maketh not ſo even and neat plates, howbeit, they that poliſh marble, fit themſelves with this ſand when it is burnt and calcined; for if they rub their leaves and plates therwith, it will make them ſlicke and faire; for otherwiſe, if it be not calcined to a fine pouder, of it ſelfe it is churliſh and rugged: which is the fault likewiſe of the ſand that commeth from Naxos and Coptis, which commonly is called the Ægyptian ſand: for theſe ſands verely were uſed in old time to the cutting of marbles. Afterwards they met with a ſand as good as the beſt, and went no farther than to a certaine bay or creeke in the Adriaticke ſea or Venice gulfe, which being left bare when the tide is gone, they may at a low water eaſily diſcerne to have beene caſt up by the floud. And now adaies our ſawyers of marble, make no more adoe, but take the firſt ſand they come by (it makes no matter out of what river it be) this ſerves their turne well ynough; and thus they abuſe & deceive the world, although few chapmen there be that know what loſſe there is by their marble leaves ſawne in that ſort: howbeit, ſuch groſſe ſand as that, firſt maketh a wider ſlit in the main ſtone, and by conſequence ſpendeth and conſumeth more of the marble: againe, there is more worke and labour about the poliſhing therof, the ſaw and ſand beforeſaid leaveth the faces of the ſtone ſo rugged and uneven: and by this meanes the plates become ſlight and thin before they can bee employed. To conclude, the ſand from Thebais in high Ægypt, is very good to polliſh withall: like as the grit that commeth of gravellie ſtones or pumiſh ground, ſerveth very well for the ſaid purpoſe.

Chap. VII.

Of Whetſtones and Grindſtones, comming out of Naxos and Armenia: Of diverſe kinds of Marble.

FOr poliſhing of ſtatues and images made of Marble; for cutting, filing, and trimming of precious ſtones, Naxium ſerved a long time, and was commended before any other ſtone: for by this word Naxium I underſtand the whetſtones and grindſtones that come out of the Iſland Cyprus: but afterwards, thoſe which were brought from Armenia, woon the name from them, and were eſteemed better.

As

A As for the ſundrie ſorts of Marble and their colours, to diſcourſe of them in generall, were needleſſe they are ſo well and eaſily knowne: and to reckon them all in particular, were endleſſe, they be in number ſo many and infinit: for what corner of the world is there, where you ſhall not find one marble or other different from the reſt? And yet in my Coſmographie, I have alreadie written of the beſt and moſt excellent kinds of marble, as I had occaſion to ſpeake of the nations and countries where they be found. Howbeit, this would be noted, that all ſorts of marble be not found in quarries and rockes, that ſtand upon veines thereof: for much you ſhall meet with, lying ebbe in the ground, and the ſame ſcattering by peeces here and there. But the greene marble that commeth from Lacedæmon, is eſteemed moſt precious, and to bee more gay and pleaſant than all other. As touching the marbles called Auguſtum and Tiberium, they were found in Æ-
B gypt firſt after that ſort lying looſe and ſcattered, during the time that *Auguſtus* and *Tiberius* were Emperours of Rome, of whom they tooke their name. And albeit theſe marbles be flecked and ſpotted, yet they differ from the Serpentine marble called Ophites; for that the ſpeckes in Ophites, doe reſemble thoſe in a ſerpents skin, whereupon it tooke that name: whereas the other two bee diſtinguiſhed with ſpots after a diverſe ſort: for Auguſtum hath veines curled, after the manner of waves, running round as it were like whirlepooles; and Tiberium ſpreadeth rather abroad in ſtrakes, winding yet and turning after the order of whitiſh haire. Neither bee there any pillars found of the foreſaid Serpentine marble, unleſſe they bee very ſmall. And of this marble there bee two kinds: the white, which is gentle and ſoft: the blacke, which is churliſh and hard. Both of them are ſaid to eaſe the headach, and to cure the ſting of ſerpents, if they be but caried
C about one in peeces, either hanging at the neck, or otherwiſe tied to any part. Some there be who preſcribe the whiter kind to bee applied accordingly for the phrenſie and lethargie. Howbeit againſt ſerpents, there be who commend eſpecially above the reſt, that which of the colour of aſhes they commonly call* Tephria. As touching the marble of Memphis or great Cair in Ægypt, named thereupon Memphites, it is of the nature of theſe *precious ſtones, rather than of quarries. The uſe hereof is to be ground into pouder, and with vinegre to be reduced into a liniment, for to be applied unto thoſe parts that are to bee cauterized or cut: for it ſo aſtonieth and benummeth the member, that it feeleth no paine, either by the ſearing yron or the Chyrurgians lancet. The Porphyrite marble, which alſo commeth out of Ægypt, is of a red colour: of which kind, looke which hath white ſpots or ſtreakes running among, is called thereupon Leucoſtictos: And quar-
D ries there bee in Ægypt, ſtanding wholly upon this marble, which yeeld ſo ſufficient, cut and hew thereout as big and as huge peeces as you will. *Triarius Pollio*, Procuratour generall under *Claudius Cæſar*, in the province of Ægypt, brought for the Emperour certaine ſtatues of this Porphyrie, out of Ægypt: which new deviſe of his was not very well liked and accepted, for no man took example by him afterwards to doe the ſemblable. The Ægyptians alſo found in Æthyopia another kind of marble, which they call Baſaltes, reſembling yron as well in colour as hardneſſe; and thereupon it tooke the name. The greateſt peece of this marble that ever was found, *Veſpaſian Auguſtus* the Emperour dedicated in his temple of *Peace*, and it was a ſtatue reſembling the river Nilus, with ſixteene little children playing about it; wherby is ſignified the number of cubits, unto which height the ſaid river riſeth when it is at the higheſt. It is ſaid alſo, that within the temple
E of *Serapis* in Thebes, a cittie of high Ægypt, there is another ſtatue not unlike to this marble Baſaltes, and many thinke it was made for *Memnon*; & by report, every day at the ſun-riſing, ſo ſoon as the raies or beames doe beat thereupon, it ſeemeth to cracke and cleave. As for * Onyx, our auncient writers were of opinion, That it was found in thoſe daies upon the mountains of Arabia and no where elſe: yet *Sudines* ſaith, that it is gotten in Germanie. *Cornelius Nepos* affirmeth, That there was at firſt great wonder made at the drinking cups of this ſtone: and afterwards, at the feet of tables and beds, of chaires and ſtooles likewiſe thereof: howbeit, afterwards (quoth he) *L. Lentulus Spinter* ſhewed at Rome wine veſſels, as big as good barrels, ſuch as came out of the Iſle Chios with wine: but within five yeare after by his ſaying, he ſaw pillars alſo, and thoſe two and thirty foot long, all of Onyx or Chalcedonie. But in proceſſe of time this ſtone altered and varied
I much: for *Cornelius Balbus* brought foure ſmall pillars thereof, and ſhewed them in his Theatre for a ſtraunge and miraculous ſight. And in my time I have ſeen of them above thirtie, much fairer and bigger, which went to the making of a Summer parlour for pleaſure, that *Calliſtus*, one of the enfranchiſed ſlaves of *Claudius Cæſar* (a man well known for his exceeding riches and power) built for his owne ſelfe.

*Here *Plinie* remembreth himſelfe, and maketh a third kind of *Ophites*, as *Dioſcorides* did before him

**Dioſ.* ſaith it is no bigger thã a little pebble or gravel ſtone

*or rather *Onychites Caſſedonius*

CHAP.

G

Chap. VIII.

Of the stone called Alabastrites: likewise, of Lygdinus and Alabandicus.

THis Onyx stone, or Onychitis aforesaid, some name Alabastrites; whereof they use for to make hollow boxes and pots to receive sweet perfumes and ointments, because it is thought that they will keepe and preserve them excellently well, without corruption. The same being burnt and calcined, is very good for diverse plastres. This Cassidonie or Alabaster is found about Thebes in Ægypt, and Damascus in Syria: and this Alabaster is whiter than the rest. Howbeit, the best and principall simply is that which commeth out of Carmania: next to H it in goodnesse is that of India: and then the Alabaster of Syria and Asia. The least esteemed of all other, is brought out of Cappadocia, and no beautie or lustre it hath at all. In sum, come it from what countrey it will, those peeces which stand most of a yellowish colour, like honey, spotted also in the head and nothing transparent, goe for the best. And generally throughout, looke where you meet with any in colour white, or resembling horne, is rejected for naught, like as whatsoever of it is like glasse.

As touching the stones Lygdinus, found in the mountaine Taurus, many are of opinion, That they be well neare as good as the former, for to keepe odoriferous ointments: and those for bignesse and capacitie, exceed not boules and good broad platters: passing faire and white they be: and in times past were wont to be brought onely out of Arabia. Moreover, there bee I two kinds besides of marble, well esteemed both, and in great price, notwithstanding in nature they bee verie contrarie: the one is called Coraliticus, found in Asia; you shall not light upon any above two cubits long: in whitenesse they come passing neare unto yvorie, and otherwise also they have a certaine resemblance unto it. The other called Alabandicus, after the name of the countrey that yeeldeth it, is contrariwise blacke: Howbeit, there is of it to bee found growing in Miletus, but not altogether so blacke, for it enclineth or declineth rather to a purple colour. This stone of Miletus will resolve in the fire, and commonly they use to melt it for drinking cups, in manner of glasses. To come now to the Thebaicke marble, marked it is with certaine drops here and there of a golden colour: and naturally it is found growing in that part of Affricke, which confineth upon the Ægyptians, and lieth under their jurisdiction. A peculiar K propertie it hath by a secret in Nature, respective unto the eyes, to serve for to grind collyries with, that is to say, those pouders which are appropriat to the diseases of that part. But about Syrene, in the province of Thebais, there is a marble (thereupon called Syrenites) which sometime they named Pyrrhopœcilos: The kings of Ægypt in times past (as it were upon a strife and contention, one to exceed another) made of this stone certain long beames, which they called Obeliskes, and consecrated them unto the Sun, whome they honoured as a god: And indeed, some resemblance they carrie of Sunne beames, when they are made to the forme of Obeliskes, and the verie Ægyptian name implieth so much. The first that ever began to erect these Obeliskes, was *Mitres*, king of Ægypt, who held his royall seat and court in Heliopolis, the citie of the Sunne; where hee was admonished in a dreame by a vision, so to doe. And thus much may L appeare by the inscription of certaine letters engraven upon the said Obeliske: for those characters, figures, and formes that we doe see enchased in them, be the verie * letters that the Ægyptians use themselves. After him, other princes also set up more of these Obeliskes in the abovenamed citie: and namely king *Sochis* for his part, foure in number, those carying in length eight and fortie cubits apeece. And *Ramises* (in whose reigne Troy was woon by the Greekes) erected an Obeliske fortie cubits long, in the said citie: but beeing departed from thence (for that he tooke pleasure in another citie, where sometimes stood the royall pallace of king *Mneuis*) he pitched on end another Obeliske, which caried in length * a hundred foot wanting one, and on every side foure cubits square.

* *Hieroglyphicæ.*

* *Vndecenis*, by the Grammaticall Analogie, should signifie nine or eleven: but I take it, that here it is put for *undecentenis*: otherwise there was no proportion betweene the height & the bredth. Neither is it like, that this prowd prince, being removed from his former seat (where he had erected Obeliskes threescore and twelve foot high) unto another citie which he loved better, would set up a monument of nine or eleven foot, for his memoriall, as may appeare more in the next chapter. M

Chap.

A

Chap. ix.

Of three Obeliskes. The first, of Thebes in high Ægypt: the second, of great Alexandria in Ægypt: and the third, which standeth at Rome in the large Cirque or shew-place.

IT is said, that *Ramises* abovenamed, kept twentie thousand men at worke about this Obeliske: The king himselfe in person, when it should be reared on end, fearing least the engines devised for to raise it, and hold the head therof betweene heaven and earth, in the rearing should faile and not be able to beare that monstrous weight; becausehee would lay the heavier charge upon
B the artificers that were about this enterprise, upon their uttermost perill, caused his owne sonne to bee bound unto the top thereof, imagining also, that the care of the engineers who undertooke the weighing up of this Obeliske, over the young prince, for feare of hurting him, would induce them also to bee more heedfull to preserve the stone. Certes, this Obeliske was a peece of worke so admirable, that when king *Cambyses* had woon the citie where it stood, by assault, and put all within to fire and sword, having burnt all before him, as farre as to the very foundation and underpinning of the Obeliske, commaunded expressely to quench the fire: and so in a kind of reverence yet unto a masse and pile of stone, spared it, who had no regard at all of the citie besides. Other Obeliskes there bee, twaine; the one erected by king *Smarres*, the other by *Eraphius*, both without characters, and the same are eight and fortie cubites in height apeece. At Alexandria,
C king *Ptolomæus*, surnamed *Philadelphus*, set up another Obeliske eightie cubites long, the which, king *Nectabis* before him had caused to be hewed out of the quarrie, plaine without any work: but much more difficultie there was in carying it from the quarrie, and setting it upright, than there had been labour in the hewing. Some write, That *Satyrus*, a great architect or engraver, conveied it to Alexandria by the meanes of flat bottomes or sleads. But *Calixenus* saith, That one *Phænix* did the deed, who caused a trench to be cut from the river Nilus, & to be caried (with water) as far as to the place where the Obeliske lay along: then hee devised two broad barges, prepared and well fraught with small squares of the same stone, a foot every way, to the double poise or weight of the Obeliske it selfe in proportion; by reason whereof, the vessels having their full load, might come under the Obeliske just, as it lay hollow overthwart the breadth of the fosse, with either end
D resting upon the bankes: which done, hee began to discharge the vessels underneath, & to throw out the stones wherewith they were laden, by meanes whereof, as they were lightened, they arose up higher and higher to the very Obeliske, and received the charge ordained for them. Hee writeth moreover, That there were six others like to it hewed out of the same mountaine, & the workman who cut and squared them, had fiftie talents for a reward. But the foresaid Obeliske was afterwards by the abovenamed king, erected in the haven of Arsinoë, in testimonie of love to *Arsinoe*, his wife and sister both. But for that it did hurt to the ship-docke there, one *Maximus*, a governour of Ægypt under the Romanes, removed it from thence into the market place of the said citie, cutting off the top of it, intending to put a finiall thereupon guilded, which afterwards was forelet and forgotten. Two Obeliskes more there were in the haven of Alexandria, neare to the
E temple of *Cæsar*, which were hewed out of the rocke by *Mesphees*, king of Ægypt, and those were two and fortie cubits in height. But above all other difficulties, it passeth what adoe there was to transport them by sea to Rome: and verely, the ships provided of purpose therefore, were passing faire and wonderfull to see unto. As for one of the said ships which brought the former Obeliske, *Augustus Cæsar* the Emperour of famous memorie, had dedicated it unto the harbour or haven at Puteoli, there to remaine for ever as a miracle to behold, but it fortuned to bee consumed with fire: the other, wherein *C. Cæsar* had transported the second Obeliske into the river, after it had been kept safe for certain yeares together to be seene (for that it was the most admirable Carrick that ever had been knowne to flote upon the sea) *Claudius Cæsar* late Emperour of Rome, caused it to be brought to Ostia, where, for the safetie and securitie of the haven, he sunke it, and therup-
F on as a sure foundation, hee raised certaine piles or bastions, like turrets or skonces, with the sand of Puteoli: which being done, a new care and trouble there was to bring the Obeliske up the river Tiberis to Rome: Which being effected, it appeared well by that experiment, that upon the river Tiberis a vessell draweth as much water full, as Nilus. As touching the said Obeliske which *Augustus Cæsar* late Emperour erected in the great shew place or cirque at Rome, it was first cut off the

rocke

*Whom some take to be *Amasis*.

rocke by **Semneserteus*, king of Ægypt, in the time of whose raine, *Pythagoras* sojourned in Ægypt: and the same containeth a hundred and five and twentie foot and nine inches, besides the foot or base of the said stone. As for the other, which standeth in *Mars* field, being nine foot lower than it, hewed and squared it was by commaundement from *Sesostris* king of Ægypt. In the characters engraven in both of them, a man may see all the Philosophie and religion of the Ægyptians, for they containe the interpretation of Nature. G

Chap. X.

Of that Obeliske at Rome which standeth in Mars field, and serveth for a Gnomon. H

And as for that Obeliske which standeth in *Mars* field, *Augustus Cæsar* the Emperour devised a wonderfull meanes that it should serve to marke out the noonetide, with the length of day and night, according to the shaddowes that the Sunne doth yeeld by it: for he placed underneath at the foot of the said Obeliske, according to the bignesse and length therof, a pavement of broad stone; wherein a man might know the sixt houre or the mid day at Rome, when the shaddow was equall to the Obeliske; and how by little and little, according to certaine rules (which are lines of brasse, inlaid within the said stone) the daies doe encrease or decrease: A thing no doubt worth the knowledge, and an invention proceeding from a pregnant wit. *Manlius*, a renowned Mathematician and Astronomer, put unto the top of the said Obeliske a guilded ball, in such sort, that all the shaddow which it gave fell upon the Obelisk, and this cast other shaddows more or lesse, different from the head or top of the Obeliske aforesaid. The reason whereof (they say) was understood from the sundrie shaddows that a mans head doth yeeld. But surely for these thirtie yeares past or thereabout, the use of this quadrant aforesaid hath not been found true: and what the reason thereof should be, I know not, whether the course of the Sunne in it selfe bee not the same that heretofore, or be altered by some disposition of the heavens; or whether the whole earth be somewhat removed from the true centre in the middest of the world (which I heare say is found to be so in other places;) or that it proceed by occasion of the earthquakes which have shaken the citie of Rome, and so haply wrested the Gnomon from the old place; or last of all, whether by reason of many innundations of Tiberis, this huge and weightie Obeliske hath setled & sunke downe lower (and yet it is said that the foundation was laid as deep under ground, as the Obelisk it selfe is above the ground.) I K

Chap. XI.

The third Obeliske at Rome in the Vaticane.

There is a third Obeliske at Rome, standing within the cirque or shew place of the two emperours, *C. Caligula* and *Nero*: and this is the onely Obeliske knowne to have beene broken in the rearing. This was hewen and erected in Ægypt by *Nuncoreus*, the sonne of *Sesostris*: which *Nuncoreus* caused another to bee set up of a hundred cubits in height, and consecrated it unto the Sunne, after he had recovered his sight upon blindnesse, according as he was advertised by the Oracle, which remaineth at this day. L

Chap. XII.

Of the Ægyptian Pyramides, and of Sphinx.

Having thus discoursed of the Obelisks, it were good to say somewhat of the Pyramides also in Ægypt: a thing I assure you that bewraieth the foolish vaine-glorie of the kings in that countrey, who abounding in wealth, could not tell what to doe with their money, but spent it in such idle and needlesse vanities. And verely most writers doe report, That the principall motives which induced them to build these Pyramides, was partly to keepe the common people from idlenesse, partly also because they would not have much treasure lying by them, least either their heires apparent, or other ambitious persons who aspired to be highest, should take occasion thereby to play false and practise treasons. Certes, a man may observe the great follies of those princes herein, That they began many of these Pyramides, and left them unfinished; as M

may

A may appeare by the tokens remaining thereof. One of them there is within the territorie under the juriſdiction of *Arſinoë*; two within the province that lieth to the government of Memphis, not farre from the Labyrinth, whereof alſo I purpoſe to ſpeake: there are other twaine likewiſe in the place where ſometimes was the lake Mœris, which was nothing elſe but a mightie huge fort, entrenched by mans hand in manner of a mote or poole: but the Ægyptians (among many other memorable and wonderfull workes wrought by their princes) ſpeake much of theſe two * Pyramides, the mightie ſpires and ſteeples whereof (by their ſaying) doe ariſe out of the verie water. As for the other three which are ſo famous throughout the world (as indeed they are notable markes to be kenned afarre off by ſailers, and directions for their courſe) theſe are ſituat in the marches of Affricke upon a craggie and barrein mountaine, betweene the cittie Memphis
B and a certaine Iſland or diviſion of Nilus which (as I have ſaid before) was called Delta, within foure miles of Nilus and ſix from Memphis, where there ſtandeth a village hard unto it named Buſiris, wherein there bee certaine fellowes that ordinarily uſe to climbe up to the top of them. Over-againſt the ſaid Pyramides there is a monſtrous rocke called Sphinx, much more admirable than the Pyramides, and forſooth the paiſants that inhabit the countrey eſteemed it no leſſe than ſome divine power and god of the fields and forreſts: within it, the opinion goeth, that the bodie of king *Amaſis* was intombed; & they would beare us in hand, that the rocke was brought thither, all and whole as it is: but ſurely it is a meere crag growing naturally out of the ground; howbeit wrought alſo with mans hand, poliſhed and verie ſmooth and ſlipperie. The compaſſe of this rocks head (reſembling thus a monſter) taken about the front, or as it were the forehead,
C containeth one hundred and two foot, the length or heigth 143 foot; the heigth from the bellie to the top of the crowne in the head, ariſeth to threeſcore and two foot. But of all theſe Pyramides, the biggeſt doth conſiſt of the ſtone hewed out of the Arabicke quarries: it is ſaid, that in the building of it there were 366000 men kept at worke twentie yeeres togither: and all three were in making threeſcore and eighteene yeeres and foure monthis. The writers who have made mention of theſe Pyramides, were *Herodotus*, *Euhemerus*, *Duris* the Samian, *Ariſtagoras*, *Dionyſius*, *Artemidorus*, *Alexander Polyhiſtor*, *Butorides*, *Antiſthenes*, *Demetrius*, *Demoteles*, & *Apion*: but (as many as have written hereof) yet a man cannot know certainly and ſay, This Pyramis was built by this king: a moſt juſt puniſhment, that the name and authours of ſo monſtrous vanitie, ſhould bee buried in perpetuall oblivion: but ſome of theſe Hiſtoriographers have reported,
D That there were a thouſand and eight hundred talents laid out onely for radiſh, garlicke, and onions, during the building of theſe Pyramides. The largeſt of them taketh up eight acres of ground at the foot, foure ſquare it is made, and everie face or ſide thereof equall, containing from angle to angle eight hundred foureſcore and three foot, and at the top five and twentie: the ſecond made likewiſe foure cornered, is on everie ſide even, and comprehendeth from corner to corner ſeven hundred thirtie and ſeven foot: the third is leſſe than the former two, but farre more beautifull to behold, built of Æthiopian ſtones; it carrieth at the foot in ech face betweene foure angles, three hundred threeſcore and three foot. And yet of all theſe huge monuments, there remaine no tokens of any houſes built, no apparence of frames and engins requiſite for ſuch monſtrous buildings: a man ſhall find all about them farre and neare, faire ſand and ſmall red
E gravell, much like unto Lentill ſeed, ſuch as is to be found in the moſt part of Affricke. A man ſeeing all ſo cleane and even, would wonder at them how they came thither: but the greateſt difficultie mooving queſtion and marveile is this, What meanes were uſed to carrie ſo high as well ſuch mightie maſſes of hewen ſquared ſtone, as the filling, rubbiſh, and mortar that went thereto? for ſome are of opinion, that there were deviſed mounts of ſalt and nitre heaped up togither higher and higher as the worke aroſe and was brought up; which beeing finiſhed, were demoliſhed, and ſo waſhed away by the inundation of the river Nilus: others thinke, that there were bridges reared with bricks made of clay, which after the worke was brought to an end, were diſtributed abroad and emploied in building of privat houſes; for they hold, that Nilus could never reach thither, lying as it doth ſo low under them when it is at the higheſt, for to waſh away the
F heaps and mounts aboveſaid. Within the greateſt Pyramis there is a pit 86 cubits deepe, & thither (ſome thinke) the river was let in. As touching the heigth of theſe Pyramides and ſuch like, how the meaſure ſhould be taken, *Thales Mileſius* deviſed the means; namely, by taking the juſt length of a ſhadow, when it is meet and even with the bodie that caſteth it. Theſe were the wonderfull Pyramides of Ægypt, wherof the world ſpeaketh ſo much. But to conclude this argument,

* *Herodotus* ſaith, they were 250 foot high above the water, and as many deepe under.

That no man ſhould need to marveile any more of theſe huge workes that kings have built, let him know thus much, that one of them, the leaſt (I muſt needs ſay) but the faireſt and moſt commended for workemanſhip, was built at the coſt and charges of one *Rhodope*, a verie ſtrumper. This *Rhodope* was a bondſlave togither with *Æſope* a Philoſopher in his kind, and writer of morall fables, with whome ſhee ſerved under one maſter in the ſame houſe: the greater woonder it is therefore and more miraculous than all I have ſaid before, that ever ſhee ſhould be able to get ſuch wealth by playing the harlot. Over and above the Pyramides aboveſaid, a great name there is of a tower built by one of the kings of Ægypt within the Iſland Pharos, and it keepeth and commaundeth the haven of Alexandria, which tower (they ſay) coſt eight hundred talents the building. And here, becauſe I would omit nothing worth the writing, I cannot but note the ſingular magnanimitie of king *Ptolome*, who permitted *Soſtratus* of Gnidos (the maſter workeman and architect) to grave his owne name in this building. The uſe of this watch-tower, is to ſhew light as a lanthorne, and give direction in the night ſeaſon to ſhips, for to enter the haven, and where they ſhall avoid barrs and ſhelves: like to which there bee many beacons burning to the ſame purpoſe, and namely at Puteoli and Ravenna. This is the daunger onely, leaſt when many lights in this lanterne meet togither, they ſhould be taken for a ſtar in the skie; for that afar off ſuch lights appeare unto ſailers in manner of a ſtar. This enginer or maſter workman before ſaid, was the firſt man that is reported to have made the pendant gallerie & walking-place at Gnidos.

Chap. xiii.

Of the Labyrinths in Ægypt, Lemnos, and Italie.

SInce wee have finiſhed our Obeliskes and Pyramides, let us enter alſo into the Labyrinths; which we may truly ſay, are the moſt monſtrous works that ever were deviſed by the hand of man: neither are they incredible and fabulous, as peradventure it may be ſuppoſed; for one of them remaineth to be ſeen at this day within the juriſdiction of Heracleopolis, the firſt that ever was made, to wit, three thouſand and ſix hundred yeers agoe, by a king named *Peteſuccas*, or as ſome thinke *Tithoes*: and yet *Herodotus* ſaith, it was the whole worke of many KK. one after another, and that *Pſammerichus* was the laſt that put his hand to it and made an end thereof. The reaſon that mooved theſe princes to make this Labyrinth, is not reſolved by writers, but divers cauſes are by them alledged: *Demoteles* ſaith, that this Labyrinth was the roiall pallace and ſeat of king *Motherudes*: *Lycias* affirmeth it to be the ſepulchre of king *Mœris*: the greater part are of opinion, that it was an ædifice dedicated expreſſely and conſecrated unto the Sun, which in my conceit commeth neareſt to the truth. Certes, there is no doubt made that *Dædalus* tooke from hence the patterne and platforme of his Labyrinth which he made in Crete; but ſurely he expreſſed not above the hundredth part thereof, chuſing onely that corner of the Labyrinth which containeth a number of waies and paſſages, meeting and encountring one another, winding and turning in and out everie way, after ſo intricat manner and ſo inexplicable, that when a man is once in, hee cannot poſſibly get out againe: neither muſt wee thinke that theſe turnings and returnings were after the manner of mazes which are drawne upon the pavement and plain floore of a field, ſuch as we commonly ſee ſerve to make ſport and paſtime among boies, that is to ſay, which within a little compaſſe and round border comprehend many miles; but here were many dores contrived, which might trouble and confound the memorie, for ſeeing ſuch varietie of entries, allies, and waies, ſome croſſed and encountred, others flanked on either hand, a man wandred ſtill and knew not whether he went forward or backward, nor in truth where he was. And this Labyrinth in Crete is counted the ſecond to that of Ægypt: the third is in the Iſle Lemnos: the fourth in Italie: made they were all of poliſhed ſtone, & beſides vaulted over head with arches. As for the Labyrinth in Ægypt, the entrie thereof (whereat I much marveile) was made with columns of ſtone, and all the reſt ſtuffed ſo ſubſtantially and after ſuch a wonderfull manner couched and laid by art of maſonrie, that impoſſible it was they ſhould in many hundred yeers bee disjoynted and diſſolved, notwithſtanding that the inhabitants of Heracleopolis did what they could to the contrarie; who for a ſpight that they bare unto the whole worke, annoied and empeached it wonderfully. To deſcribe the ſite and plot thereof, to unfold the architecture of the whole, and to rehearſe everie particular thereof, it is not poſſible; for divided the building is into ſixteene regions or quarters, according to the ſixteene ſeverall governments in Ægypt (which they

A they call Nomos) and within the ſame are contained certain vaſt and ſtately pallaces which beare the names of the ſaid juriſdictions, and be anſwerable to them: beſides, within the ſame precinct are the temples of all the Ægyptian gods: over and above, fifteen little chappels or ſhrines, everie one encloſing a *Nemeſis*, to which goddeſſe they bee all dedicated: to ſay nothing of many Pyramides fortie ells in heigth apeece, and everie of them having ſix walls at the foot, in ſuch ſort, that before a man can come to the Labyrinth indeed which is ſo intricat & inexplicable, and wherein (as I ſaid before) he ſhall be ſure to looſe himſelfe, he may make account to be wearie and tired out: for yet he is to paſſe over certaine lofts, galleries, and garrets, all of them ſo high that he muſt climbe ſtaires of nintie ſteps apeece ere hee can land at them; within the which, a number of columns and ſtatues there be, all of porphyrit or red marble, a world of images and ſtatues
B repreſenting as well gods as men, beſides an infinit ſort of other peeces pourtraied in monſtrous and ugly ſhapes, and there erected. What ſhould I ſpeake of other roumes and lodgings which are framed and ſituat in ſuch manner, that no ſooner are the dores and gates opened which lead unto them, but a man ſhall heare fearefull cracks of terrible thunder: furthermore, the paſſages from place to place are for the moſt part ſo conveyed, that they be as darke as pitch, ſo as there is no going through them without fire light: and ſtill be we ſhort of the Labyrinth, for without the maine wall therof, there be two other mightie upright walls or wings, ſuch as in building they call Ptera; and when you are paſſed them, you meet with more ſhrowds under the ground, in manner of caves and countermines vaulted over head, and as darke as dungeons. Moreover, it is ſaid, that about 600 yeers before the time of K. *Alexander* the Great, one *Curcamnos* (an eunuch or groome
C of king *Nectabis* chamber) made ſome ſmall reparations here about this Labyrinth, and never any but hee would goe about ſuch a peece of worke. It is reported alſo, that while the maine arches and vaults were in rearing (and thoſe were made all of foure ſquare aſhler ſtone) the place ſhone all about and gave light with the beams and plancher made of the Ægyptian Acacia ſodden in oile. And thus much may ſerve ſufficiently for the Labyrinths of Ægypt and Candie.

The Labyrinth in Lemnos was much like to them, onely in this reſpect more admirable, for that it had a hundred and fortie columns of marble more than the other, all wrought round by turners craft, but with ſuch dexteritie, that a verie child was able to weld the wheele that turned them, the pins and poles whereby they hung were ſo artificially poiſed. The maſter deviſers and
D architects of this Labyrinth, were *Zmilus*, *Rholus*, and a third unto them, one *Theodorus* who was borne in the ſame Iſland. Of this, there remaine ſome reliques to be ſeene at this day; whereas a man ſhall not find one ſmall remnant either of the Italian or Candian Labyrinths: for meet it is that I ſhould write ſomewhat alſo of our Labyrinth heere in Italie, which *Porſena* K. of Tuſcane cauſed to be made for his own ſepulchre; and the rather, becauſe you may know that forrein kings were not ſo vain in expences, but our princes in Italie ſurpaſſed them in vanitie: but for that there goe ſo many tales and fables of it which are incredible, I thinke it good in the deſcription therof to uſe the verie words of my author *M. Varro*: King *Porſena* (quoth he) was interred under the cittie Cluſinum in Tuſcane, in which verie place he left a ſumptuous monument or tombe built all of ſquare ſtone; thirtie foot it caried in breadth on everie ſide, and fiftie in heigth; within the baſe or foot whereof (which likewiſe was foure ſquare) hee made a Labyrinth ſo intricat, that if a
E man were entred into it without a bottom or clue of thread in his hand, and leaving the one end therof faſtened to the entrie or dore, it was impoſſible that ever he ſhould find the way out again. Vpon this quadrant there ſtood five Pyramides or ſteeples, foure at the foure corners, and one in the mids, which at the foot or foundation caried 75 foot everie way in bredth, & were brought up to the heigth of 150: theſe grew ſharpe ſpired toward the top, but in the verie head ſo contrived, that they met all in one great roundle of braſſe which raught from one to the other, and covered them all in manner of a cap, and the ſame riſing up in the mids with a creſt moſt ſtately: from this cover there hung round about at little chains, a number of bells or cymbals, which being ſhaken with the wind, made a jangling noiſe that mought be heard a great way off, much like unto that ring of bels which was deviſed in times paſt over the temple of *Iupiter* at Dodona: and
F yet are we not come to an end of this building mounted aloft in the aire, for this cover over head ſerved but for a foundation of foure other Pyramides, and everie one of them aroſe a hundred foot high above the other worke: upon the tops whereof there was yet one terrace more to ſuſtaine five Pyramides, and thoſe ſhot up to ſuch a monſtrous heigth, that *Varro* was aſhamed to report it: but if wee may give credit to the tales that goe currant in Tuſcane, it was equall to the

* Which was 250 foot: so that the whole was 500 foot.

whole *building underneath. O the outragious madnesse of a foolish prince, seeking thus in a vainglorious mind to be immortalized by a superfluous expence which could bring no good at all to any creature, but contrariwise weakned the state of his kingdome! And when all was done, the artificer that enterprised and finished the worke, went away with the greater part of the praise and glorie. G

Chap. xiiii.

Of a garden made upon Terraces. Of a cittie standing all upon vaults and arches from the ground. And of the temple of Diana in Ephesus.

H

WEe read moreover of gardens made in the aire; nay it is recorded, that a whole cittie (and namely Thebes in Ægypt) was built so hollow, that the Ægyptian KK. were wont to lead whole armies of men under the houses of the said cittie, in such sort as none of the inhabitants could beware thereof, yea and sodainly appeare from under the ground: a marveilous matter I assure you, but much more woonderfull in case the river Nilus also ran thorow the mids of the said towne. But surely of this opinion am I, that if this were true, *Homer* no doubt would have written of it, considering he hath spoken so much in the praise and commendation of this cittie, and especially of the * hundred gates that it had. But to speake of a stately and magnificent worke indeed, the temple of *Diana* in Ephesus is admirable, which at the common charges of all the princes in Asia was * two hundred and twentie yeers a building. First and foremost, they chose a marrish ground to set it upon, because it might not be subject to the danger of earthquakes, or feare the chinkes and opening of the ground: againe, to the end that so mightie and huge building of stone-worke should stand upon a sure and firme foundation (notwithstanding the nature of the soile given to be slipperie and unsteadfast) they laid the first couch and course of the ground-worke with charcole well rammed in manner of a pavement, and upon it a bed of wooll-packs: this temple carried in length throughout, four hundred twentie and five foot, in breadth two hundred and twentie: in it were a hundred and seven & twentie pillars, made by so many KK. and everie one of them threescore foot high; of which, six and thirtie were curiously wrought and engraven, whereof one was the handyworke of *Scopas*: *Chersiphron* the famous architect was the chiefe deviser or master of the works, and who undertooke the * rearing thereof: the greatest wonder belonging thereto was this, How those huge chapters of pillars, together with their frizes and architraves, being brought up and raised so high, should be fitted to the sockets of their shafts: but as it is said, he compassed this enterprise and brought it to effect, by the means of certaine bags or sacks filled with sand; for of these he made a soft bed as it were raised above the heads of the pillars, upon which bed rested the chapters, and ever as he emptied the nethermost, the foresaid chapters settled downeward by little and little, and so at his pleasure hee might place them where they should stand: but the greatest difficultie in this kind of worke, was about the verie frontispice and maine lintle-tree which lay over the jambes or cheeks of the great dore of the said temple; for so huge and mightie it was, that he could not weld it to lay and bestow the same as it ought, for when hee had done what hee could, it was not to his mind, nor couched and settled in the right place: whereupon the workman *Chersiphron* was much perplexed in his mind, and so wearie of his life, that he purposed to make himselfe away: but as he lay in bed in the night season, and fell asleepe all wearie upon these dumpish and desperat cogitations, the goddesse *Diana* (in whose honour this temple was framed, and now at the point to be reared) appeared sensibly unto him in person, willing him to be of good cheare and resolve to live still, assuring him that shee her selfe had laid the said stone of the frontispice, and couched it accordingly: which appeared true indeed the morrow morning, for it seemed that the verie weight thereof had caused it to settle just into the place, and made a joynt as *Chersiphron* would have wished it. As touching all the other singularities belonging to this temple, and namely the gorgeous ornaments that set it out, they would require many volumes to discipher and particularize upon them; and when all is done, little or nothing pertinent they are to the illustration of Natures worke, which is the principall marke that I aime at.

* Θώβαι ἑκατόμπυλοι.

*In the fortith chap. of the 16 book, he saith 400.

* After the frame was made.

Chap.

A

Chap. xv.

Of the proud temple in Cyzicum. The fugitive stone. The eccho which resoundeth seven times to one crie. Of a great building without pin or naile of yron. The sumptuous and admirable ædifices in Rome.

THere is at this day a temple standing at Cyzicum, wherin the mason had bestowed threads of gold in all the joynts under everie stone throughout, and those were all faire polished: within this temple, prince *Cyzicus* (who caused it to be built) minded to dedicat the image of *Iupiter* in yvorie, and of *Apollo* in marble, setting a crowne upon his head. Certes, these joynts
B thus enterlaced with most fine and daintie threads, gave a woonderfull grace and beautie to the whole Church, by sending and breathing (as it were) from them certaine raies, which by reverberation cause all the images therein to have a glittering lustre: in such sort, that over and above the devise and wittie invention of the workeman, the verie matter also (although it be close couched and hidden betweene each stone) commendeth the price and riches of the worke.

Within the said towne there is a stone called the Fugitive or Runnaway: The brave knights of Greece called Argonauts, who accompanied prince *Iason* in his voiage for the golden fleece, after they had used it for an anchar, left it there: but for that this stone was readie many times to run away and be gone out of their Prytaneum (for so they call their publicke hall) they foudred it fast with lead. In the same cittie, neare unto that gate which is called Thracia, there stand seven
C turrets, which doe multiplie a voice, and send backe many againe for one: this miraculous rebounding of the voice, the Greekes have a prettie name for, and call it Echo. True it is, that this repercussion and redoubling of the voice, proceedeth otherwhiles from the nature of the place, and most of all in vallies lying betweene hills; but at Cyzicum it commeth by fortune, and no such reason can bee given thereof. At Olympia the like is wrought by art, for there is a gallerie there made of purpose, which after a woonderfull manner delivereth the same voice which it receiveth, seven times backe, whereupon they call it Heptaphonon. Moreover, in Cyzicum there is a faire and large building, which (because they keepe courts and sit in councell there) is named Buleuterion: the same is built in such sort, as there goeth not one pin or naile to all the carpen-
D trie thereof: and the stories are so laid, that a man may take away the beams and rafters without any prop or shoare to support them, yea and bestow them againe fast enough without laces to bind them. After which manner, the moderne bridge at Rome was so framed over the river Tybetis; and a matter of religion and conscience was made thereof, to maintaine it so, in remembrance of the difficultie in taking it a peeces and breaking it downe, at what time as *Horatius Cocles* made the place good against the power of K. *Porsena*.

And now since the coherence of matters hath brought me to Rome, me thinks I should not doe amisse to proceed unto the miraculous buildings of this our cittie, to shew the docilitie of our people, and what proofe there is of their progresse in all things, during the space of nine hundred yeers; that it may appeare how not onely in magnanimitie and prowesse they have conquered the world, but in magnificence also of stately and sumptuous buildings surmounted all
E nations of the earth: and as a man shall find this singularitie and excellencie of theirs, in the particular survey of everie one of their stately and woonderfull ædifices as they have been reared from time to time, so if hee put them all togither and take a generall view of them at once, hee shall conceive no otherwise of their greatnesse, than of another world assembled (as it were) to make shew in one place: for if I should reckon among great workes (as needs I must) the grand cirque or shew-place built by *Cæsar* Dictator, which tooke up of ground three stadia or furlongs in length, and one in breadth, containing also in ædifices and roums foure acres or jugera, wherin were bestowed to sit at ease and behold the sights with pleasure, two hundred and threescore thousand persons: what tearme should I give, but of Stately and Magnificent buildings, either
M unto the royall pallace of *Paulus Æmilius*, enriched with goodly pillars of Sinadian marble out
F of Phrygia, most admirable to behold; or to the sumptuous Forum of *Augustus Cæsar* late Emperour, or yet the temple of *Peace* built by the Emperour *Vespasianus Augustus*, now living, the goodliest and fairest buildings that ever were? what should I speake of the temple * *Pantheon*, made by *Agrippa* to the honour of *Iupiter Revenger*? as also how before this time, *Valerius* of Ostia the architect or enginer, made a roufe over the great theatre at Rome against the time that

* The round church of *Nostre*, dame now at Rome.

Libo exhibited his ſolemnitie of games and plaies to the people? Wonder wee at the diſpences G
that KK. were at about their Pyramides? and wonder wee not rather that *Iulius Cæſar* Dictatour
diſburſed for the purchaſe of that plot of ground only and no more wherein he built his Forum,
*H-S *millies.* a * hundred millions of ſeſterces? And if there bee any here that take pleaſure to hoord up mo-
ney, and be loth to part with a penie, and love not to be at charges and lay forth ought, will they
not make a wonder when they heare that *P. Clodius* (whome *Milo* ſlew) paid for the houſe wher-
in he dwelt, fourteen millions and eight hundred thouſand ſeſterces? ſurely if they do not, I do;
and take it to be as fooliſh an expence and as wonderfull, as that of the KK. in Ægypt above na-
med: Likewiſe when I conſider the debts that *Milo* himſelfe ought, and which amounted to
ſeventie millions of ſeſterces, I count it one of the moſt prodigious enormities that a mans cor-
rupt mind can bring forth. But old men marveiled even in thoſe daies at the mightie thick ram- H
piers that K. *Tarquinius Priſcus* cauſed to bee made, the huge foundations alſo of the Capitoll
that he laid, the vaulted ſinks alſo and draughts (to ſpeake of a peece of worke the greateſt of all
others) which he deviſed, by undermining and cutting through the ſeven hills wherupon Rome
is ſeated, and making the citie hanging as it were in the aire between heaven and earth, like unto
Thebes in Ægypt, whereof erewhile I made mention; ſo as a man might paſſe under the ſtreets
and houſes with botes. But how would they be aſtonied now, to ſee how *M. Agrippa* in his Ædile-
ſhip, after he had been Conſull, cauſed ſeven rivers to meet togither under the citie in one main
channell, and to run with ſuch a ſwift ſtreame and current, that they take all afore them whatſoe-
ver is in the way, and carrie it downe into Tyber: and being otherwhiles encreaſed with ſodaine
ſhowres and land-fluds, they ſhake the paving under them, they ſlanck the ſides of the wals about I
them: ſometimes alſo they receive the Tyber water into them when he riſeth extraordinarily,
ſo as a man ſhall perceive the ſtreame of two contrarie waters affront and charge one another
with great force and violence within under the ground: And yet for all this, theſe water-workes
aforeſaid yeeld not a jot, but abide firme and faſt, without any ſenſible decay occaſioned thereby.
Moreover, theſe ſtreams carrie downe eftſoons huge and heavie peeces of ſtones within them,
mightie loads are drawn over them continually, yet theſe arched conduits neither ſettle & ſtoup
under the one, nor be once ſhaken with the other; downe many a houſe falleth of it ſelfe, and the
ruins beat againſt theſe vaults: to ſay nothing of thoſe that tumble upon them with the violent
force of skarefires, ne yet of the terrible earthquakes which ſhake the whole earth about them:
yet for all theſe injuries, they have continued ſince *Tarquinius Priſcus*, almoſt eight hundred K
yeers, inexpugnable. And here by the way I will not conceale from you a memorable example
which is come into my mind by occaſion of this diſcourſe, and the rather, for that even the beſt
and moſt renowmed Chroniclers who have taken upon them to pen our Romane hiſtorie, have
paſſed it over in ſilence: When this K. *Tarquinius* ſurnamed *Priſcus*, cauſed theſe vaults under
the ground to be made, and forced the common people to labour hard thereat with their owne
hands, it happened that many a good Roman citizen being now over-toiled in this kind of worke
(which whether it were more daungerous or tedious, was hard to ſay) choſe rather to kill them-
ſelves for to be rid of this irkeſome and painfull life; in ſuch ſort, that daily there were people miſ-
ſing, and their bodies found after they were periſhed. This king therefore, to prevent farther miſ-
chiefe, and to provide that his workes begun might bee brought to an end, deviſed a remedie L
* At Rome. which never was invented before, nor practiſed * afterwards, and that was this, That the bodies
of as many as were thus found dead, ſhould be hung upon jebbets, expoſed not only to the view
of all their fellow cittizens to bee deſpiſed as curſed creatures, but alſo to the wild and ravenous
foules of the aire to be torne and devoured. The Romans (as they are the only nation under hea-
ven impatient of any diſhonor) ſeeing this object preſented before their eyes, were mightily aba-
ſhed; and as this mind of theirs had gained them victorie many a time in deſperat battailes, ſo at
this preſent alſo it guided and directed them: and beeing (as they were) diſmaied at this diſgrace,
they made account no leſſe to be aſhamed of ſuch an ignominie after death, than they now blu-
ſhed thereat in their life. But to returne againe unto theſe ſinks and water-works of ours under the M
ground: K. *Tarquine* above-named, cauſed them to be made ſo large and of ſuch capacitie, that
a good wain load of hay might paſſe within them. But all that ever I have ſaid alreadie is nothing
or at leaſtwiſe verie little, in compariſon of one wonderfull thing which I am content to ſet down
before I come to our new and moderne buildings: In that yeere when *M. Lepidus* and *Q. Ca-
tulus* were Conſuls at Rome (according as I find all the beſt writers to agree) there was not a fairer

and

A and more ſumptuous houſe in all Rome, than that wherein *Lepidus* himſelfe dwelt: but verely before five and thirtie yeares were come and gone, there were a hundred houſes and more braver than it by many degrees. Now, if a man liſt by this reckoning to make an eſtimat of the infinite maſſe of marble, as well in pillars as ſquare Aſhler, the rich and curious pictures, beſides other ſumptuous furniture, meet indeed for a king, which muſt of neceſſitie be employed in a hundred ſuch houſes, as might not onely compare with that moſt beautifull and gorgeous houſe of *Catulus*, but alſo exceed the ſame; as alſo the infinit number of other houſes afterwards, even untill this day, which have gone beyond thoſe hundred in ſumptuoſities: What would he ſay, and to what an unmeaſurable proportion will all this ariſe? Certes, it cannot bee denied, but fire (which burneth many a ſtately pallace) doth ſay well to the plucking down of mans pride, and puniſhing
B ſuch waſtfull ſuperfluities; and yet theſe and ſuch like examples, will not reforme the abuſes that reign in the world: neither will this leſſon enter into our heads, That there is ought under heaven more fraile, mor tall, and tranſitorie, than man himſelfe. But what do I ſtand upon thoſe glorious edifices, when two pallaces onely have ſurpaſſed them all in coſtlineſſe and magnificence. Twice in our time we have ſeene the whole pourpriſe of Rome to be taken up, for to make the pallaces of two Emperours, *C. Caligula*, and *Nero*: and as for that of *Nero* (becauſe there might bee nothing wanting of ſuperfluitie in the higheſt degree) hee cauſed it to bee all guilded, and called it was, The golden pallace. For why? thoſe noble Romanes who were the founders of this our Empire, dwelt (no doubt) in ſuch glorious and ſtately houſes; thoſe I meane who went from the very plough taile, or els out of their country cabines (where they were found at repaſt by the fire ſide)
C to manage the warres, to atcheeve brave feats of armes, to conquer mightie nations, and to return with victory triumphant into the citie; ſuch, I ſay, as had not ſo much free land in the whole world as would ſerve for one of the cellars of theſe Prodigals. And here I cannot but thinke with my ſelfe how little in proportion to the magnificent buildings of theſe daies were thoſe plots of grounds which in old time the whole ſtate gave unto thoſe invincible captaines by publicke decree for to build them houſes upon, and how many of ſuch places would goe to one of theſe in our time: And yet this was the greateſt honour that they could deviſe to beſtow upon thoſe valiant and hardie knights, as it may appeare by **L. Valerius Publicola*, the firſt Conſull that ever was at Rome, and had companion with him in that government *L. Brutus*, who had no other reward in recompence of his good ſervice to the Commonweale, and ſo many demerits; as alſo by his
D brother, who in the ſame Conſulſhip defeated the Samnites twice: where it is worth the noting, that in the patent this braunch went withall, *That they were allowed to open the gates of their houſes outward, ſo as the dores might be caſt to the ſtreet ſide*: this was in thoſe daies the moſt glorious and honourable ſhew that ſuch mens houſes made, even thoſe who had triumphed over the enemie. Howbeit, as ſumptuous in this kind, as either *C. Caligula* or *Nero* was, yet ſhall they not enjoy the glorie of this fame, though you put them two and two together: for I will ſhew, that all this pride and exceſſe of theirs in building their pallaces (princes though they were & mighty monarchs) came behind the privat workes of *M. Scaurus*: Whoſe example in his Ædileſhip was of ſo ill conſequence, as I wot not whether ever there were any thing that overthrew ſo much all good manners and orderly civilitie: in ſuch ſort, as hard it is to ſay whether *Sylla* did more dammage to
E the ſtate, in having a *ſonne in law ſo rich and mightie, than by the proſcription of ſo many thouſand Romane citizens. And in truth, this *Scaurus* when he was Ædile, cauſed a wonderfull peece of worke to be made, and exceeding all that ever had been knowne wrought by mans hand, not onely thoſe that have been erected for a month or ſuch a thing, but even thoſe that have ben deſtined for perpetuitie; and a Theatre it was: the ſtage had three lofts one above another, wherein were three hundred and threeſcore columnes of marble; (a ſtraunge and admirable ſight in that citie, which in times paſt could not endure ſix ſmall pillars of marble, hewed out of the quarrey in mount Hymettus, in the houſe of a *moſt honourable perſonage, without a great reproch and rebuke given unto him for it;) the baſe or nethermoſt part of the ſtage, was all of marble; the middle of glaſſe (an exceſſive ſuperfluitie, never heard of before or after;) as for the uppermoſt, the
F bourds, plankes, and floores were guilded; the columnes beneath, were (as I have ſaid before) fortie foot high, wanting twaine: and between theſe columnes (as I have ſhewed before) there ſtood of ſtatues and images in braſſe to the number of three thouſand. The Theatre it ſelfe was able to receive foureſcore thouſand perſons to ſit well, and at eaſe. Whereas the compaſſe of *Pompeies* Amphitheatre (notwithſtanding the cittie of Rome ſo much enlarged, and more peopled in his time)

* *Publius*, out of *Livie*.

* For *Sylla* maried the mother of *Scaurus*.

* *L. Craſſus*.

time) was deuised for to containe no greater number than fortie thousand seats at large. As touching the other furniture of this Theatre of *Scaurus* in rich hangings, which were cloth of gold: painted tables, the most exquisit that could be found: plaiers apparell and other stuffe meet for to adorne the stage, there was such abundance thereof, that there being caried backe to his house of pleasure at Tusculum the surplusage thereof, over and above the daintiest part, wherof he had daily use at Rome, his servants and slaves there, upon indignation for this waste and monstrous superfluities of their maister, set the said countrey house on fire, and burnt as much as came to a hundred millions of sesterces. Certes, when I consider and behold the monstrous humours of these prodigall spirits, my mind is drawne away still from the progresse of mine intended journie, and forced I am to digresse out of my way, and to annex unto this vanitie of *Scaurus* as great folie of another, not in masonrie and marble, but in carpentrie and timber: and *C. Curio* it was, hee who in the civile warres betweene *Cæsar* and *Pompey*, lost his life in the quarrell of *Cæsar*. This gentleman, desirous to shew pleasure unto the people of Rome at the funerals of his father deceased, as the manner then was, and seeing that he could not outgoe *Scaurus* in rich and sumptuous furniture (for where should he have had such a father in law againe as *Sylla*? Where could he have found the like mother to dame *Metella*, who had her share in all forfeitures and confiscations of the goods of outlawed citizens? and where was it possible for him to meet with such another father as *M. Scaurus*, the principall person of the whole citie so long together, who parted stakes with *Marius* in pilling and polling of the provinces, and was the very receptacle & gulfe which received and swallowed all their spoiles and pillage?) and *Scaurus* himselfe verely, if hee might have had all the goods in the world, could not have done as hee did before, nor make the like Theatre againe, by reason that his house at Tusculum was burnt, where the costly and rich furniture, the goodliest rare ornaments which he had gotten together from all parts of the world, were consumed to ashes: by which fire yet this good hee got and prerogative above all other, That no man ever after him was able to match that sumptuositie of his Theatre. This gentleman (I say) *Curio*, all things considered, was put to his shifts, and deuised to surpasse *Scaurus* in wit, since he could not come neare him in wealth. And what might his invention bee? Certes, it is worth the knowledge, if there were no more but this, that we may have joy of our owne conceits and fashions, and call our selves worthily, as our manner is, *Majores, that is to say, superiour every way to all others. To come then to *C. Curio*, and his cunning deuise, he caused two Theatres to bee framed of timber, and those exceeding big, howbeit so, as they might bee turned about as a man would have them, approch neare one to the other, or be remooved farther asunder as one would desire, and all by the meanes of one hooke apeece that they hung by, which bare the weight of the whole frame, the countrepoise was so even, and all the whole therefore sure and firme. Now he ordered the matter thus, that to behold the severall stage plaies and shewes in the forenoone before dinner, they should be set backe to back, to the end, that the stages should not trouble one another: and when the people had taken their pleasure that way, hee turned the Theatres about in a trice against the afternoone, that they affronted one another: and toward the latter end of the day, and namely, when the fencers and sword-plaiers were to come in place, he brought both the Theatres nearer together (and yet every man sat still and kept his place, according to his rank and order) insomuch, as by the meeting of the hornes or corners of them both together in compasse, he made a faire round Amphitheatre of it: and there in the middest between, he exhibited indeed unto them all jointly, a fight and spectacle of sword-fencers fighting at sharpe, whome he had hired for that purpose: but in truth, a man may say more truly, that he caried the whole people of Rome round about at his pleasure, bound sure ynough for stirring or remooving. Now let us come to the point, and consider a little better of this thing. What should a man woonder at most therein, the deuiser or the deuise it selfe? The workeman of this fabricke, or the maister that set him on worke? Whether of the twaine is more admirable, either the venterous head of him that deuised it, or the bold heart of him that undertooke it? to commaund such a thing to be done, or to obey and yeeld to goe in hand with it? But when we have said all that we can, the follie of the blind and bold people of Rome went beyond all; who trusted such a tickliish frame, and durst sit there, in a seat so moveable. Loe where a man might have seene the bodie of that people, which is commaunder and ruler of the whole earth, the conquerour of the world, the disposer of kingdomes and realmes at their pleasure, the devider of countries and nations at their will, the giver of lawes to forraine states, the vicegerent of the immortall gods under heaven and representing

their

* The Romans delighted much in this word *Maiores*, as may appear by their *More Maiorum, &c.*

A their image unto all mankind: hanging in the air within a frame at the mercy of one only hooke, rejoicing and readie to clap hands at their owne daunger. What a cheape market of mens lives was here toward! What was the loſſe at Cannæ to this hazard, that they ſhould complaine ſo much as they doe of Cannæ? How neare unto a miſcheefe were they, which might have happened hereby in the turning of a hand? Certes, when there is newes come of a cittie ſwallowed up by a wide chinke and opening of the earth, all men generally in a publicke commiſeration doe greeve thereat, and there is not one but his heart doth earne; and yet, behold the univerſall ſtate and people of Rome, as if they were put into a couple of barkes, ſupported betweene heaven and earth, and ſitting at the devotion onely of two pins or hookes. And what ſpectacle doe they behold, a number of fencers trying it out with unrebated ſwords? nay ywis, but even themſelves ra-
B ther entered into a moſt deſperat fight, and at the point to breake their necks every mothers ſon, if the ſcaffold failed never ſo little, & the frame went out of joint: Now ſurely by this proofe, *Curio* had gotten a good hand over the people of Rome, and no Tribunes of the Commons with all their Orations could doe more: from that time forward he might make account to bee ſo gracious, as to lead all the tribes after him in any ſuits; and have them hanging in the aire at his pleaſure. What a mightie man with them might hee bee (thinke you) preaching unto them from the Roſtra? What would not he dare to propoſe, having audience in that publick place before them, who could perſuade them thus, as he did, to ſit upon ſuch turning and tickliſh Theatres. And in truth, if we will conſider this pageant upright, we muſt needs confeſſe & may bee bold to ſay, that *Curio* had all the people of Rome to performe a brave skirmiſh and combat indeed to honor and
C ſolemnize the funerals of his father before his tombe. And yet here is not all: for hee was at his chaunge and varietie of magnificent ſhewes: and when he perceived once that the hookes of his frames were ſtretched ynough and began to be out of order, hee kept them ſtill cloſe together round in forme of a perfect Amphitheatre, and the very laſt day of his funerall ſolemnities, upon two ſtages juſt in the middeſt, he repreſented wreſtlers and other champions to performe their devoire, and then all on a ſuddaine cauſing the ſaid ſtages to be disjoined and hailed one from another a contrary way, he brought forth the ſame day the fencers & ſword players who had woon the priſe, and with that ſhew made an end of all. See what *Curio* was able to doe! And yet was he neither king nor Keſar: he was not ſo much as a generall or commaunder of an armie; nay, hee was not named for any great rich man: as whoſe principall ſtate depended upon this, That when
D the great men of the cittie, *Cæſar* and *Pompey*, were skuffling together by the eares, hee knew well how to fiſh in a troubled water. But to leave *Curio* and ſuch as he was with their fooliſh and idle expences, let us come to the miraculous workes that *Q. Marcius Rex* performed, and that to ſome good purpoſe: which if we conſider and eſteeme aright, paſſe all the other before rehearſed. This gentleman when he was Pretour, having commandement and commiſſion both from the Senat, to repaire the conduits to the waters of Appia, Anio, and Tepula, which ſerved Rome, did not that onely, but alſo conveighed a new water into the cittie, which of his own name he called Martia: and notwithſtanding that hee was to pierce certaine mountaines, and make trenches quite through them under the ground, for to bring the water thither from the Spring, yet hee perfourmed all within the time of his Pretourſhip. As for *Agrippa*, whiles he was Ædile, beſides the con-
E duits from all other fountaines which he ſcoured, repaired, and cauſed to keepe their currant: he brought another of his owne to the cittie, which is knowne by the name of Virgo: he made ſeven hundred pooles for receit of waters: a hundred and five conduits, yeelding water at cockes and ſpouts: beſides a hundred and thirtie conduit heads in the fields, and the moſt of them built ſtrongly with vaults, and adorned right ſtately. Moreover, upon theſe workes of his he erected ſtatues and images, to the number of three hundred, partly of braſſe, and partly of marble, beſides foure hundred pillars of marble, and all within the compaſſe of one yeare. And if wee may beleeve his owne ſpeech, diſcourſing of the acts done by him during his Ædileſhip, hee addeth moreover and ſaith, That the plaies and games which hee exhibited that yeare, for to doe the people pleaſure, continued threeſcore daies together, wanting one: that hee cauſed a hundred
F threeſcore and ten baines and ſtouves to be made within the cittie, wherein people of all ſorts and degrees might bath and ſweat of free coſt, and not pay a denier; the which remaine at this day, and have brought with them an infinit number of others. But of all the conduits that ever were before this time, that which was laſt begun by *C. Caligula Cæſar*, and finiſhed by *Claudius Cæſar* his ſucceſſour, paſſeth for ſumptuouſneſſe: for they commaunded the waters from the two fountaines,

taines, Curtius and Cæruleus, whose heads were 40 miles of: and these they carried before them with such a force and to such an height, that they mounted up to the top of the highest hils of Rome, and served them that dwelt thereupon. This worke cost *three hundred millions of sesterces. Certes, if a man would well and truly consider the abundance of water that is brought therby, and how many places it serveth, as well publicke as privat, in baines, stewes, and fishpooles, for kitchins and other houses of office, for pipes and little riverets to water gardens, as well about the citie, as in manors and houses of pleasure in the fields neare unto the citie; over & besides, what a mightie way these waters be brought; the number of arches that of necessitie must be built of purpose for to conveigh them; the mountaines that bee pierced and mined through to give way together, with the vallies that are raised and made even and levell with other ground: hee will confesse, that there was never any desseine in the whole world enterprised and effected, more admirable than this. In the ranke of these most memorable workes of man, I may well raunge the mountaine that was digged through by the same *Claudius Cæsar*, for to void away the water out of the lough or meere Fucinus, although this worke was left unfinished for hatred of his *successour: which I assure you cost an incredible and inenarrable summe of money, besides the infinit toile and labour of a multitude of workemen and labourers so many yeares together, as well to force the water which came upon the pioners from under the ground with devise of engines and windles up to the top of the hill, whereas it stood upon meere earth; as to cut and hew through hard rags and rockes of flint: and all this by candlelight within the earth, in such sort, as unlesse a man had been there to have seene the manner of it, unpossible it is either to conceive in mind or expresse with tongue the difficulty of the enterprise. As for the peere and haven at Ostia (because I would make an end once of these matters) I will not say a word thereof, nor of the waies and passages cut through the mountaines, ne yet of the mightie piles and damns to exclude the Tuscane sea, for the Lucrine lake, with so many rampiers and bridges made of such infinit cost. Howbeit, among many other miraculous things in Ægypt, one thing more I will relate out of mine author *Papyrius Fabianus*, a great learned Naturalist, namely, That marble doth grow daily in the quarries: and in very truth, the farmers of those quarries, and such as ordinarily do labour and dig out stone, doe affirme no lesse; who upon their experience doe assure us, that look what holes and caves be made in those rockes and mountaines, the same will gather againe and fill up in time: which if it be true, good hope there is, that so long as marbles doe live, excesse in building will never die.

*Sestertium ter millies: howbeit Budæus readeth quingenties, quinquagies, quinquies, and that is not much more than the sixt part; and yet by his computation ariseth to a million three hundred eightie five thousand and five hundred French crownes.

*Nero.

Chap. XVI.

The sundrie kinds of the Load-stone, and the medicines thereto depending.

NOw that I am to passe from marbles, to the singular & admirable natures of other stones; who doubteth but the Magnet or Loadstone will present it self in the first place? for is there any thing more wonderfull, and wherein Nature hath more travelled to shew her power, than in it? True it is, that to rockes and stones she had given *voice (as I have already shewed) whereby they are able to answere a man, nay, they are ready to gainesay and multiplie words upon him. But is that all? what is there to our seeming more dull than the stiffe and hard stone? And yet behold, Nature hath bestowed upon it, sence, yea and hands also, with the use thereof. What can we devise more stubborne and rebellious in the owne kind, than the hard yron, yet it yeeldeth, and will abide to be ordered: for loe, it is willing to be drawne by the load-stone: a marvellous matter that this mettall, which tameth and conquereth all things else, should run toward I wot not what, and the nearer that it approcheth, standeth still, as if it were arrested, and suffereth it selfe to bee held therewith, nay, it claspeth and clungeth to it, and will not away. And hereupon it is, that some call the load-stone * Sideritis, others Heracleos. As for the name Magnes that it hath, it tooke it (as *Nicander* saith) of the first inventor and deviser thereof, who found it (by his saying) upon the mountaine Ida (for now it is to be had in all other countries, like as in Spaine also;) and (by report) a Neat-heard he was: who, as he kept his beasts upon the foresaid mountaine, might perceive as he went up and downe, both the hob-nailes which were on his shoes, and also the yron picke or graine of his staffe, to sticke unto the said stone. Moreover, *Sotacus* ascribeth and setteth downe five sundrie kinds of the load-stone: the first, which commeth out of Æthyopia; the second, from that Magnesia which confineth upon Macedonie, and namely,

*i. The ecchō.

*σίδηρος in Greek is yron.

A namely,on the right hand,as you goe from thence toward the lake Bœbeis; the third is found in Echium,a towne of Bœotia; the fourth about Alexandria,in the region of Troas; and the fift in Magnesia,a country in Asia Minor. The principall difference observed in these stones,consisteth in the sex (for some be male,others female;)the next lieth in the colour. As for those which are brought out of Macedonie and Magnesia,they bee partly red, and partly blacke. The Bœotian loadstone standeth more upon red than blacke: contrariwise, that of Troas is blacke, and of the female sex,in which regard it is not of that vertue that others be. But the worst of all comes from Magnesia in Natolia,and the same is white: neither doth it draw yron as the rest, but resembleth the pumish stone. In summe,this is found by experience, That the blewer any of these loadstones be,the better they are and more powerfull. And the Æthyopian is simply the best,insomuch,as it
B is worth the weight in silver: Found it is in Zimiri,for so they call the sandie region of Æthyopia: which country yeeldeth also the sanguine loadstone,called Hæmatites,which both in colour resembleth bloud,and also if it bee bruised,yeeldeth a bloudie humour, yea and otherwhiles that which is like unto Saffron. As for the propertie of drawing yron,this bloud-stone Hæmatites is nothing like to the loadstone indeed. But if you would know and trie the true Æthyopian magnet, it is of power to draw unto it any of the other sorts of loadstones. This is a generall vertue in them all,more or lesse,according to that portion of strength which Nature hath endued them withall, That they are very good to be put into those medicines which are prepared for the eyes: but principally they doe represse the vehement flux of humours that fall into them: being calcined and beaten into pouder,they doe heale any burne or scald. To conclude, there is another
C mountaine in the same Æthyopia,and not farre from the said Zimiris,which breedeth the stone Theamedes that will abide no yron,but rejecteth and driveth the same from it. But of both these natures,as well the one as the other,I have written oftentimes alreadie.

Chap. xvii.

Of certaine stones which will quickly consume the bodies that be laid therein. Of others againe that preserve them a long time. Of the stone called Assius, and the medicinable properties thereof.

D WIthin the Isle Scyros there is a stone(by report)which so long as it is whole and sound will swim and flote upon the water: breake the same into small peeces,it will sinke. Neat unto Assos,a citie in Troas, there is found in the quarries a certaine stone called Sarcophagus,which runneth in a direct veine,and is apt to be cloven and so cut out of the rocke by flakes: The reason of that name is this,because that within the space of fortie daies it is known for certaine to consume the bodies of the dead which are bestowed therein, skin,flesh,and bone, all save the teeth. And *Mutianus* mine Author affirmeth, That looke what mirroirs, *currycombes, cloth, or shoes soever be cast into the said coffins with the dead,they will turne all into stone. Of this nature there be stones in Lycia and in the East countries, which if they bee hung or applied to living bodies also,will eat and fret them away. Yet the stone called Chernites,resembling yvo-
E rie,is more mild and gentle: for keepe it will and preserve dead bodies without consuming them at all,and in a sepulchre or coffin of this stone,the bodie of king *Darius*(they say) was bestowed. Touching the stone called Porus, like it is unto the marble of Paros for white colour and hardnesse,howbeit,nothing so weightie. *Theophrastus* writeth, That there be found in Ægypt certaine cleare and transparent stones, and those hee saith bee like unto the Serpentine marble Ophites: haply such there were in his time, for now are there none of them to bee found; but as they are gone,so there be new come in their place. As for the stone Assius,in tast it is saltish,but singular good to allay the paine of the gout,if the feet onely be put into a trough or hollow vessell made of that stone. Moreover,all greefes,paines,and infirmities of the legs,will be healed in such quarries: wheras in all mettall mines,the legs take harme. Furthermore,this stone yeeldeth in the top
F of the quarrie a certaine light substance,apt to be reduced into a soft pouder,which they call the floure of the said stone, and is as effectuall as the stone it selfe in some cases. Like it is for all the world to a red pumish stone. If it be mixed with Cyprian brasse or copper,it cureth the accidents of womens breasts: but being incorporat with pitch or rosin,it discusseth the kings evill,and any biles or botches. The same reduced into a lohoch to bee licked downe leasurely,serveth well in a phthy-

*Strigiles. He meaneth those that be used in baines to fetch off the sweat and filthinesse of our bodies.

phthysicke: and tempered with honey, it healeth up old ulcers and skinneth them cleane: and G
yet this propertie it hath, to eat away any excrescence of prowd flesh. The same is good for the bitings of wild and venomous beasts. Such morimals or sores as scorne ordinarie cures & be full of suppuration, it drieth. Finally, there is an excellent cataplasme made with it and beane-flower put together, for the gout.

Chap. xviii.

Of Yvorie minerall, digged out of the ground. Of stones that are of a bonie nature, and such, as their veines represent Date trees within: and of other kinds of stone.

H
Theophrastus and *Mutianus* abovenamed, are verely perswaded, That there be some stones which engender others. And as for *Theophrastus*, he affirmeth, That there is a minerall Yvorie found within the ground, as well blacke as white: also, that there be bones growing within the earth, yea, and stones of a bonie substance. About Munda, a cittie in Spaine, where *Cæsar* Dictatour defeated *Pompey*, there are found stones resembling Date trees, breake them as often as you will. There be also certaine blacke stones, whereof there is as great account made as of marbles: like as the stone also of the cape Tænara. And such blacke stones (*Varro* saith) be more firm and hard which come out of Africa, than those of Italie: and contrariwise, that there bee white stones harder to be wrought by the Turner, than the marble of Paros: The said *Varro* affirmeth, That the flint of Luna may be slit with the saw; whereas that of Tusculum will cracke and flie in I
peeces in the fire: also, That the darke and duskish Sabine stone, if it be sprinckled with oile, will burne of a light fire: moreover, That about Volsinij there have been found quernes or hand-mill-stones framed readie for worke, yea, and some we have seene to turn about and grind of their own accord; but such have been taken for prodigies. And since I am fallen upon the mention of such mill-stones, there is not a countrey in the world affourdeth better of that kind than Italie dooth: neither doe such grow in the rocke, and are hewed forth, but be entire stones of themselves apart: and yet in some provinces there are none of them to be had at all. And in this kind there be of a more free and softer grit, which being smoothed and pollished with a slicke stone, may seem a far off as if they were Serpentine marble: and verely, there is not a stone will endure better, or lie longer in building. For thus you must thinke, that all stones bee not of one and the same nature K
to abide raine and weather; heat of Summer and cold in Winter alike: for some be more durable than others, like as we find in sundrie kinds of timber. Finally, there be stones also, which may not away with the raies of the Moon: which in continuance of time will gather rust, yea, and with oyle will chaunge their white colour.

Chap. xix.

Of Curalium or Pyrites, i. the Marcasin: and the medicinable vertues thereof. Of the stone Ostracites, and the Amiant: together with the properties serving in Physicke: also, of the stone Melitites, and the vertues thereof. Likewise L
of the Geat, and the effects that it worketh in Physicke. Of Spunges. Lastly, of the Phrygian stone, and the nature of it.

THe mill-stone Curalium, some call Pyrites, because it seemeth to have great store of fire in it: howbeit, there is another fire stone going under the name of Pyrites or Marcasin, which resembleth brasse ore in the mine. And they say, that of it there is found great plenty in the Isle Cypros, and in those mines which are about Acarnania, where a man shall meet with one in colour like silver, and another like gold. These stones be calcined many and sundrie waies. Some boile them two or three times in honey, so long, untill all the liquor bee consumed: others burne them first in fire of coales, then they calcine them with hony, and afterwards wash them, after the M
manner of brasse. These stones thus prepared, are good in Physick, namely, to heat, to drie, to discusse, to subtiliat grosse humors, and to mollifie all schirrhosities or hard tumors. The same are much used also crude and uncalcined (being reduced into pouder) for the kings evill, and fellons. Moreover, in the ranke of these Marcasines, some raunge certaine stones, which wee call quicke fire-

A fire-ſtones, and of all others they be moſt ponderous: theſe bee moſt neceſſarie for the eſpialls belonging unto a campe, for if they ſtrike them either with an yron ſpike or another ſtone, they will caſt forth ſparks of fire, which lighting upon matches dipt in brimſtone, drie puffs or leaves, will cauſe them to catch fire ſooner than a man can ſay the word.

As touching the ſtones Oſtracitæ, they have a reſemblance to oyſter ſhels, wherof they tooke their name: uſed they are much in ſtead of pumiſh ſtone to ſmooth and ſlicke the skin: taken in drinke, they ſtaunch any flux of bloud; and in forme of a liniment applied with hony, they heale the ulcers in womens breaſts, and aſſuage their paine.

The * Amiant ſtone is like unto Alume, and beeing put into the fire, looſeth nothing of the ſubſtance: a ſingular propertie it hath to reſiſt all enchantments and ſorceries, ſuch eſpecially as B magicians doe practiſe. As for Gæodes, the Greeks have given it this ſignificant name, becauſe it containeth encloſed within the bellie a certaine earth; a medecine ſoveraigne for the eyes, as alſo for the infirmities incident as well to womens paps as mens genetoirs.

* It is taken for Alume de plume.

The ſtone Melitites hath that name, becauſe if it bee bruiſed or braied, it yeeldeth from it a certaine ſweet juice in manner of honey: the ſame being incorporat in wax, is good to cure the flegmaticke wheales, and other puſhes or ſpecks of the bodie; it healeth likewiſe the exulceration of the throat: applied with wooll, it taketh away the chilblanes or angrie bloudyfalls called Epinyctides: like as the griefe of the matrice it eaſeth in the ſame manner.

The Geat, which otherwiſe we call Gagates, carrieth the name of a towne and river both in Lycia, called Gages: it is ſaid alſo, that the ſea caſteth it up at a full tide or high water into the C Iſland Leucola, where it is gathered within the ſpace of twelve ſtadia, and no where elſe: blacke it is, plaine and even, of a hollow ſubſtance in manner of the pumiſh ſtone, not much differing from the nature of wood; light, brittle, and if it bee rubbed or bruiſed, of a ſtrong ſavour: looke what letters are imprinted with it into any veſſell of earth, they will never be gotten out againe: whiles it burneth, it yeeldeth the ſmell of brimſtone: but a wonderfull thing it is of this jeat ſtone, that water will ſoone make it to flame, and oile will quench it againe: in burning, the perfume thereof chaſeth away ſerpents, and bringeth women againe that lie in a traunce by the ſuffocation or riſing of the mother: the ſaid ſmoke diſcovereth the falling ſickneſſe, and bewraieth whether a young damſell be a *maiden or no; the ſame being boiled in wine, helpeth the toothach; and tempered with wax, cureth the ſwelling glandules named the Kings evill. They ſay that the D Magicians uſe this jeat ſtone much in their ſorceries which they practiſe by the means of red hot axes, which they call Axinomantia; for they affirme, that being caſt thereupon it will burne and conſume, if that which we deſire and wiſh ſhall happen accordingly.

* If ſhe drinke it faſting, preſently it provoketh urine, if ſhe be a pure virgin.

As for Spunges, I meane by them in this place certaine ſtones found in Spunges, & the ſame alſo doe engender naturally within them. Some there bee who call them Tecolithos, becauſe they are good for the bladder, in this reſpect, that they breake the ſtone if they be drunke in wine.

As concerning the Phrygian ſtone, it beareth the name of the countrey where it is ordinarily found, and it groweth in lumps that be hollow in manner of a pumiſh ſtone: the order is to ſteep it well in wine before it be calcined, and in the burning to maintaine the fire with blaſt of bellows untill it wax red; then, to quench it againe in ſweet wine, continuing this courſe three times: and E when it is thus prepared, it is good only for to ſcoure cloth and make it readie for the dier to take a colour.

Chap. xx.

Of the red bloud-ſtone Hæmatites, and the five ſorts thereof: alſo of the blacke ſanguine Stone called Schiſtos.

THe bloud-ſtone Schiſtos and Hœmatites both, have a great affinitie one with another. As for the bloud-ſtone Hœmatites, a meere minerall it is and found in mines of mettall: being burnt, it commeth to the colour of vermillon: the manner of calcining it, is much after that of the Phrygian ſtone, but wine ſerveth not to quench it: many ſophiſticat it with Schiſtos, F and obtrude the one for the other: but the difference is ſoon knowne, for that the right Hœmatites hath red veins in it, and beſides is by nature fraile and eaſie to crumble: of woonderfull operation it is to helpe bloudſhotten eies: the ſame given to women to drinke, ſtaieth the immoderat flux that followeth them: they alſo that uſe to caſt up bloud at the mouth, find helpe by drinking it with the juice of a pomegranat: in the diſeaſes likewiſe of the bladder it is verie effectuall:

and being taken in wine, it is ſoveraigne againſt the ſting of ſerpents. In all theſe caſes the bloud- G
ſtone Schiſtos is effectuall, but weaker onely it is in operation: and yet among theſe ſanguine or bloud ſtones, thoſe are taken for the beſt and moſt helpefull which in colour reſemble ſaffron; and ſuch have a peculiar reſplendent luſtre by themſelves. This ſtone beeing applied to weeping and waterie eyes with womans milke, doth them much good; and is ſoveraigne alſo to reſtraine and keepe them in, if they bee readie to ſtart out of the head: And this I write according to the mind and opinion of our moderne authors. But *Sotacus* a verie auncient writer hath delivered unto us five kinds of bloud-ſtone, beſides that Hœmatites which is called Magnes or the load-ſtone: among which, he giveth the chiefe prize and principall praiſe to the Æthiopian, for that it is ſo ſoveraigne for to bee put into medecins appropriat to the eyes; as alſo into thoſe which for their excellent operation be called Panchreſta. A ſecond ſort he ſaith, is called Androdamas, H
blacke of colour, and for weight and hardneſſe ſurpaſſing all the reſt, whereupon it tooke that name; and of this kind there are found great ſtore in Barbarie: hee affirmeth moreover, that it hath a qualitie to draw unto it ſilver, braſſe, and iron: and for to make proofe whether it bee good or no, it ought to bee ground upon the touch called Baſanites; for it will yeeld a bloudie juice, the which is a right ſoveraigne remedie for the diſeaſes of the liver. For the third kind of bloud-ſtone, he maketh the Arabicke, for that it is brought out of Arabia: as hard it is as the other, for hardly will there any juice come from it though it be put to the grindſtone; and the ſame other-while is of a ſaffron colour. The fourth ſort he ſaith, is called Elatites, ſo long as it is crude; but being once calcined, it taketh the name Miltites; a verie excellent thing for burns and ſcaldings, and in all caſes much better than any ruddle whatſoever. In the fifth place he reckneth that which I
is called Schiſtos: this is held to be ſingular in repreſſing the flux of bloud from the hæmorrhoid veins. But generally of all theſe bloudſtones, he concludeth thus, That if they be pulveriſed and taken in oile upon a faſting ſtomacke, to the weight of three drams, they be right ſoveraigne for all fluxes of bloud. The ſame authour writeth of another Schiſtos that is none of theſe Hœmatites, and this they call Anthracites: and by his ſaying, found there is of it in Affricke, blacke in colour, which if it be ground upon a whetſtone or grindſtone with water, yeeldeth toward the nether end or ſide thereof that lay next unto the ground, a certain blacke juice; but on the other ſide, of a ſaffron colour: and hee is of opinion, that the ſaid juice is ſingular for thoſe medecines which be appropriat to the eyes.

K

Chap. xxi.

Of the foure kinds of the Ægle-ſtone, Aëtites: of the ſtone Callimus: of the ſtones Samnus and Arabus: and of Pumiſh ſtones.

THe Ægle-ſtones called Aëtites, be much renowmed in regard of the verie name that they carrie: found they are in Ægles neſts, as I have ſhewed alreadie in my tenth booke: and it is ſaid, that they be two togither, to wit, the male and the female: alſo that without them the Ægles cannot hatch, which is the reaſon that they never have above two yong Ægles at one airie. Of this Ægle-ſtone there be foure kinds: for one ſort thereof is bred in Affricke; the ſame is verie ſmall and ſoft, containing within it as it were in a wombe, a certaine clay which is ſweet, L
pleaſant, and white: the ſtone it ſelfe is brittle and apt to crumble, and this is thought to bee the female ſex. The ſecond, which is taken for the male, groweth in Arabia: hard this is and reſembleth a gall-nut in faſhion, and the ſame otherwhile is of a reddiſh colour, having encloſed within the bellie thereof another hard ſtone. The third is found in the Iſle Cypros; for colour much like to thoſe that be engendred in Affricke, otherwiſe bigger and made more flat and broad than they: the reſt be uſually round in manner of a globe: this hath alſo within the wombe a ſweet ſand and other ſmall gravelly ſtones, but it ſelfe is ſo tender that a man may crumble it between his fingers. The fourth kind is named Taphiuſius, for that it is bred neare unto the cape Leucas in a place neare unto Taphiuſa, on the right hand as men ſaile from the ſaid Taphiuſa toward Leucas: there is found of it in rivers, but the ſame is white and round: within the belly of it there M
is another ſtone called Callimus, and there is not a thing more tender than it. But to come unto the properties of theſe Ægle-ſtones: They are commended as ſingular for women with child, or four-footed beaſts that are with young; for if they be hung about their necks, or otherwiſe tied to any part within the skin of a beaſt ſacrificed, they will cauſe them to goe out their full time; but

remooved

A remooved they must not be but at the verie time of deliverance, for otherwise the verie wombe or matrice would slip out withall; and unlesse they be remooved then, they shall never be delivered. Within the same Isle Samos (wherein we praised the goldsmiths earth Tripolie) there is a stone likewise called Samius, very good to burnish and polish gold: the same serveth also in physicke togither with milke, for ulcers of the eyes, being applied in manner aforesaid; and in that sort it cureth also their weeping and watering which hath continued a long time: the same being taken in drinke, helpeth the infirmitie and other accidents of the stomacke; it cureth the dizzinesse of the head, and restoreth those to their right senses againe who be troubled in their brain. Some are of opinion, that it is holesome to bee given unto those that are subject to the falling sickenesse, or difficultie of making water: besides, it is one of the ingredients that goe to the ma-
B king of those medecines which be called Acopa: for to know whether it bee good, see that it be passing white and heavie withall. It is said, that if a woman weare it hanging or tied about her, it will keepe her from untimely slips of her abortive fruit, and withall containe the matrice though it were given to fall downe too low.

Touching the stone Arabus, like it is to yvorie; a proper thing for dentifrices, if it be calcined and reduced to powder: a peculiar propertie it hath besides, to cure the hæmorrhoids, beeing applied thereto in lint, so that there be fine linnen cloaths laid afterwards thereupon.

I must not overpasse in silence, the treatise of pumish stones and their nature: I am not ignorant that in architecture and masonrie, they use to call by the name of Pumices or Pumishes those hollowed stones or bricks as if they were eaten into, which hang downe from those vaulted
C buildings which they call Musea, to represent a cave or hollow vault artificially made. But to speake more properly of those Pumishes which are used by women for to smooth and slicke their skin, yea and by your leave, by men also in these daies; also for to pollish books, as *Catullus* saith, the best of them are found in Melos, Scyros, and the Islands of Ætolia: and those ought to bee 2 verie white, and according to their proportion exceeding light: the same should be also as spun-
3 geous as is possible, and drie without; easie to be beaten to powder, and in the rubbing betweene the fingers not apt to yeeld from them any sand. As for their medicinable vertues, they doe extenuat and drie, after three calcinings, so that regard be had in the torrifying, that it be done with cleane charcoles that burn cleare, and that they be everie time quenched with white wine: which done, they are to be washed like unto Cadmia or the Calamine stone; and being dried againe,
D they would be laid up in some drie place which is in any wise danke or given to gather mouldinesse. The powder of this stone is commended principally in medecines for the eyes, for a gentle mundificative it is, and cleanseth the ulcers and sores incident unto them: it doth incarnat hollow skars and maketh them even with the rest about them. Some, after the third burning, suffer them to coole of themselves, and not by quenching; and chuse rather to beat them afterwards with some sprinckling of wine among: they enter likewise into those emollitive or lenitive plastres which are devised for the sores of the head or ulcers in the privities. The best dentifrices for to cleanse or whiten the teeth, bee made of the pumish. *Theophrastus* writeth, that great drun-
5 kards who drinke for a wager, use to take the powder of the pumish stone before-hand; for then
4 they may, nay they must quaffe lustily indeed, for unlesse they bee filled with drinke, they are en-
E daungered by the foresaid powder. To conclude, hee saith, that so exceeding refrigerative it is, that if new wine doe worke or purge never so much, cast but a little pumish stone into it, you shall see it give over immediatly.

Chap. XXII.

Of stones which be good for Apothecaries to make their mortars of: of soft stones: of the glasse-stone: of flints and the shining stone Phengites: of whetstones and grindstones: of other stones that serve in building, which resist the violence of fire and tempests.

F OVr auncient writers in old time were carefull to find stones fit for mortars, and not onely to serve Apothecaries for to beat and pulverize their druggs, or painters to grind their colours, but the cookes also in the kitchin for to powder their spices: and in verie truth, they preferred the Ephesian marble before all others; and next to it, that of Thebais in high Ægypt, which I called before Pyrrhopœcilon, although some there be that name it Pharonium: in a

third degree they place a kind of Chalazius named Chryſites; but the Phyſicians make moſt G
account of that kind of whetſtone which they call Baſanites, becauſe this ſtone ſendeth nothing from it, for all the ſtamping and punning that is made in it. As for ſuch ſtones as yeeld a certaine moiſture from them, they are ſuppoſed to bee good for eyeſalves, and therefore in that regard the Æthiopian marble is beſt eſteemed for that purpoſe. As for the marble of Tænara, of Carthage called Pœnicum, and the bloud-ſtone Homatites, they are all good (they ſay) for thoſe compoſitions which ſtand upon ſaffron: but that Tænarian marble which is blacke, as alſo the white marble of Paros, is not ſo good for Phyſicians, who rather chuſe the Alabaſtrite of Ægypt, or the white Serpentine marble: for this kind of Ophites it is wherof they make their veſſels and barrels. In the Iſland Siphnus there groweth in the quarries, a ſtone, which they uſe to hew hollow, and by turners craft make veſſels for the kitchin good to boile viands in; alſo verie handſom H
for platters and diſhes to ſerve up meat to the table; much like unto the greene ſtone that commeth from Comus in Italie, which wee ſee ordinarily emploied to thoſe uſes: but this propertie hath the Siphnian ſtone by it ſelfe, that if it be once heat with oile, it beginneth to looke blacke and waxeth hard withall, being otherwiſe naturally exceeding ſoft: ſuch difference ther is among ſtones. For on the further ſide of the Alps there be ſtones found exceeding ſoft: and in the province Belgica or Picardie, they have a certaine white ſtone, which they ſlit through with a ſaw as they doe timber, yea and with much more facilitie, wherewith they make plates that ſerve to cover their houſes in manner of ſlates or tyles, both on the ſides and alſo in gutter and ridge; yea and if they liſt, to make fine worke upon the rouſes that may ſhine like unto peacocks feathers, which they call Pavonacea: and verely this kind of ſtone is apt alſo to be cloven. I

Speculatis lapis As touching * Talc (which alſo goeth in the name of a ſtone) it is by nature much more eaſie to be cloven into as thin flakes as a man will. This kind of glaſſe ſtone, the hither part of Spaine onely in old time did affourd us, and the ſame not all throughout, but within the compaſſe of a hundred miles, namely about the citie Segobrica: but in theſe we have it from Cypros, Cappadocia, and Sicilie, and of late alſo it hath been found in Barbarie: howbeit, the beſt glaſſe-ſtone commeth from Spaine and Cappadocia, for it is the tendreſt and carrieth largeſt pannels, although they be not altogither the cleareſt, but ſomewhat duskiſh. There be alſo of them in Italy about Bononia, but the ſame bee ſhort and ſmall, full of ſpots alſo and joyned to peeces of flint; and yet it ſeemeth that in nature they bee much like unto thoſe that in Spaine be digged out of pits which they ſinke to a great depth. Moreover, there is found of this Talc betweene other K
ſtones encloſed in a rocke and lying under the ground, which muſt be hewed out if a man would have them. But for the moſt part, this Talc lieth in manner of a veine in the mine by it ſelfe, as if it were perfitly cut alreadie by nature; and yet was there never any peece knowne to bee above five foot long. Some are of opinion, that it is a liquid humor of the earth congealed to an yce after the manner of criſtall. Certes, that it groweth hard into the nature of a ſtone, may appeare evidently by this, That when any wild beaſts are chaunced to fall into ſuch pits where this glaſſe ſtone is gotten, the very marow of their bones (after one winter) will be converted and turned into a ſtonie ſubſtance like to the Talc it ſelfe. Otherwhiles there is found of this kind which is blacke; but the white is of a ſtraunge and wonderfull nature, for being (as it is well knowne) tender and brittle, nothing more, yet it will endure extreame heat and frozen cold, and never crack; L
nay you ſhall never ſee it decay for age, keepe it ſo long as you will, ſo that it may eſcape outward injuries: notwithſtanding wee doe ſee many ſtones in building laid with ſtrong mortar and cement, yet ſubject to age. There hath been deviſed another uſe alſo of Talc in ſmaller peeces, namely, to pave therewith the floore of the great ſhew-place or cirque in Rome, during the running of charriots and other feats of activitie there perfourmed, to the end that their whiteneſſe might give a more lovely gloſſe to commend the place. In the daies of *Nero* late Emperour, there was found in Cappadocia a ſtone as hard as marble, white and tranſparent and ſhining through, yea even on that ſide where it hath certaine reddiſh ſtreakes or ſpots: in which regard, (for that it is ſo reſplendent) it hath found a name to be called Phengites: Of this ſtone, the ſaid Emperour cauſed the temple of *Fortune* to bee built called Seia, (which king *Servius* had firſt M
dedicated) compriſed within the compaſſe of *Neroes* golden houſe: and therefore when the dores ſtood open in the daie time, a man might ſee within, the day light, after the manner of glaſſe-ſtones; yet ſo, as if all the light were within-forth onely, and not let in from the aire thorow the windowes. Moreover, king *Iuba* writeth, that in Arabia there is a certaine ſtone found,

which

A which likewiſe ſhineth as glaſſe, whereof the inhabitants of thoſe parts doe make their mirrours or looking-glaſſes.

It remaineth now, that I ſhould proceed to thoſe ſtones which are by workmen emploied to good and neceſſarie uſes: firſt of all, to thoſe which ſerve to whet tools and inſtruments of yron, of which there be many ſorts: Thoſe of Candie, for a long time were of greateſt name & moſt in requeſt: in a ſecond degree were thoſe accounted which came from the mountaine Targetus in Laconia: but both the one and the other ſerve for no uſe, without oile. But among the grind-ſtones and whetſtones which are occupied with water, thoſe of Naxos were in greateſt price and moſt commended; next to them, thoſe of Armenia, wherof I have alreadie written. The ſtones of Cilicia will do well enough either with water or oile, it skilleth not whether: but the whetſtones
B that come from Arſinoë, are onely uſed with water. There bee found in Italie whetſtones, which with water will give a wonderfull keene edge; alſo beyond the Alps, and ſuch they call Paſſernices. In a fourth ranke are to be reckoned thoſe ſtones which ſerve with a mans ſpittle, and ſuch be the hones that barbers occupie for to ſharpen their raſors; but they are of little or no uſe at all becauſe they be ſo ſoft and brittle: and of this kind, the chiefe are ſent out of the hither part of Spaine from the countrey Flamminitana. As for other ſtones whereof I have not written alreadie, they be all naught for building, ſo ſoft they be, and by that means nothing durable: and yet in ſome countries they have none other to build withall, as namely at Carthage in Africke, notwithſtanding the walls of the houſes there are ſubject to the vapours of the ſea, are pinched and pearced with winds, yea and beaten with raine and weather; againſt which inconveniences the
C inhabitants are forced to keepe their walls with pitching, for otherwiſe (the ſtones are ſo tender and ſoft) the ordinarie parget of lime would fret and eat them: whereupon there goeth a pretie ſpeech of the Carthaginians, that they doe contrarie to all others, in that they uſe pitch to their houſes, and lime to their wines; for in truth they tun up their new wines with lime. There be found moreover about Rome other ſoft ſtones, to wit, in the territories belonging to Fidena and Alba: in Liguria likewiſe, Vmbria, and Venice, they have a white free ſtone, which may bee eaſily cut with a toothed ſaw: theſe are verie tractable and eaſie to be wrought, and will laſt reaſonable well, but within houſe only; for if the weather lie upon them, if the raine beat, and the pinching froſt come, they will pill and ſhake, yea and breake into peeces; neither bee they durable againſt the breath and vapour of the ſea. The Tyburtine ſtones, they will endure all other things
D well enough, onely they may not abide hot vapours, for if the heat of Summer take them, they will gape and be readie to cleave in ſunder. As for flints, the blacke, and in ſome places the red alſo, are much commended: in certaine countries, the white be verie good; as namely, thoſe in the quarries about Anicia within the territorie of Tarquinij about the lake neare unto Volſinij: alſo along the tract of Statona, there bee good building-ſtones that will take no harme by fire; theſe are commonly uſed for thoſe monuments and memorials wherin ought is to be engraved, for they continue a long time and are not the worſe for age: Of this kind of ſtone, the founders make their moulds for to melt braſſe in. Moreover, there is a kind of greene ſtone, which woonderfully checketh and ſcorneth all fire; but in no place is there plentie thereof to bee had: and
E whereſoever it is found, it groweth not in manner of a rocke or quarrie, but lieth ſcattered here and there. Of the reſt that hitherto are not named, the pale ſtone is not good for building, and ſeldome will it ſerve to make mortar of. The round pebbles are laſting enough, and will endure any hardneſſe, but ſurely in building nothing truſtie, unleſſe they be knit and bound with ſtrong mortar and couched well togither. Thoſe that are gathered out of rivers make no ſure building, for they ſeeme alwaies to relent and be moiſt: but for ſuch ſtones as theſe, and generally for all thoſe that we doubt, the onely remedie is to dig them out of the ground in Summer, to let them have two yeers ſeaſoning in lying abroad and taking all kinds of weather before they be emploied in building; and looke how much thereof hath caught harme by this means, the ſame will ſerve verie well in groundworks and foundations: and that which continueth ſtill ſound, you may be bold to put it in building, yea in open workes without dore. The Greekes have a kind of wall
F which they make of hard pebbles or flint couched even and laid in order by line and levell, like as we doe in bricke walls; and this kind of building they call in maſonrie Iſodomon: but in caſe they be not even laid nor raunged ſtreight, but that ſome part of the wall is thicker than others, they tearme it Pſeudiſodomon. A third manner they have which they name Emplecton, namely, when the front onely of the wall is ſmooth and even, for otherwiſe within they huddle and fill

one with another. Moreover, to lay a wall artificially and to bind the ſtones well, they ought in alternative courſe to ride & reach one over another halfe, ſo that the joint may fall out in the mids of a ſtone both above and under; a neceſſarie point to bee conſidered in the very mids of a wall if it be poſſible: if not ſo, yet in any caſe toward the ſides and ends thereof: as for the middle of the wall within, it would be well ſtuffed and filled with any rubbiſh, rammell, and broken ſtones. There is a kind of net-worke building in maſonry called Dictyotheton, ordinarily uſed in Rome, but ſubject it is to cracke and chinke. In ſum, a wall would be built by rule and ſquire, by line and levell, and anſwerable to the plumbe.

Chap. xxiii.

Of Ciſterns, and Lime: of ſundrie ſorts of Sand: of the tempering of Sand and Lime togither for mortar: of faults in Maſonrie: of Pargetting and other Rough-caſting: of the proportion of Columns and Pillars.

FOr to make good ciſterns which might hold water, the mortar that goeth thereto ought to be made of five parts of fine pure ſand and gravelly togither, to two parts of the moſt ſtrong and binding lime that may be gotten; provided alwais that the fragments of flint which are to be emploied herein, be ſmall, and exceed not the weight of one pound apeece: this done, not onely the bottome or paving, but the ſide-walls and the ends, ought to be rammed downe hard with yron beetles: howbeit, for to keepe good and cleare water, it were the better way to have alwaies two ciſterns togither, that in the former the water may ſettle & caſt downe all the grounds to the bottome, and ſo the cleare water onely paſſe into the other as if it were ſtrained through a fine colondre. As touching lime, *Cato Cenſorius* diſalloweth that which is made of divers ſtones, or of ſundrie colours: and to ſpeake a truth, white ſtones are better to make lime than the hard, and ſuch is more meet to lay ſtone withall in maſonrie; howbeit the lime which commeth of hollow and fiſtulous ſtones, is thought to ſerve better for to cover and parget walls. The lime which commeth of flint, is rejected both for the one and the other: alſo the lime made of ſtones digged out of the ground, is far better than of pebbles gathered from river ſides: that which commeth of milſtones is moſt profitable, for it is more fattie and glutinous than others. A ſtraunge and wonderfull matter it is, that any thing after it hath been once burnt and calcined, ſhould be ſet on fire againe with water. And thus much of Lime.

As touching Sand, there be three kinds thereof: the one is digged out of pitts in the ground, and this requireth a fourth part of lime to bee put unto it in making mortar: a ſecond commeth out of river ſides or the ſea ſhore, and this would have a third part: and if there be beſides another third part of potſherds beaten to powder and put thereto, the ſtuffe or mortar will be the better. Betweene the Apennine hill and the river Po, there is no ſand digged out of the ground, ne yet any ſea ſand at all. And verely, the greateſt reaſon that cities fall to decay and be ſo ruinat, is this, For that the mortar beeing robbed of the due proportion of lime, hath not that binding as it ought, and ſo the walls built therewith are not ſodred accordingly. Alſo, this would be obſerved, that mortar the elder that it is, the better it is found for building. Moreover, in the old laws which provide for the perpetuitie of houſes in auncient time, wee find it expreſſely ſet downe, That the undertaker to build a houſe at a certaine price, ſhall uſe no mortar under three yeers of age: and this was the reaſon that in thoſe daies a man ſhould not ſee any rough-caſt or parget to riſe or chawne illfavouredly as now they doe: and in truth, unleſſe there be laid upon walls three coats or couches (as it were) of mortar made with ſand and lime, and two courſes over them of other mortar made of marble grit and lime tempered togither, the walls will not be permanent nor otherwiſe faire and reſplendent as they ought to be: and looke where walls be dampiſh and given to ſweat a certaine ſalt humour or ſal-petre, it were verie well to lay a ground underneath of mortar made of the pouder of potſheards and lime wrought togither. In Greece they have a caſt by themſelves, to temper and beat in morters, the mortar made of lime and ſand wherewith they meane to parget and cover their walls, with a great wooden peſtill. As for the mortar made of marble-grit and lime togither, the true mark to know whether it have making ſufficient for building is this, namely, if it will not ſticke to the ſhovell that worketh it, but will come out of the heape neat and cleane: but contrariwiſe, in whiting and fret-worke, the lime being ſoked and wet in water, ought to cleave faſt like glew; neither ought it to bee tempered with water, but in the groſſe

A groſſe maſſe or lumpe. At Elis there ſtandeth a temple conſecrated to the honour of *Minerva*, wherein *Panneus*, the brother of *Phidias*, uſed a parget (as they ſay) which he tempered with milk
2 and ſaffron together: and therefore at this day, if a man wet his thumbe with ſpittle, and rub it againſt the wall, he ſhall perceive both the ſmell and taſt of ſaffron to remaine ſtill.

As touching pillars in any building, the thicker they ſtand one to another, the bigger & groſſer they ſeeme to be. Our architects and maſons make foure ſorts of them: For they ſay, that ſuch pillars as beare in compaſſe or thickneſſe toward the foot, as much as commeth to the ſixt part of the height, be called Dorique: thoſe that carie but a ninth part, are Ionique: ſuch as have a
2 ſeventh part, be Tuſcanique. And as for the Corinthian pillars, their proportion is anſwereable
3 to the Ionique; onely this is the difference, that the chapters of theſe Corinthian pillars ariſe in
B height to as much as the compaſſe at the baſe taketh up: in which regard they ſeeme more ſlender than others. As for the height of the Ionicke chapter, it is juſt the third part of the thickeneſſe. The proportion ordinarily in old time for the height of pillars, was anſwerable to the third
3 part of the breadth of the temple. In the temple of *Diana* at Epheſus, the invention was firſt practiſed to pitch the footſtall of pillars upon a quadrant or ſquare below, and to ſet chapiters upon their heads. And as touching the proportion, it was thought ſufficient in the beginning, if a columne contained in compaſſe or thickneſſe the eight part of the height; alſo, that the ſquare of the quadrant under the baſe, ſhould contain halfe the thickneſſe of the pillar: finally, that the pillars ſhould be ſmaller by one ſeventh part in the head, than at the foot. Over and beſides theſe pillars, there be others alſo of the Atticke faſhion, and thoſe be made with foure corners, and the
C ſides are equall.

Chap. xxiiii.

The medicinable properties of Lime. Alſo, as touching the Maltha uſed in old time, and of Plaſtre.

MVch uſe there is of Lime alſo even in Phyſicke: but then there muſt be choſen that which is quicke and unqueint. Such lime is caufticke, diſcuſſive, and extractive: the ſame alſo is proper to repreſſe corroſive ulcers that begin to ſpread and run far. If the ſaid lime bee tempered with vinegre and oile of roſes, it maketh an excellent healing plaſtre, which will skin
D up a ſore cleane. The ſame if it be incorporat with ſwines greace or liquid roſin and honey toge-
3 ther, ſerveth alſo to ſet bones in joint: & the ſame compoſition is likewiſe good for the kings evill.

Concerning Maltha, it was wont to be made of quicke and new lime: for they tooke the lime-ſtone and quenched it in wine, which done, preſently they punned it with ſwines greaſe and figs; hereof they made ordinarily two couches: and being thus tempered and laid, it was thought to be the faſteſt whitening that could be deviſed, and in hardneſſe to exceed a ſtone. But looke whatſoever is to bee pargetted with this Maltha or morter thus prepared, ought firſt to bee rubbed throughly with a ſize of oile.

Of neare affinitie unto Lime is Plaſtre, whereof bee many kinds: for there is a kind of plaſtre artificiall, and namely in Syria and about Thurium, made of ſtone calcined in manner of lime:
E and there is of it that is digged out of the ground naturally, as namely, in the Iſle Cyprus, and about the Perrhœbians. Neare Thymphæa, a citie in Ætolia, it lieth very ebbe and as it were even with the ground. As for the ſtone that is to be burnt for it, the ſame ought to be not unlike to the ſtone Alabaſtrites, or at leaſtwiſe to that which ſtandeth much upon marble. In Syria they chuſe for this purpoſe the hardeſt, and they burne the ſame with Cow dung, that it may the ſooner bee calcined. But the beſt plaſtre of all other is known (by expetience) to be made of the Talc or the glaſſe ſtone aforeſaid, or at leaſtwiſe of ſuch as hath the like flakes as Talc. Plaſtre muſt be wrought and driven preſently whiles it is wet and will run, for nothing in the world will ſo ſoone thicken and drie: and yet when it hath been uſed alreadie, it may be beaten againe to pouder, and ſerve the turne in new workes. Plaſtre ſerveth paſſing well to white wals or ſeeling; alſo for to make lit-
F tle images in fretworke, to ſet forth houſes; yea, and the browes of pillars and wals, to caſt off rain. To conclude, I may not forget that which befell to *C. Proculeius*, a great favourit and follower of *Auguſtus Cæſar*, who in an extreame fit of the paine of the ſtomacke, dranke plaſtre, and ſo killed himſelfe wilfully.

G

Chap. xxv.

Sundrie kinds of paved floores: and when at first they began to be used at Rome. Of open terraces paved. Of Greekish pavements. And the first invention of arched or embowed roufes.

THe devise of paved floores arose first from the Greeks, who made them with great art, and curiously, in regard of the painting in sundrie colours which they bestowed therupon. But these brave painted floores were put downe, when pavements made of stone and quarrels came in place: The most famous workman in this kind, was one *Sosus*, who at Pergamus wrought that rich pavement in the common hall, which they call Asaroton œcon, garnished with brickes H
or small tiles enealed with sundrie colours: and hee devised, that the worke upon this pavement should resemble the crums and scraps that fell from the table, and such like stuffe as commonly is swept away, as if they were left still by negligence upon the pavement. Among the rest, wonderfull was his handiworke there, in pourtraying a Dove drinking, which was so lively represented as if the shaddow of her head had dimmed the brightnesse of the water: there, should a man have seene other Pigeons sitting upon the brim of the water-tankerd, pruning themselves with their bils, and disporting in the Sunneshine. The old paved floores, which now also are much used, especially under roufe and couvert, howsoever they came from barbarous countries, were in Italie first patted and beaten downe with heavie rammers; as we may collect by the very name it selfe, Pavement, which commeth of Pavire, *i.* to ram downe hard. As for that manner of paving with I
small tiles or quarrels engraven, the first that ever was seene at Rome, was made within the temple of *Iupiter Capitolinum*, and not before the third Punicke warre begun. But ere the Cimbrians warres began, such pavements were much taken up in Rome, and men tooke great delight and pleasure therein, as may appeare sufficiently by that common verse out of *Lucilius* the Poët.

Ante Pavimenta æta emblemata vermiculata, &c.

Before the pavements checker-wrought in painted Marquettrie, &c.

As touching open galleries and terraces, they were devised by the Greekes, who were wont to cover their houses with such. And in truth, where the countrey is warme, such devises doe well: K
howbeit, they are dangerous and deceitfull, where there is store of rain and frost. But for to make a terrace so paved, necessarie it is first to lay two courses of bourds or plankes underneath, and those crosse and overthwart one the other: the ends of which plankes or bourds ought to be nailed, to the end they should not twine or cast aside; which done, take of new rubbish two third parts, and put thereto one third part of shards stamped to pouder, then with other old rubbish mix two five parts of lime, and herewith lay a couch of a foot thickneſſe, and bee sure to ram it hard together. Over which there must be laid a coat or course of mortar, six fingers bredth thick: and upon this middle, couch broad square paving tiles or quarrels, and the same ought to enter at least two fingers deepe into the said bed of morter. Now for that this floore or pavement must rise higher in the top, this proportion is to bee observed, that in every ten foot it gaine an inch L
and a halfe. After which, the pavement thus laid is to be plained & polished diligently with some hard stone: and above all, regard would be had, that the plankes or bourded floore were made of Oke. As for such as doe cast or twine any way, they be thought naught. Moreover, it were better to lay a course of flint or chaffe betweene it and the lime, to the end, that the said lime might not have so much force to hurt the bourd underneath. Requisit also it were to put underneath round pebbles among. After the like manner bee the spiked pavements made of flat tiles & shards. And here I must not forget one kind of paving more, which is called Grecanicke, the manner whereof is thus: The Greekes after they have well rammed a floore which they meane to pave, lay therupon a pavement of rubbish, or else broken tileshards; and then upon it, a couch of charcoale well beaten and driven close together, with sand, lime, and small cendres well mixed together: which M
done, they doe lay their paving stuffe to the thickneſſe of halfe a foot, but so even, as the rule and square will give it; and this is thought to be a true earthen paved floore of the best making. But if the same be smoothed also with a hard slicke stone, the whole pavement will seeme all blacke. As for those pavements called Lithostrata, which bee made of diverse coloured squares couched in

workes,

A workes, the invention began by *Syllaes* time, who used thereto small quarrels or tiles at Prenesse within the temple of *Fortune*, which pavement remaineth to be seene at this day. But in processe of time pavements were driven out of ground-floores, and passed up into chambers, and those were seeled over head with glasse: which also is but a new invention of late devised: for *Agrippa* verely in those baines which hee caused to be made at Rome, annealed all the potterie worke that there was, and enamelled the same with diverse colours: whereas all others hee adorned onely with whiting: and no doubt he would never have forgotten to have arched them over with glasse if the invention had ben practised before, or if from the wals and partitions of glasse which *Scaurus* made upon his stage, as I said before, anyone had proceeded also to rouse chambers therwith. But since I am fallen upon the mention of glasse, it shall not bee impertinent to discourse some-
B what of the nature thereof.

Chap. xxvi.

The first invention of Glasse, and the manner of making it: Of a kind of Glasse, called Obsidianum. Also of sundrie kinds of Glasse, and those of manie formes.

THere is one part of Syria called Phœnice, bordering upon Iurie, which at the foot of the mount Carmell, hath a meere named Cendevia; out of which the river Belus is thought to spring, and within five miles space, falleth into the sea, neare unto the colonie Ptolemais:
C This river runneth but slowly, and seemeth a dead or dormant water, unwholesome for drinke, howbeit, used in many sacred ceremonies with great devotion; full of mud it is, and the same very deepe ere a man shall meet with the firme ground: and unlesse it be at some spring tide, when the sea floweth up high into the river, it never sheweth sand in the bottome; but then, by occasion of the surging waves, which not onely stirre the water, but also cast up and scoure away the grosse mud, the sand is rolled too and fro, and being cast up, sheweth very bright and cleare, as if it were purified by the waves of the sea: and in truth, men hold opinion, That by the mordacitie and astringent qualitie of the salt water, the sands become good, which before served to no purpose. The coast along this river which sheweth this kind of sand, is not above halfe a mile in all, and yet for many a hundred yeare it hath furnished all places with matter sufficient to make glasse. As
D touching which devise, the common voice and fame runneth, That there arrived sometimes certaine marchants in a ship laden with nitre, in the mouth of this river, and beeing landed, minded to seeth their victuals upon the shore and the very sands: but for that they wanted other stones, to serve as trevets to beare up their pans and cauldrons over the fire, they made shift with certaine peeces of sal-nitre out of the ship, to support the said pans, and so made fire underneath: which being once afire among the sand and gravell of the shore, they might perceive a certaine cleare liquor run from under the fire in very streames, and hereupon they say came the first invention of making glasse. But afterwards (as mans wit is very inventive) men were not content to mix nitre with this sand, but began to put the Load-stone among, for that it is thought naturally to draw the liquor of glasse unto it, as well as yron. Then they fell likewise to calcine and burne in
E many other places shining gravell stones, shels of fishes, yea, and sand digged out of the ground, for to make glasse therewith. Moreover, diverse authours there bee who affirme, That the Indians use to make glasse of the broken peeces of Crystall, and therefore no glasse comparable to that of India. Now the matter whereof glasse is made, must be boiled or burnt with a fire of drie wood, and the same burning light and cleare without smoake, and there would be put thereto brasse of Cypros, and nitre, especially that which commeth from Ophyr. The furnace must bee kept with fire continually, after the manner as they use in melting the ore of brasse. Now the first burning yeeldeth certaine lumpes of a fattie substance, and blackish of colour. This matter is so keene and penetrant whiles it is hot, that if it touch or breath upon any part of the bodie, it will pierce and cut to the very bone ere one be aware or doe feele it. These masses or lumpes bee put into the fire
F againe, and melted a second time in the glasse houses, where the colour is given that they shall have: and then some of it with blast of the mouth, is fashioned to what forme or shape the workman will: other parcels polished with the Turners instrument, and some againe engraven, chased, and embossed in manner of silver plates: in all which feats, the Sidonians in times past were famous artificers: for at Sidon were devised also mirroirs or looking glasses. Thus much as touching

ching the antique manner of making glasse. But now adaies there is a glasse made in Italie of a G
certaine white sand, found in the river Vulturnus for six miles space along the shore towns, from the mouth where he discharged himselfe into the sea, and this is betweene Cumes and the lake Lucrinus. This sand is passing soft and tender, wherby it may be reduced very easily into fine pouder, either to be beaten in morter or ground in mill: to which pouder the manner is to put three parts of nitre, either in weight or measure; and after it is the first time melted, they use to let it passe into other furnaces, where it is reduced into a certaine masse, which, because it is compounded of sand and nitre, they call Ammonitrum: This must be melted again, and then it becommeth pure glasse, and the very matter indeed of the white cleare glasses. And in this sort throughout France and Spaine the manner is to temper their sand, and to prepare it for the making of glasse. More-
over, it is said, That during the reigne of *Tiberius* the Emperor, there was devised a certaine tem- H
per of glasse, which made it pliable and flexible to wind and turne without breaking: but the* artificer who devised this, was put downe, and his worke-house, for feare least vessels made of such glasse should take away the credit from the rich plate of brasse, silver, and gold, and make them of no price: and verely, this bruit hath run currant a long time (but how true, it is not so certain.) But what booted the abolishing of glasse-makers, seeing that in the daies of the Emperour *Nero* the art was growne to such perfection, that two drinking cups of glasse (and those not big, which they called Pterotos) were sold for 6000 sesterces.

*It is said, that whé a suppliant vnto this Emperor came before him, and shewed unto him a glasse whole & sound which had ben of purpose broken before, hee causedhim presently to be put to death. *Cæl. Rhodig. lib. 20. cap. 30.*

There may be raunged among the kinds of glasses, those which they call Obsidiana, for that they carie some resemblance of that stone, which one *Obsidius* found in Æthyopia; exceeding blacke in colour, otherwhiles also transparent: howbeit, the sight therein is but thicke and dus- I
kish. It serveth for a mirroir to stand in a wall, and in stead of the image yeeldeth backe shaddows. Of this kind of glasse many have made jewels in manner of precious stones: and I my selfe have seene massive pourtraitures made thereof, resembling *Augustus* late Emperor of famous memorie, who was wont to take pleasure in the thickenesse of this stone, insomuch as hee dedicated in the temple of *Concord* for a straunge and miraculous matter, foure Elephants made of this Obsidian stone. Also, *Tiberius Cæsar* sent backe againe to the citizens of Heliopolis a certain image of prince *Menelaus*, found among the moveable goods of one who had been lord governor in Ægypt, which he had taken away out of a temple, among other ceremoniall reliques: & the said statue was all of the Iaiet, called Obsidianus. And by this it may appeare, That this matter began long time before to be in use, which now seemeth to be renued again and counterfeited by glasse K
that resembleth it so neare. As for the said Obsidian stone, *Xenocrates* writeth, That it is found naturally growing among the Indians; within Samnium also in Italie, and in Spain along the coast of the Ocean. Moreover, there is a kind of Obsidian glasse, with a tincture artificiall, as blacke as Iaiet, which serveth for dishes and platters to hold meat: like as other glasse, red throughout, and not transparent, called for that colour Hæmatinon. By art likewise there be vessels of glasse made white and of the colour of Cassidonie, resembling also the Iacinct and Saphire, yea, & any other colours whatsoever. In summe, there is not any matter at this day more tractable and willing either to receive any forme or take a colour, than glasse: but of all glasses, those be most in request and commended above the rest, which be white, transparent, and cleare throughout, comming as neare as it is possible to Crystall. And verely, such pleasure doe men take now adaies in drinking L
out of faire glasses, that they have in manner put downe our cups and boules of silver or gold. But this I must tell you, that this ware may not abide the heat of the fire, unlesse some cold liquor were put therein before: and indeed, hold a round ball or hollow apple of glasse full of water against the Sunne, it will be so hot, that it is ready to burne any cloth that it toucheth. As for broken glasses, well may they be glued and sodered againe by a warme heat of the fire, but melted or cast againe they cannot be whole, unlesse a man make a new furnace of peeces broken one from another: like as we see there be made counting rundles thereof, which some call Abaculos, whereof some are of diverse and sundrie colours. Moreover, this would be noted, That if glasse and sulphur be melted together, they will souder and unite into a hard stone. To conclude, having thus dis-
coursed of all things that are knowne to be done by wit or art, according to the direction of Na- M
ture, I cannot chuse but marvell at fire and the operations thereof, seeing that nothing in a manner is brought to perfection but by fire; and thereby any thing may be done.

CHAP.

Chap. xxvii.

The wonderfull operations of Fire: the medicinable properties that it hath: and the prodigious ſignifications obſerved thereby.

Fire receiveth ſundry ſorts of ſand and earth: out of which, it doth extract and melt one while glaſſe, another while ſilver, in this place vermillion, in that diverſe ſorts of lead and tin; ſometime painters colours, and another while matters medicinable. By fire, ſtones are reſolved into braſſe; by fire yron is made, and the ſame is tamed likewiſe therewith: fire burneth and calcineth ſtone, wherof is made that morter which bindeth all work in maſonry. As for ſome things, the more they be burnt, the better they are; and of one and the ſame matter, a man ſhall ſee one ſubſtance engendred in the firſt fire, another in the ſecond, and another alſo in the third. As for the coales that goe to theſe fires, when they be quenched they begin to have their ſtrength, and after they be thought extinct and dead they are of greateſt vertue. This element of Fire is infinit, and never ceaſeth to be working, inſomuch, as it is hard to ſay whether it conſume more than it engendreth. The very fire alſo is of great effect in Phyſicke: for this is knowne for certaine by experience, that there is not a better thing in the world againſt the peſtilence (which is occaſioned by the darkneſſe of the Sun and the want of cleare light from him) than to make fires & perfumes in diverſe ſorts, either to clarifie or to correct the aire: according as *Empedocles* and *Hippocrates* have ſhewed and teſtified in many places. *M. Varro* writeth, That fire is good for convulſions, crampes, and contuſions of the inward parts: and for this purpoſe I will alleadge the very words that he uſeth: The old Latine word *Lix* (quoth he) is nothing elſe but the aſhes of the hearth: and hereupon commeth *Lixivus Cinis*, *i.* lie aſhes, which beeing drunke, is medicinable: as wee may ſee by fencers and ſword-plaiers, who after they have done their flouriſhing and be readie to enter into fight at ſharpe, refreſh themſelves with this potion. Furthermore, it is ſaid, That a coale of Oke wood being reduced into aſhes and incorporat with honey, cureth the carbuncle, which is a peſtilent diſeaſe, wherof two noblemen of Rome (both Conſuls in their time) died of late, according as I have alreadie ſhewed. See the wonderfull power in Nature, that things deſpiſed and of no account (as aſhes, and coales) ſhould affourd remedies for the health of man! But before I make an end of Fire, and the hearth where it burneth, I will not overpaſſe one admirable example commended unto us by the Romane Chronicles: in which wee read, That during the reigne of *Tarquinius Priſcus*, king of Rome, there appeared all on a ſuddaine upon the hearth where hee kept fire, out of the very aſhes, the genitall member of a man: by vertue whereof, a wench belonging unto *Tanaquil* the queene as ſhe ſat before the ſaid fire, conceived and aroſe from the fire with child. And of this conception came *Servius Tullus*, who ſucceeded *Tarquin* in the kingdom. And afterwards, whiles he was a young child and lay aſleepe within the court, his head was ſeene on a light fire, and thereupon he was taken to be the ſon of the domeſticall ſpirits of the chimney. Which was the reaſon, that when he was come to the crowne, he firſt inſtituted the Compitalia, and the ſolemne games in the honour of ſuch houſe-gods or familiar ſpirits.

THE

THE XXXVII. BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS SECVNDVS.

¶ The Proëme.

TO the end that nothing might be wanting to this hystorie of mine concerning Natures workes, there remaine behind nothing but precious stones, wherein appeareth her majestie, brought into a narrow and streight roume: and to say a truth, in no part of the world is she more wonderfull, in many respects: whether you regard their varietie, colours, matter, or beautie; which are so rich and precious, that many make conscience to seale with them, thinking it unlawfull to engrave any print in them, or to deminish their honour and estimation by that meanes. Some of them are reckoned inestimable, or valued at all the goods of the world besides, insomuch as many men thinke some one precious stone or gem sufficient, to behold therein the very perfection of Nature and her absolute worke. Touching the first invention of wearing such stones in jewels, and how it tooke first root and grew afterwards to that height as all the world is in admiration thereof, I have alreadie shewed in some sort in my Treatise of gold and rings. And yet I will not conceale from you that which Poets doe fable of this matter, who would beare us in hand, that all began at the rocke Caucasus, whereunto Prometheus *was bound fast, who was the first that set a little fragment of this rocke within a peece of yron, which being done about his finger, was the ring, and the foresaid stone the gem: whereof the Poets make much foolish moralization.*

Chap. 1.

Of the rich precious stones of Polycrates *the Tyrant, and king* Pyrrhus. *The first lappidaries or cutters in precious stones. And who was the first that had a case of rings and gems in Rome.*

PRometheus having given this precedent, brought other stones into great price and credit, insomuch as men were mightily enamoured upon them: and *Polycrates* of Samos, the puissant prince and mightie monarch over all the Islands and coasts thereabout, in the height of his felicitie & happie estate, which himselfe confessed to be excessive; beeing troubled in his mind that he had tasted of no misfortune, and willing after a sort to play at fortunes game, one while to win and another while to loose, & in some measure to satisfie her inconstancie, was persuaded in his mind that hee should content her sufficiently by the voluntarie losse of one gem that he had, and which hee set so great store by: thinking verely, that this one hearts greefe for parting from so precious a jewell was sufficient to excuse & redeeme him from the spightfull envie of that mutable goddesse. Seeing therefore the world to come upon him still, and no soure sorrows entermingled with his sweet delights, in a wearinesse of this continuall blessednesse he embarked himselfe and sailed into the deepe, where wilfully hee flung into the sea a ring from his finger, together with the said stone so precious, set therein. But see what ensued? A mightie fish, even made as a man would say for the king,

A king, chanced to ſwallow it down as if it had ben ſome bait; which being afterwards caught by fiſhers, & thought to be of an extraordinarie bigneſſe, was brought as a preſent into the kings pallace, and ſo ſent into the kitchen; where the cooke found within the bellie therof the foreſaid ring of his lords and maſters. Oh the ſubtiltie of ſlie Fortune, who all this while twiſted the cord that another day ſhould hang *Polycrates*! This ſtone (as it is well known) was a Sardonyx: & if we may beleeve it, the verie ſame it is, which at Rome is ſhewed in the temple of *Concord*, where *Auguſta* the Empreſſe dedicated it as an oblation, enchaſed within a golden horne: and verely if it be the ſame, one of the leaſt Sardonyches it is among many other there which be preferred before it.

Next to this ſtone of *Polycrates*, there goeth a royall name of the gem which *Pyrrhus* K. of Al-
B banie had; him I mean, who warred againſt the Romans: for (by report) an Agath he had, wher-
in a man might ſee the nine Muſes, and *Apollo* with his harpe, lively repreſented, not by art and mans hand, but even naturally imprinted: for the veins and ſtrakes of the ſtone were ſo diſpoſed, that a man might diſtinguiſh every one of the Muſes aſunder, and ech one diſtinguiſhed by their ſeverall marks and ornaments. Setting aſide theſe two gems above-named, we do not read in authors, of any great reckoning made of ſuch jewels; unleſſe wee ſpeake of one *Iſmenias* a famous minſtrell, who had the name to weare many of them ordinarily about him, and thoſe verie gay and glittering: and ſurely his vanitie that way was ſuch, that there goeth a notable tale of him; for meeting upon a time in a merchants hand with an Emeraud in the Iſland Cyprus, wherein ladie *Amymone* was engraven, and wherof the price was at firſt held at ſix deniers in gold, he made no more adoe but cauſed the mony to be paid preſently: but the merchant being a man of ſome
C conſcience, and thinking indeed the price too high, gave two of them back againe unto *Iſmenias*: whereat being ill apaid, I beſhrew you, (qd. he) for this bating of the mony hath much empaired the worth of the ſtone. This *Iſmenias* (as it is thought) was the firſt who brought up the order, that all ſuch muſicians and minſtrels as himſelfe, ſhould be knowne by their gems, and eſteemed skilfull in that art according as they were ſet out therewith more or leſſe. And in verie truth, *Dionyſodorus* a great minſtrell, who lived in thoſe daies with him, uſed likewiſe to bee in his chaunge and varietie of pretious ſtones, becauſe hee would not ſeeme any way to come behind *Iſmenias*. There was a third alſo as vaine as the beſt, a muſician in that age named *Nicomachus*, who loved to have a number of gems about him, but no judgement hee had in the world to chuſe them. Theſe examples which offer themſelves by fortune to me in the beginning of this my book, may
D ſerve to pull downe their plumes who ſtand ſo much upon the vaine oſtentation of theſe ſtones, when they ſhall ſee how all the pride that they take herein, ſmelleth but of the vaine humour of ſome odd minſtrels. But to return againe unto *Polycrates* his gem, which at this day is to be ſeen within the temple of *Concord*. And not onely in the time of *Iſmenias*, but alſo many yeers after, it ſhould ſeem that Emerauds were wont to be cut and engraven. This opinion alſo may be confirmed by the act and edict of K. *Alexander* the Great, which forbad expreſly, That no man ſhould be ſo hardie as to engrave his image in pretious ſtone, but *Pyrgoteles*; who (no doubt) was ſimply the beſt in that art. After him, *Apollonides* and *Cronius* were of great fame: & principally one *Dioſcorides*, who counterfeited in ſtone the lively form of *Auguſtus Cæſar*, the which ſerved the Emperors his ſucceſſors as a ſignet to ſeale withall. *Sylla* Dictator was wont alwais to ſigne with a ſeale
E repreſenting K. *Iugurtha*, tied & bound as he was yeelded unto him. We read in Chronicles alſo, that a certaine Spaniard of Intercatia, whoſe father *Scipio Æmilianus* ſlew in ſingle fight, uſed afterwards no other ſeale but that which repreſented this combat: wherupon grew this merrie conceit of *Stilo Præconinus*, who asked, What this Spaniard would have done if his father had killed *Scipio*? *Auguſtus* late Emperor of worthy memorie, uſed at the beginning to ſeale with the image Sphinx upon his ſignet: and verely in the casket of his mothers jewels, two of theſe hee found ſo like one unto the other, that one could not be knowne and diſcerned from the other: and as hee was wont to weare one of them about him wherſoever he went, ſo in his abſence (during the civile warrs which he levied againſt *M. Antonius*) his friends who managed his affairs at Rome, ſigned with the other Sphinx, all thoſe letters and edicts which paſſed in his name, for the performance
F of ſome demaunds which thoſe times did require. And from hence it came, that thoſe who received any ſuch letters or edicts, containing ſome matter of difficultie, were wont pleaſantly & merrily to ſay, That the ſaid Sphinx came ever with ſome hard riddle or other that could not be expounded. Moreover, the Frog, wherewith *Mæcenas* uſed to ſeale, was alwaies terrible unto thoſe who received any letters ſigned therewith; for evermore they were ſure upon the receit of it to

make some paiment of impost or taxes levied upon them. But *Augustus Cæsar*, to avoid the ob- G
loquie that arose by his Sphinx, gave over sealing therewith, and signed ever after with the image of K. *Alexander* the Great.

As touching a cabinet or case for many rings and such jewels, which they call by a forreine Greeke name Dactyliotheca, the first that ever was knowne to have any such at Rome, was *Scaurus*, whose mother *Sylla* the Dictatour married: and for a long time there was no other besides; untill *Pompeius* the Great met with the jewell-casket of King *Mithridates*, which among many other rich oblations, he presented in the Capitoll; and by the relation of *M. Varro* and other approoved authors of that time, it was much preferred before that of *Scaurus*: in imitation of whose example, *Cæsar* Dictatour consecrated in the temple of *Venus Genitrix*, six such like cabi- H
nets or caskets of rings and jewels: and *Marcellus*, sonne to *Octavia*, dedicated one in the temple Palatine of *Apollo*. Finally, this is to be observed, that the said victorie of *Pompeius* which he atchieved over K. *Mithridates*, set mens teeth at Rome a watering after pearls and pretious stones; like as the conquests obtained by *L. Scipio* and *Cn. Manlius*, brought them into love with silver plate curiously enchased and embossed: also with rich hangings of cloth of gold, silver, and tissue, togither with beds and tables of brasse; even as the brasen statues and vessels of Cotinthian brasse, and the curious painted tables, came in request upon the victorie that *L. Mummius* gained over Achæa.

Chap. II.

I *Of Iems and pretious stones that* Pompeius *shewed in his triumph. The nature of Crystall, and the medicinable properties thereof: the sumptuous and superfluous expences in vessels made of it. The first invention of Cassidoine vessels, and the excesse that way: the nature and properties of those Cassidoins. And what untruths the writers in old time have delivered as touching Amber.*

TO the end that it may appeare more evidently, what the triumph of *Pompey* wrought in this respect, I will put downe word for word what I find upon record in the registers that beare witnesse of the actes which passed during those triumphs. In the third triumph therefore which was decreed unto him (for that he had scoured the seas of pyrats and rovers, reduced Na- K
tolia and the kingdome of Pontus under the dominion of the Romans, defeated kings and nations, according as I have declared in the seventh booke of this my historie) he entred Rome the last day of September, in the yeere when *M. Piso* and *M. Messala* were Consuls, on which day there was carried before him in shew, a chesse-bourd with all the men, and the same bourd was made of two pretious stones, and yet it was two foot broad and four foot long: and least any man should doubt hereof and thinke it incredible, considering that no jems at this day come neare thereto in bignesse, know he, That in this triumph hee shewed a golden moone weighing thirtie pounds, three dining-tables also of gold, other vessell likewise of massie gold and pretious stones as much as would garnish nine cupbourds; three images of beaten gold representing *Minerva*, *Mars*, and *Apollo*; coronets made of stones to the number of three and thirtie; a L
mountaine made of gold foure square, wherein a man might see red deere, lyons, fruit-trees of all sorts, and the whole mountain environed and compassed all about with a vine of gold: moreover, an oratorie or closet consisting of pearle, in the top or louver whereof there was a clocke or horologe: He caused also to be borne before him in a pompous shew, his owne image made of pearls; the pourtraiture (I say) of that *Cn. Pompeius*, whome regall majestie and ornaments would have better beseemed; and that good face and venerable visage so highly honoured among all nations, was now all of pearls; as if that manly countenance and severitie of his had been vanquished, and roiotous excesse and superfluitie had triumphed over him, rather than hee over it. O *Pompey*, ô *Magnus*, how could this title and surname *Le-grand*, have continued among those nations, if thou hadst in thy first victorie triumphed after this manner! What, *Magnus*, were M
there no meanes else but to seeke out pearles, (things so prodigall, superfluous, and devised for women, and which it had not beseemed *Pompey* once to weare about him) and therewith to pourtray and counterfeit thy manly visege! And was this the way indeed to have thy selfe seeme pretious? doth not that pourtraiture come nearer unto thee and resemble thy person farre liker,

which

A which thou didst cause to be*erected upon the top of the Pirenæan hills? Certes, a foule shame and ignominious reproch it was to be shewed in this manner; nay, to say more truly, a woonderfull prodigie it was, presaging the heavie ire of the gods; for so men were to beleeve and evidently to conceive thereby, that even then and so long before, the head of *Pompey* made of orient pearle, even the richest of the Levant, should bee so presented without a bodie. But setting this aside, how manlike was all the rest of his triumph, and how answerable to himselfe? For first and foremost, given freely by him unto the chamber of the cittie, there were a thousand talents: secondly, upon his lieutenants and treasurers of the campe, who had performed so good service in defending the sea-coasts, hee bestowed two thousand Sestertia apeece: thirdly, to everie souldior who accompanied him in that voiage, he allowed fiftie Sestertia. Well, this superfluitie yet of *Pompeies* triumph, served in some sort to excuse *Caius Caligula* the Emperour, and to
B make his delicacie and excesse to bee more tollerable; who over and besides all other effeminat tricks and womanly devises, whereof hee was full, used to draw upon his leggs little buskins or startups made of pearle: *Pompeys* precedent (I say) in some measure justified *Nero* the Emperor, who made of rich and faire great pearls, the sceptars and maces, the visors also and masks which players used upon the stage, yea and the verie bed-roums which went with him as hee travailed by the way: So as we seeme now to have lost that vantage and right which wee had to find fault with drinking-cups enriched with pearls, yea and much other houshold stuffe and implements garnished therewith, since that whersoever we goe from one end of the house to the other, wee seeme to passe through rings, or such jewels at leastwise which were woont to beautifie our fin-
C gers onely: for is there any superfluitie else, but in regard and comparison hereof, it may seeme more tollerable and lesse offensive? But to returne unto the triumph of *Pompey*: this victorie of his, brought into Rome first our cups and other vessels of Cassidoine; and *Pompey* himselfe was the first who that verie day of his triumph presented unto *Iupiter Capitolinus*, six such cups: and presently from that time forward men also began to have a mind unto them, in cupbourds, counting tables, yea and in vessell for the kitchin, and to serve up meat in: and verely, from day to day the excesse herein hath so farre overgrowne, that one great Cassidoine cup hath been sold for
* fourescore sesterces, but a faire and large one it was, and would containe well three sextars [*id est*, halfe a wine gallon.] There are not many yeers past, since that a noble man who had been Consull of Rome, used to drinke out of this cup; and notwithstanding that in pledging upon a time
D a ladie whom hee fancied, he bit out a peece of the brim thereof (which her sweet lips touched) yet this injurie done unto it, rather made it more esteemed and valued at a higher price; neither is there at this day a cup of Cassidoine more pretious or dearer than the same. But as touching other excesse of this personage, and namely how much he consumed and devoured in superfluities of this kind, a man may estimat by the multitude of such Cassidoine vessell found in his cabinet after his death, which *Nero Domitius* tooke away perforce from his children: and in truth, such a number there were of them, that being set out to the shew, they were sufficient to furnish and take up a peculiar theatre, which of purpose he caused to bee made beyond the Tyber in the gardens there: and enough it was for *Nero* to behold the said theatre replenished with people at the plaies which he exhibited there in the honor of his wife the Empresse *Poppæa*, after one child-
E bed of hers, where among other musicians, hee sung voluntarie upon the stage before the plaies began. I saw him there my selfe to make shew of many broken peeces of one cup which hee caused to be gathered togither full charily, as I take it, to exhibit a spectacle whereat the world should lament and crie out in detestation of Fortune, no lesse ywis, than if they had beene the bones and reliques of king *Alexander* the Great his corps to bee laid solemnly in his sepulchre; and herein he pleased himselfe not a little. *Titus Petronius*, late Consull of Rome, when hee lay at the point of death, called for a faire broad-mouthed cup of Cassidoine, which had cost him before-time * three hundred thousand sesterces, and presently brake it in peeces in hatred and despight of *Nero*, for feare least the same prince might have seazed upon it after his decease, and therewith furnished his owne bourd. But *Nero* himselfe (as it became an Emperour indeed) went
F beyond all others in this kind of excesse, who bought one * drinking cup that stood him in three hundred thousand sesterces; a memorable matter (no doubt) that an Emperour, a father and patron of his country, should drink in a cup so deare. But before I proceed any farther, it is to be noted, that wee have these rich Cassidoin vessels [called in Latin Murrhina] from out of the Levant: for found they be in many places of the East parts, and those otherwise not greatly renowmed, but

* That is to say, columns & pillars, wherin were engraven the names of citties and nations subdued by him in those voyages into Spaine.

* *Octoginta sestertios*: where you must thinke that be useth *sestertium* in the neuter gender, which is a thousand *sestertij*: for otherwise 80 sesterces come but to 20 deniers Romain, and that is about 12 *sh.* 6 *d.* sterling: too much under the price of such a jewell: and yet some read for *sestertijs*, [*talentis*,] and that is as much above the proportiō, for one talent was esteemed at 50000 sesterces.

* *i.* The value of 6 talents.

* *Trecentis sestertijs capidem*: I suspect this place; for hee should have inferred a greater sum than that before of *T. Petronius*: or else *Capis* is a smaller pecce than *Trulla*: & that should not seeme, if it be derived *à capiendo*, & so called for the capacitie; but rather of the ears, wherby a man may take hold thereof.

but most within the kingdome of Parthia: howbeit, the principall come from out of Carmania. G
The stone whereof these vessels be made, is thought to be a certaine humour thickened and baked as it were within the ground by the naturall heat thereof. In no place shall a man meet with any of these stones larger than small tablements of pillars or counting-bourds; and seldome are they so thicke as to serve for such a drinking cup as I have spoken of alreadie: resplendent they are in some sort, but that brightnesse is not pearcing, and to say a truth, it may bee called rather a polished glosse or lustre, than a radiant and transparent clearenesse: but that which maketh them so much esteemed, is the varietie of colours; for in these stones a man shall perceive certaine veins or spots, which as they be turned about resemble divers colours enclining partly to purple and partly to a white: hee shall see them also of a third colour composed of them both, resembling the flame of fire: Thus they passe from one to another as a man holdeth them; in so H
much as their * purple seemeth to stand much upon white, and * their milkie white to beare as much upon the purple. Some esteemed those Cassidoine or Murrhine stones richest, which represent as it were certaine reverberations of sundrie colours meeting all togither about their edges and extremities, such as wee observe in rainbowes: others are delighted with certaine fattie spots appearing in them; and no account is made of them which shew either pale or transparent in any part of them, for these be reckned great faults and blemishes. In like manner, if there be seene in the Cassidoine any spots like corns or graines of salt: if it containe resemblances of werts, although they beare not up but lie flat as they doe many times in our bodies: finally, the Cassidoine stones are commended in some sort also for the smell that they doe yeeld.

* *Purpura candescente.*
* *Aut lacte rubescente.*

As touching Crystall, it proceedeth of a contrarie cause, namely of cold; for a liquor it is I
congealed by extreame frost in manner of yce; and for proofe hereof, you shall find crystall in no place els but where the winter snow is frozen hard: so as we may boldly say, it is verie yce and nothing else, whereupon the Greeks have give it the right name Crystallos, *i.* Yce. We have this crystall likewise out of the East parts, but there is none better than that which India sendeth unto us. Ingendred it is also in Asia, and namely about Alabanda, Ortosia, and the mountains adjoyning, but in request it is not no more than that which is found in Cyprus: howbeit, there is excellent crystall within Europe, and namely upon the crests of the Alps. King *Iuba* writeth, that
in a certaine Island lying within the red sea over-against Arabia named * Neron, there groweth crystoll: as also in another thereby, which yeeldeth the * Topase pretious stone; where, *Pythagoras* (lieutenant or governour under king *Ptolome*) digged forth a peece which carried a cubit K
in length. *Cornelius* * *Bocchus* affirmeth, that in Portugall upon certaine exceeding high mountaines, where they sinke pits for the levell of the water, there bee found great crystall quarters or masses of a woonderfull weight. But marveilous is that which *Xenocrates* the Ephesian reporteth, namely, that in Asia and Cyprus there be peeces of crystall turned up with the verie plough, so ebb it lieth within the ground; an incredible thing, considering that before-time no man beleeved that ever it could bee found in any place standing upon an earthly substance, but onely among cliffes and craggs. It soundeth yet more like a truth, which the same *Xenocrates* writeth, namely, that often times it is caried downe the streame running from the mountains. As for *Sudines*, hee saith confidently, that crystall is not engendred but in places exposed onely to the South: and verely this is most true, for you shall never meet with it in wateriſh countries lying L
Northerly, be the climat never so cold, no though the rivers be frozen to an yce even to the verie bottome. Wee must conclude therefore of necessitie, that certaine cœlestiall humours, to wit, of raine and some small snow togither, doe concurre to the making of crystall: and hereupon it commeth, that impatient it is of heat, and unlesse it be for to drinke water or other liquor actually cold, it is altogither rejected: but straunge it is, that it should grow as it doth, six angled: neither is it an easie matter to assigne a sound reason thereof, the rather for that the points bee not all of one fashion; and the sides betweene each corner are so absolute even and smooth, as no lapidarie in the world with all his skill can polish any stone so plaine. The greatest and most weightie peece of crystall that ever I could see, was that which *Livia Augusta* the Empresse dedicated in the Capitoll, which weighed about fiftie pounds. *Xenocrates* mine authour above-named, af- M
firmeth, that there was seene a vessell of crystall as much as an amphore: and some besides him doe say, that there have beene brought out of India, crystall glasses containing foure sextars apeece. Thus much I dare my selfe avouch, that crystall groweth within certaine rockes upon the Alps, and those so steepe and inaccessible, that for the most part they are constrained to hang

* Some read *Necrosn.*
* Which some take for Chrysolite.
* or *Nepos.*

by

A by ropes that ſhall get it forth. They that bee skilfull and well experieneed therein, goe by divers markes and ſignes which direct them to places where there is criſtall, and whereby alſo they can diſcerne good from bad; for this you muſt thinke, there be many imperfections and faults therein; as namely, when it is rough or rugged in hand, ruſtie like yron, clowdie and full of ſpeckes: otherwhiles there is a ſecret hidden fiſtulous ulcer as it were within: there lieth alſo in it a certain hard knurre, which is brittle and apt to breake into ſmall crumbs, beſides the corne or graine therein called Sal. Some peeces of cryſtall you ſhall have which carrie a certaine red ruſt: others be full of hairie ſtrakes, a man would imagine they were ſo many rifts; but cunning artificers can hide this laſt imperfection when they cut and engrave the peece that hath it: for in truth, if a cryſtall be pure and cleare of it ſelfe, much fairer it is plaine, than ſo wrought and engraven; and
B ſuch cryſtalls the Greeks call Aconteta; but above all, when they looke not like the froth of clear water: laſt of all, this is to be conſidered, that the heavier cryſtall is in proportion, the better account there is made of it. Moreover, I read of certaine Phyſicians who are of opinion, that there is not a better and more holeſome cauterie for any part of the bodie that requireth cauteriſing or burning, than a ball or pomander of cryſtall held oppoſit betweene the member and the Sun beams. But will you heare of another notorious example of follie and madneſſe in theſe cryſtals as well as in Caſſidoins? There are not many yeers ſince a dame of Rome, and thee none of the richeſt, who bought one boll or drinking cup of cryſtall, and paid 150000 ſeſterces for it. As for *Nero* the Emperour (of whome I ſpake erewhile) when unhappie news was brought unto him of a great overthrow and a field loſt to the daunger of his owne ſtate and the common-wealth,
C in the heigth of his rage and a moſt furious fit of anger, caught up two cryſtall drinking cups and paſht them all to peeces: his ſpight was belike at all the men living in that age, & better meanes hee could not deviſe to plague and puniſh them, than to prevent that no man elſe ſhould drinke out of thoſe glaſſes: and in verie truth, a cryſtall being once broken, cannot by any deviſe whatſoever be reunited and made whole againe as before. Wee have at this day cups and veſſels of glaſſe that come paſſing neare unto cryſtall: but woonderfull it is, that notwithſtanding our glaſſes be ſo like, yet they have not abated and brought downe the price of cryſtall, but rather cauſed it to be farre dearer.

In the next degree to Cryſtall, wee are to place Amber, a thing that hitherto I heare women onely ſet daintie ſtore by and adorne themſelves withall: ſtrange it is, that l'Ambre, Caſſidoine,
D3 and Cryſtall, ſhould thus be in equall requeſt with fine pretious ſtones; marie for Caſſidoin and Cryſtall, in ſome reſpects verely they may ſeeme to deſerve a higher roume, and namely in regard that both of them are ſo appropriat for to drinke water or cold liquor out of ſuch cups: but as for Amber, our delicates and wantons have not yet deviſed any probable reaſon why there ſhould be ſuch a reckning made of it: but ſurely it is the follie and vaine curioſitie of the Greeks that hath given occaſion thereof, and brought it into ſo great a name. And here I muſt beſeech the readers to beare with me in this my diſcourſe as touching the firſt originall of Amber; for I thinke it not impertinent to deliver what marveiles and woonders the Greekes have broached as touching this thing, that the age and poſteritie enſuing may yet be acquainted with their fabuloſities: firſt and foremoſt therefore, many of their Poëts, yea and as I ſuppoſe, the chiefe and
E principall of them, to wit, *Æſchylus*, *Philoxenus*, *Nicander*, *Euripides*, and *Satyrus*, tell us a tale of the ſiſters of young prince *Phaëton*, weeping piteouſly for the miſerable death of their brother who was ſmitten with lightning, were turned into Poplar trees, which in ſtead of teares yeelded everie yeere a certaine liquor called Electrum [*id eſt*, Amber] which iſſued from them where they grew along the river Eridanus, which wee call Padus, *id eſt*, the Po: and the reaſon why the ſame was named Electrum, is this, Becauſe the Sunne in old time was uſually called * Electot in Greeke. But that this is one of their lowd lies, it appeareth evidently by the teſtimonie of all Italie. But ſome of theſe Greeke writers and ſuch as would ſeeme to be more ſpeculative and better ſeene in the works of Nature than their fellows, have told us of certaine Iſlands that ſhould lye along the coaſt within the Venice gulfe, called Electrides, forſooth becauſe that amber is there
F gathered, by reaſon that the foreſaid river Po falleth into the ſea among them: howbeit well known it is, that there were never yet Iſlands ſo named within that tract; no nor any Iſlands at all neare to that place, into which the river Padus could poſſibly bring any thing at all downe his ſtreame. As for *Æſchylus* the foreſaid Poët, who ſaith that the river Eridanus is in Iberia, that is to ſay, Spaine, and otherwiſe that it is called Rhodanus: as alſo for *Euripides* and *Apollonius*, who ſay that

* ἠλέκτωρ, *qui nos ἀλέκτους faciat*, Becauſe he rouſeth and raiſeth us in a morning out of our beds.

Rhosne and Po both meet in one, and discharge themselves togither into the said Venice gulfe, they shew their grosse ignorance in Cosmographie and description of the world; and therefore they would bee rather pardoned if they knew not what Amber was. Those that write more modestly than the rest (and yet can lye as well as the best) beare us in hand, that about the sides of the foresaid Venice gulfe or Adriaticke sea, upon rockes otherwise inaccessible, there grow trees which yeerely at the rising of the Dogstar doe yeeld forth this amber in manner of a gum. *Theophrastus* contrariwise affirmeth, that amber is digged out of the ground. As for *Chares*, he saith, that *Phaëton* died in Æthiopia neare unto the temple of *Iupiter Ammon*, which is the reason of a chappell there wherein hee is shrined, as also of an oracle much renowmed; in which quarters (quoth he) amber is engendred. *Philemon* would make us beleeve, that amber is minerall, and that within Scythia in two places it is gotten foorth of the earth; in the one it is found white and of the colour of wax, which they call Electrum; in the other it is reddish or tawnie, and that is named Sualternicum. *Demostratus* calleth amber, Lyncurion, for that it commeth of the urine of the wild beasts named Onces or Lynces: the which is distinct in colour, for that which proceedeth from the male is reddish and of a firie colour; the other which passeth from the female, is more weake in colour, and enclineth rather to be whitish. Some give it the name Langurium, and make report of certaine beasts in Italie named Languriæ. *Zenothemis* tearmeth the same beasts Langas, and by his saying, they live about the Po. *Sudines* talketh of a tree in Liguria, which should beare this amber: of whose opinion also was *Metrodorus*. *Sotacus* was verely persuaded, that it ran downe from certaine trees in Brittaine, and those he thereupon called Electrides. *Pytheas* affirmeth, that in Almaine there is the arme of the Ocean called Mentonomon, along which there inhabit certaine people named Gutti, for the space of six thousand stadia; from which, within one daies sailing, there lyeth an Island called Abalus, into which at everie Spring tide, there is cast up by the waves of the sea at a high water, a great quantitie of amber; and it is taken for nothing else but a certaine excrement congealed and hardned, which the sea in that season purgeth and sendeth away. The inhabitants of those parts (saith he) use it for their ordinarie fewell to burne, and to sell it unto the Saxons and other Dutch, their next neighbours. *Timæus* accorded with him, save only that he would have the said Island to be called *Baltia. *Philemon* was of this mind, that amber would never flame if it were set on fire. *Niceas* would have us conceive, that it should be a certaine juice or humour proceeding (I wot not how) from the raies of the Sun; and yet hee maketh a reason thereof, imagining that the said beams should be exceeding hot toward the Sun setting, which rebounding from the earth, leave behind them a certaine fattie sweat in that part of the Ocean; and the same afterwards is cast up with *tides into the Sea-shore and sands of the Germans. Hee writeth also, that in Ægypt it is engendred after that manner, where it is called Sacal: as also among the Indians, who make more account of it than of frankincense. Semblably in Syria, the women (saith hee) make wherves of it for their spindles, where they use to call it Harpax, because it will catch up leaves, straws, and fringes hanging to cloaths. *Theophrastus* reporteth, that the ocean casteth up amber at tides, to the capes of the Pyrenæan hills: which *Xenocrates* also beleeved, who is the last that hath written of Amber, and such like. There is at this day living, *Asarubas*, who hath reported, that neare unto the Atlanticke sea there is the lake Cephisis, which the Mores call *Electrum, and the same being chafed and heat throughly by the Sun, casteth up from the mud thereof, amber, floting aloft upon the water. *Menesias* maketh report of a place in Affricke named Sicyone, as also of the river Crathis, which floweth out of a lough and runneth into the sea; in which lake or lough, there live certaine kinds of foule which hee nameth Meleagrides and Penelopes: herein amber is engendred (by his saying) after the same manner as before I shewed in the lake Electris. *Theomenes* saith, that neare unto the great Syrtis where the hortyard and garden of the Hesperides lieth, a man shall find that amber falleth out of the said garden into a lake beneath, and then the virgins attending upon that place, come ordinarily to gather it. *Ctesias* affirmeth, that among the Indians there is a river called Hypobarus, (which word signifieth as much, as bearing all good vessels) it runneth out of the North and falleth into the East sea, neare unto a wild mountaine full of trees that beare amber. He addeth moreover & saith, that those trees are called Aphytacoræ, by which denomination is meant, most delightsom sweetnesse. *Mithridates* writeth, that toward the coast of Germanie there lieth an Island, and the same named Oserícta, replenished with woods of Cedar trees yeelding Amber, which runneth from them into rocks. *Xenocrates* is of opinion, That Amber

G H I K L M

* or Banomania.

* æstibus, some read æstatibus, i. in Summer.

* or rather *Electris*, as appeareth a little after.

A ber was called in Italie not only Succinum, but also Thieüm: whereas the Scythians name it Sacrium (for there also it is engendered:) also he saith, that others thinke it is engendered in Numidia. But I wonder most at *Sophocles* the Tragicall Poët (a man, who wrote his Poësies with so grave & 2 loftie a stile, and lived besides in so good reputation; being otherwise borne at Athens, and descended from a noble house, emploied also in the managing of state affairs, as who had the charge and conduct of an armie) that hee should goe beyond all others in fabulous reports, as touching Amber: for he sticketh not to avouch, That beyond India it proceedeth from the teares that fall 3 from the eyes of the birds Meleagrides, wailing and weeping for the death of *Meleager*. Who would not marvaile, that either himselfe should be of that beleefe, or hope to persuade others to his opinion? For what child is there to be found so simple and ignorant, who will beleeve, that
B birds should keepe their times to shed tears every yeare so duly, and especially so great drops and in such quantitie, sufficient to engender Amber in that abundance? Besides, what congruitie is there, that birds should depart as farre as to the Indians and beyond, for to mourn and lament the death of *Meleager*, when he died in Greece? What should a man say to this? Are there not many more as goodly tales as these, which Poëts have sent abroad into the world? And their profession of Poëtrie, that is to say, of fayning and devising fables, may in some sort excuse them. But that any man should seriously and by way of hystorie deliver such stuffe, as touching a thing so rife and common, brought in every day in abundance by merchants which were ynough to convince such impudent lies, is a meere mockerie of the world in the highest degree; a contempt offered unto all men, and argueth an habit of lying, and an impunitie of that vice intollerable. 5
C

Chap. iii.

Of the true originall and generation of Amber. The sundrie kinds thereof. The excesse and superfluitie of people, as touching Amber. The medicinable properties that it affourdeth. Of Lincurium, and the vertues that it hath in Physicke.

BVt to leave Poëts with their tales, and to speake resolutely and with knowledge, of Amber: knowne it is for certaine, That engendered it is in certaine Islands of the Ocean Septentrio-
D nall, where it beateth upon the coasts of Germanie: and the Almains call it *Glessum. And in very truth, in that voyage by sea which *Germanicus Cæsar* made into those parts, our countreymen named one of those Islands Glessaria, by reason of the Amber there found; which Island the Barbarians called Austravia. It is engendred then in certain trees, resembling Pines in some 5 sort, and issueth forth from the marrow of them, like as gum in Cherrie trees, and rosin in Pines. And verely, these trees are so full of this liquor, that it swelleth and breaketh forth in abundance: which afterwards either congealeth with the cold, or thickeneth by the heat of the Autumn. Now if at any time the sea rise by any extraordinarie tide, and catch any of it away out of the Islands, then verely it is cast a shore upon the coasts of Germanie, where it is so apt to roule, that it seemeth (as it were) to hang and settle lightly upon the sands, whereby it is the more easily gotten.
E And for that our auncestours heretofore in old time beleeved that it was the juice of a tree, they called it therefore in Latine Succinum. That it commeth from trees of a Pine kind, may appeare by this, That if a man rub it, he shall find the smell of Pine-wood: also, for that when it burneth, the flame and fume (both) resembleth that of Torch-wood. The Germanes make great trafficke thereof, and bring it into Pannonia, and so from thence unto us, through our provinces [of Istria and Venice;] for from Pannonia, the Venetians first (who confine next upon the marches thereof, and whom the Greekes call Heneti) received it by way of marchandize in the maritime port townes along the Adriaticke sea, and so by that meanes brought it into name and request: which ordinarie trafficke may be the reason which gave occasion to the foresaid tale that runneth of the Po and the Poplars about it, that should weep Amber. And even at this day the countrey dames
F of Lumbardie, and those parts beyond the Po, use to weare faire carkanets and collars of Amber-beads to adorne themselves especially, and in some sort for the health also of their bodies: for perswaded they are, that it withstandeth the inflammation of the Amygdales and other accidents of the throat and chawes: for that the people of that country are subject to *poghes under their throat, about those fleshie parts neare unto it, by reason of sundrie kinds of waters which breed those

*For the perspicuitie and brightnes like unto glasse.

*This disease is called *Bronchocele* or *Hernia gutturis*, ordinarie in Savoy and those parts about Geneva,

thoſe infirmities. The foreſaid coaſt of Germanie is almoſt ſix hundred miles from Carnuntum G
in Pannonia, and yet of late daies much frequented by merchants from all quarters. Certes, a
Gentleman of Rome diſcovered thoſe parts, by occaſion that he was ſent thither by commiſſion
from *Iulianus* (who had the charge under *Nero* for furniſhing of the ſolemne plaies and ſights of
ſword-fencers) to buy up good ſtore of Amber. This gentleman (I ſay) ſurveied diligently all thoſe
coaſts, and ſaw the manner of the whole traffick for that commoditie, yea, & brought into Rome
ſuch plentie thereof, that the great nets and cordage (which for defence of the outſtanding and
open gallerie within the Theatre were oppoſed againſt the wild beaſts, there to be baited and to
fight) were buttoned and ſet out with Amber; the armour likewiſe, the bieres, and other furniture
for buriall of thoſe fencers which ſhould happen there to bee killed, yea, and in one word, all the
apparrell and proviſion for one day to the ſetting out of thoſe paſtimes and diſports, ſtood moſt H
of Amber. The greateſt peece of Amber that he brought over, weighed thirteen pounds. More-
over, it is held for certain, That it is to be found among the Indians. *Archelaus*, who ſometime
reigned as king in Cappadocia, writeth, That from thence it is brought rude and uncleane, with
peeces of barke ſticking within it: but the way to ſcoure and polliſh it, is to ſeeth it in the greaſe
of a ſow that ſuckleth pigs. That it doth deſtill and drop at the firſt very clear and liquid, it is evi-
dent by this argument, for that a man may ſee diverſe things within, to wit, Piſmires, Gnats, and
Lizards, which no doubt were entangled and ſtucke within it when it was greene and freſh, and ſo
remained encloſed within as it waxed harder. Many kinds there be of Amber. The white is moſt
redolent and ſmels beſt: but neither that, nor yet thoſe peeces which are coloured like wax, be of
any price. The high coloured Amber, namely that which is of a deepe yellow enclining to red, I
is much more eſteemed, and the rather, if it be cleare and tranſparent, provided alwaies that the
glittering thereof be not too ardent. Commendable it is in Amber, and ſheweth it to bee rich, if
it repreſent fire in ſome ſort: but it muſt not be too too fierie. But the excellent Amber is that
which is called Falernum, for the colour which it carrieth, reſembling the wine Falernum: and
the ſame is cleare and tranſparent, with a gay luſtre that pleaſeth and contenteth the eie very well.
And yet ſome there be, who delight more in that Amber which looketh with a mild yellow, like
unto boiled and clarified honey. But this I am to give you to underſtand, That there may be given
unto Amber what tincture or colour a man will: but commonly they uſe thereto the ſuet of Kids
and the root of Orchanet: and no mervaile, ſince that ſome have deviſed alſo to enrich it with a
purple die. To come unto the properties that Amber hath, If it bee well rubbed and chauſed be- K
tweene the fingers, the potentiall faculties that lieth within, is ſet on work, and brought into actu-
all operation, whereby you ſhall ſee it to draw chaffe ſtrawes, drie leaves, yea, and thin rinds of the
Linden or Tillet tree, after the ſame ſort as the loadſtone draweth yron. Moreover, take the ſha-
vings ſcraped from Amber, and put them into lampe-oile, they will burne and maintaine light
both longer and alſo more cleare than weekes or matches made of the very tire and beſt of flax.
As touching the eſtimation that our delicates and wantons make thereof: Some there bee, who
for their pleaſure will give more for a puppet or image made of Amber to the likeneſſe and pro-
portion of man or woman, be it never ſo little, than for the lively and luſtie bodie indeed of a tall
man and valiant ſouldior. But what ſhould I ſay to ſuch? Certainely they deſerve to be well cha-
ſtiſed for their perverſe judgement, & one rebuke is not ſufficient. Yet can I hold better with them L
who take pleaſure in other things, and me thinks they have ſome reaſon thereof: for Corinth veſ-
ſell, there is good cauſe that a man ſhould ſet his mind thereupon, in regard of the ſingular tem-
per of the braſſe, with ſome proportion of ſilver and gold: in peeces of mettall engraven, encha-
ſed, and emboſſed, the curious art and the wittie deviſe ſeene upon the worke, may well raviſh the
ſpirit of the buyer, and draw him on to give a round price: Touching the cups made of Caſſido-
nie and Cryſtall, I have ſhewed alreadie, wherin lieth their grace and what may enamour a chap-
man and cauſe him to bid well and offer frankely for them: Faire pearles and goodly uniones are
commended, for that our brave dames enrich their borders therewith, and ſet out the attire of
their heads: gems and precious ſtones adorne and beautifie our fingers: in ſumme, there is no ſu-
perfluitie that we have, but grounded it is either upon ſome colourable uſe that we may pretend, M
or elſe upon ſome gallant ſhew that it maketh: As for this Amber, I ſee nothing in the world to
commend it; onely it is a mind that folke have to take an affection to it, they know not wherfore,
even of a delicat and fooliſh wantonneſſe. And in truth, *Nero Domitius*, among many other foo-
leries and gauds wherein he ſhewed what a monſter he was in his life, proceeded ſo farre, that he

made

A made a ſonnet in praiſe of the haire of the Empreſſe *Poppæa* his wife, which he compared to Amber, and as I remember, in one ſtaffe of his dittie hee tearmed them Succina, *i.* Ambre: and from that time our daintie dames and fine ladies have begun to ſet their mind upon this colour, and have placed it in the third ranke of rich tincture: whereby we may ſee there is no ſuperfluitie and diſorder in the world, but it hath a pretence and cloake of ſome precious name or other. And yet I will not diſgrace Amber too much: for why? there is ſome good uſe thereof in Phyſicke. But I muſt tell you againe, our women regard not that one whit; that is not it wherefore they take ſo great a liking unto Ambre. True it is, that a collar of Ambre beads worne about the neck of yong infants, is a ſingular preſervative unto them againſt ſecret poyſon, & a countercharme for witch-
5 2 3 craft and ſorcerie. *Calliſtratus* ſaith, That ſuch collars are very good for all ages, and namely, to
B preſerve as many as weare them againſt fantaſticall illuſions and frights that drive folke out of their wits: yea and Amber, whether it be taken in drinke or hung about one, cureth the difficultie of voiding urine. This *Calliſtratus* brought in a new name to diſtinguiſh yellow Ambre from the reſt, calling it Chryſelectrum, which is as much to ſay as gold Amber. And in very truth, this Amber is of a moſt lovely and beautifull colour in a morning. This propertie it hath beſides by it ſelfe, that it will catch fire exceeding quickly, for if it be neare it, you ſhall ſee it will ſoone be of a light fire. He ſaith of this yellow Amber, that if it be worne about the necke in a collar, it cureth feavers, and healeth the diſeaſes of the mouth, throat, and jawes: reduced into pouder and tempered with honey and oile of roſes, it is ſoveraigne for the infirmities of the eares. Stamped together with the beſt Atticke honey, it maketh a ſingular eyeſalve for to helpe a dim ſight: pulverized,
C and the pouder thereof taken ſimply alone, or elſe drunke in water with Maſticke, is ſoveraign for the maladies of the ſtomacke. Furthermore, Amber is very proper to falſifie many precious ſtones which are commended for their perſpicuitie and tranſparent cleareneſſe; but eſpecially to counterfeit Amethyſts, by reaſon that as I have alreadie ſaid, it is capable of any tincture that a man would give it. The froward peeviſhneſſe of ſome Authours who have written of Lyncurium, enforceth me to ſpeake of it immediatly after Amber: for ſay that it be not Electrum or Amber, as ſome would have it, yet they ſtand ſtiffely in this, that it is a precious ſtone; mary they hold, that it commeth from the urine of an Once, by reaſon that this wild beaſt ſo ſoone as it hath piſſed, covereth it with earth, upon a ſpight and envie to man, that he ſhould have no good therby.
They affirme moreover, That the Once ſtone or Lyncurium is of the ſame colour that Ambre
D ardent which reſembleth the fire, and that it ſerveth well to be engraven: neither by their ſaying doth it catch at leaves onely and ſtrawes, but thin plates alſo of braſſe and yron: and of this opinion was *Diocles* and *Theophraſtus*. For mine owne part, I hold all to bee meere untruths: neither do I thinke, that in our age there hath been a man who ever ſaw any precious ſtone of that name. Whatſoever alſo is written as touching the vertues medicinable of Lyncurium, I take them to be no better than fables, namely, that if it be given in drinke, it will ſend out the ſtone of the bladder: if it be drunke in wine, it will cure the jaundiſe preſently, or if it be but caried about one, it will do the deed: but ynough of ſuch fantaſticall dreames and lying vanities, and time it is now to treat of thoſe precious ſtones, whereof there is no doubt made at all, and to begin with thoſe that by all mens confeſſion are moſt rich and of higheſt price. In which diſcourſe I will not proſecute this
E theame onely, but alſo (for to advance the knowledge of poſteritie in thoſe things that may profit this life) I meane eftſoones to have a fling at Magicians for their abhominable lies and monſtrous vanities, for in nothing ſo much have they overpaſſed themſelves as in the reports of gems and precious ſtones, exceeding the tearmes and limits of Phyſicke, whiles under a colour of faire and pleaſing medicines, they hold us with a tale of their prodigious effects and incredible.

Chap. iiii.

Of Diamants and their ſundrie kinds. Their vertues and properties medicinable. Of Pearles.

F THe Diamant carieth the greateſt price, not onely among precious ſtones, but alſo above all things elſe in the world: neither was it knowne for a long time what a Diamant was, unleſſe it were by ſome kings and princes, and thoſe but very few. The onely ſtone it is that wee find in mines of mettall. Very ſildome it is, and thought a miracle to meet with a diamant in a veine of gold, and yet it ſeemeth as though it ſhould grow no where but in gold. The writers of ancient time

time were of opinion that it was to be had in the mines only of Æthyopia, and namely betweene G
the temple of *Mercurie* and the Iſland Meroë, affirming moreover, that the faireſt Diamant that
ever was found, exceeded not in bigneſſe a Cucumber ſeed, whereunto alſo it was not unlike in
colour. But in theſe daies there be knowne ſix ſorts of Diamants. The Indian is not engendred in
mines of gold, but hath a great affinitie with Cryſtall, and groweth much after that manner; for
in tranſparent and cleare colour it differeth not at all, neither yet otherwhiles in the ſmooth ſides
and faces which it carieth betweene ſix angles, pointed ſharpe at one end in manner of a top, or
elſe two contrarie waies lozengewiſe (a wonderfull thing to conſider) as if the flat ends of two tops
were ſet and joined together: and for bigneſſe, it hath been knowne of the quantitie of an Hazel-
nut or Filbard kernill. The Diamants of Arabia, be much like unto the Indian, only they are leſſe;
they grow alſo after the ſame order: As for the reſt, they are of a more pale and yellow colour, te- H
ſtifying out of what countrey and nation they come, for they breed not but in mines of gold,
and thoſe the moſt excellent of all others. The triall of theſe Diamants is upon a ſmiths Anvill:
for ſtrike as hard as you will with an hammer upon the point of a Diamant, you ſhall ſee how it
ſcorneth all blowes, and rather than it will ſeeme to relent, firſt flieth the hammer that ſmiteth,
in peeces, and the very anvill it ſelfe underneath cleaveth in twaine. Wonderfull and inenarra-
ble is the hardneſſe of a Diamant: beſides it hath a Nature to conquer the furie of fire, nay, you
ſhall never make it hote, doe what you can: for this untamable vertue that it hath, the Greekes
have given it the name Adamas. One of theſe kinds the ſaid Greekes call Cenchron, for that it
is as big ordinarily as the Millet ſeed: a ſecond ſort they name Macedonicum, found in the mine
of gold neat Philippi; and this is that Diamant, which for quantitie is compared to the Cucum- I
ber ſeed: After theſe, there is the Cyprian Diamant, ſo called, becauſe it is found in the Iſle Cy-
prus; it enclineth much to the colour of braſſe, but in caſes of Phyſicke (as I will ſhew anon) moſt
effectuall: Next to which I muſt raunge the Diamant Siderites, which ſhineth as bright as ſteele,
whereupon it tooke that name: in weight it paſſeth the reſt, but in nature it is farre unlike; for it
will not abide the hammer but breake into peeces; beſides another adamant will pierce it, and
bore a hole quite through it: which alſo may be ſaid of the Cyprian Diamant: ſo as to ſpeake in
one word, theſe two laſt rehearſed, may go only under the name of Diamants: for otherwiſe they
are but baſtards, and not true Diamants. Moreover, as touching the concord and diſcord that is
betweene things naturall, which the Greekes call Sympathia and Antipathia (whereof I have ſo
much written in all my bookes, and endevoured to acquaint the readers therewith) in nothing K
throughout the world may we obſerve both the one & the other more evidently, than in the Dia-
mant: For this invincible minerall (againſt which neither fire nor ſteele, the two moſt violent and
puiſſant creatures of Natures making, have any power, but that it checketh and deſpiſeth both
the one and the other) is forced to yeeld the gantelet, and give place unto the bloud of a Goat,
this onely thing is the meanes to breake it in ſunder, howbeit, care muſt be had, that the Diamant
be ſteeped therin whiles it is freſh drawn from the beaſt before it be cold: and yet when you have
made all the ſteeping you can, you muſt have many a blow at the Diamant with hammer upon
the anvill: for even then alſo, unleſſe they be of excellent proofe & good indeed, it will put them
to it, and breake both the one and the other: But I would gladly know whoſe invention this might
be to ſoake the Diamant in Goats bloud, whoſe head deviſed it firſt, or rather by what chance was L
it found out and knowne? What conjecture ſhould lead a man to make an experiment of ſuch a
ſingular & admirable ſecret, eſpecially in a goat, the filthieſt beaſt one of them in the whole world?
Certes I muſt aſcribe both this invention and all ſuch like to the might and beneficence together
of the divine powers: neither are we to argue and reaſon how and why Nature hath done this or
that? ſufficient it is that her will was ſo, and thus ſhe would have it. But to come againe to the Dia-
mant, when this proofe taketh effect to our mind, ſo that the Diamant once crack, you ſhall ſee it
breake and crumble into ſo ſmall peeces, that hardly the eie can diſcerne the one from the other.
Well, lapidaries are very deſirous of Diamants & ſeeke much after them: they ſet them into han-
dles of yron, & by their means they will with facilitie cut into any thing, be it never ſo hard. More-
over, there is ſuch a naturall enmitie between Diamants and Loadſtones, that if it be laid near to M
a peece of yron, it will not ſuffer it to be drawn away by the loadſtone: nay, if the ſaid loadſtone be
brought ſo near a peece of yron, that it have caught hold therof, the Diamant, if it come in place,
will cauſe it to leave the hold & let it go. The Diamant hath a property to fruſtrate the malicious
effects of poyſon; to drive away thoſe imaginations that ſet folke beſides themſelves; & to expell

A vaine feares that trouble and possesse the mind: which is the reason that some have called it Anachites. *Metrodorus Scepsius* affirmeth, That the Diamant is found in Germanie and the Island Baltia, wherein Amber is engendered: but as farre as ever I could read, he is the onely man that saith so. This Diamant also of Almaine hee preferreth before those of Arabia, howbeit, no man doubteth that he lieth stoutly. After the precious diamants of India and Arabia, we in these parts of the world esteeme most of pearls: but as touching them, I have written sufficiently in my ninth booke, where I discoursed of such matters as the seas doe yeeld.

Chap. V.

Of the Emeraud, and the sundrie sorts thereof. Of greene gems or precious stones, and such as be lightsome and cleare all thorow.

B EMerauds for many causes deserve the * third place: for there is not a colour more pleasing to the eye. True it is, that we take great delight to behold greene hearbes and leaves of trees, but this is nothing to the pleasure wee have in looking upon the Emeraud, for compare it with other things, be they never so greene, it surpasseth them all in pleasant verdure. Besides, there is not a gem or precious stone that so fully possesseth the eye, and yet never contenteth it with satietie. Nay, if the sight hath beene wearied and dimmed by intentive poring upon any thing else, the beholding of this stone doth refresh and restore it againe, which lappidaries well know, that cut and engrave fine stones; for they have not a better means to refresh their eyes than the Emeraud, the mild greene that it hath doth so comfort and revive their wearines and lassitude. Moreover, the longer and farther off that a man looketh upon Emerauds, the fairer and bigger they seeme to the eye, by reason that they cause the reverberation of the aire about them for to seeme greene: for neither Sunne nor shade, ne yet the light of candle, causeth them to change & loose their lustre: but contrariwise, as they ever send out their owne raies by little and little, so they entertaine reciprocally the visuall beames of our eyes; and for all the spissitude and thicknesse that they seeme to have, they admit gently our sight to pierce into their bottome; a thing that is not ordinarie in water. The same are many times shaped hollow, thereby to gather, unite, and fortifie the spirits that maintaine our eyesight. In regard of these manifold pleasures that they shew to our eyes, by generall consent of all men spared they are, and lappidaries bee forbidden expressely to D cut and engrave them: and yet the Emerauds of Scythia and Ægypt bee so hard, as they cannot be perced or wounded by any instrument. Moreover, when you meet with a table-Emerauld, hold the flat face thereof against any thing, it will represent the said object to the eye, as well as a mirroir or looking glasse. And verely, *Nero* the Emperour was wont to behold the combates of fencers and sword-plaiers in a faire Emeraud. Now this first and formost is to be noted, that of Emerauds there be twelve kinds. The faireſt and richest of all other, be those of Tartarie and called they are Scythicke, of the nation Scythia from whence they came: And in truth, there be none fuller and higher in colour or have fewer blemishes: and looke how farre Emerauds goe beyond other precious stones, so farre doe the Scythian Emerauds surpasse all others. The Bactrian Emerauds, as they are the next neighbours, so they come neareſt in goodnesse to the Scythicke: found these E bee in chinkes and joints (as it were) of rockes in the sea, and gathered (by report) about the dog-daies, when the Northeast Etesian winds do blow; for then they glitter and shine within the earth that is growne about them, by reason that the said winds (which in those parts are strong) remove the sand away from them, and cause them to be seen: but these by report be farre lesse than those of Scythia. In a third place follow the Emerauds of Ægypt, & they be gotten out of certain craggie hils and cliffes about Coptos, a town in high Ægypt. As for all others, they be found ordinarily in brasse mines: which is the reason that the Emerauds of the Isle Cypros be held for cheese and principall among those nine: and yet their singular commendation lieth not in any clear or mild colour that they have, but their onely grace consisteth herein, that they seeme moist with a certaine fattinesse, and on which side soever a man doe view them, they resemble the liquid water F of the sea, for transparent they be and shining withall, that is to say, they send out a colour of their owne, and withall, through their perspicuitie receive the penetrant beames of our eyes. It is reported, That in the same Isle Cypros, about the sepulchre of *Hermias* a petie king there, and near unto the sea sides where were pooles and stewes of great fishes kept to bee salted, there stood in old time a lion of marble, in the head of which Lion were set certaine faire Emerauds in stead of eyes,

*To wit, after Diamants and Pearles.

eyes, looking oppoſit into the ſea: but they glittered and pierced ſo deepe into the water, that the Tunies upon that coaſt were afraid therat, and fled from the nets and other inſtruments that the fiſhers laid to take them withall: who marvailed a long time at this ſtraunge accident: but in the end knowing what the matter was, they chaunged the eies of the foreſaid Lion, and removed the Emerauds. But requiſit it is that I ſhould ſet downe the imperfections and defaults of Emerauds, for that a man may ſo eaſily bee deceived and beguiled in the choiſe of them: Firſt therefore all Emerauds bee ſubject to ſome blemiſhes, and yet as wee obſerve in men, they have their particular defects by themſelves, according to the nation where they bee found; for thoſe of Cypres have not an uniforme verdure, but you ſhall ſee in one and the ſame ſtone a mixture (as it were) of diverſe greenes, more or leſſe in ſundrie parts: neither keepe they ever that rich greene after one tenour, which we ſee in the Scythian Emerauds. Over and beſides, in ſome you ſhall meet with a cloud or ſhaddow running betweene, which doth impeach the cleare colour: neither is the ſame commendable, if it be over bright. Theſe faults are the cauſe that Emerauds are diſtinguiſhed by diverſe names and kinds: for ſome be darke, and thoſe are called blind: others be thicke, without any cleareneſſe or perſpicuitie at all. And ſome againe are diſcommended and rejected for divers little clouds, which alſo are different from the ſhade aforeſaid: for this little cloud wherof I ſpeak, is a fault in whiteneſſe, when as in viewing of an Emeraud it looketh not greene all through, but either the eyeſight meeteth with ſome white in the way, or elſe at leaſtwiſe in the bottome. And thus much as touching the faults in colour. But in the very bodie and ſubſtance of the Emeraud there be others obſerved, to wit, when there appeare either hairie ſtreakes, or congealed ſpecks reſembling corns of ſalt, or elſe ſpots of lead. Next unto the Cyprian Emerauds, there is reckoning made of the Æthyopian, which as king *Iuba* mine authour dooth report, are found in Æthyopia, from Coptos in Ægypt three daies journey: Theſe be of a cheareſull and lively green, but hardly ſhall you find any of them clear, pure, and of one colour. Among theſe, *Democritus* raungeth the Hermionian Emerauds and the Perſian: of which, the former ſeeme to ſwell out as if they were emboſſed and fattie withall: the Perſian are not tranſparent, & yet of a pleaſant greene and uniforme, contenting the eye-ſight well ynough, though it cannot pierce and enter into them; and much like they be to the glowing eyes of cats and Panthers, for we may perceive them to glitter and ſhine, and yet they be not tranſlucent. Theſe Emerauds in the Sunne looſe their luſtre & become dim: but in the ſhade they ſhine gallantly, yea, and caſt from them their beautifull raies farther than any other. And yet the generall fault in all theſe, is this, if they ſhew the colour either of gall or the skie; likewiſe if in the Sunne they glitter and ſhine cleare, but yet appear not green: Theſe imperfections are perceived ordinarily and moſt of all in the Atticke Emerauds, found in ſilver mines at a place called Thoricos, yet are not theſe ſo groſſe and fattie as others, and alwaies they ſeeme more beautifull a farre off than neare at hand: Theſe are ſubject ordinarily unto the fault called Plumbago, that is to ſay, in the Sun they looke with a leaden hew: Moreover, this peculiar qualitie they have by themſelves, that ſome of them wear and decay with age, inſomuch as by little and little their lively greene decaieth; and beſides, in the Sunne they looſe their luſtre. After the Atticke Emerauds, thoſe of Media bee accounted the greeneſt, and otherwhiles they reſemble the green Saphire. Theſe ſeeme to be full of waves, and to containe within them divers ſhapes and figures of many things, as for example, poppie heads, birds, wings, and finnes, *locks of haire, and ſuch like. Such Emerauds as are not found naturally greene, may bee made better and receive their perfection, by waſhing them in wine and oile. In one word, there is not a greater Emeraud to be found than thoſe of Media. As touching Carchedonian Emerauds, I wot not well whether they be now out of all requeſt & knowledge, ſince their mines of braſſe have failed them; and yet were they alwaies (at their beſt) the ſmalleſt of all others, and bare the loweſt price: the ſame were brittle & eaſie to be broken, their colour alſo was not ſetled but uncertain & changeable, reſembling for all the world the greene feathers in Peacockes tailes, or the downe of Pigeons neckes, as a man held and turned them one way or other they ſhined more or leſſe, beeing otherwiſe of themſelves full of veines and skales. A ſpeciall fault there was, wherunto theſe Emerauds were ſubject, which lapidaries called Sarcicon, that is to ſay, a certaine carnoſitie or fleſhineſſe incident unto gems. Gathered they were in a certaine mountaine neare unto Carchedon, which thereupon was named Smaragdites. King *Iuba* hath left in writing, That the Emeraud called Cholos, ſerved the Arabians much in their buildings: for to adorne and beautifie their houſes, they were wont to encloſe and ſet the ſame in the walls like as the white marble, which the Æ-

G H I K L M

*Capillorum, not catulorum.

gyptians

A gyptians name Alabaſtrites. He reporteth moreover, that there be many other Emerauds neare by taken forth of the mountaine Taygetus in Laconia, and thoſe therfore be named Laconicke, and much like they are to thoſe of Media. Hee ſpeaketh likewiſe of others in Sicilie. Reckoned there is in the ranke of Emerauds, a certain gem brought out of Perſia, named Tanos; howbeit of an unpleaſant greene it is, & foule within: as alſo the ſtone Chalcoſmaragdos that commeth out of the Iſle Cyprus, which hath in it certaine veins of braſſe that trouble the greene colour. *Theophraſtus* maketh report, that hee hath read in the books and records of the Ægyptians, that a K. of Babylon ſent as a preſent to one of their kings, one entire Emeraud foure cubits long and
+ three in breadth. Alſo, that there had been within the temple of *Iupiter* among them, an obeliske made of foure Emerauds, which obeliske notwithſtanding was fortie cubits long, and carried in
B breadth foure cubits in ſome places, and two in others. He addeth moreover, that while he wrot his hiſtorie, there was at Tyros within the temple of *Hercules*, a pillar ſtanding of one Emeraud, unleſſe haply it were ſome baſtard Emeraud, for ſuch (quoth he) are found; and namely, in Cyprus there was ſeene naturally growing, a ſtone, whereof the one halfe was a plaine Emeraud, the other a Iaſper, as if the humour had not been fully transformed and converted into an Emeraud. *Apion* the Grammarian ſurnamed * Pliſtonices, wrote not long before, and he hath left upon record, That there was remaining ſtill within the labyrinth of Ægypt, the gyantlike image of their god *Serapis* nine cubits tall, and of one entire Emeraud.

* *i.* Contentious, or Victorious.

Moreover, many are of opinion, that Beryls are of the ſame nature that the Emeraud, or at leaſtwiſe verie like: from India they come as from their native place, for ſeldome are they to be
C found elſe-where: lapidaries by their art and cunning know how to cut them with ſix angles and to poliſh them ſmooth; for otherwiſe their luſtre which is but ſad, would bee dull and dead indeed, unleſſe it were quickened and revived by the repercuſſion of thoſe angles: for be they poliſhed never ſo much any other way, yet they have not that lively gloſſe which thoſe ſix faces give unto them. Of theſe Beryls, thoſe are beſt accounted of, which carrie a ſea-water greene, and reſemble the greeneſſe of the ſea when it is clear. Next to them, are thoſe which they call Chryſoberylli: theſe bee ſomewhat more pallet, and the luſtre that they have tendeth to the colour of gold. A third kind there is approching neare to this, but that it is more pale (howſoever ſome do thinke it is no kind of Beryll, but a gem by it ſelfe) and this they call Chryſopraſos. In a fourth degree are placed the Beryls named Hyacinthizontes, becauſe they encline ſomewhat to the Ia-
D cinct. And in a fifth, ſuch as ſtand much upon the colour of the skie, whereupon they take their name Aëroïdes. After them, be the Beryls Cerini, for that they ſeeme like wax: then the Oleagini, that is to ſay, of an oyle colour. And in the laſt places bee the Cryſtalline, which are white, and come verie neare to cryſtals. All the ſort of theſe Beryll ſtones have theſe faults, to wit, white hairie ſtreaks or lines in them, yea and other filthie ordure; beeing of themſelves without theſe imperfections, apt to ſhed their colour, which ſoone fadeth. The Indians take a wonderfull pleaſure in long Beryls, and commend them for the onely ſtones and gems in the world, as if they cared not to be ſet in gold, but choſe rather to be worne without it: and in truth, in that regard their manner is to bore holes through them, and then to file them up into cheins and collars, with haires of elephants: howbeit, when they meet with ſome excellent Beryls indeed, which are come
E to their abſolute goodneſſe and perfection, they thinke it not good to pierce ſuch, but preſently they tip them with gold, that is to ſay, they ſet unto their heads certaine knobs in manner of boſſes which doe comprehend and encloſe the ſame. And in verie truth, they delight to cut their Beryls into long rolls or pillaſtres in manner of cylindres, rather than after the manner of other gems, becauſe their principall grace and commendation lieth in their length. Some are of opinion, that the Beryll groweth naturally cornered and with many faces; and they hold thoſe Beryls to be richeſt, which being bored through along, have their white pith taken forth, for to give them a better luſtre of gold put unto them; by the reverberation whereof, the overmuch perſpicuitie of the ſtone may ſeeme more corpulent and in ſome ſort corrected. Over and above the faults alreadie noted, ſubject they are alſo to thoſe imperfections which be incident to the Eme-
F rauds, yea and beſides to certaine ſpecks called Pterygiæ. It is thought, that Beryls be found likewiſe in theſe parts of the world, to wit, about the kingdome of Pontus. As for the Indians, after that cryſtall was once found out, deſpiſed to ſophiſticat and falſifie other gems therewith, but Beryls eſpecially.

G

Chap. vi.

Of the pretious stone Opalus, and all the sundrie kinds. The faults in them and the means to trie which be good. Also divers sorts of other gems and pretious stones.

THe stones called Opales, differ little or nothing otherwhiles from Beryls; and yet the same sometime are nothing at all like them: neither is there a gem that they will give place unto, unlesse it be the Emeraud: India land is the onely mother of them: lapidaries therfore and those who have written books of pretious stones, have given unto them the name and glorie of the greatest price, but especially for the difficultie in finding them out and chusing of them H
which is inenarrable: for in the Opall, you shall see the burning fire of the Carbuncle or Rubie,
2 the glorious purple of the Amethyst, the greene sea of the Emeraud, and all glittering togither
3 mixed after an incredible maner. Some Opals carie such a resplendent lustre with them that they are able to match the bravest and richest colours of painters; others represent the flaming fire of brimstone, yea and the bright blaze of burning oile. The Opall is ordinarily as bigg as a filberd nut. And heere commeth to my mind an historie among us as touching the Opall, worthie of remembrance: for there is at this day to be seene one of these Opals, for the which gem *Marcus Antonius* proscribed and outlawed *Nonius* a Senatour of Rome the sonne of that *Struma Nonius*, at whome the stomacke of *Catullus* the Poët did rise so much, seeing him (as he did) sit in a stately chaire of yvorie called Curulis, and grandfather to that *Servilius Nonianus* whome I my selfe have seene Consull. Now the said Senatour when hee was driven to flie upon this proscription, tooke no more with him of all the goods which hee had, but onely a ring wherein this Opall was set, which (as it is well knowne) had been valewed sometime at twentie thousand sesterces. But as the cruell and inordinat appetite of *Antonie* (who for a jewell onely outlawed and banished a Romane Senatour) was woonderfull on the one side, so the peevishnesse and contumacie of *Nonius* was as straunge on the other side, who was so farre in love of that gem which cost him his proscription, and rather than to part with it suffered himselfe to bee turned out of house and home: and yet the verie wild beasts are better advised than so, who are content to bite off those parts of their bodie and leave them behind them for the hunters, for which they
4 see themselves in daunger of death. In the Opale, there be observed also divers blemishes and K
imperfections as well as in other stones; namely, if the colour resemble the floure of that hearbe which is called Heliotropium, *id est*, Turnesole: also if it looke like crystall or haile: likewise if there be a spot comming betweene in manner of a grain or kernell of salt: if it be rough in handling, and if there be certaine small pricks or spots represented to the eyes: neither is there any pretious stone that the Indians can counterfeit so well by the means of glasse, as this; insomuch as hardly a man shall discerne the naturall Opall from the false, when they have done withall: but the onely triall is by the Sunne, for if a man hold an Opall betwixt his thumbe and finger against the beams of the Sunne, if it be a counterfeit, hee shall find those divers colours which shewed therein, to run all into one and the same transparent colour, and so to rest in the bodie of the stone; whereas the brightnesse of the true Opall eftsoones doth chaunge, and sendeth foorth L
the lustre too and fro more and lesse, yea and the glittering of the light shineth also upon the fingers. This gem, for the rare and incomparable beautie and grace that is in it, most writers have called Pæderos.

There is also another kind of Opalos apart by it selfe, according to the opinion of some, who say that it is called by the Indians Sangenon. It is said, that there be Opals in Ægypt and in Arabia, like as in the kingdome also of Pontus, but such of all other beare the lowest price. In Galatia likewise, and in the Isles Thrasos and Cyprus: for albeit they have the lovely beautie of the Opalus, yet their lustre is nothing so lively and lightsome, and seldome shall you meet with any of them that is not rugged: their chiefe colours stand much upon brasse and purple: the fresh verdure of the greene Emeraud is away, which the true Opale doth participat. This is generally M
held, that they are more commendable which be shadowed as it were with the colour of wine, than delaied with the cleareneſſe of water.

Thus farre foorth have I written of gems and pretious stones which bee esteemed principall and most rich, according to the decree generally set downe and pronounced by our nice and costly

A coſtly dames: for wee may conclude upon this point more certainely, going by their ſentence, than grounding upon the judgement of men: for men (kings eſpecially and great men) make the price of each gem according to their ſeverall fancies. *Claudius Cæſar* the Emperour made no reckoning of any but the Emeraud and the Sardonyx, and theſe ordinarily he wore upon his fingers: but *Scipio Africanus* (as ſaith *Demoſtratus*) tooke a liking to the Sardonyx before him, and was the firſt Roman that uſed it; and ever ſince, this gem hath ben in great requeſt at Rome: in regard of which credit, I will raunge it next unto the Opall. In old time the Sardonyx, as may appeare by the verie name, was taken for the pretious ſtone which ſeemed to be a *Cornalline upon white, that is to ſay, as if the ground under a mans naile were fleſh, and both togither tranſparent and cleare: and in verie truth, the Sardonyx of India is ſuch, according to *Iſmenias*, *De-*
B *moſtratus*, *Zenathemis*, and *Sotacus*. As for theſe two laſt named, they verely doe name all the reſt that are not cleare and ſhew not through them, Blind Sardonyches, ſuch as the Arabian be; and theſe have carried away the name of Onyx, without any mention or apparence at all of the Sarda or Cornalline: and theſe ſtones have begun of late to bee knowne and diſtinguiſhed by their ſundrie colours; for ſome of them have their ground blacke or much upon azure and the naile of a mans hand: for it hath been generally thought and beleeved, that ſuch have a tincture of white, and yet not without a ſhew of purple, as if the ſaid white enclined to a vermillon or Amethyſt. *Zenathemis* writeth, that theſe ſtones were not ſet by among the Indians; notwithſtanding otherwiſe they were ſo large and bigg, as thereof they made ordinarily ſword handles and dagger hafts: and no marveile, for certaine it is, that in thoſe parts land flouds comming
C downe with a ſtreame from the hills, have diſcovered ſuch and brought them to light. Hee ſaith alſo, that they were at the beginning highly accepted of in thoſe parts; for that there is not in manner a ſtone engraven, that will imprint the ſeale upon wax cleanly without plucking the wax away, but it: and through our perſuaſions, the Indians alſo grew into a good conceit of them, and tooke pleaſure in wearing the ſame: and verely, the common people of India make holes through them, and ſo weare them enfiled as carkans and collars about their neckes onely. And hereupon it commeth, that thoſe are taken to be Indian Sardonyches or Cornallines which be thus bored through. As for the Arabicke, excellent they are thought to be which are environed with a white circle, and the ſame verie bright and moſt ſlender: neither doth this circle ſhine in the concavitie or in the fall of the gem, but glittereth onely in the verie boſſes; and beſides,
D the verie ground thereof is moſt blacke. True it is, that the ground of theſe Sardoins is found in the Indian ſtones to reſemble wax or horne, yea within the white circle, in ſo much as there is a reſemblance in ſome ſort of a rainbow, by means of certaine cloudie vapours ſeeming to proceed from them: and verely the ſuperficiall face of this ſtone is redder than the ſhells of Lobſters. As touching thoſe that be in colour like to honey or lees (for this is taken to be an imperfection and fault in Cornallines) they bee all rejected; likewiſe if the white circle that girdeth it about ſpread and doe not gather round and compact togither: ſemblably, it is counted a great blemiſh in this gem, if it have a veine of any other colour (but that which is naturall) growing out of ſquare: for the nature of this ſtone is ſuch, like as of all things elſe, not to abide any ſtraunge thing to diſturbe the ſeat thereof. There be alſo Armeniacke Cornallines, which in all reſpects
E elſe are to be liked, but for the pale circle that claſpeth them.

By occaſion of this ſtone Sardonyx, I am put in mind for the names ſake, to write of the gem Onyx alſo: for notwithſtanding there be a ſtone ſo called in Carmania (which is the Caſſidoine) yet there goeth alſo a gem under that name. *Sudines* ſaith, that the pretious ſtone Onyx hath a white in it reſembling the naile of a mans finger: it hath likewiſe (quoth hee) the colour of a Chryſolith otherwiſe called a Topaſe, of a Cornalline alſo, and a Iaſper. *Zenathemis* affirmeth, that the Indian Onyx is of divers and ſundrie colours; to wit, of a fierie red, a blacke, a *horne grey; having alſo otherwhiles certaine white ſtrakes or veines in faſhion of eyes compaſſing it about; and in ſome of them you ſhall ſee white ſtrakes or veins likewiſe to goe croſſe and byas betweene them. *Sotacus* maketh mention moreover of an Arabian Onyx, but it differeth from
F others (ſaith hee) in this reſpect, That the Indian Onyx hath certaine ſparkes in it, and the ſame environed and compaſſed about with white circles either ſingle or many fold, farre otherwiſe than the Indian Sardonyx; for in the former, the white ſeemed to bee pointed prickes, but in theſe they bee compleat circles. As for the Arabian Onyches, there bee found of them blacke, with white circles. *Satyrus* reporteth furthermore, that the Indian Onyx is fleſhie; that in one

*Sarda.

*Whereof haply they be called *Cornalium.*

part it resembleth a Rubie otherwise called a Carbuncle, in another a Chrysolith and an Amethist, yet he maketh no account of such: but the true Onyx indeed (quoth hee) hath verie many veins, and those of sundrie colours; garnished also it is with circles as white as milke: and albeit the colours of the veins be inexplicable as a man casteth his eye upon them severally, yet meeting as it were all in one, they make a good consort and yeeld a lustre most pleasing to the sight. Now that I have treated of the Onyx, I must not defer to say somwhat also of the nature of Sarda, which maketh the other halfe of the stone Sardonyx, and so by that means (as it were by the way) to discourse of those gems that are of an ardent and fierie colour. G

Chap. VII.

Of Carbuncles or Rubies, and their sundrie kinds: of their defaults and imperfections: of the means to trie them. Of other pretious stones resembling the fire. H

AMong these red gems, the Rubies otherwise called Carbuncles, challenge the principall place and are esteemed richest: they have their name in Greeke of the * likenesse unto fire, and yet fire hath no power of them, which is the reason that some call them Apyroti. As touching their kinds: there be Rubies of India, and Rubies of the Garamants, which carrie the name also of Carchedonij, *i.* Carthaginian, in regard of excellencie, by reason of the wealth and puissance of the citie Carthage the Great. In this ranke, some doe place the Æthiopian Rubies and the Alexandrian, which are found indeed among the cliffs of the hill Orthosia, but trimmed and brought to their perfection by the * Alabandians. Moreover, in all sorts of Rubies, those are taken for the male which shew a quicke red more fire-like than the rest; and contrariwise female, such as shine not so bright but after a faint manner. In the male it is observed, that some seeme to flame more cleare and pure, others are darker and blacker: there be againe that shine brighter than the rest, yea and in the Sun give a more ardent and burning lustre: but the best simply be those which are called Amethystizontes, that is to say, that in the end of their fire resemble the blew violet colour of the Amethyst. The next in goodnesse to them, are those which they call Syrtitæ; and such doe glitter and shine of their owne nature: by reason whereof, they are discovered soone wheresoever they lie, by the reverberation of the Sun-beams. As touching the Indian Rubies, *Satyrus* saith, they are not found cleare, but for the most part foule; howbeit, after they be scoured, their brightnesse is most fierie. He affirmeth moreover, that the Æthiopian Rubies are greasie and shine not out, but seeme to have a fire burning within as if it were enfolded in some thing about it. *Callistratus* holdeth opinion, that if a Carbuncle or Rubie be laid upon a thing, it ought to yeeld certaine white clouds, in the edges and extremities of the glittering that it maketh; but if it be held up or hung in the aire, it flameth and burneth out fire red: & hereupon it is, that most men have called it the white Carbuncle; like as they have named those Indian Rubies * Lithizontes, which shine more faintly & with a browniſh or duskish flame. As for the Carchedonian Rubies, *Callistratus* saith, they be far lesse than others; wheras of the Indians some are so big, that being made hollow they will containe the measure of one sextar. *Archelaus* writeth, that the Carchedonian rubies be blacker than others to see too; but if they be quickned as it were with fire or Sun, or be held bowing forward, they are more ardent and fierie than any other: the same in a shadie house, seeme purple; in the open aire, flaming; against the raies of the Sun, sparkling: he avoucheth moreover, that the fierie heat thereof is so actuall, that if a man seale with them, though it bee in a shadowie and coole place, they will melt the verie wax that is stamped therewith. Many authours have written, that the Indian Rubies bee whiter than the Carchedonian; and contrarie to the nature of the Carchedonian, if they bee bended forward, they loose much of their vivacitie and be dimmer and more dull by that meanes: also, that in the Carchedonian Rubies which be male, there are seene certaine raies as it were of starres twinkling within; whereas the female contrariwise, sparckle all their fire without-foorth: that the Alabandines be more darke and blackish than others, and withall rough in hand. It is said moreover, that there be certain stones growing in Thracia, of the same colour that Rubies, and which will not be chafed and made hote in the fire. *Theophrastus* writeth, that there bee Rubies found about Orchomenus in the countrey of Arcadie, as also in the Isle Chios: and as for the Orchomenian, they bee of a blacker kind, and serve to make mirroirs of. The Trœzenian Rubies (by his saying) are

of

* For the Greeks call them πυρῖτας.

* These are called yet by Lapidaries, Alabandines, or Almādines. I K L M

* As one would say, more like some ordinary stone than a pretious gem.

A of divers colours and ſpotted with white ſpecks comming in among: and the Corinthian Rubies be more pale and whiter than the reſt. *Bocchus* writeth, that there be brought Rubies from Marſils and Lisbon in Portugall; but with much adoe and great difficultie they are found, by reaſon of the clay wherein they be enlapped, in certaine deſarts and forreſts burnt with the Sun. In ſum, there is not a harder thing than to diſcerne theſe ſundtie kinds of Rubies one from another; they are ſo eaſie to be counterfeited and falſified by the art and skill of lapidaries and goldſmiths, who have a caſt to lay ſome foile under, to make them for to ſhine and glitter like fire. Men ſay, that the Æthiopians have a deviſe to ſteepe their duskiſh and darke Rubies in vinegre; for in fourteen
5 daies they will be pure and gliſter, yea and continue ſo fourteene moneths after. There is a way to counterfeit Rubies with falſe glaſſe ſtones, which they will make ſeeme Rubies as like as is poſſi-
B ble; but the grinding upon a mill ſoone diſcovereth the fraud, like as it doth in any other artificiall and ſophiſticat gems whatſoever; for their matter is more ſoft and brittle withall than the fine and pure ſtones indeed: alſo the falſe Rubies are detected by the hardneſſe of the powder that is fetched from them, & the weight; for theſe glaſſe rubies be farre lighter: and otherwhiles a man ſhall ſee in theſe falſified rubies certaine little riſings in manner of bliſters or bladders, which ſhine like ſilver. Moreover, there is found in Theſprotia a certaine minerall Rubie called Anthracitis, reſembling coles of fire: But whereas ſome authors have written, that ſuch grow in Liguria, I take it to be a meere untruth, unleſſe haply in times paſt ſuch might bee found there. It is ſaid alſo, that there be of theſe kind of Rubies, which are compaſſed about with a white veine, and their colour is fierie as well as of the reſt before-named: but this peculiar propertie they have
C by themſelves, That being caſt into the fire, they ſeeme dead and doe looſe their luſtre: contrariwiſe, if they bee well ſprinckled and drenched with water, they ſeeme to glow, yea and to flame out againe.

There is a ſtone much like to this, called Sandaſtros, which ſome name Garamantites, growing among the Indians in a place likewiſe ſo named. It is engendred alſo in that part of Arabia which regardeth the South Sun. The chiefe grace and commendation of Sandaſtros, is to bee cleare, and to have certaine drops as it were of gold like ſtars ſhining within, that is to ſay, alwaies in the bodie of the ſtone, and never in the coat or outſide: in regard of which ſtarre-like ſpecks, there is attributed ſome religious matter to theſe ſtones, for that they repreſent in ſome ſort to them that behold them, the ſeven ſtars called Hyades, both in number and alſo in order & man-
D ner of diſpoſition: which is the reaſon, that the wiſe men of Aſſyria named Chaldæi, doe obſerve them with much devotion. Moreover, theſe Sandaſtres are diſtinguiſhed by the ſex, for the male ſeeme to have a more ſad and deepe colour, and by the reverberation of their fire within, give a tincture to thoſe things that they touch or lie neare unto: & the Indian verely of this kind are ſaid for to dim the eyſight. As for the female Sandaſtres, they carrie not ſuch an ardent ſhew of fire, but are more pleaſant to the eye, as being attractive rather than burning. Some writers there be, who preferre the Arabian Sandaſtres before the Indian, ſaying that the Arabian are like unto the Chryſolithes that be ſomewhat ſmokie. As for *Iſmenias*, he affirmeth, that the Sandaſtres are ſo tender that they cannot be poliſhed: in a great errour therefore bee they who call this ſtone Sandareſos: But all authors herein accord, That the more ſtars doe make apparence
E in them, ſo much better is the price. Furthermore, this is to bee noted, that the neareneſſe in name, otherwhiles is the cauſe of error; as we may ſee by Sandaſer, which *Nicander* called Sandaſerion, others Sandaſeron: and in truth, this Sandaſer ſome take to bee Sandaſter; and the Sandaſter indeed, Sandareſos; which is found likewiſe among the Indians, bearing the name of the place where it groweth: in colour it reſembleth an apple, or elſe greene oile: and in truth, no account is there made of it.

As touching Lychnites, ſo called for the reſemblance that it hath to the blaze of a candle lighted, which giveth a ſingular grace unto it, and maketh it verie rich, it may be raunged well among theſe fierie and ardent ſtones: found this is about Orthoſia & throughout all Caria and the places adjoyning: but the moſt excellent come from the Indians, which ſome have thought and
F ſaid to be the milder kind of Carbuncle or Rubie balais. In a ſecond degree of worth & account unto this Lychnites, is Ionis, ſo called of the March violet which in colour it doth verie much reſemble.

Over and beſides, I find other ſorts of Rubies different from thoſe abovenamed; for ſome of them hold of the freſh and glorious purple of Lac, others ſtand as much upon the Scarlet or

Crimsen: which being chafed in the Sun, or otherwise set in a heat by rubbing with the fingers, will draw unto them chaffe, strawes, shreads, and leaves of paper. The common Grenat also of Carchedon or Carthage, is said to doe as much, although it be inferiour in price to the former. These Grenats are found upon the hills among the Nasamons, and as the inhabitant are of opinion, are engendred by means of a certaine divine dew or heavenly showre: found they are twinkling against the moon-light, and especially when shee is in the full. In times past, all the trafficke of the Grenats was at Carthage, whereupon they tooke the name of Carchedon. But *Archelaus* saith, that there be of them in Ægypt also about the cittie Thebes; howbeit, such are brittle, full of veins, and like unto a cole going out and readie to die. I find, that drinking cups have beene made of this stone, as also of the former, called Lychnites. Generally, all Rubies be verie hard for to be cut; and this ill qualitie they have, That they never doe seale cleane, but ordinarily plucke some of the wax away with the signet: contrariwise, the Cornalline or Sarda, signeth verie faire without any of the wax sticking to it: this Sarda giveth part of the name to the Sardonyx: the gem it is selfe is verie common, found first about *Sardis; but in truth, the principall is that which commeth from about Babylonia, out of certaine quarries of stone, where it was fonnd sticking within another stone in manner of the heart. After this manner, it is said, that the Persians had sometime minerall Cornallines, but the mine now doth fade: howbeit, there be of them in many other places besides, to wit, in Paros and Assos. The Indians send unto us three severall kinds, to wit, the red, the fattie (called thereupon Demium) and the third which ordinarily have a ground of silver-foile laid under them to give a lustre. The Indian Sardes or Cornallines are transparent and carrie a through light with them: the Arabian be more thicke: there be found of them also about Ægypt, but they have commonly a ground of gold-foile. These gems likewise are distinguished by the sex, for the male have a more bright and orient lustre; the female are not so resplendent, but shine as it were through a grosse and fattie matter. In old time, there was not a pretious stone in greater request, than the Cornalline: and in truth, *Menander* and *Philemon* have named this stone in their * Comœdies, for a brave and proud gem: neither can we find a pretious stone that maintaineth the lustre longer than it, against any humour wherein it is drenched; and yet oile is more contrarie unto it than any other liquor. To conclude, those that be of the colour of honey, are rejected for nought; howbeit, if they resemble the colour of earthen pots, they be worse than those.

*A citie, whereupon it tooke the name, and not of Sardinia the Isle, as some thinke.

* μόλιγδον δὲ τῶν τοιούτων ἐστὶ καὶ σάρδιον. *Menander in Pedio:* Speaking of the Emeraud and Cornallines.

Chap. viii.

Of the *Topaze, and the sundrie kinds of it. Of *Callais: and of other greene pretious stones not transparent.

*Some take it for our Chrysolith.

*It is thought to be our Turquois.

The Topaze or Chrysolith, hath a singular greene colour by it selfe, for which it is esteemed verie rich; and when it was first found, it surpassed all others in price: they were discovered first in an Isle of Arabia called Chitis, wherein certaine rovers (Troglodytes) beeing newly landed, after they had ben driven thither by tempest and urged with famine, began to feed upon hearbs and dig for roots, and by that means met with the Topaze stone: This is the opinion of *Archelaus*. But K. *Iuba* reporteth, that there is an Island within the red sea called Topazas, distant from the continent 300 stadia, the which is oftentimes so mistie, that sailers have much adoe to find it, whereupon it tooke that name: for in the Troglodytes language (saith he) Topazin is as much to say, as to search or seeke for a thing. It is said, that the first that tooke a liking unto the stone, was queene *Berenice* the mother of *Ptolome* the second, and that by the meanes of *Philemon* (lieutenant generall unto her sonne in those countries) who presented one of them to the said queene. Of which Chrysolite, *Ptolomæus Philadelphus* K. of Ægypt, caused the statue of his wife *Arsinoë* to be made, foure cubits long; and in the honour of the said queene his wife, dedicated it in a chappell named the Golden temple. The moderne writers doe report, that there be found of these Chrysolits about Alabastrum a towne in Thebais, a province in high Ægypt; and two kinds they make thereof, to wit, Prasoïdes, and Chrysopteros; which latter commeth neare unto the golden Berill called Chrysoprasson, for that the colour therof resembleth fully the juice of Porret; and of all pretious stones it is the largest: this propertie it hath above all other gems, That only it commeth under the file to be polished for noble men; whereas all other be scoured by the grindstones comming out of Naxos: this stone will weare with usage.

This

A This ſtone in regard of colour may be accompanied with the Turquois called Gallais, for a certaine green it hath enclining to a yellow. It is found beyond the fartheſt parts of India among the inhabitants of the mountaine Caucaſus, to wit, the Phicarians and Aſdates; they grow unto a very great bigneſſe, but the ſame is fiſtulous and full of filth. The pureſt and richeſt of this kind be thoſe of Carmania. But in both countries they be found in ycie cliffes hardly acceſſible, where you ſhall ſee them bearing out after the manner of boſſes like unto eyes: they ſticke unto thoſe crags and rockes ſo lightly, that a man would ſay that ſaw them, how they grew not naturally out of the rocke, but were onely ſet too by mans hand. And for that the place where they doe grow, is ſo ſteepe that a horſeman is not able to ride up to them, and becauſe the people of that countrey be loth to climbe ſo high with their feet, being otherwiſe acquainted ordinarily to the horſe-
B backe, beſides, in regard of the daunger in venturing to climbe for them, therefore they reach them a farre off with ſlings, and ſo drive them downe, withall the hard moſſe about them: And in very deed, a commoditie this is of great revenue, and beſides, the rich men know not the like jewell to weare about their neckes. By a collar or chaine of theſe Turquoiſes, men are judged wealthy more or leſſe: and this is the glorie that they take from their child-hood to bee able to ſay, that thus many Turquoiſes they have pulled and caſt downe by that manner of flinging. And yet in the practiſe of this feat, all ſped not alike; for ſome you ſhall have to throw downe many fair Turquoiſes at the firſt fling; and many for it againe who wearie their armes and courſe after them, and yet cannot get one Turquois. This (I ſay) is the manner of chaſing or hunting Torquoiſes: and when they be gotten, they muſt come into the lapidaries hands to be cut and formed to what fa-
C ſhion you will: and in truth they be otherwiſe brittle and eaſie to be wrought upon. The beſt Turquois is that which approcheſt neareſt to the graſſe green of an Emeraud, howbeit, all the grace that they have, ſeemeth to come from outward helpe: beeing ſet in gold, they looke moſt beautifull, neither is there a precious ſtone that becommeth gold better. The fairer that a Turquoiſe is, the ſooner looſeth it the colour by oyle, ointment, or wine: contrariwiſe, the baſer that they bee, the better doe they hold their owne and maintane their luſtre. Neither ſhall you meet with anie precious ſtone more eaſie to be falſified and counterfeited with glaſſe, than a Turquoiſe. Laſtly, ſome writers affirme, That they be found in Arabia, within the neaſt of certaine birds called Melacoryphi, which is as much to ſay as Black cops.

As touching greene ſtones, there be manie more kinds: but of the baſer ſort we reckon one of
D a Porret colour, which we call Praſius, and the firſt kind of it is all greene; wheras the ſecond hath upon the greene, certaine red ſpots like bloud, which cauſe it to ſeeme unpleaſant to the eye, and rough in hand: the third is greene, but yet parted with thtee white ſtrakes.

The ſtone Chryſopraſius, *i.* the ſea water or Horehound green, is preferred before the other. In ſome ſort it reſembleth the greene juice of a Leeke, but it declineth ſomewhat from the Topaze, as if it were betweene it and gold. Some of theſe are ſo great and bigg, that there be drinking cups made thereof, after the faſhion of boats: but pilaſtres or round ſtaves in manner of cylindres or rolls, are very quickly framed of ſuch ſtones. Theſe bee found among the Indians: like as another ſtone, which is called * Nilios: A weake luſtre it hath and will not long continue, for looke but a while wiſtly upon it, you ſhall perceive it ſoone to fade: *Sudines* ſaith, That there be
E of them found in Syverus, a river that paſſeth through the countrey of Attica: in colour it reſembleth a ſmoakie Topaze, or otherwhiles that of a honey colour. King *Iuba* reporteth, That it is bred in Æthyopia, and namely about the bankes and ſides of a river which we call Nilus, wherupon it commeth to be named Nilios.

* Thought to be the Almain Chryſolit.

There is a ſtone called Molochites, for that the greene colour which it hath, commeth neare unto a Mallow, and is more dim than the reſt wherof I have ſpoken. Commended it is highly in ſignets for to ſeale faire: and beſides it is ſuppoſed to be by a naturall vertue that it hath, a countercharme to preſerve little babes and infants from all witchcrafts and ſorceries.

A kind of Iaſper likewiſe there is of a greene colour, and the ſame oftentimes is tranſparent: and although there be many other ſtones goe beyond it in richeſſe, yet it retaineth ſtill the aun-
F cient glorie and honour that it had. A gem it is, common to manie other countries; India yeeldeth it unto us like to an Emeraud. Gall of Cyprus is verie hard, and of a greyiſh fattie colour, betweene white and greene. The Perſians ſend us a Iaſper like to the skie or aire, and thereupon it is called Aërizuſa: and ſuch a one is that which commeth from the Caſpian hils. The Iaſper about the river Thermodoon is blew as Azure. In Phrygia you ſhall have it purple: in

Cappa-

Cappadocia partly purple and partly blew, but no kind of lustre hath it at all. Out of Amises, a citie in Pontus, we have Iaspers brought, much like unto the Indian: & the Iasper of Chalcedon is muddie and troubled. But it were better to set downe their degrees in goodnesse, rather than to stand upon the countries from whence they are transported. The best Iasper then is that esteemed which standeth much upon purple or Lac: the second is incarnat, or of a rose colour: the third resembleth the Emeraud in greenenesse. To every one of these severall kinds, the Greekes have imposed significant names. And in a fourth place the Greekes have raunged another called Borea, like unto the morning skie in the time of Autumne; and this may well be called Aërizusa. There is a Iasper also in colour like to the Sarda, *i.* the Cornalline, as also resembling much the violets. There be as many more sorts behind, which I have not touched, but subject they be all to blemishes, as namely being blew or like to Crystall or * waterie fleame. Last of all, we have a Iasper called Terebinthizusa by the Greekes, but as I take it very unproperly, as if it were compounded of many gems of one and the same kind; and therefore the better sort of such are enclosed within a circle of gold, yet so, as they be open both above and beneath, neither is any thing but the edges onely compassed with gold. The faults or imperfections of the Iasper be these, If the lustre endure not long, notwithstanding it glitter a farre off; also if it shew a spot like unto a graine of salt; besides all other which I have alreadie named in the rest. Moreover, Iaspers may be falsified by the meanes of glasse: and this is soone detected, namely, when they cast a reverberation of their lustre outwardly, and hold it not within. To conclude with the stones called Sphragides, they are not much unlike to the Iaspers: And this gift they have above all the rest, that they make the best signets, and seale faire st.

πορφυρίζουσα, ἰοειδίζουσα. αἱμαραγδίζουσα.

* πρὸς μιξὶν, which *Plinius* inconsideratly hath turned, *Myxus.*

G H I

Chap. IX.

Sundrie kinds of Iaspers.

OF divers sorts of Iaspers, all the East part (by report) are most affected to that which is like the Emeraud, and they carie it ordinarily about them as a countercharme. The same if it be compassed round about with one white crosse line in the middest, is called Grammatias; if with many, Polygrammos. And here by the way I can hold no longer, but my mind serves me very well to challenge the Magicians, who have given it out, That this stone is verie good for those to have about them who are to make some publicke speech or solemne Oration to the people. Moreover, we have a Iasper called Onycho-puncta and Iasponyx, which seemeth to enclose a cloud within it, and in some sort to resemble the snow. This Iasper is fashioned like unto a Star and beset with diverse reddish points: a man that saw it, would say it were a kind of Megarian salt. There is besides a Iasper which seemeth as if it were infected with smoake, and this is called Capnias. Concerning the bignesse of the Iasper, I have seene one of them nine inches long, which served for to represent the visage of *Nero* the Emperour, standing readie armed with a cuirace.

K

As touching the precious stone Cyanos, I must speake of it apart, notwithstanding I have of late mentioned and applied it to one of the names of the Iasper, to wit, that with the blew colour. The best Cyanos is that of Scythia, the next commeth from Cypros: and in the last place we are to reckon the Ægyptian. This stone is very apt to bee counterfeited, and especially by tincture: the invention whereof is ascribed to a king of Ægypt, who was highly honoured for beeing the first that gave a colour to it. Distinguished these stones also are by the sex, for there be of them both male and also female. Otherwhiles you shall perceive a certaine pouder in them as it were of gold, and yet not like to that of Saphires: for the Saphire also glittereth with markes and prickes of gold. Saphires are likewise sometime blew; mixed also with purple, although that be very seldome: the best are among the Medes, yet in no place be they transparent. Moreover, they are untoward for to bee cut and engraven, by reason that the lapidarie shall meet with certaine hard knots of Crystall comming here and there betweene. The bleweſt are thought to bee the male.

L

M

Next after these, I am to raunge those stones that bee of a purple colour, and such as decline somewhat from them, and yet seeme to depend of them: of which, I must place in the first ranke as principall, the Amethysts of India: And of them there bee found in a part of Arabia, which bordereth upon Syria, and is called Petræa: also in Armenia the lesse, in Ægypt, and in Fraunce:

but

A but the fouleſt and of moſt baſe account,be thoſe of Thaſos & Cyprus. The reaſon of the name Amethyſt,is generally thought to be this,that notwithſtanding it approch very neare to the colour of wine, yet before it throughly taſt thereof,it turneth into a March Violet colour: and that purple luſtre which it hath, is not altogether fix, but declineth in the end to the colour of wine. There is not one of theſe Amethyſts,but it is tranſparent with a Violet colour.Eaſie they are all to be cut and engraven. And as for the Indian Amethyſts, they have the full and rich colour of the Phœnicean purple die: and in truth,the diers wiſh that they may but give a tincture anſwerable to it.Verely this purple colour is pleaſing to the eie,neither doth it ſtrike and pierce the ſight ſo forcibly as the Rubies doe.In a ſecond ranke are to be raunged the Amethyſts enclining to the Iacincts;the colour of which ſtone the Indians call Sacon,like as the gem it ſelfe Sacodion:Now
B if the colour be more weake and feeble,they call it Sapinos: and this Amethyſt in a third degree is named Paranites in the marches of Arabia,which name it taketh of the people. The fourth kind reſembleth the colour of wine.The fift declineth neare unto Cryſtall,ſave onely that toward the bottome thereof, it ſtandeth of a certaine whitiſh purple: but this is nothing eſteemed, for the excellent Amethyſt indeed beeing held up in the aire,ought to ſhine in manner of a Rubie, and to carie a certaine purple luſtre,mildly participating of the incarnat roſe colour:Such Amethyſts as theſe ſome chuſe rather to call Pæderotes, like as a kind of Opate or Anterotes: many give them the name of *Venus* gems,for the great grace that they have & decent lovelineſſe which they ſeeme to ſhew both in faſhion and colour,eſpecially without-forth.The Magicians,as vaine herein as in all other things,ſeem to beare us in hand that they have a ſpeciall vertue to withſtand
C drunkenneſſe,whereupon they ſhould be called Amethyſts:Neither ſtay they ſo,but tell us, that if the name of the Moone and the Sunne,be engraven in them and ſo worne about the neck hanging,either with the haires of a Cynocephalus head,or elſe Swallowes feathers,they are a ſoveraigne remedie againſt charmes and ſorceries that be practiſed,with poyſoning. Nay they would make us beleeve that there is a way to uſe them,which will cauſe men to be gracious with princes who have any negotiation with them, and that by the means thereof they ſhall find eaſie acceſſe to their preſence, and favour in their eyes. Alſo,by their ſaying, they are of force to avert haile and ſuch like diſtemperature of the weather,yea,and to turne away Locuſts,ſo there be a charme in manner of a praier ſaid withall,the forme whereof they alſo do preſcribe and ſhew: & no marvaile: for they have promiſed the like of Emerauds,if there were enchaſed in them the forme ei-
D ther of Ægles,or the flies named Beetils. In ſetting downe which toies and vanities, they ſhew well ynough in what contempt they have mankind,and how they are diſpoſed for to mocke the world.

It followeth now by good order to ſpeake of the Iacinths,which, albeit they differ much from Amethyſts in ſome reſpect,yet in luſtre they approch very neare: and this is onely the difference between them, That the brave Violet colour, which in the Amethyſt is full and rich,in the Iacint is delaied and weaker. The Iacint alſo at the firſt ſight is pleaſant and acceptacle, but the lovely beautie therof vaniſheth away before it hath given a man ynough. And ſo farre is it off from contenting the eye fully and ſatisfying the pleaſure therof,that it fadeth ſooner than the dainty floure of that name,*i.*Hyacinthus: ſo quickly doth the luſtre paſſe away,in manner before it come to the
E eye. Æthyopia furniſheth us with Iacinths and Chryſolithes both,which are tranſparent and carie the colour of gold: howbeit thoſe of India be preferred before them; they of Bactriana likewiſe,if they be not ſpotted and flecked with divers colours. The worſt of all others,be the Arabian: for they bee not onely skewed in colour, but alſo foule and troubled: and looke what radiant luſtre they have,interrupted it is with a cloud of ſpots: and if any chaunce to be clear otherwiſe, yet a man that looketh on them, would ſay they were full of their owne duſt. The beſt are thoſe, which being laid into gold,cauſe it to looke whitiſh in manner of ſilver,in compariſon to them. Such as bee cleare and tranſparent, Goldſmiths uſe to ſet within a houpe of gold, ſo as they may be ſeene both beneath and above. The reſt had need of a ground of Latton foile to give them a luſtre: howbeit, now adaies ſome that are not skilfull lapidaries have taken up a cuſtome to call
F ſome Iacints Chryſelectri,which encline to the colour of a baſe gold called Electrum;the which in a morning are more beautifull and glorious to the eye, than all the day after. Thoſe Iacints that come from Pontus,are knowne by their lightneſſe: ſome of them be hard and of an Orange red; others be ſoft and foule. *Bocchus* mine author reporteth, That they be found in Spaine alſo, in that place where hee ſaith they ſinke pits for to levell water, and out of which the peaſants doe

take

*or Citrine Iacinth.

take forth Crystall. He affirmeth also, That he hath seene a *Chrysolith of twelve pound weight. G
Moreover, there be certaine Iacinths which have a white veine comming between, and those are called Leucochrysi. And of this kind some be named Capniæ, because they be smaller. You shall find of them like unto glasse beads, and yet of a shining yellow in manner of Saffron. And verely false Iacinths there be counterfeited by glasse so artificially, that a man shall hardly discern them by the eye: howbeit handle and feele them, you shall soone find the deceit, for the fine Iacints indeed are colder naturally than those that be counterfeit. Among these Iacints, I may raunge well ynough those stones which are called Melichrysi, which shew as if cleare honey shone through gold. These we have from India: but of all other they are most subject to injurie and will soonest breake. The same countrey yeeldeth also a gem called Xystion, whereof there is such plentie, that the verie common people doe weare them.

H

If wee should speake of white stones, the principall of them all is the gem named Pæderos: And yet considering that under this name they passe other *fair and beautifull stones (such a prerogative hath the word to signifie some excellencie of lovelinesse) there may bee question made how it can bee properly used for one gem, or one colour; yet surely there is a kind of precious stone by it selfe called Pæderos, and the same worth the looking on; and there seeme to meet together a skie colour, and the same in his manner greenish, upon a clear and transparent Crystall: accompanied these be with a purple and a certain yellow and bright gold colour of Muskade, and the same is alwaies the last colour that appeareth outwardly and giveth the lustre: and yet a man that beheld this stone, would say that the head thereof were crowned with a chaplet of purple: and as it appeareth to have these colours confounded all together, so it seemeth as if everie one had a severall lustre by it selfe. A more pure and clearer gem there is not againe: comfortable unto the head and pleasing to the eye. The best simplie of this kind wee have from the Indians, who call it Argenon. In a second degree to it is that of Ægypt, where it is called Senites. Of a third sort there be in Arabia, but those are rough. Those of Natolia and the kingdome of Pontus, are not so radiant and quicke as the others: and yet from Galatia, Thracia, and Cyprus, we have such as be more feeble than they. If you would know what faults be incident to these Pæderotes particularly: they carie otherwhiles a languishing lustre; troubled they be with unnaturall colours; & generally subject they are to all the defects and imperfections of others.

*Of which name there is Opalus & the Amethyst.

I

*Gira-solum.

In the second place of white gems, is *Asteria to be counted: a wonderfull propertie it hath in Nature, for which it deserveth to bee cheese, for that it keepeth enclosed within a certaine light K
in manner of the apple in the eye: which according as a man dooth hold or turne, hee shall see how it will send and transfuse it from the owne place; one would thinke that it walked within and shifted from place to place. And the same, if it be opposed against the beames of the Sun, casteth forth bright and white raies of the owne, in manner of a star, whereupon it tooke the name Asterias: and verie hard it is to bee engraven. Those which come out of India bee preferred before them of Carmania.

In like manner a white precious stone there is called Astrios, approching neare to Crystall: this is engendered among the Indians and along the coasts of Pallene: From the verie centre within, there shineth a kind of star in manner of a full Moon in the height of her brightnes. Some give this reason of the name, that being held against anie starres, it receiveth from them a light L
and sendeth the same from it againe in manner of beams. And they hold that the best be in Carmania, and there is not another gem againe lesse subject to blemishes and imperfections than it. As also that a worse kind thereof is called Ceraunias: and the worst of all other resembleth the blase or flame of lampes and candles.

As touching Astroites, manie make great account of it: and such as have written more diligently thereof, doe report, That *Zoroastres* hath highly commended it and told wonders thereof in art Magicke.

Sudines speaketh of another gem called Astrobolos, and saith it is like unto a fish eye, and casteth forth white glittering raies against the Sunne.

Among white precious stones may be reckoned that which they call Ceraunia, which is apt M
to receive light and lustre both from Sunne and Moone and other starres. It selfe looketh like Crystall cleare, howbeit, the lustre that commeth from it seemeth to be of a blew Azure colour: and Carmania is the native place therof. *Zenothemis* confesseth, That it is a white gem, and hath within a starre-like fire, which seemeth to run too and fro and chaunge place, according as a man

turneth

A turneth it. Hee affirmeth alſo, That the foreſaid Ceraunię will become dull and duskiſh: which if they be ſoaked for certaine daies together in vinegre and ſal-nitre, will recover their light and conceive a new fire in manner of a ſtar, which will continue for ſo many moneths as they lay daies infuſed; and after that looſe their luſtre againe. *Sotacus* hath ſet downe two kinds more of Ceraunia, to wit, the blacke and the red, ſaying that they doe reſemble halberds or ax-heads. And by his ſaying, the blacke, ſuch eſpecially as bee round withall, are endued with this vertue, that by the meanes of them cities may be forced, and whole navies at ſea diſcomfited; and theſe (forſooth) be called Betuli, whereas the long ones be named properly Ceraunię.

It is ſaid that there is one more Ceraunia yet, but very geaſon it is and hard to be found, which the Parthian Magicians ſet much ſtore by, and they onely can find it, for that it is no where to bee
B had than in a place which hath been ſhot with a thunderbolt.

Next after the Ceraunia, there is a ſtone in name called Iris: digged out of the ground it is in a certaine Iſland of the red ſea, diſtant from the city Berenice threeſcore miles. For the moſt part it reſembleth Cryſtall: which is the reaſon that ſome have tearmed it the root of Cryſtall. But the cauſe why they call it Iris, is, That if the beames of the Sunne ſtrike upon it directly within houſe, it doth ſend from it againſt the walls that bee neare, the very reſemblance both in forme and alſo in colour of a rainebow; and eftſoones it will chaunge the ſame in much varietie, to the great admiration of them that behold it. For certaine it is knowne, that ſix angles it hath in maner of the Cryſtall: but they ſay that ſome of them have their ſides rugged, and the ſame unequally angled: which if they be laid abroad againſt the Sunne in the open aire, doe ſcatter the
C beames of the Sunne, which light upon them too and fro: alſo that others doe yeeld a brightnes from themſelves, and thereby illuminat all that is about them. As for the diverſe colours which they caſt forth, it never happeneth but in a darke or ſhaddowie place: whereby a man may know, that the varietie of colours is not in the ſtone Iris, but commeth by the reverberation of the wals. But the beſt Iris is that which repreſenteth the greateſt circles upon the wall, and thoſe which bee likeſt unto raine-bowes indeed. There is another gem called Iris, like unto the other in all reſpects, but that it is exceeding hard: *Horus* ſaith, That if it be calcined and pulverized, it is a ſingular remedie againſt the biting of Ichneumones: alſo that naturally it is to bee found in Perſis.

Much like in forme and ſhape to Iris, but not of the ſame effect, is there another ſtone called Zeros: a man that ſeeth it, would take it to bee a Cryſtall, with a blacke ſtrake parting it over-
D thwart. Thus having laid abroad the precious ſtones and jewels which are diſtinguiſhed by ſundrie kinds of principall colours, I will proceed to the reſt, and diſcourſe of them according to the order of the Alphabet.

Chap. X.

Of certaine gems digeſted in order according to the Alphabet.

THe Agate was in old time of great eſtimation, but now it is in more requeſt. Found it was firſt in Sicilie neare unto a river called likewiſe Achates: but afterwards in many other places. It exceedeth in bigneſſe, and is full of varietie in colours, whereby it hath gotten many
E names: for called it is Phaſſachates, Cerachates, Sardachates, Hæmachates, Leucachates, and Dendrachates, as if the veines therof reſembled a little tree. As touching the Agath, called Antachates, as it burneth you ſhall have it to ſmell like unto Myrrhe. Alſo, there is an Agath of a reddiſh colour reſembling Corrall: and thereupon called Coralloachates: and the ſame is beſet with certaine ſpots or drops of gold, in manner of the Saphire: of which kind there is paſſing great plentie in Candie, where they call it the holy or ſacred Agate: for people are perſuaded that it availeth much againſt the ſting of venomous ſpiders and ſcorpions: which propertie I could very well beleeve to be in the Sicilian Agaths, for that ſo ſoone as ſcorpions come within the aire and breath of the ſaid provincc of Sicilie, as venomous as they bee otherwiſe, they die thereupon. The Agates likewiſe found among the Indians, have the ſame operation, and beſides
F doe repreſent many other miracles; for you ſhall find imprinted naturally in them the form and proportion of rivers, woods, and laboring horſes: a man ſhall ſee in them coaches and little chariots or horſelitters, together with the furniture and ornaments belonging to horſes. As for Phyſicians, they make their grinding ſtones thereof for fine pouders. And it is holden for a truth, that onely to behold and looke upon an Agate, is very comfortable for the eyes. If they bee but held

in

in the mouth, they quench and allay thirst. The Phrygian Agates have no part of green in them. G
Those that bee found about Thebes in Ægypt, are without red and white veines: howbeit, these also be effectuall against scorpions. Of the same credite likewise are the Cyprian Agates. Some hold opinion, That the singular grace and commendation in an Agate, is to bee cleare and transparent like glasse. There be found of them in Thrace, and about the mountaine Oeta, in the hill Pernassus, in Lesbos and Messene, and such have flowers in them imprinted, like to those which grow by the high waies and paths in the fields: also in the Isle of Rhodes. But the Magicians observe diverse other sorts; and as for those that bee like unto a Lions skin, they have the name to be powerfull against scorpions. In Persia they are persuaded, That a perfume of such Agathes, turneth away tempests and all extraordinarie impressions of the aire, as also staieth the violent streame and rage of rivers. But to know which be proper for this purpose, they use to cast them H
into a cauldron of seething water: for if they coole the same, it is an argument that they bee right. But to be sure that they may doe good, they must be worne tied by the haires of a Lions mane: for as touching those Agates which seeme to have the print of an Hyænes skin, the Magicians cannot abide them, as causing discord in a house. But they hold, That the Agath of one simple colour, causeth those wrestlers to bee invincible who have it about them. And a proofe hereof they take by seething it in a pot full of oyle, with diverse painters colours, for within one two houres after that it hath sivered and boiled therein, it will bring them all to one entire colour of Vermillion. Thus much of Achates or the Agath. The stone which is named Acopis, resembleth sal-nitre: hollow it is and light in manner of the pumish stone, howbeit, spotted with
golden spots or drops in manner of starres. Seeth this gently in oyle, and therewith annoint the I
bodie, it riddeth away all wearinesse and lassitudes, if we may beleeve the Magicians. The stone Alabastrites is found about Alabastrum, a citie in Ægypt, and Damasco in Syria, white of colour it is, and entermeddled with sundrie colours. This being calcined with Sal gem and reduced into pouder, is said to correct a stinking breath and strong savour of the teeth. In the gesiers of Cockes there bee found certaine stones, called thereupon Alectonæ, which in shew resemble Crystall, and be as big as Beanes: *Milo* that great wrestler of Crotone, used to carie this stone about him, whereby he was invincible in all the feats of strength or activitie that he tried, as Magicians would seeme to persuade us. Androdamas is a stone of a bright colour like silver, and in manner of a Diamant, square, and alwaies growing in a table lozenge-wise. The Magicians
suppose, That it tooke that name for repressing the anger and furious violence of men. As touch- K
ing Argyrodamas, whether it be the same, or another stone, authours have not resolved. Antipathes is a stone all blacke, and nothing at all transparent. You shall find whether it bee a true stone or no, by seething it in milke, for no sooner is it put in, but it causeth the milke to looke like Myrrhe. The Magicians would have us to thinke, That it is good against witch-craft, and eye biting especially. Arabica is passing like unto yvorie: and for yvorie might it goe, but that it is so hard, which bewraieth it to be a stone. It is thought, that as many as have it about them, shall find ease of the paine of sinewes. The stone Aromatites is thought principally to grow in Arabia, and yet it is found in Ægypt about Pyræ: but wheresoever it is to be had, a stone hard it is, in colour and smell both resembling Myrrhe: in which regard, much used it is of queenes and great ladies. Asbestos is engendered within the mountaines of Arcadia, and is of an yron grey L
colour. As for Aspilate, *Democritus* saith, That it is bred in Arabia, and of a firie colour: which by his saying ought to be tied with cammels haire and so hung fast about them that bee troubled with the schirrhosities of the spleene, also (if he say true) it is found in the neast of certaine Arabian birds. Another likewise of that name groweth there in the cape Leucopetra, but it is of a silver colour, and glittereth withall: excellent to be worne about one against the fantasticall feares and imaginations in the night season. The same *Democritus* saith, That in Persis, India, and the mountaine Ida, there is a stone found, named Atizoë, glistering bright as silver; three fingers thicke, formed in manner of a Lentill, and of a pleasant and delectable savour: The Sages of Persia never goe about the election and ordering of a king, but they thinke it necessarie to have M
it about them. As for Augites, many bee of opinion, That it is no other stone than Callais, *i.* the Turquoise. Amphitane is a stone, knowne by another name also, Chrysocolla: found it is in that part of India where the Pismires-Volant do rake out gold; where it resembleth gold, and is in fashion foure square. It is reported constantly, That it hath the same force naturally that the Loadstone hath, but that it draweth gold to it as well as silver. Aphrodisiace is partly white

and

A and partly reddiſh. Aſyctos beeing once heat at the fire, will continue a ſevennight after hot: blacke it is and ponderous, having certaine veins that devide it: it is thought to be good againſt cold. As touching Ægyptilla, *Iacchus* taketh it for a white ſtone, with a veine partly of a Sard or Cornalline, and partly blacke, paſſing through it overthwart: howbeit the common ſort take Ægyptilla to be blew, with a blacke mote in the bottome.

As for the ſtone Balanites, there be two kinds thereof; to wit, of a greeniſh colour, and reſembling Corinth braſſe: the former commeth from Coptos, the other out of the region Troglodytica; and they have a firie veine cutting them juſt in the mids. The ſame Coptos ſendeth other ſtones unto us beſides, to wit, thoſe which be called Batrachitæ; the one like in colour to a frog, a ſecond unto * yvorie, the third is of a blackiſh red. * Baptes, howſoever otherwiſe it be ſoft and B tender, yet an excellent odour it hath. The ſtone called Belus eye is white, and hath within it a black apple, the mids wherof a man ſhall ſee to glitter like gold: this ſtone for the ſingular beautie that it hath, is dedicated to *Belus* the moſt ſacred god of the Aſſyrians. There is another ſtone named Belus, growing (as *Democritus* ſaith) about Arbelæ, to the bigneſſe of a wall-nut in manner and forme of glaſſe. As for Baroptenus or Baroptis, it is blacke, enterlaced as it were with certaine knots, both white and alſo of a ſanguine red, after a ſtraunge and wonderfull manner. Botrytes is found ſometime black, otherwhiles red, and like it is unto a cluſter of grapes when it beginneth firſt to knit. As for it which is more like unto the hair of women, *Zoroaſtres* calleth it * Boſtrychites. *Bucardia reſembleth an ox-heart, and is to be found only about Babylon. Brontia is ſhaped in manner of a Tortoiſe head: it falleth with a cracke of thunder (as it is thought) from C heaven; and if wee will beleeve it, quencheth the fire of lightning. Bolæ are found after a great ſtorme or tempeſt, reſembling a clod.

B

* *Eborî*: ſome ſay, *Ebeni*, *i.* Ebene.

* *i.* Ambre died red with the root of Orchanes.

* A kind of Amiantum or alume de plume.

* A kind of Turquois.

C

Cadmitis were the verie ſame which they call Oſtracitis, but that otherwhiles it is compaſſed about with certain blew-bottles. Callais commeth very neare unto the Sapphir, but that it is whiter, and reſembleth rather the water of the ſea about the ſhore. Capnites (as ſome thinke) is a kind of ſtone by it ſelfe, beſet with many wreaths, and thoſe ſeeming to ſmoke, as I have ſaid alreadie in due place: the naturall place of it is Cappadocia and Phrygia: in ſome ſort it is like yvorie. As touching Callainæ, it is commonly ſaid, that they be found alwaies many joyned togither. Catochites is a ſtone proper unto the Iſland Corſica: in bigneſſe it exceedeth ordinarie pretious ſtones: a wonderfull ſtone, if all be true that is reported thereof, and namely, That if a man lay his D hand thereupon, it will hold it faſt in manner of a glewie gum. Catopyrites groweth in Cappadocia. Cepites or Cepocapites, is a white ſtone, and the veins therein ſeeme to meet togither in knots; and ſo white and cleare withall, that it may ſerve as a mirrour to ſhew ones face. Ceramites in colour reſembleth an earthen pot. As for Cinædiæ, they be found in the braine of a fiſh named Cinædus: white they be and of a long faſhion, and of a wonderfull nature, if we may beleeve that which is reported of the event which they ſignifie; and namely, that according as they bee 2 cleare or troubled in colour, they doe preſage either ſtorms or calme at ſea. Cerites is like unto wax; and Circos, unto wreaths or circles. Corſoides, is made in maner of a gray peruke of haire: Corallo-achates, unto a corall ſet with gold ſpots: Corallis, to vermillon, and is engendred in India and Syene. Craterites hath a colour betweene the Chryſolith and the baſe gold Electrum, E of an exceeding hard ſubſtance. Crocallis doth repreſent a cherrie. Cyſſites is engendred about Coptos, and is of a white color: it ſeemeth as it were to be with child, for ſomething ſtirreth and rattleth within the bellie if it be ſhaken. Calcophonos is a blacke ſtone; if a man ſtrike upon it, he ſhall perceive it to ring like a peece of braſſe: and the magicians would perſuade thoſe that play in Tragœdies to carrie it about them continually. As for the ſtone Chelidonia, there bee two ſorts of it: in colour they do both reſemble the Swallow, and of one ſide which is purple, you ſhall ſee blacke ſpots intermingled here and there among. Chelonia is no more but the verie eie of an Indian Tortoiſe: of a moſt ſtraunge nature by the magicians ſaying, and working great woonders, but they will lye moſt monſtrouſly; for they would promiſe and aſſure us, That after one hath well rinſed or waſhed his mouth with honey, and then lay it upon the tongue, hee ſhall F preſently have the ſpirit of propheſie, and be able to foretell future things all a day long, either in the full or chaunge of the moone; but if this bee practiſed in the wane of the moone, hee ſhall have this gift but onely before the Sun-riſing: upon other daies, namely while the moone is croiſſant, from ſix of the clocke or ſun-riſing ſix houres after. Moreover, there be certaine ſtones called Chelonitides, becauſe they be like unto Tortoiſes, by which theſe magicians would ſeeme

to tell us by way of propheſie and revelation, many things for to allay tempeſts and ſtormes: G
but eſpecially the ſtone of this kind which hath golden drops or ſpots in it, if togither with a flie
called a Beetle it be caſt into a pan of ſeething water, it will avert tempeſts that approach. Chlo-
rites is a ſtone of a graſſe-greene colour, according as the name doth import; and by the ſaying
of magicians, it is found in the geſier of the bird called Motacilla or Wagtaile, yea and is en-
gendred togither with the ſaid bird. They give direction (forſooth as their manner is) to enchaſe
or encloſe it with a peece of yron, and then it will doe wonders. Choaſpites taketh that name of
the river Choaſpes; greene it is and reſplendent like burniſhed gold. Chryſolampis is found in
Æthiopia; all the day long of a pale colour, but by night it gloweth in manner of a cole of fire.
Chryſopis is ſo like unto gold, as a man would take it for no other. The ſtones called Cepioni-
des, grow in Æolis about Atarne, a little village now, but ſometime a great towne: they have ma- H
ny colours, and be tranſparent; ſometimes in manner of glaſſe, otherwhiles like Cryſtall or the
Iaſper: ſuch alſo as bee not cleare through but foule and thicke within, are notwithſtanding ſo
pure and neat without, that they will repreſent a mans or womans viſage as well as a mirroir or
looking-glaſſe.

D Daphnias is a ſtone, whereof *Zoroaſtres* writeth, and namely that it is good againſt the falling
ſickneſſe. Diadochus is like unto Berill. Diphris is of two kinds; the white and the blacke, the
male and the female; wherein may be perceived verie diſtinctly, thoſe members that diſtinguiſh
the ſex, by reaſon of a certaine line or veine of the ſtone. Dionyſias is a blacke ſtone and hard
withall, having certaine red ſpots intermingled: if it be ſtamped in water, it giveth the taſt of wine,
and is thought to withſtand drunkenneſſe. Draconites or Dracontia, is a ſtone engendred in the I
braines of ſerpents, but unleſſe it be cut out whiles they bee alive, namely after their heads be
chopt off, it never groweth to the nature of a pretious ſtone; for of an inbred malice and envie
that this creature hath to man, if perceiving it ſelfe to languiſh and draw on toward death, it kil-
leth the vertue of the ſaid ſtone: and therfore they take theſe ſerpents whiles they be aſleepe, and
off with their heads. *Sotacus* (who wrote that he ſaw one of theſe ſtones in a kings hand) repor-
teth, that they who go to ſeeke theſe ſtones uſe to ride in a coach drawn with two ſteeds, & when
they have eſpied a dragon or ſerpent, caſt in their way certaine medicinable drugs to bring them
aſleep, and ſo have means & leiſure to cut off their heads: white they are naturally & tranſparent,
for impoſſible it is by any art to poliſh them, neither doth the lapidarie lay his hand unto them.

E Encardia is a pretious ſtone, named alſo Cardiſcæ: one ſort there is of them, wherein a man K
may perceive the ſhape of an heart to beare out: a ſecond likewiſe there is ſo called, of a greene
colour, and the ſame doth repreſent alſo the forme of an heart: the third ſheweth the heart onely
blacke, for all the reſt is white. Enorchis is a faire white ſtone; the ſame being devided, the frag-
ments thereof doe reſemble a mans genetoirs, whereof it tooke that name. As touching Exhe-
benus the ſtone, *Zoroaſtres* ſaith, that it is moſt beautifull and white, and therwith goldſmiths uſe
to burniſh and poliſh their gold. As for Eriſtalis, being of it ſelfe a white ſtone, ſeemeth as a man
holdeth it, to wax red. Erotylos, which ſome call Amphicome, others Hieromnemon, is com-
mended much by *Democritus*, for ſundrie experiments in propheſying and foretelling fortunes.
Eumeces groweth in the Bactrians countrey, like unto a flint; being laid under a mans head ly-
ing aſleepe upon his bed, it repreſenteth by viſions and dreams in the night all that he is deſirous L
to know, even as well as an oracle. As for Eumetres, the Aſſyrians call it the ſtone or gem of *Belus*
the moſt ſacred god among them, and whome they honour with greateſt devotion: as green it is
as a leeke, and ſerveth verie much in their ſuperſtitious invocations, ſacrifices, and exorciſms. Eu-
petalos hath foure colours, to wit, of azur, fire, vermillon, and an apple. Eureos is like the ſtone of
an olive, chamfered in maner of winkle ſhels, but verie white it is not. Eurotias ſeemeth to have a
certain mouldines that covereth the black underneath. Euſebes ſeemeth to be that kind of ſtone
whereof (by report) was made the ſeat in *Hercules* temple at Tyros, where the gods were woont to
appeare and ſhew themſelves. Moreover, any pretious ſtone is called Epimelas, when being of it
ſelfe white, it is overcaſt with a blacke colour aloft.

G The gem Galaxias, ſome call Galactites, like unto thoſe laſt before-named, but that it hath M
certain veins either white or of a bloud colour running between. As for Galactites indeed, it is as
white as milke, and thereupon it tooke that name. Many there be who call the ſame ſtone Leucas,
Leucographias, & Synnephites, which if it be bruſed yeeldeth a liquor reſembling milke, both in
colour & taſt: and in truth, it is ſaid, that it breedeth ſtore of milke in nources that give ſucke: alſo

that

A that if it be hung about the necks of infants, it cauſeth ſalivation; but being held in the mouth, it melteth preſently. Moreover, they ſay, that it hurteth memorie and cauſeth oblivion: this ſtone commeth from the river Achelous. Some there be, who call that Emeraud Galactites, which ſeemeth as it were to be bound about with white veins. Galaicos is much like unto Argyrodanus, but that it is ſomewhat fouler: commonly they are found by two or three togither. As for Gaſidanes, we have it from the Medians; in colour it reſembleth blades of corne, & ſeemeth beſet here and there with floures: it groweth alſo about Arbelæ: this gem is ſaid likewiſe to bee * conceived with young, and by ſhaking to bewray and confeſſe a child within the wombe, and it doth conceive everie three moneths. Gloſſi petra reſembleth a mans tongue, and groweth not upon the ground, but in the eclipſe of the moone falleth from heaven, and is thought by the B magicians to be verie neceſſarie for pandors and thoſe that court faire women: but wee have no reaſon to beleeve it, conſidering what vaine promiſes they have made otherwiſe of it; for they beare us in hand, that it doth appeaſe winds. Gorgonia is nothing els but Corall: the name Gorgonia groweth upon this occaſion, That it turneth to be as hard as a ſtone: it aſſuageth the trouble of the ſea and maketh it calme: the magicians alſo affirme, that it preſerveth from lightning and terrible whirlewinds. As vaine they be alſo in warranting ſo much of the hearbe Gunjane, namely, that it will worke revenge and puniſhment upon our enemies.

* Haply our Bezoar.

The pretious ſtone Heliotropium, is found in Æthiopia, Affricke, and Cyprus: the ground thereof is a deepe greene in manner of a leeke, but the ſame is garniſhed with veins of bloud: the reaſon of the name Heliotropium is this, For that if it be throwne into a paile of water, it chaungeth the raies of the Sun by way of reverberation into a bloudie colour, eſpecially that which commeth out of Æthiopia; the ſame beeing without the water, doth repreſent the bodie of the Sun, like unto a mirroir: and if there bee an eclipſe of the Sun, a man may perceive eaſily in this ſtone how the moone goeth under it, and obſcureth the light: but moſt impudent and palpable is the vanitie of magicians in their reports of this ſtone; for they let not to ſay, That if a man carrie it about him, togither with the hearbe Heliotropium, and beſides mumble certaine charmes or prayers, hee ſhall goe inviſible. Semblably, Hephæſtites is of the nature of a looking-glaſſe, for although it bee reddiſh or of an orenge colour, yet it ſheweth ones face in it: the meanes to know this ſtone whether it bee right or no, is this; in caſe beeing put into ſcalding water, it preſently cooleth it; or if in the Sun it will ſet on fire any drie wood or ſuch like fewell: this ſtone is D found growing upon the hill Corycus. Horminodes is a ſtone ſo called, in regard of the greene colour that it hath reſembling the hearbe Clarie; for otherwhiles it is white, and ſometime againe blacke, yea and pale now and then; howbeit hooped about it is with a circle of gold in colour. Hexecontalithos, for bigneſſe is but ſmall, and yet for the number of colours that it hath, it got this name: found it is in the region of the Troglodytes. Hieracites chaungeth colour all whole alternatively by turnes; it ſeemeth to be blackiſh among kites feathers. Hamnites reſembleth the ſpawne of fiſhes: and yet ſome of them be found as it were compoſed of nitre, and otherwiſe it is exceeding hard. The pretious ſtone called Hammons-horne, is reckoned among the moſt ſacred gemms of Æthiopia: of a gold colour it is, and ſheweth the forme of a rams horne: the magicians promiſe, that by the vertue of this ſtone, there will appeare dreames E in the night which repreſent things to come. Hormeſion is thought to bee one of the lovelieſt gems that a man can ſee, for a certaine fierie colour it hath, and the ſame ſpreadeth forth beams of gold, and alwaies carrieth with it in the edges a white and pleaſant light. Hyenia tooke the name of the Hyens eye: found they are in them when they be aſſailed and killed: and if wee may give credit to magicians words, if theſe ſtones be put under a mans tongue, hee ſhall preſently propheſie of things to come. The bloud-ſtone Hæmatites is found in Æthiopia principally, and thoſe be ſimply the beſt of all others; howbeit there are of them likewiſe in Arabia and Affricke: in colour it is like unto bloud, and ſo called: a ſtone that I muſt not overpaſſe in ſilence, in regard of my promiſe that I made to reprove the vanities and illuſions of theſe impudent and barbarous magicians who deceive the world with their impoſtures: for *Zachalias* the Babylonian, F in thoſe books which he wrote to king *Mithridates*, attributeth unto gems all the deſtinies and fortunes that be incident unto man: and particularly touching theſe bloud-ſtones, not contented to have graced them with medicinable vertues reſpective to the eyes and the liver, hee ordained it to be given unto thoſe for to have about them, who have any petition unto a king or great prince, for it would ſpeed and further the ſuite: alſo in caſe of law matters it giveth good iſſue

H

and sentence on their side, yea and in wars, victorie over enemies. There is another of that kind, G
called by the Indians Henui, but the Greekes name it Xanthos: of a whitish colour it is upon a
ground of a yellow tawnie.

I The stones called Idæi-Dactyli, be found in Candie: of an yron colour they be, and resemble in forme the thumbe of a mans hand. As touching Icterias, there be foure kinds thereof, to wit, one like unto a pale coloured bird called the Lariot; and therefore is thought to be good against the jaundise: a second there is of the same name, but more enclining to a *swert colour: the third resembleth a greene leafe, broader than the former, weighing little or nothing, and is besides full of pale and wan veins: the fourth is of the same colour, but it hath blacke veins running too and fro. The stone called *Iupiters* gem, is white, light, and tender. The stone Indico taketh name of those nations from whence it commeth; the colour outwardly is somewhat reddish, and if it be H
rubbed, there commeth from it a certaine purple humor in manner of a sweat. There is another of that name, but it is white, and sheweth like unto dust or powder. The same Indians have another gem called Ion, for that it resembleth the colour of the March violet; but seldome shall a man see it with a fresh and gay blew indeed.

*Lividior.

L The stone Lepitodes doth represent skales of fishes in sundrie colours. Lesbias taketh name of the Isle Lesbos the native place thereof: howbeit they are found in India likewise. Leucophthalmus, is otherwise reddish or tawnie, howbeit in that colour it carrieth the forme of an eye, both for white and blacke. Leucopetalos sheweth white in manner of snow, and yet the same is garnished with a lustre of gold. Libanochrus in colour resembleth frankincense, but a liquor or moisture it yeeldeth answerable to honey. Limoniates seemeth to be all one with the Emeraud. I
As touching the unctuous stone Liparis, I find this onely written of it, That a stinke or perfume thereof fetcheth foorth any venomous vermine. The stone Lysimachus is like unto the marble of Rhodes, and hath in it certaine veines or streakes of gold: This stone must be polished upon marble: and when all the superfluities be fetched off, it is found to grow narrow pointwise. Leucochrysos seemeth to be made of a Chrysolith, having white veins or streaks betweene.

M A gem there is called Memnonia, but I have not read the description thereof. As for Medea, it is a blacke stone, and found it was first by that famous *Medea* of whome the Poëts write so many fables, yet certaine veins it hath of a golden colour: a kind of sweat issueth from it yellow as saffron, and in tast much resembling wine. Meconites doth represent expressely, poppie heads. The stone Mitrax we had from the Persians, and the mountains along the red sea: many colours K
it hath, and against the Sun it glittereth diversly. Merocles is greene like unto a leeke, and yet if you rub it, you shall see a humour come from it like to milke. The Indian stone Morion (which is most blacke and yet transparent) they call Pramnion: if it be entermingled with the fierie red of the Carbuncle or Rubie, they call it Alexandrinum; like as the Cyprian, Morion, which hath a shew of the Sarda or Cornalline: found there bee of them in Tyrus and Galatia. *Xenocrates* reporteth, that under the Alps also they are gathered. These bee the gems that be fitted for to engrave the forme of any thing from a pattern. As for Myrrhites, it hath the colour of myrrhe and the forme of a fine pretious stone: it yeeldeth the smell of a sweet perfume or ointment, and beingrubbed giveth a savour also of Nard. As touching Myrmecias, it is blacke, and hath certaine risings in it like to werts. Myrsinites, in colour resemblethhoney, and in odour the myrtle. Mesoleucos is a gem devided just in the mids with a white line: contrariwise, Mesomelas, when three L
is a blacke line cutteth through any other colour in the middest.

N Nasamonites is in colour like to bloud, howbeit certaine blacke veines it hath. Nebrites is a stone consecrat to god *Bacchus*: it tooke that name of the resemblance which it hath to those skins of deere that hee was wont to weare: there be others of the same kind, but blacke they are. The gem Nympharena keepeth the name of a cittie and nation in Persia; and it resembleth the teeth of a water-horse.

O Orca is the barbarous name of a certaine precious stone, which is very pleasant unto the eye: wherein concurre together blacke, yellow, greene, and white. Ombria, which some call Notia, is M
said to fall from heaven in stormes, showers of raine, and lightening, after the manner of other stones, called thereupon Ceraunia and Brontia: and the like effects are attributed to it, as be reported of Brontia: and thus much moreover, That so long as it lieth upon the hearth of an altar, the * libaments will not burne that bee offered thereupon. Orites is in forme round as a globe: some call it Siderites, it will abide the fire and feele no harme thereby. Ostracias or Ostracites is

* As the ham growing in the forward, and such things, whereof assay was given first to the fire.

made

A made in manner of a ſhell, and is exceeding hard. A ſecond kind there is of it reſembling an Agath, but that an Agath in the polliſhing ſeemeth to looke greaſily, which the Oſtracias dooth not. And the harder kind of this ſtone is of that power, that the fragments thereof will ſerve to engrave other gems. As for Oſtracites, it tooke the name of an Oyſtre ſhell, which it doth repreſent. The Barbarians have a precious ſtone, which they call Ophicardelos; blacke of colour, and the ſame encloſed with two white lines or circles. As touching the ſtone Obſidianus, I have written ſufficiently in the booke going next before: and yet there be certaine gems of that name and carrying the ſame colour, not onely in Æthyopia and India, but alſo in Samnium, as ſome are of opinion, yea, and in the coaſts of the Spaniſh Ocean.

Panchrus, according to the name, ſeemeth to conſiſt (in manner) of all colours. Pangonius is P
B no longer than a mans finger: it differeth from Cryſtall in this onely, that it hath more angles in number, whereupon it got the name. As for Paneros, what manner of ſtone it is *Metrodorus* hath not ſet downe, howbeit he reciteth an elegant verſe of queen *Timaris*, which together with the ſtone ſhe conſecrated to *Venus*: whereby is given to underſtand, That by the meanes therof ſhe became fruitfull and bare children: Some there be who call this gem Panſebaſton. Now concerning the gems of Pontus, knowne by the name of Ponticæ, there be many ſorts of them. One is full of ſtarres, garniſhed with bloudie or blacke ſpecks in manner of drops; and this is counted among the ſacred ſtones: another in ſtead of ſtarres hath ſtrakes and lines onely of the ſame colours: and there be of them again which repreſent the forme of mountains and vallies. The gem Phloginos, which is called likewiſe Chryſtes, is found in Ægypt, and is likened unto the Oſtracias
C of Attica. Phœnicites tooke the name of the ſimilitude that it hath to a Date. And Phycites was ſo named, becauſe of the likeneſſe it hath to the ſea weed or Lectuce, named Phycos in Greeke. Perileucos is a ſtone, ſo called by occaſion of a whitiſh lace that ſeemeth to goe from the mouth of the gem downe to the verie bottome. The gems Pæantides, which ſome name Gemonides, are ſaid to conceive and to bring forth other little ſtones: but a ſingular vertue they have to help women that be in travell of child-birth. Such bee found in Macedonie, neare unto the monument or ſepulchre of *Tireſias*, and that which they bring forth, ſeemeth like unto water grown to be congealed into yce.

The Sunnes gem is white: and after the manner of the Sunne, whoſe name it beareth, it ca- S
ſteth footh ſhining raies round about on every ſide. Sagda is a ſtone, which the Chaldæans find
D ſticking to ſhips, and they ſay it is greene as Porrets or Leekes. Samothracia the Iſland yeeldeth us a precious ſtone of the owne name, blacke of colour, light in hand, and like to [rotten] wood. As for Saurites, it is found (by report) in the bellie of a greene Lizard, ſlit open with the edge of a cane or reed. Selenites is a precious ſtone, white and tranſparent, yeelding from it a yellow luſtre in manner of honey, and repreſenting within it the proportion of the Moone, according as ſhe groweth toward to the full, or decreaſeth in the wane againſt the chaunge: This admirable ſtone is thought to be found in Arabia. Siderites is much like to yron: and ſuppoſed it is, That if it be brought among them that are at ſome variance or controverſie alreadie in law, it will breed diſcord and maintain diſſention ſtill. Of this Siderites is made another ſtone, which is engendred in Æthyopia, called Sideropœcilos, for the ſundry ſpots therin. Spongites is like unto a ſpunge, even
E as it carieth a name reſpective unto it. Synodontites commeth from the braine of certain fiſhes called Synodontes. The ſtones Syrtitæ be found in the ſhore of the Syrtes in Barbarie, yea, and in Lucania, ſhining with the colour mixt of ſaffron and honey, but within they containe certaine ſtarres, which have but a dim and duskiſh light. The ſtone Syringites is hollow throughout in manner of a pipe, and is like unto a ſtraw betweene two joints.

Trichrus that commeth out of Affricke is blacke, howbeit if it bee rubbed it yeeldeth three T
kinds of humours from it; to wit, from the root or bottome blacke, out of the midds like bloud, and in the head white. Telirrhizos is of an aſh colour or reddiſh, and yet the bottome thereof is a lovely and ſightly white. Telicardios is much eſteemed in the realme of Perſia, where it is engendred: in colour it reſembleth the heart, and they call it there in their language, a Spot. The
F ſtone Thracia is of three kinds; the firſt greene, the ſecond more pale, and the third full of ſpots of bloud. Tephritis, although otherwiſe it be of the colour of aſhes, yet it repreſents a new Moon croiſant and tipped with hornes. Tecolithus ſeemeth like unto the ſtone or kernill of an Olive: It is not raunged in the number of precious ſtones, but whoſoever licke thereof, ſhall find, That it will breake the ſtone and expell it. The ſtone called *Venus* haire, is exceeding blacke and ſhining;

howbeit it maketh a shew of red haires sprinckled among. G

V Veientana is a gem proper unto Italie, found about Veij, a cittie in Tuscane: this stone is blacke and crossed through the middest with a white path.

Z Zanthenes (as *Democritus* writeth) is found ordinarily in Media: in colour it resembleth base gold Electrum: and if a man doe stampe it in Date wine and Saffron together, it will relent in manner of wax, and cast a most sweet and pleasant smell. Zmilaces is a stone which the river Euphrates yeeldeth, like unto the marble of Proconnesus, but that in the middest it hath a greenish colour. Finally, Zoronisios is engendered in the river Indus: commonly it is called the Magicians gem; more of it I find not written.

Chap. xi. H

Of certaine precious stones, taking their names from the members of mans bodie, from beasts also and other things.

BEsides those gems comprehended under the Alphabet, there be more precious stones also compriſed after other sorts of distinction, according to divers significant varieties: for some there be which bear the names of certain members of the bodie; as for example, Hepatites, of the liver; Steatites, of the sundry sorts of fat, grease or tallow of each beast. Adad *Nephros is a stone worshipped among the Ægyptians, so is Thendactylus also. As for Adad, he is the cheese god among the Assyrians. The stone Triophthalmos groweth together with the Onyx stone, and representeth three eyes of a man together. I

* It taketh the name of the kidneies.

There be gems take their names likewise of beasts, to wit, Carcinias of the colour which the sea-crab hath, Echites, of a Viper; Scorpites, either of the colour or form of a Scorpion; Scarites, of the fish Scaurus, *i.* a Gilthead; Triglites, of the Barble; Ægophthalmos, of a Goats eye; like as another, for the resemblance that it hath to the *eye of a swine. Geranites tooke name of a cranes colour; even as Hieracites of the Hawkes or Faulcons colour. Aëtites resembleth the colour of that Ægle which hath a white taile. Myrmerites sheweth the forme of a Pismire creeping within the stone; so doth Cantharias, of Beetils. Lycophthalmos hath the resemblance of a Wolfes eie, and consisteth of foure colours; the outward parts are tawnie, enclining to a bloud red, in the middest there is a blacke, enclosed within a white circle, as like to the said eye as possibly can bee. The stone Taos is like unto a Peacocke, even as the gem Chelonia to the Tortoise. In Hammochrysos there is a resemblance of sand, as if sand & gold were entermingled. Cenchrites is made like unto the graines or seeds of Millet scattered here and there. Pyrites hath a great affinitie with the stock of a tree: and the same will burne after the manner of wood. Cissites is white, and in that white shining seemeth to bee clasped every where with leaves of yvie. Narcissites likewise is distinguished and parted with veines of yvie. Cyamea is blacke, but being broken, it yeeldeth out of it a resemblance of a Beane. Pyren is so called by reason of an Olive stone or kernill which it resembleth: within this stone there appeare otherwhiles as it were fish bones. Chalazias as it carrieth the name of haile, so it representeth as well the colour as the shape thereof; but as hard it is as the Diamant: It is reported also, that if it be put into the fire, yet it will continue cold and not alter a whit. The fire stone Pyrites is verely blacke: but rub it with your finger, you shall find it to burne. Polyzonos is a blacke stone of it selfe, but many white fillets it hath about it. Astrapias is white or blew like Azur, yet from the middest thereof there seeme to shoot raies of lightening. In the stone Phlegontis there appeare a burning flame within, and never commeth forth. In the Granat named Authracitis, there is a shew otherwhiles of sparkles running too and fro. Enhydros is evermore absolutely smooth and white, containing within a certaine liquor that moveth too and fro if a man shake it, as he may perceive in egges. Polytrix is a greene stone, bedecked with fine veines in manner of the haire of ones head: but (by report) it will make the haire to shead of as many as carie it about them. Of a Lions skin, Leontios beareth the name: like as Pardalios of a Panther. The golden colour in the Topaze, gave it the name Chrysolith: so the grasie green of a Leeke was occasion of the name Chrysoprasos: and of honey was devised the colour and name Melichrus, although there bee many kinds of it. As for Melichloros, it is of two colours, partly yellow, and partly resembling honey. Crocias is yellow as Saffron: and Polia sheweth a certaine greynesse in manner of Spart. As for Spartopolios the blacke, it sheweth like gristlie veins to the other, but much harder. Rhodites took name of the Rose: Melites of the Apple, the colour wher-

* *Hyophthalmos.*

K L M

of

A of it ſheweth: Chalcites of braſſe; and Sycites of a figge. I ſee no proportion or reaſon at all betweene the ſtone Borſycites and that name; this ſtone is blacke and braunching, and the leaves are white, or red like bloud; no more than I doe in Gemites, which repreſenteth (as it were) engraven in the ſtone, white hands claſped one within another. As for Anachitis, it is ſaid, That ſpirits may be raiſed by it in the skill of Hydromantie: like as by Synochitis, the ghoſts which are raiſed, may be kept above ſtill. What ſhould I ſpeake of the white Dendritis, which if it be buried in the ground under a tree that is to bee fallen, the edge of the ax that heweth it, will not turne or wax blunt. There bee a number of other, and thoſe in Nature more prodigious than the reſt: for which the Barbarians have deviſed ſtraunge names, profeſſing unto us, that they were ſtones indeed. For mine own part it ſhall ſuffice that I have diſproved their lies in theſe abovenamed.

B

Chap. xii.

Of new ſtones, and thoſe naturall. Of ſuch as be counterfeit and artificiall. Of diverſe formes and ſhapes of gems.

There grow ſtill precious ſtones unlooked for every day, that bee new and have no names, ſuch as that in Lampſacus, where one was found in the gold mines ſo faire and beautifull, that it was thought a preſent worth ſending to K. *Alexander* the Great, as *Theophraſtus* writeth. As touching the ſtones Cochlides, which now are moſt common, they ſeeme rather artificiall than naturall: and verely it is ſaid, That in Arabia there be found of them huge maſſes which
C are ſodden in honey ſeven daies and nights together continually; by which meanes, after that all the earthie and groſſe refuſe of this ſtone is taken away, the ſtone it ſelfe remaineth pure and fine; and then comming under the lapidaries hand, they bee divided into ſundry veines, and reduced into drawne or inlaid worke of Marquetage, as he will himſelfe. And herein is ſeen the cunning of the cutter, for that it is ſo vendible, & every mans money. In old time they were made of that bigneſſe, that the KK. of the Eaſt had their horſes ſet out therewith, not onely in their frontſtals, but alſo in the pendants of their capariſons. And verely, all other precious ſtones being decocted in honey, looke faire and neat with a pleaſant luſtre: but principally the Corſicks, which abhorre all things els that are more eager than hony. Moreover, this is to be noted, that our lapidaries have a
D teame for thoſe ſtones which are of diverſe colours, and they call them Phyſes, as if they had not another uſuall name for them: and this they doe in the ſubtiltie of their wit, to make them ſeeme more wonderfull by theſe ſtrange words of art, as if they would venditat them for the very wonders of Natures worke: whereas indeed there bee an infinit number of names, deviſed all by the vaine Greeks, who knew not how to make an end, which I purpoſe not to rehearſe; and verely, after I had diſcourſed of the noble and rich ſtones, I contented my ſelfe in ſome ſort to ſpecifie thoſe of a baſer degree, ſuch I mean as were more rare than others, & to diſtinguiſh them that were moſt worthie to bee treated of. But this eftſoones would bee remembred, That one and the ſelfeſame ſtone changeth the name, according to the ſundry ſpots, marks and werts that ariſe in them; accotding alſo to the manifold lines drawn in them, the divers veines running betweene, and the varietie of colours therin obſerved. It remaineth now to ſet downe ſome generall obſervations indifferent to
E all ſorts of gems, and that after the opinion of the beſt approved and experienced authors in this kind. Any ſtones that be either hollow and ſunk in, or bearing out in boſſe or bellie, be nothing ſo good as thoſe which carie an even and levell table. The long faſhioned gems are moſt eſteemed; next unto them ſuch as be formed like to Lentill ſeed: after them thoſe that be round in manner of a targuet: and as for ſuch as be made with many faces and angled, they bee of all other leaſt accounted of. To diſerne a fine and true ſtone from a falſe & counterfet, is very difficult, foraſmuch as there is an invention to transform true gems into the counterfeit of another kind. And in truth men have deviſed to make Sardonches by ſetting and glewing together the gems named Ceraunia, and that ſo artificially, that it is unpoſſible to ſee therein mans hand; ſo handſomely are couched, the blacke taken from this, the white from that, and the vermillion red from another, accor-
F ding as the richneſſe of the ſtone doth require, and all thoſe in their kind moſt approved. Moreover, there be in my hands certaine bookes of authors extant, whom I will not nominat for all the good in the world, wherein is deciphered the manner and meanes how to give the tincture of an Emeraud to a Cryſtall, and how to ſophiſticat other tranſparent gems, namely, how to make a Sardonyx of a Cornalline, and in one word, to transforme one ſtone into another. And to ſay a truth, there is not any fraud and deceit in the world turneth to greater gaine and profit than this.

Chap.

G

Chap. xiii.

The way how to make proofe of fine precious ſtones.

LEt other writers teach how to deceive the world by counterfeit gems, for mine owne part I will take a contrary courſe, and ſhew the meanes how to find out falſe ſtones that be thus ſophiſticat: for ſurely, wanton and prodigall though men and women bee in the exceſſive wearing of theſe jewels, yet meet it is they ſhould be armed and inſtructed againſt ſuch couſiners. And albeit I have alreadie touched ſomewhat reſpectively as I treated of the cheefe and principall gems, yet I will adde ſomewhat more to the reſt: Firſt and formoſt therefore this is obſerved, That all ſtones which be tranſparent, ought to have their triall in a morning betimes, or at the farH theſt (if need ſo require) within foure houres after morning light, but in no wiſe later. Now there bee diverſe experiments that ſerve for this purpoſe, to wit, the weight of a ſtone, for commonly the fine gem indeed is heavier than the other: Secondly, the very bodie and ſubſtance is to bee conſidered; for it is an ordinarie matter to ſee in the ground and bottome of falſified ſtones certain little puſhes as it were riſing out; to feel them rough in hand outwardly; alſo to perceive their filaments not to continue their luſtre ſurely, and to beare it out to the very eye, but commonly in the way to vaniſh and be ſpent. But the moſt effectuall proofe of all, is to take a little fragments, for to be ground afterward upon a plate of yron: but lapidaries will not endure this triall; they refuſe alſo the experiment made by the file. Furthermore, the fragments of the blacke Agath or Geat, will not raſe or skarifie true gems. *Item*, Falſe ſtones if they be pierced or engraven, will ſhew no I white. Such difference there is moreover in ſtones, that ſome ſcorne all engraving with an yron punſon: others likewiſe cannot be cut but with the inſtrument or graver bent and turned backe: but there is not one but may be engraven with the Diamant. And verily, the moſt materiall thing herein, is to heat the graving ſteele or punſon.

As touching rivers that affourd precious ſtones, Aceſines and Ganges are the cheefe: and of all lands, India is the principall.

And now having diſcourſed ſufficiently of all the workes of Nature, it were meet to conclude with a certaine generall difference betweene the things themſelves, and eſpecially between countrey and countrey. For a finall concluſion therefore, go through the whole earth and all the lands lying under the cope of heaven, Italie will be found the moſt beautifull & goodlieſt region under K the Sun, ſurpaſſing all other whatſoever, and worthily to be counted the cheefe and principall in every reſpect: Italie (I ſay) the very ladie and queen, yea, a ſecond mother next to dame Nature of the world: Cheefe for hardie men, cheefe for faire and beautifull women, enriched with captains, ſouldiors, and ſlaves; flouriſhing in all arts and excellent ſciences, abounding with noble wits and men of ſingular ſpirit; ſituat under a climat moſt holeſome and temperat, ſeated alſo commodiouſly (by reaſon of the coaſts ſo full of convenient havens) for traffick with all nations, wherin the winds are moſt comfortable (for it extendeth it ſelfe and lieth to the beſt quarter of the heaven, even the middeſt juſt betweene Eaſt and Weſt;) having waters at commaund, large forreſts and faire, and thoſe yeelding moſt healthfull aire; bounded with mighty rampiers of high mountains, ſtored with wild beaſts and thoſe harmleſſe: finally, the ground ſo fertile for corn, the ſoile ſo batL tle for herbage, as none to it comparable. In ſum, whatſoever is neceſſarie & requiſit for the maintenance of this life is there to be had, in no place better: all kind of corne and graine, wines, oile, wooll, linnen, woollen & excellent bœufes; as for horſefleſh, I have alwaies heard, even from the mouth of thoſe that be profeſſed runners in the race with horſe and chariot, That the breed of Italie paſſeth all others: for mines of gold, ſilver, braſſe, and yron, it gave place to no countrey whatſoever, ſo long as it pleaſed the ſtate to employ it that way; and in lieu of thoſe rich commodities which it hath ſtill within her wombe, ſhee yeeldeth unto us varietie of good liquors, plentie of all ſorts of corne, and abundance of pleaſant fruits of all kinds. But if I ſhould ſpeake of a land after Italie (ſetting aſide the monſtrous and fabulous reports that goe of India) in my conceit Spaine M is next in all reſpects, I meane thoſe coaſts which are environned with the ſea.

FINIS.

An Index pointing to the principall matters contained in the second Tome of *Plinies* naturall Historie.
